(i) General principles; (ii) determination of treatment policy; (iii) choice of technique, time and dose; (iv) calibration of X-ray plant and choice of operating prescription of X-ray treatment; (vii) beam-director system; (ix) construction of ray beam direction applicators; (x) the reaction to radiation; (xi) the skin; (xii) the lip; (xiii) the mouth; (xiv) the pharynx and larynx; (xv) head and neck—various; (xvi) secondary lymph nodes; (xvii) the oesophagus; (xviii) the lung and mediastinum; (xix) the breast; (xx) the uterine cervix; (xxi) the body of the uterus; (xxii) the bladder; (xxiii) the rectum and the anus; (xxiv) the genital organs; (xxv) bone and connective tissue; (xxvi) the reticulo-endothelial system; (xxvii) the blood; (xxviii) the brain; (xxix) causes of failure of treatment; (xxx) telerradium therapy; (xxxi) protection of staff from radiation effects; (xxxii) organization; (xxxiii) research on the biological action of radiation; (xxxiv) new radiotherapeutic agents. Index. Radium dosage graphs.

Paterson's book on the treatment of malignant disease by radium and x rays is the first of its kind to be published in Great Britain. It completes a trilogy of which the two preceding volumes have consisted of (i) a statement of results and (ii) an account of the system of radium dosage. Like the centre from which they emanate, the volumes have shown an expanding tendency and this last volume is an ambitious, beautifully produced publication of which the author may be justifiably proud. It is really a series of monographs describing the conceptions of the Manchester School, and their rationale and methods of treatment in dealing with malignant disease. Other methods and other ideas are given little consideration for, as the author states in the introduction, "... there are many alternative, equally well-founded approaches to the various problems", and the book must be considered as "... one particular practice of that specialty in which it is hoped that a reasonable synthesis of most that is well-tried has been achieved." But no apology is needed, for as a clear, dogmatic but reasonable statement describing the principles, reflecting a wide experience of the treatment of cancer on the basis of sound clinical knowledge and unremitting scientific effort, it will be difficult to equal and well-nigh impossible to surpass. The author warns us, however, and the reader will do well to remember, that he deals with an "evolving specialty" and that the "dogmatic" presentation should be taken as definiteness of statement, not fixity of opinion. An account is given of radiotherapeutic principles, principles on

which treatment policy is based, the techniques used and the apparatus necessary. Clear accounts are given of the radium dosage system and adequate graphs and tables included for moulds and implants, to make the book useful for practical reference. Indeed the keynote of the book is that enough detail is provided for Manchester techniques based on Manchester principles to be carried out by the radiotherapist who masters its contents.

In a book of more than 600 pages it is not possible to give a comprehensive list of all the points which occur to the reviewer in connexion with matters of detail, but in addition to the virtues mentioned above, the following are noteworthy. The stress laid on the necessity of nursing and adequate diet, together with the practical details, is an excellent feature. The chapter on field selection and prescription is interesting and useful, although to the reviewer it seems that the principles followed involve undesirable irradiation of normal tissues.

Criticisms which might be made are numerous, but for the most part are of omissions for which the author excuses himself in the introduction. However, it does not seem to accord with his principles to consider that the x-ray treatment dose given to a larynx in five weeks should be equal to or less than, for instance, the radium dose given to a tongue in a few days. No mention is made of the use of coagulation for vulval carcinoma. The difference between permanent seed implants and radium implants is not emphasized and the possibility of using unequally loaded radium needles as an important advance in technique is not mentioned.

The collaborators who have contributed special chapters are worthy of the author. The radiotherapists are Margaret Tod, on gynaecological and reticulo-endothelial conditions, J. L. Dobbie on x-ray field selection, Walter Levitt on treatment of blood conditions, and B. W. Windeyer & J. E. Roberts on telerradium treatment. Edith Paterson contributes a review of radiobiological work, and Geoffrey Jefferson in his own masterly style adds lustre to the book by his account of tumours of the central nervous system. Help with the physics has been given by W. J. Meredith. It is undoubtedly a book for all radiotherapists.

Frank Ellis

### 1381 Radiotherapy and Cancer

A. G. C. Taylor, Joan Lassetter & T. K. Morgan. London: H. K. Lewis & Co. Ltd., 1948. 81 pages. 22 x 15 cm. 7s. 6d. [£0.375]

Part I. The basis and methods of treatment. Physics—Radiobiology—The intention of treatment—Records—Methods of treatment. Part II. The treatment of cancer in individual sites. A histological classification—Buccal cavity and pharynx—Digestive organs—Respiratory organs—Female genital organs—Male genital organs—Urinary tract—Skin—Nervous system—Eye—Endocrine glands—Sarcoma.

These notes, written by the radiotherapists of the Wessex Radiotherapy Board, which controls the radiotherapy at Southampton, Bournemouth and Portsmouth, were written primarily to enable radiotherapists in the region to have a common statement of classification, principles and methods of treatment so that they could pool their experience and make the best use of their limited physical service. They are also intended to give physicians, surgeons and general practitioners an understanding of the radiotherapist's point of view in the treatment of cancer, as it was thought that this information might stand them in good stead when advising their patients and would contribute to the success of team work in the treatment of this group of diseases.

The first part explains the mode of action and the effects of radiation, the basis of selection of cases for treatment and the methods employed. The second part gives the authors' views on the treatment of cancer according to site, extent of spread and microscopical structure. The notes are clear and well set out, but so compressed that the sections on physics and biology will be of little value to those with any knowledge of the subject and can hardly produce much enlightenment in those with none. That the methods of treatment are set down by sites shows that much care and thought have been given to these problems and that a high standard of treatment is maintained. Such brief statements may be of value as general guides but there is also no little danger that they may lead to the impression that tumours and not patients are being treated.

Surgery is briefly mentioned in places where it is put forward as an alternative method of treatment, but does not, for instance,

receive any mention as a method of treatment for the primary tumour in cases of carcinoma of the alveolus. A regular quantitative estimation of prolan A excretion in the urine in all cases of tumours of the testicle is advocated in a section which occupies one quarter of the whole of the note on testicular tumours. In carcinoma of the bronchus it is suggested that plain x rays, tomographs, bronchograms and examination of the sputum for malignant cells should all be done before bronchoscopy is performed in a suspected case. Ewing's tumour is listed as a histological entity, a reticulo-endothelial tumour which resembles sympatheticoblastoma.

Such individual criticisms naturally arise from the method of presentation and do not necessarily detract from the value of these notes as a guide to the organization of treatment by radiation amongst a group of radiotherapists who meet regularly for discussions.

D. W. Smithers

## REHABILITATION

### 1382 The Rehabilitation of the Injured. Vol. 2: Remedial Gymnastics

John H. C. Colson. London: Cassell & Co. Ltd., 1947. xii + 556 pages; 439 figures. 22 x 14 cm. £1 10s. [£1.5]

(i) Introductory. Part I. The theory of specific remedial exercises. (ii) The classification of movement; (iii) the mechanics of active movements; (iv) basic principles of specific remedial exercises; (v) the aims of specific remedial exercises and the methods used to accomplish them; (vi) the application of specific remedial exercises. Part II. The rationale of specific remedial exercises. (vii) The relationship of the pathological changes which take place in the tissues after injury to the purposes of specific remedial exercises. Part III. The relationship of specific remedial exercises to splints and plaster casts. (viii) Types of splints and plaster casts used for the commoner bone and joint injuries. Part IV. Specific exercises with special remedial apparatus. (ix) Assisted movements with apparatus; (x) resisted movements with apparatus; (xi) essentials of pulley and suspension therapy apparatus. Part V. Specific remedial exercises in the treatment of the commoner bone and joint injuries. (xii) Fracture and fracture-dislocation of the ankle joint; (xiii) fracture of the shafts of the tibia and fibula; (xiv) fracture of the external tuberosity of the tibia; (xv) fracture of the patella; (xvi) injuries of the semilunar cartilages; (xvii) fracture of the shaft of the femur; (xviii) fracture of the neck of the femur; (xix) injuries of the pelvis; (xx) fracture and fracture-dislocation of the dorso-lumbar spine; (xxi) fracture and fracture-dislocation of the cervical spine; (xxii) fracture of the clavicle; (xxiii) dislocation of the shoulder joint; (xxiv) fracture of the shaft of the humerus; (xxv) dislocation of the elbow joint; (xxvi) fracture of the head of the radius; (xxvii) fracture of the shafts of the radius and ulna; (xxviii) injuries of the wrist joint; (xxix) injuries of the hand and fingers. Part VI. The treatment of amputation stumps. (xxx) Amputation stumps: the physiotherapist's part in their preparation for limb wearing. Part VII. Re-education in walking. (xxxi) Theoretical and practical aspects of re-education in walking in the treatment of lower limb injuries. Index.

One of the most significant changes which has taken place within recent years, in the treatment of cases of injury, is the importance which is now assigned to the early and progressive use of remedial exercises, given under skilled supervision and with scrupulous regard to exact methods of technique. It is not so very long ago since absolute rest and rigid immobilization were regarded as the essentials of treatment of any fracture or serious injury. But prolonged rest and immobilization are far from ideal for the recovery of physical function. They lead only too readily to wasting of muscles, stagnation of the circulation, swelling and stiffness of joints, and decalcification of bones. As a result, a fracture so treated is usually followed by a prolonged period of weakness and impaired mobility, and, only too often, by some permanent disability.

It is to counter these ill effects that physiotherapy is now extensively employed in cases of injury, and with excellent results. In the first instance this took a somewhat passive form, and was mainly confined to massage and the application of various forms of heat and electrical stimulation, with the patient having everything done for him by the kindly masseuse. But this has now been superseded in all the more modern schools by the early use of voluntary exercises, directed towards the promotion of healthy circulation in the injured part, the recovery of muscular use and power, and the prevention of adhesions or stiffness.

The development of a scientific technique, in the application of remedial exercises to all forms of injury, owes an immense debt to Mr. John Colson, and the present volume is the result of continuous study of the subject for many years, and to practical experiments carried out in some of the leading hospital rehabilitation centres in the country. With the aid of an excellent series

of photographs and of over 400 attractive line diagrams Mr. Colson describes in detail the type of exercise (or, rather, the course of exercises) required for every kind of fracture or other serious injury, the technical points to be observed, the progression to be followed, and the amount of time to be devoted to each exercise. In each case the actual results of the injury are carefully described and the essential aim of the exercise pointed out. Additional chapters on the classification and mechanics of movement and the basic principles of remedial exercises supply the scientific background to the system of remedial gymnastics recommended, and valuable contributions are also made by Mr. J. M. Fitton and Dr. Langdale Kelham, who, respectively, describe in detail the methods of re-education for the patient who has lost the lower limbs, and the treatment of amputation stumps.

This book should be carefully studied by all who are responsible for the treatment of injuries, whether as surgeons, physiotherapists or remedial gymnasts. A similar volume is needed describing the exercises suitable for non-traumatic forms of physical disability.

Harold Bolme

### 1383 Rehabilitation of the Physically Handicapped

Henry H. Kessler. New York: Columbia University Press; London: Geoffrey Cumberlege, Oxford University Press, 1947. xi + 274 pages. 24 x 15 cm. £1

Part I. Problems of the physically handicapped. (i) General considerations; (ii) problems of the disabled; (iii) the crippled child; (iv) the injured worker; (v) the disabled veteran; (vi) the chronic disabled. Part II. Principles of rehabilitation. (vii) Physical restoration; (viii) rehabilitation centers; (ix) vocational guidance; (x) vocational training; (xi) selective placement. Part III. Rehabilitation in practice. (xii) The mentally and emotionally disabled; (xiii) the orthopedic patient; (xiv) the blind and the deaf; (xv) medical and surgical invalids. Part IV. A national program. (xvi) Legislation and administration; (xvii) a national challenge. Bibliography. Index.

The first rehabilitation centre to be established in the United States was the New Jersey Rehabilitation Clinic, Newark. It was opened in 1919, for the after-care and physical reconditioning of ex-Service men disabled from the First World War, and its first Assistant Director (and subsequent Director) was Dr. Henry Kessler. He continued in that post until 1941, when called up for active duty as a Lieutenant Commander in the United States Navy, in which capacity he organized two of the chief naval rehabilitation centres. The present volume is the product of that wide experience, and provides one of the fullest and most comprehensive accounts of rehabilitation in the USA that has yet appeared.

The book is divided into four parts, dealing respectively with the problems of the disabled, the principles of rehabilitation, the operation of rehabilitation in actual practice, and the part which it should play in a national programme of social security, with a summary of the main laws which have been passed by Congress for the benefit of the physically handicapped, and the actions which have derived from them.

Some of the finest passages in the book are those describing the effect of severe disability on those afflicted: the sense of isolation and inferiority commonly felt by the blind and deaf, the frustration experienced by the seriously disabled in the cutting off of activity and ambition, and the lack of understanding displayed by the general public. As Kessler says of one such group, "they die a hundred spiritual deaths daily".

The essential parts of a well-co-ordinated programme of rehabilitation—expert medical and surgical treatment, physical restoration, vocational guidance and training, and selective placement in work which will provide outlet for the maximum use of physical and mental capacity—are fully and well described, and accounts are given of their application to crippled children, orthopaedic and traumatic disabilities, the mentally and emotionally unstable, and to chronic medical and surgical disorders.

Although mainly confined to the United States, where the main emphasis in rehabilitation has always been on provision for the disabled ex-service man rather than on the far larger and more needy population of civilian disabled, Dr. Kessler presents a broad and sympathetic approach to the whole problem. He has caught a vision of the true function of rehabilitation, not just as a means of employing, in some subsidiary capacity, the man who would otherwise be dependent on charity, but as a method of reintegrating the personality and restoring the functional powers

of the physically handicapped man, preparing him for a sphere of life in which his disabilities will no longer prove a handicap, and conserving for the nation a valuable source of man-power in every department of productive work.

Harold Balme

## RENAL DISEASES

### 1384 Glomerular Nephritis: Diagnosis and Treatment

Thomas Addis. New York: The Macmillan Company, 1948. xix + 338 pages; 58 figures; 1 plate. 24 x 16 cm. £2

(i) Special clinical laboratory methods for the physical examination of patients with renal disease; (ii) special clinical dietetic methods; (iii) inferences as to the nature of the renal lesion; (iv) inferences as to the extent of the renal lesion; (v) the theory of the differentiation of glomerular nephritis from other diseases; (vi) the differentiation of glomerular nephritis from other diseases; (vii) glomerular nephritis; (viii) theory and practice in the treatment of glomerular nephritis. Appendix. References. Index.

This book summarizes the experience of a worker who has devoted over 40 years to the study of nephritis, and for this reason alone it deserves attention. Addis's approach is clinical, backed up by laboratory techniques so simple that they are available to everybody. These techniques are clearly described. Stress is laid on a careful quantitative examination of the urinary sediment in deciding on the nature of the disease process and its activity, and in the book is collected information on the formed elements of urine in various diseases, which would be difficult to find elsewhere. Of particular interest is the section dealing with the course of nephritis. The only comparable long-term study is that of Ellis and, while there is agreement on many points, Addis clearly does not agree with Ellis's differentiation of two types of nephritis.

The section on treatment is the most important and deserves attention. The thesis is developed that, during all phases of nephritis, the osmotic work of the kidney should be reduced to a minimum. Experimental work on animals is presented in support of this view and the dietary management in the various phases of the disease described.

The book is, however, not without its defects. It is marred by the inclusion of unnecessary philosophical considerations which make it difficult to separate out the relevant material. The style is too diffuse and condensation would have allowed of presentation of more factual information. Many important aspects of nephritis are ignored. For example, no mention is made of the cardiac or pulmonary manifestations of acute nephritis which are so often the presenting features and which are responsible for many of the deaths in the acute phase. In the section on treatment some space might have been devoted to other possible interpretations of the experimental findings and more should have been said on the water and mineral needs of the patients in the various phases of nephritis. These and other omissions make the whole presentation rather unbalanced but, despite this, it is a book that can be recommended to those interested in the problems of renal disease.

G. M. Bull

### 1385 New Ways of Treating Uraemia. The Artificial Kidney, Peritoneal Lavage, Intestinal Lavage

W. J. Kolff. London: J. & A. Churchill Ltd., 1947. 112 pages; 59 illustrations. 24 x 16 cm. 10s. 6d. [£0.525]

Part I. Artificial kidney. (i) Brief survey of attempts at blood- (and tissue-) purification in renal uraemia; (ii) the artificial kidney as it is used now in the clinic; (iii) technical experiences with the artificial kidney gained in clinical use, and hints for the use of the kidney in future; (iv) clinical pictures, in which treatment with the artificial kidney is to be considered. Survey of the first 25 patients treated with the artificial kidney; (v) the clinical symptoms of uraemia during and after the dialysis; (vi) reactions of the patient during dialysis and their therapy; (vii) investigation on substances which were removed (or supplied) by the dialysis with the artificial kidney; (viii) instructions for fitting up and cleaning the artificial kidney. Summary of Part I: artificial kidney. Appendix (Plans). Literature. Part II. Peritoneal lavage. Part III. Treatment of serious chronic uraemia by perfusion of an isolated intestinal loop. Part IV. Treatment of uraemia with high caloric low protein diets.

The author begins by stating in this work, published in 1947, that the artificial kidney is probably the most effective means of

removing non-colloid particles from circulating plasma by diffusion. The older methods proposed and used by other workers are described in detail, the main difficulties having been due to the absence of a harmless and reliable agent for the prevention of clotting, the unreliability of the earlier dialyzing membranes and the insufficient capacity of the dialyzing systems.

The present type of artificial kidney, as used by the author, is described in detail. A big cylinder rotates in a tank filled with fluid, a long tube of cellophane is wound round this cylinder spirally and blood from the patient flows through the tube. Continuous dialysis only is now used by the author. The details of construction and drawings given should enable any good instrument maker to reproduce the machine. The fluid used in the tank consists of tap water with 0.6 per cent NaCl, 0.04 per cent KCl, 0.2 per cent NaHCO<sub>3</sub> and 1.5-2 per cent glucose added.

The author considers that any acute uraemia with a blood urea of over 350 mg. per cent, raised blood potassium, or decreased alkali reserve, warrants treatment by the artificial kidney. Of the first series of 15 patients so treated, only 1 survived, but the deaths are shown not to have been due to treatment by the kidney; of the second series of 10, 4 have survived. The largest amount of urea removed in a single dialysis has been 260 g. During dialysis, the blood potassium, sodium, chloride and alkali reserve must be closely followed.

Short chapters are added dealing with peritoneal lavage, the technique of perfusion of an intestinal loop and with the high calorie/low protein diet in the treatment of uraemia. No mention is made, however, of the now quite frequently used method of continuous intestinal lavage; and the advantages or otherwise of the available methods are not fully discussed in a comparative fashion.

G. Loewi

## RHEUMATISM

### 1386 Textbook of the Rheumatic Diseases

Edited by W. S. C. Copeman. Edinburgh: E. & S. Livingstone Ltd., 1948. viii + 612 pages; 351 illustrations. 24 x 17 cm. £2 10s. [£2.5]

... the nomenclature and classification of the rheumatic diseases; (i) the skin and subcutaneous tissues in relation to the rheumatic diseases; (ii) the anatomy and physiology of pain; (iii) the clinical approach to pain; (iv) the anatomy and physiology of joints; (v) climatic and environmental factors in the rheumatic diseases; (vi) rheumatic fever (acute rheumatism); (vii) chorea (St. Vitus's dance); (viii) rheumatoid arthritis; (ix) some aspects of Still's disease; (x) osteoarthritis; (xi) the rarer arthritic syndromes; (xii) spondylitis; (xiii) gout; (xiv) non-articular rheumatism; (xv) brachial neuritis; (xvi) sciatica; (xvii) the differential diagnosis of rheumatism; (xviii) special pathology of the rheumatic diseases; (xix) clinical pathology of the rheumatic diseases; (xx) the radiology of the rheumatic diseases; (xxi) radiotherapy in the rheumatic diseases; (xxii) physiotherapy in the treatment of the chronic rheumatic diseases; (xxiii) hydrotherapy and spa treatment; (xxiv) principles of the orthopaedic treatment of arthritis; (xxv) special problems in the orthopaedic treatment of arthritis; (xxvi) psychiatric aspects of the rheumatic diseases; (xxvii) social and industrial aspects of rheumatism; (xxviii) statistics of the rheumatic diseases. Index.

In the past decade, the medical profession in Great Britain has become increasingly aware of the importance of rheumatism as a cause of painful disability to the individual, and of economic damage to the community. One result of this has been the creation of rheumatism research departments by the Universities of Manchester, Leeds and Bristol, in association with the neighbouring spa hospitals of Buxton, Harrogate and Bath; another has been an increased emphasis on the subject by medical teachers generally. Research workers and teachers alike have regretted the absence of a really comprehensive textbook of the rheumatic diseases: here at last is a serious attempt to produce such a book.

Dr. Copeman has chosen to write with a team of contributors, and, although this is unusual for a book on an apparently narrow specialty, it is essential if authoritative views are to be given on the influence on diagnosis or treatment of physiology, neurology, pathology, radiology, orthopaedics, psychiatry, and social and physical medicine.

The book begins well with an historical summary by the editor, and with fundamental sections on the significance of pain, by J. H. Kellgren, and the anatomy and physiology of joints, by D. V. Davies. The standard is maintained by chapters on the commoner rheumatic disorders—including acute rheumatism,

by Lord Horder, chorea, by the editor, and osteo-arthritis, by E. R. T. Fletcher. At first sight, there would appear to be a lack of balance in the allocation of 57 pages for Professor Cohen's fine chapter on gout, and of only 23 pages for Professor Davidson's concise account of rheumatoid arthritis, but this is adjusted by the separate description of Still's disease, by B. Schlesinger. In the same way, the apparent inadequacy of 8 pages for Sir Adolphe Abrahams' differential diagnosis of rheumatism is compensated by the allowance of 52 pages for Professor Cohen's admirable section on the rarer arthritic syndromes.

The value of the specialist-contributor is well shown by the sections on special and clinical pathology, by H. J. Gibson, on radiology, by Campbell Golding, and on the often-underestimated hydrotherapy and spa treatment by G. D. Kersley; only by "scissors and paste" methods could a general physician write chapters of such accuracy and understanding. The general principles of the orthopaedic treatment of arthritis are clearly described by Sir Reginald Watson-Jones & H. Osmond-Clarke, but their chapter on special problems in such treatment suffers a little from compression—which is perhaps inevitable in a primarily medical work.

In brief, the book goes far to meet a real need, and should be welcomed by the general physician as well as by the specialist in the rheumatic diseases and in physical medicine. Although one feels that a smaller team of contributors might have been more satisfactory, Dr. Copeman deserves great credit for his editing, which has reduced overlapping to a minimum and given adequate references and a bountiful supply of excellent illustrations.

The book is produced by Messrs. E. & S. Livingstone, of Edinburgh, and is in keeping with their high reputation.

D. N. Ross

## SOCIAL MEDICINE

### 1387 Changing Disciplines. Lectures on the History, Method, and Motives of Social Pathology

John A. Ryle. London: Geoffrey Cumberlege, Oxford University Press, 1948. x + 122 pages; 13 figures. 19 x 13 cm. 12s. 6d. [£0.625]

(i) Social pathology and the new age in medicine; (ii) the social post-mortem examination and its bearing on aetiological research; (iii) teaching and research in social medicine. An account of the Oxford experiment; (iv) the meaning of normal and the measurement of health; (v) social medicine and the population problem, (vi) medical ethics and the new humanism. Index of authors and references. Index of subjects.

At this stage in the development of social medicine in Great Britain this book can claim a peculiar interest. The author was the first in this country to occupy a chair of social medicine. Moreover, the Institute of Social Medicine at Oxford, of which he is the director, was created in order that through experiment and experience the scope and content of the subject should be given a more exact definition. It became Professor Ryle's responsibility to give direction to its development. This being so, it follows that the results of his experience, when presented, must do much to mould the organization and function of all the other academic departments of social medicine which have come into being in Britain since the war.

It was fortunate, therefore, that the mounting interest in social medicine in America led to a visit of Professor Ryle to the USA, where he was invited to state his creed and display his philosophy. It was fortunate for the reason that in preparation for this visit he was forced to crystallize some of his ideas which have been shaped by the growth of his Institute. None could have better qualifications for these tasks than the author, for he had not only seen in his own lifetime those changes within medicine which had yielded in the end the new discipline of social medicine but he himself had, by his reactions to these changes, been persuaded to transfer his own interests from clinical and personal medicine to new ventures in the field of social pathology.

Professor Ryle has formed the opinion that though medicine, with its scientific and technical advances, has greatly increased in respect of its powers, it has at the same time become less competent to deal with certain of the deeper personal needs of the individual and the broader social needs of the community. He

is persuaded that medicine cannot rest content to be concerned in the main with the phenomena of clinical pathology, but must once more become competent to deal with the medical problems of the total individual in relation to his total environment, both physical and social.

In this book, which presents the subject-matter of a series of lectures, the author answers a number of questions with which he has been living and makes suggestions as to how medicine in the immediate future may become better able to tackle the new problems that social changes have created.

Whilst in Great Britain there is coming into being a general agreement concerning the content, techniques, scope and aims of social medicine, abroad there is much confusion and misunderstanding. To those who seek a knowledge of what social medicine is and of its relationship to the other branches of medicine this book is strongly to be recommended, for it is a serious and successful attempt to construct and to present a general theory of the subject.

F. A. E. Crew

### 1388 The Natural History of Disease

John A. Ryle. Second edition. London: Geoffrey Cumberlege, Oxford University Press, 1948. xiv + 484 pages. 22 x 14 cm. £1 2s. 6d. [£1.125]

(i) The physician as naturalist; (ii) the training and use of the senses in clinical work; (iii) the clinical study of pain; (iv) visceral pain and referred pain; (v) the study of symptoms; (vi) the nature and relief of some common gastric symptoms; (vii) the natural history of duodenal ulcer; (viii) anorexia; (ix) chronic diarrhoea; (x) fatty stools from obstruction of the lacteals; (xi) observations on colonic pain; (xii) chronic spasmodic affections of the colon and the diseases which they simulate; (xiii) on examining the rectum; (xiv) ball-valve accumulations in the rectum; (xv) visceral neuroses; (xvi) the natural history, prognosis, and treatment of staphylococcal fever; (xvii) the natural history, prognosis, and treatment of streptococcal fever; (xviii) the natural history, prognosis, and treatment of infections with *Bacillus coli communis*; (xix) the prognosis and treatment of lobar pneumonia; (xx) prognosis; (xxi) the radial pulse; (xxii) hyperpiesia; (xxiii) chronic Bright's disease without albuminuria; (xxiv) angina pectoris and allied seizures; (xxv) a note on John Hunter's cardiac infarct; (xxvi) three cases of cardiac distress; (xxvii) thrombophlebitis migrans; (xxviii) notes on prostatic and gastric uraemia; (xxix) myxoedema and other manifestations of thyroid deficiency; (xxx) meningitis and meningism; (xxxi) some alarming seizures; (xxxii) of nosophobia; (xxxiii) observations on the abdominal and circulatory phenomena of allergy; (xxxiv) diathesis, or variation and disease in man; (xxxv) opening remarks at a discussion on research in clinical medicine; (xxxvi) the social pathology of rheumatic fever; (xxxvii) the Hippocratic ideal. Index to authors. Subject index.

A republication of lectures and essays provides interesting and stimulating reading, easily adaptable to occasional and interrupted leisure. Professor Ryle discusses the importance of the qualities of the naturalist and the humanist in the good physician. Recent technical training has perhaps tended to overshadow the importance of the more simple observational methods in clinical medicine; eagerness to measure objectively may lead us to overlook the less measurable but possibly more relevant features of the clinical picture.

Nothing in medicine is so insignificant as to merit inattention . . . But there can be no dispute about the merits of the two methods; they are complementary . . . A series of cases of headache, backache, or abdominal pain, as fully investigated as circumstances will permit . . . may ultimately furnish the material for a reasoned contribution . . . The only essential apparatus for the research is a good card index.

The value of the careful study of symptoms and of the "whole" patient and his environment is illustrated in several essays. Methods of studying pains and common gastric and other visceral symptoms are discussed on the basis of the author's clinical experience. Readers familiar with the 1936 edition will find only minor modifications in its chapters; new chapters cover such general clinical matters as the uses of prognosis (Chapter XX) and both the social and psychiatric aspects of common disease, such as the social pathology of rheumatic fever (Chapter XXXVI) and nosophobia (Chapter XXXII).

The essays are very readable and throughout are fully illustrated from the wide clinical experience on which they are based. The book covers many of the daily practical problems of clinical medicine, and differs from textbooks in its predominant concern with the symptomatology that is both common and incompletely understood. The book should be of interest to all physicians, and should prove particularly helpful to students and practitioners in balancing their digestion of some of the medical "scientific" literature which is both less relevant and less interesting.

# 1389 The Social Medicine of Old Age. Report of an Inquiry in Wolverhampton

J. H. Sheldon. London: Published for the trustees of the Nuffield Foundation by Geoffrey Cumberlege, Oxford University Press, 1948. x + 239 pages. 21 x 14 cm. 5s. (paper cover); 10s. (cloth cover) [£0.5]

(i) Introduction; (ii) physical state of old people living at home—I. General; (iii) physical state of old people living at home—II. Local symptoms; (iv) mental state of old people living at home; (v) domestic structure; (vi) the management of illness in the home; stresses and strains; (vii) random reflections. Appendix 1: questionnaire used in the survey. Appendix 2: statistical tables. Index.

There has long been a tendency towards partisanship among both social and medical workers for the old or the young in the community. We were even warned quite recently not to be too lavish in our dealings with the aged lest we take too much attention away from other problems and rob the younger generation of their rights and needs. Here at last, in J. H. Sheldon's *Social medicine of old age*, is a book which makes no attempt to establish a case for or against the aged as a group in need of care and attention.

With unemotional objectivity Dr. Sheldon places his findings before us: (i) that 98 per cent of the old people in his sample lived at home; (ii) that, ill or well, old people at home are subject to certain hazards; (iii) that these hazards, in their turn, threaten the stability and balance of the lives of those who live in association with old people.

Taking a random sample of the population, without regard to health-level or income-level, the author has set out to present a picture of old people in everyday life in an industrial town (Wolverhampton). Contact with such a sample, he points out, greatly enriches the physician's experience, since this is usually confined to those avowedly ill, temporarily or permanently, and seldom includes those carrying on their daily lives, without or with recognized disabilities. Using the technique of the questionnaire filled out in the patient's home by the investigator (in this case Dr. Sheldon himself), he has been able to maintain the freshness of the direct response, augmented by his own close observation during the interview. Important for future investigators is the lesson of infinite patience called for when the interview is hampered by the subject's slowness of comprehension, deafness, over-eagerness for the visitor's company or reluctance to talk to a stranger, and the sharp difference of approach necessary between one subject and another. "For all these reasons, five interviews and the later writing up of the results is the best that can be done in an average full day's work."

Dr. Sheldon follows his study of the physical and mental state of old people at home, the domestic structure in which they live and the management of illness in the home, with an important chapter which he calls "Random Reflections", a title which indicates that he feels there is far to go before we may draw conclusions. Here he touches on what is normal for old age; possible lines of further inquiry; and the important contributions that can be made by the general practitioner. He underlines the incredible determination to live in spite of serious physical defects, loneliness, economic and emotional stresses, and shows how those well occupied seem best able to overcome their disabilities. The value of specific remedial measures, such as dentures, spectacles, hearing-aids, physiotherapy and chiropody, is also discussed. Perhaps Dr. Sheldon's most vital and original contribution to gerontology is that implied in the following paragraph:

The previous chapters have dwelt [sic] in detail with the physical and mental state of the old people forming the sample, dealing essentially with each subject as an individual. No true understanding of the problems of old age in the community could be reached if the inquiry were limited to this individual aspect of old age, and there can be no social medicine of old age without a knowledge of the reciprocal relations between the old people and the community of which they form part.

Without minimizing the burden of old age to the old person, he depicts vividly the cost to those not yet old:

It was found in Wolverhampton that 7.7 per cent of the old people were suffering great strain on the younger generation. . . . The details provided in the text concerning the difficulties experienced by these unfortunates over such simple but necessary matters as time for relaxation, getting out of the house, and still more of getting away for a holiday, speak for themselves. These members of the younger generation are clearly carrying a grossly unfair burden, and any scheme for the betterment of old age that failed to include a consideration of their needs would be lacking in equity.

In these days when "No room at the hospital" has become a slogan repeated ad nauseam, it is well to have it brought home to both medical and lay readers how great a proportion of the work

for old age is to be done outside hospital walls. Above all it is urgent to insist that there is no danger of over-estimating the needs of the old at the expense of other communal needs, if it is remembered that neglect of old age as a social responsibility increases the burden on the young and middle generations. It is to be hoped that Dr. Sheldon has blazed a trail which many will follow.

S. R. Burstein

## SURGERY

### 1390 Radical Surgery in Advanced Abdominal Cancer

Alexander Brunschwig. Chicago: University of Chicago Press; London: Cambridge University Press, 1947. xii + 324 pages; 118 figures. 25 x 17 cm. £2.2s. [£2.1]

(i) Historical; (ii) operable and inoperable carcinoma; (iii) nonsurgical contraindications to radical resections of abdominal cancer; (iv) supportive treatment for patients undergoing extensive intra-abdominal operations; (v) total gastrectomy; transhiatal total gastrectomy; cardioesophagectomy; (vi) total operations in the presence of perforated gastric carcinoma; (vii) operations for recurrent gastric cancer; gastrectomy for metastatic carcinoma (to the stomach); (ix) operations for advanced cancer of the small intestine; (x) operations for advanced cancer of the colon; (xi) carcinoma of the head of the pancreas; (xii) operations for cancer of the body of the pancreas; (xiii) operations for hepatic neoplasms; (xiv) operations for advanced carcinoma of the extra-hepatic biliary ducts; (xv) injuries to the hepatic artery, portal vein, and superior mesenteric vessels; (xvi) operations upon the spleen involved in advanced intra-abdominal cancer; (xvii) operations upon the adrenal gland; (xviii) operations for intra-abdominal extension of gynecologic cancer—complications of irradiation therapy; (xix) results of radical surgical excision in 100 cases of advanced abdominal cancer; (xx) conclusions. Index.

The name of Brunschwig requires no introduction to surgical readers on either side of the Atlantic, and he is especially well known for his pioneer work in relation to malignant tumours of the pancreas.

In Great Britain no surgeon has done more than George Grey Turner to encourage surgeons, especially younger colleagues, to deal with malignant disease vigorously and thoroughly, promising them that their prowess will many times be rewarded, and the reviewer has often said that Grey Turner's little book, *Some encouragements in cancer surgery*, published a quarter of a century ago, should be on every young surgeon's bookshelf. This volume from Dr. Brunschwig's pen carries the same note of encouragement for those who have to deal with cancer. Inasmuch as he confines himself to advanced cancer in the abdomen, there are no formidable rival methods of therapy to contend with and he is at pains to ascertain what surgical courage, fortified with all the recent additions to the surgical armamentarium, can effect in prolonging life, relieving distress, and making the "passing on" more easy for those afflicted with abdominal cancer. Some of his surgical ablations in advanced cancer have been indeed *tours de force*—the removal of stomach, spleen, part of colon, pancreas, liver, etc.

Perhaps the most valuable chapter of the work is that which analyzes the results of operative surgery in 100 patients with advanced abdominal malignancy. 34% died of operation; 17% received no relief; 30% derived relief in varying measure. But he can make the proud boast that 19% i.e., one in five, were rewarded with prolonged survival, 13% averaging nearly 3½ years. One patient, whose stomach, distal half of pancreas, a loop of jejunum and its mesentery and adjacent retroperitoneal tissue were resected, was alive more than ten years later. A similar case also was alive after nine years, and there are others recorded who have survived more than five years.

There is a useful brief history of the evolution of abdominal surgery in the first few pages of the book. Every abdominal surgeon should be the possessor of this volume. Its author expresses his great appreciation to that fine surgeon, Dallas B. Phemister, Fellow of the Royal College of Surgeons of England and President of the American College of Surgeons, for his interest and encouragement.

(xxix) liver—cirrhosis; (xxx) lymphogranuloma inguinale; (xxxi) lung—tumours;  
(xxxii) lupus vulgaris; (xxxiii) lymphogranuloma inguinale. Index to Volume 5.

The system of surgery of which this is the 5th volume is a  
British one, and the result has been a very high level  
of progress in all parts with Hodgkin's disease at  
both the most interesting and the worst.

The system of surgery, of which this is the 5th volume is a great credit to British surgery. The editors have chosen their contributors very wisely and the result has been a very high level of exposition. This volume starts with Hodgkin's disease and ends with lymphogranuloma inguinale, both most interesting and informative articles. Features which show that the work is well abreast of the times are inclusion of a chapter on the law foot, on compression injury and industrial injuries, while a new and useful outlook is shown by inclusion of a chapter on the lipoidoses but after reading it one wishes that there were fewer conditions needing eponymic terms. Diseases of the kidney are dealt with by six separate experts; though each section is good one almost feels that some unity of outlook is lost by such subdivision. There are long and well-illustrated articles on diseases of the larynx and tumours of the lung. Two of the most concise and informative chapters are on hyperpiesia and physiology of sweating: a masterpiece of compressed but readable matter. We have purposely avoided mentioning the names of the contributors, for it would be invidious to single out any where the general excellence is so high. It is our considered opinion that for any practitioner—since it is authoritative, beautifully produced, and well indexed.

**Special Reports**  
**Acids**  
Robert Elman. London: Hamish Hamish, 24 x 16  
1947. xx + 284 pages; 31 figures. 24 x 16  
[£1.05]

(i) Introduction; (ii) general indications and methods for the parental administration of fluids; (iii) water and electrolyte needs; (iv) energy (caloric) needs; (v) vitamin needs; (vi) protein needs; (vii) clinical manifestations of protein deficiency; (viii) methods of parental protein administration: plasma transfusions; (ix) methods of parental protein administration: amino acids and hydrolyzed protein; (x) a practical program for parental alimentation; (xi) clinical results with parental alimentation. Appendix: milestones in parental alimentation. Index.

Elman has produced a comprehensive and well-documented intravenous alimentation, ostensibly as applied to the physiologist and pathologist. The original contributions of the author and protein hydrolyzation are likely to be equally instructive to the pediatrician and the pediatric pathologist.

Dr. Elman has produced a comprehensive and well-documented account of intravenous alimentation, ostensibly as applied to the physician or even to the physiologist and pathologist; Dr. Elman himself has made important original contributions in the field, especially on the use of amino-acids and protein hydrolysates, and is thus particularly well qualified to summarize and review critically the considerable literature which has accumulated, especially over the last decade. The first chapter, which gives a short but comprehensive survey of the history of parenteral infusion, makes very pleasant reading and it is obvious that the author has enjoyed writing it. In the chapter on water and salt balance the distinction between dehydration as such and a deficit of electrolyte is emphasized. Another chapter provides a short discussion on caloric needs. Energy requirements in infusion fluids are nowadays met mainly by addition of glucose; however, it has been found difficult to provide in this way more than 600-700

Calories per day, which is obviously insufficient. Recent work by Stare leads one to expect that in the near future fat emulsions might be available which could be used for intravenous injection. The availability of infusion fluids which cover the energy requirements of man without the need to employ excessive volumes of water would greatly increase the scope of intravenous alimentations. Dr. Elman accepts the usual American figures for ascorbic acid requirements; the usual daily requirement, he states, "... has been found to vary between 50 and 150 mg." There is no real experimental basis for the belief that administration of vitamin C to patients who do not show definite clinical signs of vitamin deficiency has beneficial effect. The concept of a "sub-clinical" deficiency is hazy and potentially mischievous and is often used as an excuse for the administration of a variety of vitamin preparations to patients who do not need them.

Probably the most important chapters of the book are those on protein deficiency and its correction by intravenous means. The author does emphasize, as the author should, the importance of feeding should normal channels of feeding have been employed. The tissues of

been found to be of benefit to patients who do not suffer from a deficiency which has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect.

deficiency has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect.

deficiency is hazy and potentially misleading. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect.

an excuse for the administration of a variety of vitamins. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect. The author does not make any experimental basis to patients who do not suffer from a deficiency which has beneficial effect.

Probably the most important chapters of the book are those dealing with protein deficiency and its correction by intravenous alimentation. It is important to emphasize, as the author does, that whenever possible the normal channels of feeding should be used. Recent work, in which isotopic labels have been employed, has demonstrated the exact chemical nature of these reactions, and the by-passing of the alimentary canal may therefore alter the normal pattern of protein metabolism. There are, however, certain conditions in which feeding by mouth is difficult or impossible and other methods of alimentation must be used, of which intravenous administration is only one. At the present time, when protein hydrolysates are commercially available, the therapeutic value of parenteral administration of proteins tends to be over-emphasized and it appears to the reviewer that Dr. Elman's presentation is not quite free from this fault. Some of the successes claimed for the intravenous treatment may possibly be due to the water and salt supplied to dehydrated patients rather than to the nitrogen administered. The loss of nitrogen which occurs after fractures, operations and other traumata is fully discussed by Dr. Elman. The mechanism of this mobilization of protein is not yet fully understood, but it appears that increase of protein intake by parenteral feeding does not seriously reduce this loss of nitrogen. The question may be asked, whether this apparently physiological response to injury is necessarily deleterious to the patient. It may be preferable to wait until the acute phase is passed and to increase the protein intake during convalescence, when the patient can be fed by the normal route. Dr. Elman's presentation is very clear and persuasive; the printing is good and remarkably free from errors. Altogether the book can be recommended as a stimulating and fairly comprehensive account of an important field of clinical science.

**393 Retropubic Urinary Surgery** Edinburgh: E. & S. Livingstone. [E.L.]  
Terence Millin. 163 figures. 25 x 18 cm. £1 5s.  
vii + 208 pages; 163 figures. (i) surgical approaches to the  
prostate; (ii) prostatic obstruction; (iii) retropubic prostatectomy;  
(iv) historical; (v) surgical anatomy; (vi) pre-operative care; (vii)  
(x) post-operative care; (xi) armamentarium; (ix) retropubic prostatectomy;  
stomy; (xii) operative difficulties; (xiii) post-operative prostate; (xiv) the cal-  
sub-cervical and sub-trigonal lobes; (xv) the prostate; (xvi) carcinoma of the  
culous prostate; (xvii) carcinoma of the prostate; (xviii) traumatic rupture of the  
bladder; (xix) post-prostatectomy obstruction; (xx) anaesthesia; (xxi) stress  
posterior urethra; (xii) prostatic abscess; (xiii) anatomical; (xxii) stress  
incontinence in women. Case analyses (Appendices I and II). Index.

This monograph is largely devoted to prostatectomy by the retropubic approach and, thanks to the choice of paper and excellently produced, and, thanks to the various types of type, easy to read. The author describes the various types of prostatic obstruction, and these are illustrated by endoscopic views in colour and photographs of actual specimens. With this description of the morbid anatomy as a basis, the results of surgical approaches to the prostate are reviewed, and the actual surgical approaches to the prostate are reviewed, and the results in each are considered. Retropubic prostatectomy is described in detail, having regard to the surgical care and management of the patient. Each stage of the operation is described in detail and the illustrations are admirably drawn. Millin concludes this section with an analysis of the large number of cases in which he has carried out this operation. There is no doubt that retropubic prostatectomy is a significant forward

step in prostatic surgery, and great credit is due to the author for his brilliant exposition of the operative technique which he has personally developed. The retropubic approach is now a standard method for the removal of the prostate. In the later chapters of the book descriptions are given of total prostatectomy and total cysto-prostatectomy for carcinoma. A brief, though well-illustrated, description of the author's operation for stress incontinence in women is provided in the last chapter. This book should be read by all surgeons interested in modern developments in prostatic surgery.

### 1394 The Surgery of the Stomach and Duodenum

T. H. Somervell. London: Edward Arnold & Co., 1948. viii + 546 pages; 231 figures. 24 x 15 cm. £2 5s. [£2.25]

(i) Introduction; (ii) embryology of the stomach and duodenum; (iii) anatomy of the stomach and surrounding organs; (iv) physiology of the stomach and duodenum; (v) gastric secretion in the human stomach; (vi) pain in abdominal viscera; (vii) diagnosis of gastric and duodenal diseases; (viii) operative methods; (ix) pre- and post-operative treatment of gastric cases; (x) congenital and infantile conditions; (xi) acute dilatation of the stomach; (xii) some injuries and diseases of the duodenum; (xiv) acute ulcers of the stomach and duodenum; (xv) chronic duodenal and gastric ulcer; (xvi) chronic gastric ulcer; (xvii) chronic duodenal ulcer; (xviii) medical treatment of duodenal ulcer; (xix) surgical treatment of duodenal ulcer; (xx) vagotomy in the treatment of duodenal ulcer; (xxi) gastrectomy for duodenal ulcer; (xxii) treatment of gastric ulcer; (xxiii) complications of gastric and duodenal ulcers; (xxiv) complications of gastric and duodenal operations; (xxv) carcinoma of the stomach; (xxvi) sarcoma and other neoplasms of the stomach; (xxvii) oesophago-gastric conditions; (xxviii) tumours of the duodenum; (xxix) the gall-bladder and pancreas in relation to gastroduodenal surgery. Bibliographic index. Index of subjects.

This monograph on the surgery of the stomach and duodenum has been written by Mr. Somervell, who has had an extraordinarily large clinical experience of this type of surgery during his 23 years' service in a Mission Hospital in South India. There are preliminary chapters on the detailed development, anatomy and physiology of the stomach and a chapter devoted to experiments on the animal stomach. These preliminary chapters are the result of extensive review of the modern literature on this interesting and important subject and the material in the various articles which have been abstracted has been extensively analyzed and is presented in an unbiased and instructive manner. The physical signs, symptoms and methods of diagnosis of gastroduodenal disease are discussed in considerable detail. The pathology and etiology of the various common and rarer diseases in this region are discussed at great length. The treatment of chronic peptic ulceration is considered and a good deal of emphasis is placed on the importance of the operation which was first described by Mr. Wilson Hey of Manchester and popularized by Mr. Somervell, namely, physiological gastrectomy. There is an excellent section on the different alternative methods of treatment which have been and are being performed. Many of these are of mere historical interest and have fallen into disrepute.

There is a section on vagotomy by Mr. I. Morrison Orr which outlines the physiological basis and discusses the experimental work on which this operation is founded; the importance of resting hyperacidity is emphasized. Mr. Orr's own results with vagotomy are analyzed and extensive reference to the results of American workers is made.

Finally, carcinoma of the stomach and oesophago-gastric conditions are discussed, with a short section on the trans-diaphragmatic approach to the stomach.

While one feels throughout the book that the author has been slightly biased by the results of physiological gastrectomy in his practice in India, the book should be of great interest and considerable value to any gastro-enterologist or any surgeon who is particularly interested in surgery of the stomach or duodenum. The illustrations are exceedingly clear and the general standard of production of the book is first-class.

H. W. Porter

### 1395 The Causation and Treatment of Delayed Union in Fractures of the Long Bone

Kenneth W. Starr. London: Butterworth & Co. Ltd., 1947. xiv + 233 pages; 106 figures; 3 plates. 25 x 18 cm. £2 2s. [£2.1]

Part I. The morphogenesis of bone. Section I. The structure of bone. Section II. The chemistry of bone. Section III. The cycle of bone reconstruction. Section IV. The relationship between structure and function in bone

morphology. Part II. The healing of fractures. Section I. The anatomical structures involved in repair. Section II. The process of repair following fractures. Part III. The aetiology and treatment of delayed union. Section I. Historical. Section II. The aetiology of delayed union; the statistics of delayed union. Section III. Adjuvant therapeutic methods. Section IV. The clinical approach. Section V. The treatment of closed fractures. Section VI. The management of open fractures. Section VII. The management of septic fractures. Section VIII. The management of the skin problem. Retrospect and prospect. Appendices. References. Index.

Delay in the union of fractures has occasioned much pathological and clinical research during the present century. Many of the factors which influence adversely the rate of union are now well recognized. In particular, the significance of impaired blood supply, of infection, of separation of the fragments, of inadequate immobilization, and of soft tissue interposition, is widely accepted. Nevertheless, the mode of operation of certain of these factors has remained a subject for discussion.

In this book, which is based upon a Jacksonian Prize Essay of the Royal College of Surgeons of England, Dr. Starr records in detail the observations he has made during a prolonged study of the healing of fractures in all its aspects—pathological, clinical and therapeutic. The material is arranged in three main parts, which deal respectively with the structure and physiology of bone, the pathology of fracture repair, and the causation and treatment of delayed union. The first part includes a straightforward account of the histology of bone, with emphasis on the distinctive features which characterize primary or woven bone on the one hand, and secondary or lamellar bone on the other. An account is given also of the complex biochemical problems of bone deposition and bone resorption. The term "resorption" is used to imply not only demineralization but also changes in the structure of secondary bone, which may become so porous that it resembles primary bone. This process of resorption is brought about by a combination of cellular and vascular activity. Its significance is further emphasized in a discussion on the pathological aspects of fracture repair, which occupies the second part of the book. Resorption of the bone ends is to be regarded as an essential preliminary to their amalgamation with the callus, and as a means by which a local source of bone salts is made available for its calcification. The physico-chemical characteristics of the fracture haematoma and the factors which influence the rate of its development into callus are also discussed. There is much of interest in this section, which many will consider the most valuable part of the book.

The third part, on the causation and treatment of delayed union in fractures, follows well-established principles. No new concept of the causes of delay is presented, nor is there anything unusual in the treatment advocated unless it be a partiality toward intermittent venous congestion and early drilling of the fragments.

In some respects the book leaves a sense of disappointment. Although there is much of interest and importance in the section on pathology, it is difficult to see that the more clinical sections point to any significant advance in our knowledge either of the causes or the treatment of delayed union. It is a difficult book to read, and while the diagrams and some of the photomicrographs are clear, the radiographs are for the most part indifferent.

H. Osmond-Clarke

### 1396 Textbook of Genito-Urinary Surgery

Edited by H. P. Winsbury-White. Edinburgh: E. & S. Livingstone Ltd., 1948. xv + 1046 pages; 451 illustrations. 25 x 18 cm. £4 10s. [£4.5]

(i) The applied anatomy of the kidneys and ureters; (ii) the development of the kidneys and their congenital defects; (iii) physiology and tests of renal function; (iv) examination of the kidneys; (v) abnormal constituents of the urine; (vi) movable kidney (nephroptosis); (vii) aneurysm of the renal artery; (viii) injuries to the kidney; (ix) hydronephrosis; (x) cysts of the kidney; (xi) new growths of the kidney and ureter; (xii) paraneuritic growths: suprarenal growths; (xiii) nephritis from the surgical point of view (the surgery of nephritis); (xiv) operations on the kidney; (xv) surgical anatomy and physiology of the ureters; (xvi) congenital abnormalities of the ureters and the ureteric orifices; (xvii) injury and fistula of the ureter; (xviii) stricture: megaloureter; (xix) operations on the ureter; (xx) the surgical anatomy of the bladder and the physiology of micturition; (xxi) examination of the bladder: catheters; (xxii) disturbances of micturition and variations in the amount of urine excreted; (xxiii) congenital malformations of the bladder; (xxiv) diverticulum—cystocele—prolapse; (xxv) injuries of the bladder; (xxvi) new growths of the bladder; (xxvii) foreign bodies in the bladder; (xxviii) fistulae of the bladder; (xxix) disturbances of micturition resulting from nervous diseases and injuries. Atomy of the bladder; (xxx) operations on the bladder; (xxxi) surgical anatomy of the male urethra; (xxxii) examination of the male urethra; (xxxiii) the development and congenital deformities of the urethra; (xxxiv) injuries of the male urethra; (xxxv) foreign bodies, cysts and fistulae of the male urethra; (xxxvi) new growths of the male urethra; (xxxvii) the female urethra; (xxxviii) the prostate; (xxxix) simple enlargement of the prostate;

(xxxviii) treatment of complications of simple enlargement of the prostate and non-operative treatment of simple enlargement; (xxxix) suprapubic prostatectomy; (xl) Wilson Hey's prostatectomy; (xli) retropubic prostatectomy; (xlii) perineal prostatectomy; (xliii) transurethral resection of the prostate by the McCarthy method; (xliv) transurethral resection of the prostate by the methods in use at the Mayo Clinic; (xlv) fibrous prostate and dysectasia; (xlvi) commentary on the various surgical procedures for the relief of prostatic obstruction; (xlvii) cancer of the prostate; (xlviii) prostatic calculi; (xlix) the seminal vesicles and Cowper's glands; (l) the testicles; (li) imperfectly descended and misplaced testicle; (lii) tumours of the testicle; (liii) tunica vaginalis; (liv) spermatic cord; (lv) the scrotum; (lvi) the penis; (lvii) new growths of the penis; (lviii) inflammation of the penis; (lix) inflammation of the scrotum; (lx) non-specific urethritis and inflammation of Cowper's glands; (lxi) inflammatory urethral stricture; (lxii) prostatitis and prostatic calculi; (lxiii) inflammation of seminal vesicles, epididymis, vasa deferentia and testes; (lxiv) inflammation of the tunica vaginalis; hydrocele; haematocoele; (lxv) cystitis; (lxvi) perleystitis; (lxvii) infections of the kidneys and ureters; (lxviii) perinephritis; (lxix) urinary fever and uraemia; (lxx) the medical treatment of non-specific infections of the urinary tract; (lxxi) leucoplakia and malacoplakia of the urinary tract; (lxxii) non-syphilitic and non-gonococcal venereal lesions of the male genitals; (lxxiii) genito-urinary tuberculosis; (lxxiv) genito-urinary schistosomiasis; (lxxv) hydatid disease of the genito-urinary system; (lxxvi) actinomycosis of the genito-urinary system; (lxxvii) syphilis of the genito-urinary organs; (lxxviii) gonorrhoea; (lxxix) general features of calculous disease of the urinary tract; (lxxx) calculous disease of the kidneys and ureters; (lxxxi) calculous disease of the bladder; (lxxxii) urethral calculi; preputial calculi; (lxxxiii) the management of glycosuria in genito-urinary surgery. Index.

This work is made up of contributions from the leading urologists of Great Britain. Not only is surgical opinion found in the composition, but there are also contributions by physicians on certain aspects of urology. The editor states in the preface that the work covers the urinary tract and the male genital system from a surgical point of view; this has undoubtedly been achieved. Each contributor deals with that section of urology on which he has become expert. The book is essentially practical in its outlook. Discussions on the theoretical aspects are, generally speaking, limited but adequate. The illustrations, line drawings, detailed drawings of operative technique, and also the plates showing pathological states, help to explain the text. The coloured illustrations are well reproduced, and there are numerous particularly fine coloured plates of various types of pathological conditions as seen through the cystoscope. In some cases one would feel that the x-ray reproductions could be improved, though, generally, they are good. More might have been written on the use of streptomycin as a urinary antiseptic, but as the drug has not yet been available in Great Britain it is difficult for the contributors to relate their own experience in this form of therapy. There is room for a more elaborate account of the investigation of sterility in the male. For the medical student this is a book of reference; for the general surgeon or the urologist it is an essential part of his equipment. The editor is to be congratulated on compiling such a wealth of expert opinion from so many eminent sources, and covering so wide a field.

morbid anatomy, symptoms, diagnosis and treatment dealt with. The methods of treatment described are perhaps somewhat conservative but a special chapter is devoted to the more recently developed fungicides and fungistatics. A useful list of media is appended. A special word of commendation must be given to the excellent photographs and coloured plates, which will be of great practical value to those who are called upon to deal with mycotic infections, especially in the tropics and subtropics.

In a very few places the information requires bringing up to date: no reference, for instance, is made to the diagnostic use of histoplasmin or to the frequency of pulmonary lesions caused by *Histoplasma capsulatum*—lesions which are liable to be confused with tuberculosis. As an introduction to a field which has up to now been poorly explored this work will be of great and lasting value.

### 1398 *História da Lepre no Brasil. Volume II. Período Republicano (1889-1946). Album das Organizações Antileprosas*

Heracleides-Cesar de Souza-Araujo. Rio de Janeiro: Imprensa Nacional, 1948. xx pages + 380 plates. 33 x 23 cm.

The first volume of this monumental work by Professor de Souza-Araujo traced the history of leprosy in Brazil from 1500 to 1889 and was the subject of an essay-review in *British Medical Bulletin*, 1947, 5, 233 (BMB 1125). The whole work is to be completed in three volumes, of which this is the second. This volume cannot be adequately reviewed separately, because it is really an album of photographs, the letter-press referring thereto being reserved for the final volume. The author's original idea was to produce the letter-press and the corresponding illustrations together, but this was not found feasible and the decision was reached to issue the photographs in one volume and the letter-press in another.

As originally visualized, the period of 57 years (1889-1946) was to be divided for purposes of description into three parts: the first to 1920, that is, before the time when modern prophylactic measures came into effect; the second, comprising the succeeding decade, during which the DNSP (Departamento Nacional de Saúde Pública) took up the question of inspection for prophylaxis; the third, which is called the "Getulian Period" because it is that of the governorship of Dr. Getulio Vargas, from 1931 onwards, during which prophylactic measures were intensified.

To bring out pictures and letter-press in one volume would have made the book unwieldy; to have brought it out in two parts would have destroyed the unity of this second period of the history. It will be clear, however, that the true value of this second volume can be properly appreciated only when the third volume appears. In order to make the work as complete as possible, the author sent out questionnaires to Directors of the Leprosy Service in the various centres. Many replied, but, as is usual when questionnaires are sent, some took no notice of the request for information. Thus, most of the photographs in this volume—there are more than a thousand on 380 plates—are original and many of them have been taken by the author himself. When no replies were received Professor de Souza-Araujo has had to use illustrations from the photographic archives of the Federação das Sociedades de Assistência aos Lázaros.

The whole forms a record of a most interesting itinerary undertaken by the author; he has personally visited many of the institutions referred to and taken the photographs on the spot himself. These show, for the different States of Brazil, the buildings, the inmates, different stages of the disease, the people at work and enjoying leisure, happy children at play and in congenial employment. There are also photographs depicting congresses and conferences, weddings and other festivals.

There are already 38 leproseries in Brazil and another was under construction in Bahia when this book was issued. Six of them are in Minas Gerais and five in São Paulo. There are 27 preventoria, or institutions for the care of children of the afflicted, and in Acre Territory yet another is being established. Minas Gerais had four of these and São Paulo three. Each has on its staff a director and a leprologist and 15 of them have also a paediatrist, so that the children are well looked after.

It is not possible to comment on the pictures individually and where all are so clearly reproduced it would be difficult and

## TROPICAL MEDICINE

### 1397 *Mycoses and Practical Mycology. A Handbook for Students and Practitioners*

N. Gohar. London: Baillière, Tindall & Cox, 1948. xi + 234 pages; 134 figures; 4 colour plates. 22 x 14 cm. £1 5s. [£1.25]

(i) Mycology; (ii) the mycoses; (iii) mycetoma; (iv) blastomycosis; (v) mycoses of the digestive tract; (vi) sporotrichosis.

Medical men are, on the whole, well supplied with textbooks on pathogenic bacteria and protozoa, but much less information is available on the parasitic fungi. Mycology, in fact, has been the Cinderella of modern medicine. This handbook has been written with the object of supplying both the dermatologist and the general practitioner with a concise clinical and practical guide to mycotic infections. This end has been attained and, in addition, precision has been given to a subject upon which there has long existed confusion regarding not only nomenclature but the identification of many pathogenic fungi.

Two introductory chapters deal with such general questions as the classification of fungi, their structure and reproduction, habitats, modes of infection and the reactions of the hosts to the fungi no less than the reactions of fungi to their hosts. The various fungal infections are then described *seriatim*; each condition is defined, its geographical distribution is discussed and its

invidious to choose any for special mention. All who are fortunate enough to possess the first two volumes of this great work will look forward eagerly to the third which, says the author, is in an advanced stage already. A further tribute must be paid to Professor de Souza-Araujo for his generosity in giving the proceeds of the sale of this volume, just as he did in the case of Volume I, to the International Leprosy Association, thereby benefiting every part of the world where sufferers from this horrible disease are to be found—a philanthropic act beyond all praise and for which thousands will be grateful.

H. Harold Scott

### 1399 The Leptospiroses

P. H. van Thiel. Leyden: Universitaire Pers Leiden, 1948. x + 231 pages; figures. 24 x 16 cm.

(i) The morphology of the leptospirae; (ii) classification; (iii) diagnosis and technique; (iv) general epidemiology; (v) general and special prophylaxis; (vi) pathogenesis of the leptospiroses; (vii) clinics and therapy of the leptospiroses; (viii) Leptospirosis icterohaemorrhagiae; (ix) Leptospirosis canicola; (x) Leptospirosis grippotyphosa; (xi) Leptospirosis pomona; (xii) Leptospirosis sejo; (xiii) Leptospirosis hebdomadis; (xiv) Leptospirosis autumnalis; (xv) Leptospirosis pyrogenes; (xvi) Leptospirosis bataviae; (xvii) Leptospirosis icterohaemoglobinurica; (xviii) Leptospirosis schöffneri; (xix) Leptospirosis andaman A; (xx) Leptospirosis australis A; (xxi) other strains that are not yet sufficiently identified; (xxii) leptospiroses caused by strains, only found in animals and perhaps, partly, occurring in man. Tables. Explanation of the figures. Bibliography. Index of authors.

During the past few years it has slowly become apparent that leptospiral infections are of very considerable importance both in man and in animals. Yet, since the monograph written by Professor A. Pettit in 1928, little or nothing has been done to collect and analyze the great mass of information which has accumulated, more especially as a result of work in Holland. This book, written in English by Professor van Thiel of Leyden, will therefore be widely welcomed, since it fills a long felt want. It was largely compiled, it appears, during the war years when information of what was being done in other countries was not easy to obtain: this perhaps accounts for the paucity of references to studies carried out after 1940. The book is particularly valuable, however, in that it gives a full account of studies in Holland and Indonesia.

After a short introduction, the morphology and classification of *Leptospira* are discussed, methods of diagnosis are described and a very lucid description of epidemiology is given. Methods of general prophylaxis are at this stage probably of more value than attempts at specific immunization, in view of the importance of using strictly homologous strains freed from foreign protein for protection. Only a brief account of treatment by antibiotics is provided, though it is concluded that there is every reason to administer penicillin "when no serum is available or to shorten the course of a relatively mild case of leptospirosis." The various species of *Leptospira* pathogenic for man and animals are then described. Although haemoglobinuria is produced in cattle by *Leptospira bovis*, the existence of leptospiral blackwater fever in man is perhaps less certain than the author suggests. The book concludes with a not very helpful table of the geographical distribution of the leptospiroses—it is scarcely worth while to be told that *Lepto. icterohaemorrhagiae* exists in Africa—a list of the animals known to carry *Leptospira*, references, and an index of authors: there is no subject index. Occasionally the English is a little involved, e.g. in such sentences as "... we uphold the point of view that a form of blackwater-fever exists being a leptospirosis next to a form closely allied to an infection with malaria..." The English reader also may be left guessing whether "French Guyana" refers to French Guinea, as here suggested, or French Guiana: it is perhaps over-optimistic to be able to exclude malaria "anamnestically".

Despite these minor blemishes this book contains a great deal of information well set out and not otherwise easily available.

G. M. Findlay

### 1400 O'Meara's Medical Guide for India and the Tropics

H. W. Williamson. Fifth edition. London: Butterworth & Co. Ltd., 1947. viii + 882 + 46 pages; 35 illustrations. 22 x 14 cm. £1 10s. [£1.5]

It is now over ten years since the 4th edition of this work was published, and its steady growth is now carried on to meet the

changed scene presented by developments in medical practice and public health administration. In the preface the author pays tribute to the Indian Medical Service, and the variety of information presented in the book reflects the scope of the work that confronted a civil surgeon in the Provinces of India, functioning as physician, surgeon and civil administrator, removed from access to specialists and forced to embrace daily almost every aspect of the practice of medicine. The book might be regarded as a memorial to the passing of that Service, and it should bid fair to take a place in the armamentarium of medical officers carrying on in fields similar to those once ploughed by many of its officers in civil employment.

The presentation and substance are encyclopaedic, subjects being arranged in alphabetical order. The work contains a wealth of medical information on medicine, surgery, obstetrics and gynaecology, ophthalmology, and laboratory methods. The needs of the rural prescriber are supplied in much useful pharmaceutical information and a simple but comprehensive, formulae. There are concise sections by specialist contributors, and these embrace much diverse information that is seldom so ready to hand, and often requires to be sought elsewhere. Three pages on the applications of medical electricity, for example, are highly informative, and notes on nursing will be found compact and comprehensive to those whose duties include the care of subordinate staffs. The encyclopaedic aspect of the work is well reflected in the large amount of miscellaneous information included but not pertaining directly to the practice of medicine. The reader will discover, *inter alia*, how to preserve eggs, remove stains, how to render fabrics fire-proof, and a table giving dosage of over seventy drugs for elephants, camels, horses or mules, cows, goats, sheep and dogs.

Civil health administration, medicolegal work and lunacy are largely represented by details of Indian procedure, but much of it can be adapted readily to requirements anywhere, and this aspect of the work is little detrimental to its use in other continents. Some of the information on foodstuffs pertains essentially to the subcontinent, and the Indian bias found in the choice of tropical diseases dealt with is a deterrent to its wider use as a work of reference in tropical medicine. For example, information on filariasis is scanty and trypanosomiasis finds no mention.

Much criticism is forestalled by the author's frank admission in the preface that when such a wide range of subject matter is treated by one author the quality must vary. The details given of certain surgical procedures are disproportionate in relation to the scant mention of others of equal or greater importance in emergency surgery. The college student in the Far East, to whom previous editions of the work are familiar, will still find the book in its new form well worth carrying around with him although he may here and there discover isolated statements that will fail to satisfy an exacting examiner. It is to be hoped he will appreciate the touches of humour which lighten the pages. This book will yield much information on the management of sick people and suggest many ideas for the organization of an efficient rural medical establishment.

J. Bennet

### TUBERCULOSIS

#### 1401 Bovine Tuberculosis: Including a Contrast with Human Tuberculosis

John Francis. London: Staples Press Ltd., 1947. 220 pages; 36 illustrations. 22 x 14 cm. £1 5s. [£1.25]

(i) The incidence of tuberculosis; (ii) pathogenesis; (iii) tuberculosis of bovine origin in man; (iv) detection of tuberculous cattle; (v) vaccination against tuberculosis; (vi) the control of bovine tuberculosis. Summary and conclusions. References. Index.

Mr. Francis has shown considerable courage in undertaking a broad review of the present position in regard to pathology and pathogenesis of tuberculosis in the bovine and in the human, since his knowledge of human tuberculosis is, on his own admission, entirely derived from textbooks and not from practical experience.

There is a great need for combined research between veterinary surgeons and physicians into the epidemiology of diseases like tuberculosis which affect both animals and man,

suspensions of penicillin, and it is hoped that most would disagree with his advice to practise "... prolonged deep massage [presumably of the site] after injection" of penicillin in an oil-wax suspension. Some more precise instructions on the management of oily and oil-wax suspensions would have made the book more helpful to the practitioner. The first two chapters are on uncomplicated gonorrhoea in the male; they describe methods of treatment, including the use of sulphonamides, in vogue before the advent of penicillin, and end with: "The most effective therapeutic agent in cases of sulphonamide-resistant gonorrhoea is penicillin", for information on which the reader is referred to Chapter IX. Today this seems very much like putting the cart before the horse. Chapter III is on local complications of gonorrhoea in the male, tests of cure, relapse, and "secondary (non-gonococcal) infection", which is dealt with again and in more detail later in the book. Chapter IV deals with gonorrhoea in the female and its local complications. Chapter V is chiefly on metastatic complications of gonorrhoea and Chapter VI is on vulvo-vaginitis in children. This is followed by a chapter on stricture of the male urethra—it seems difficult to understand why stricture should be separated from gonorrhoea in the male by chapters on gonorrhoea in females and on metastatic complications of gonorrhoea in both sexes. Chapters VIII and IX respectively are on sulphonamides and the use of penicillin in gonorrhoea. Chapters X—XIX describe the diagnosis and treatment of syphilis in the pre-penicillin era and Chapter XX provides 11 pages on the penicillin treatment of syphilis which should be read in the light of the literature on the subject that has appeared since the proofs of this chapter left the author's hands. Chapter XXI, slightly over two pages, is on the prognosis of syphilis. It contains some statements which will not meet with general agreement, such as that inadequate treatment, which is defined as less than twenty injections of a trivalent arsenical, "... appears to give results worse than no treatment at all." This is not supported by soundly conducted statistical studies and is definitely contradicted by those of Paul Rosahn (*Amer. J. med. Sci.* 1937, 193, 534) and of J. E. Kemp & K. D. Cochems (*Amer. J. Syph.* 1937, 21, 625). Part III deals with chancroid, lymphogranuloma inguinale, granuloma venereum, non-gonococcal urethritis, Reiter's syndrome, phimosis and paraphimosis, balanoposthitis, warts, scabies, trichomonad infestation, and ulcus vulvae acutum, which together occupy 25 pages. The advice to treat inguinal bubo complicating chancroid by wide incision cannot have been derived from practical comparison of this method with aspiration and injection. The section on skin tests in lymphogranuloma inguinale makes no mention of antigens prepared from other sources than lymphogranuloma inguinale buboes.

Part IV deals in 31 pages with irrigation, anterior urethroscopy, dark-ground examination, collection of blood, intravenous and intramuscular injection, lumbar puncture, dorsal slit and circumcision, fever therapy, and personal prophylaxis. The illustrations are generally good and for the most part the teaching is sound, but, as already indicated, the book would have been much more useful for students and practitioners if penicillin had been blended into the treatment schemes as closely as is, for example, the metallic treatment of syphilis.

L. W. Harrison

## VIRUS DISEASES

### 1404 *Les Ultravirus des Maladies Humaines.* Volumes I & II

C. Levaditi, P. Lépine et al. Second edition. Paris: Librairie Maloine, 1948. viii + 1907 pages; 368 figures; 3 colour plates. 24 × 16 cm. Paper covers, 6,500 fr.; boards, 7,000 fr.

This is the second edition of a textbook originally published in 1938. To keep pace with the many developments since that date the text has been extensively rewritten, and revised to the end of 1947. Many new articles are included and in consequence there are 728 additional pages and the work is now divided into two volumes. As in the previous edition, the senior authors

have written only some of the sections, the others being the work of a number of collaborators. It is essentially a book for laboratory workers, and is not an exhaustive survey with complete bibliographies. The aim has been to present a series of critical expositions, each by a worker who has himself made contributions in the field of which he writes. This method certainly makes the book very pleasant to read, but limits its value as a work of reference.

The book opens with two sections discussing the general nature of viruses. The first of these, by Dr. Levaditi, is unchanged from the first edition, but the second, by Dr. Gratia, has been extensively rewritten and provides a most stimulating critical survey of the whole field, including bacteriophage and plant viruses. There follow a number of sections dealing with individual human virus infections. These vary very much in the amount of detail which their authors have felt it necessary to include, and the extent of the revision reflects the amount of work which has been done in each field during the past 10 years. Thus, for example, the sections on vaccinia, variola, herpes simplex and herpes zoster are, in the main, unchanged, whereas the articles on poliomyelitis and yellow fever have been rewritten and expanded. In this edition the section on rickettsial diseases has been omitted entirely and although the reasons for this are quite understandable, since there has been such an enormous amount of work published during the last 10 years, yet psittacosis and lymphogranuloma inguinale are retained, and in the reviewer's opinion the three cannot be logically separated. There is no mention of trachoma.

There are new articles on eastern and western encephalomyelitis, Russian spring and summer encephalitis, epidemic hepatitis, atypical pneumonia, common cold, mumps, measles, rubella, warts, molluscum contagiosum and, rather debatably, on infectious mononucleosis. In addition the article on influenza has been entirely rewritten. All these articles are excellent in their way, but differ considerably in the amount of detail included. The new articles on the viruses causing encephalomyelitis are very sketchy and the section on influenza is a very simplified account. On the other hand the article on atypical pneumonia is a detailed study of the present complicated position.

Following the sections on specific virus diseases, there are a number of articles dealing with technical methods. These bear evidence to the rise of electron microscopy since the last edition, the extensive use of lyophil drying and the development of egg techniques for the cultivation of viruses.

It is a pity that the section on experimental techniques is so much confined to intracerebral methods and does not mention some of the hazards of intranasal inoculation. In the previous edition the article on tissue culture was by the late Dr. Harry Plotz. This has been entirely rewritten on a most ambitious scale by Dr. Wirth, and there is a new and excellent section on the irradiation of viruses. Finally there is a useful article on diagnostic methods.

There is no systematic discussion of bacteriophages even though the general articles assume a considerable knowledge of these agents. Also the rigid exclusion of all virus diseases of animals makes some of the chapters of less value than they might otherwise be. Frequent reference is made to a work published in 1943 called *Les ultravirus des maladies animales*, but in practical laboratory work on human virus infections it is impossible to avoid close consideration of the virus diseases of laboratory animals.

There is no fixed method of collecting the references. In some sections the references are printed at the bottom of each page, in other sections they are printed at the end. The index is not sufficiently detailed for a work of this magnitude, being in fact little more than an expansion of the list of contents.

In this new edition the number of illustrations has been considerably increased, but as the work is now printed on very poor paper, the reproduction leaves much to be desired. There are now three colour plates, i.e., two additional to the original one, but as both the new plates illustrate polyhedral disease of silk worms they seem redundant in a work of this type.

This textbook maintains a high standard; in some parts it should provide a useful work of reference, and in others should give a succinct exposition of the present state of knowledge to someone not familiar with that field. Unfortunately, the price makes private ownership practically impossible.

Forrest Fulton

## VOLUNTARY SOCIAL SERVICES

1405 **Voluntary Action: a Report on Methods of Social Advance**

Lord Beveridge. London: Allen & Unwin Ltd., 1948. 420 pages. 22 x 14 cm. 16s. [£0.8]

Part I. The mutual aid motive in action. (i) The friendly societies; (ii) the State and the friendly societies; (iii) mutual aid in other forms. Part II. The philanthropic motive in action. (iv) The voluntary social services and their development; (v) a chapter of pioneers; (vi) charitable trusts. Part III. The needs that remain in a social service state. (vii) The changing environment of voluntary action; (viii) some special needs that remain; (ix) some general needs that remain. Part IV. Conclusions and recommendations. (x) The future of voluntary action; (xi) the State and voluntary action; (xii) first things first. Appendices. Index.

Lord Beveridge's Report on Social Insurance and Allied Services (1942) was concerned with action by the State to achieve security for the individual in sickness and old age; on its findings is based the National Health Service Act, 1946. The present volume *Voluntary action* shows what has been, is being, and can be done, independent of the State.

Such activities are conveniently divided into those whose motive is mutual aid among members of a group or society and those which are philanthropic in nature. The former includes Friendly Societies whose members, in return for weekly payments, receive aid in time of need. This subject is dealt with in detail, for it has been sadly neglected; the last book on it was published in 1891 and the last comprehensive study was that of a Royal Commission, published in 1874. There is also a brief description of Hospital Contributory Schemes which in 1943 had a subscribing membership of about 10 millions and an income of over £6,500,000. Membership of these schemes provided the patient with free treatment in hospital, surgical appliances and grants towards the cost of convalescence, and at the same time assured the hospitals of a steady income.

The second motive for voluntary action, philanthropy, has led to the development of a variety of institutions in which contributions aid members of the community as a whole. These include the St. John Ambulance Association and Brigade, which is available for first-aid treatment in accidents and emergencies; organizations for child welfare, such as The National Society for Prevention of Cruelty to Children and Dr. Barnardo's Homes; for youth, e.g. the National Association of Boys' Clubs, the Young Men's Christian Association; for old people and for physically handicapped persons such as the blind, crippled, deaf and tuberculous.

Another subject dealt with fully is that of charitable trusts founded on money bequeathed for specific purposes. Some of these date back to the 16th century and legal problems arise as to their disposal in modern times, with regard to the wishes of the testator. The last fifty years have seen the foundation also of large trusts, wisely administered by trustees who have a liberal measure of freedom. Such include the Carnegie United Kingdom Trust (1913), the Pilgrim Trust (1930) and the Nuffield Foundation (1943). This last is the largest, with an endowment of £10,000,000. It is doing much for medicine by the establishment of Nuffield Departments in various branches of medicine at Oxford and by the granting of fellowships and scholarships in Great Britain and the Dominions. Another wealthy trust is the King Edward Hospital Fund for London, which was formed by public subscription in 1897 as a national memorial to Queen Victoria's Diamond Jubilee. This fund has made grants for hospital maintenance and for medical education and research. Now that the State has taken responsibility for the maintenance of hospitals, the administrators of the fund plan to devote more to the other two objects.

An interesting biographical section is devoted to "pioneers" in social welfare who arose to tackle the evils consequent upon the rapid industrialization which the 19th century brought. We are reminded that it was Elizabeth Fry who, in 1840, made "the first attempt in England to train and standardize nurses and nursing on a professional basis", and are told that "Florence Nightingale took some of the 'Fry Nurses' with her in the first band that went to the Crimea."

Part Three of this book deals with the needs that still remain now that so many which were left to private action have become a public responsibility. It is emphasized that these needs mainly arise through the increasing leisure of wage earners and the growing complexities of modern life.

In conclusion it is urged that the State should, in every way, encourage voluntary action for social advance. Such action must be activated by a sense of vocation and individual responsibility for it to be fully effective.

## Shorter Notices

### Bronconeumonectasias Congénitas. Quistes Aéreos y Ampollas Gigantes de Enfisema

Oscar P. Aguilar & Juan Queirel. Buenos Aires : Editorial Vazquez, 1948. 206 pages; 78 figures. 26 x 17 cm.

These authors reported their first observations on cases of cystic disease of the lungs in articles in the medical press. However, they considered that this subject merited further treatment, and have therefore written the present monograph of 206 pages "in order to bridge the gap which exists in textbooks of pulmonary pathology, in data concerning cystic formations of the lungs, especially giant cysts." The book is also intended as a guide in the differential diagnosis of spontaneous pneumothorax, large cysts and intrapulmonary air cavities of any etiology.

At the end of the 15 chapters into which the book is divided, the writers, who are respectively associate professor of the clinical and pathological study of tuberculosis, Faculty of Medicine, Buenos Aires, and director of a municipal dispensary of chest diseases, give a full report of 19 cases. These are illustrated with 78 figures, consisting of microphotographs, line drawings and radiographs, carefully analyzed and explained.

There is also a short list of references to works by Argentine authors and a separate one of foreign references; the book is well printed.

M. V. L.

### L'Aphasie et la Désintégration Fonctionnelle du Langage

Th. Majouane & P. Mozziconacci. Paris : L'Expression Scientifique Française [no date]. (Symposiums et Monographies de la Semaine de Chéniaux) 156 pages; 19 figures. 21 x 13 cm. 450 fr.

Professor Majouane is professor of diseases of the nervous system at the Paris Faculty of Medicine and physician at the Salpêtrière, while his co-author is a senior physician to the Paris hospitals. In this little book they have concentrated on the functional aspect of speech defects. They trace the history of the various theories of aphasia, and acknowledge their indebtedness, in particular, to the ideas of John Hughlings Jackson. They then describe the basic principles of an objective symptomatology of aphasia which they have evolved, and this in turn leads to the definition of two syndromes, the "syndrome of phonetic disintegration", concerned with defective verbal expression, and the "syndrome of automatic-voluntary dissociation", concerned with the abolition of voluntary verbal stimuli while the spontaneous verbal stimuli remain intact. There follows a chapter on the intellectual condition of aphasic subjects, in which a number of intelligence tests are described and illustrated, and another on the relationship of aphasia to agnosia and apraxia. Finally, the whole book leads up to a discussion of the problem of re-education. Full descriptions of five cases of aphasia and two of agnosia are given as an appendix.

A useful feature of the book is a short summary at the end of each chapter. There is no bibliography but a few books and articles on the history of the subject are suggested for further reading.

A. H.-S.

### Psychotherapy : its Uses and Limitations

D. Rhodes Allison & R. G. Gardon. London : Geoffrey Cumberlege, Oxford University Press, 1948. vii + 160 pages. 19 x 13 cm. 8s. 6d. [£0.425]

This book makes a well-timed arrival into the medical world. Psychotherapy is almost a medical household word, yet its proper role, scope, and limitations are by no means commonly known.

Modest in its claims, this publication seeks merely to indicate the types of cases in which medical practitioners may expect help from a specialist in this form of treatment. Among other things, it deals with the development of psychotherapy and its place in the treatment of psychoneuroses, temperamental instability, psychosomatic conditions, visceral neuroses, the relation of rheumatism to mental illness, the endocrine background, the psychological aspect of organic diseases, and the patient's reaction to bodily disease.

Passing reference is made to the use of group therapy, a form of treatment about which it is too early to deliver full judgement; it is likely that in a future edition a fuller account of this method would be included. At the moment it promises to be an excellent form of social rehabilitation for psychoneurotic patients. In addition, many problems arise in group discussion which are suitably dealt with by the group as a whole and it provides also a method of learning and teaching psychotherapy. Its use in the opinion of many is, however, as a supplement to, and not a substitute for, individual therapy.

This is an excellent book and one has no hesitation in recommending that it should be widely read.

### Remedial Exercises for Certain Diseases of the Heart and Lungs

Hester S. Angove. Second edition. London : Faber & Faber Ltd., 1948. 181 pages; 23 figures. 19 x 11 cm. 10s. 6d. [£0.525]

The authoress deals concisely with those heart and lung conditions and diseases of the blood vessels and veins which benefit from remedial exercises. The last chapter and an appendix are concerned with rehabilitation and chemotherapy. Experience at Guy's Hospital forms the basis for the treatments. When the book is reprinted it might be well worth utilizing the blank space on page 55 for some reference to surgery in congenital heart disease as no mention is made of this type of treatment.

Miss Angove's book should command the attention of all masseurs and massage students who are not familiar with it already, but nurses will be interested in her short, clear descriptions of the conditions treated. The book is not intended for doctors or medical students, but it can show them how much may be done by masseurs to shorten the convalescence of "many suffering from heart complication" and to "give relief to many of those lung conditions which in the past became chronic or ended in death."

F. T.

### Science and Nutrition

A. L. Sacharach. Third edition. London : Watts & Co., 1947. xii + 142 pages. 19 x 13 cm. 6s. [£0.3]

This is the 3rd edition of a little book published first in 1938. The author, who is a chemist of long experience in nutrition, surveys briefly the early experimental work on which our modern science of nutrition is based, and by means of which the importance of dietary deficiencies, qualitative rather than quantitative, could be recognized.

Section II is a résumé of the physiology of human nutrition, the chemistry of the major food constituents, carbohydrates, proteins, fats; their occurrence, and metabolism in the body. Section III deals with mineral elements in foods; Section IV with the vitamins, their detection, measurement, identification, and with the main manifestations of their deficiency in diet. Section V discusses the optimum diet necessary for the maintenance of human health and well-being and shows how much remains to be done in the practical application of scientific knowledge.

The introduction to the 2nd edition (1945), which is included in this edition, pays tribute to the policy of the Ministry of Food in Great Britain during the war years in placing rationing on a scientific basis. In this book the author attempts to explain to the layman the reasons for this basis.

D. F. A.

### Enuresis or Bed-Wetting.

R. J. Batty. Second edition. London : Staples Press Ltd., 1948. 103 pages; 9 figures. 19 x 12 cm. 9s. 6d. [£0.475]

Bed-wetting in infants and children has been a source of worry to parents throughout the ages, and its treatment is mentioned in the writings of Hippocrates and Galen. It is a difficult problem, which has to be faced not only by the general practitioner but also by the staff of every large boarding-school or other institution accommodating children. Much has been written about it, as the bibliography appended to this little book shows, but no monograph in English devoted solely to the subject was available until 1933, when the 1st edition of Dr. Batty's book appeared. In the 2nd edition, which includes chapters on the anatomy and physiology of the urinary organs; the causes, clinical features, and treatment of enuresis; and the enuresis clinic, more space has been devoted to the psychological side of the problem, and some newer remedies are included to replace others which were formerly recommended but which are no longer obtainable. The child who does not respond to treatment and whose enuresis persists into adolescence presents a particularly difficult problem, which is also dealt with in the book. As assistant medical officer to the Lancashire County Council, Dr. Batty has treated nearly 1,000 cases of enuresis, and his book is a valuable contribution towards the alleviation of a condition which has caused so much unhappiness among children and adolescents.

L. T. M.

### A Pocket Medicine

G. E. Beaumont. Second edition. London : J. & A. Churchill Ltd., 1948. viii + 208 pages. 19 x 12 cm. 9s. [£0.45]

Medical students studying for "finals" and doctors abroad who take only light luggage have already found this work a boon while "waiting and travelling". A table of some normal findings, included for the first time, is valuable for reference as it is not always easy to find "normals" quickly. The whole volume has been carefully revised or re-written and new treatments indicated where necessary. Thus radio-active phosphorus has its place, and streptomycin is dealt with in the sections on pulmonary tuberculosis and tuberculous meningitis. The index is an excellent one, and essential because the subjects are arranged under "systems", but Ghon's focus (p. 41) would be a useful addition.

F. T.

### Injertos de Piel

Alberto Raul Beaux. Buenos Aires : Editorial "El Ateneo", 1947. 257 pages; 138 figures. 27 x 18 cm.

It is well known that the war brought about important advances in the field of plastic surgery in those countries particularly afflicted by its consequences, owing to the urgent necessity of repairing large burns and gaping wounds which could be successfully treated only by means of skin grafting.

However, in countries where these needs never arose, there is an increased interest in all modern techniques of plastic surgery—"aesthetic" surgery, as it is called in certain Spanish-speaking countries, expressing its aim rather more precisely, especially from the point of view of the patient. Aesthetic surgery helps him not only to recover his former normal appearance, healing the lesion at the same time, but restores confidence lost through the accident. There are also a certain number of congenital abnormalities which will, in the future, benefit from early surgical intervention, a brighter future for the patient thus being made possible.

Doctor Alberto Raul Beaux gives an account of his own experiences, both at the Institute of Physiology, Buenos Aires, when it was directed by the eminent Professor Houssay, and later on at several other departments of the National University. The author reviews fully, with commentaries and illustrations, the different techniques of grafting in current use abroad.

This commendable book is well produced and edited, with a good list of references and an index of subjects. The paper used is excellent and the type clear; there are a large number of figures and diagrams and two colour plates.

M. V. L.

### Recent Advances in Obstetrics and Gynaecology

Alec W. Bourne & Leslie H. Williams. Seventh edition. London: J. & A. Churchill Ltd., 1948. viii + 326 pages; 85 illustrations. 21 x 13 cm. £1 1s. [£1.05]

A new edition of this famous book is always opened with the keenest interest by all obstetricians. The authors have been determined that their *Recent Advances* is not to degenerate into a small textbook but is to remain a guide to the best in modern trends.

The choice of the new subject-matter in the obstetrical section of the book has been wise. The chapter on nutrition remains as a unique contribution to obstetrical literature. The new chapter on water metabolism in pregnancy gently leads the reader along a path devoid of unpleasant mathematical stones or physiological thorns to bring him finally to the unexplored ocean of toxic oedema! The peremptory order to treat oedematous patients by increasing their fluid intake is one which many will obey with reluctance. We welcome the new section on the anaemias of pregnancy, and the fact that Professor L. J. Davis has written it is sufficient to recommend it to obstetricians who have been familiar with his work on haemoglobin and pregnancy.

We mourn the omission of Wilfred Shaw's chapter on ovarian tumours from the section on gynaecology. Perhaps in a future edition it will reappear, triumphantly bearing an account of some ovarian tumour which shall have superseded the gynandroblastomata as the darling of the gynaecological pathologist. We are all most grateful for the sane and reasoned account of the treatment of carcinoma of the cervix. Without its sustaining effects there would be many unhappy, bewildered candidates for the Membership of the Royal College of Obstetricians. One had hoped that the time had come for an appraisal of the value of the vaginal smear in cancer diagnosis, but that was not to be. It was obvious that the sex hormones had outgrown their home and that subject is now fully dealt with in another volume of the series, *Recent advances in sex and reproductive*

*physiology*, by J. M. Robson. The admirable account of the fascial sling operations is one which should be read by all contemplating performing this type of operation. The reviewer can add his quota to the brilliant successes obtained by these operations but would also add incisional herniae to the list of complications. Our authors are well served by their radiological colleagues, Dr. Rohan Williams and Dr. Levitt, in their respective contributions.

Bourne & Williams have written this edition of their *Recent Advances* with care and dignity, as befits their position of authority. Their unflagging interest and enthusiasm is evident and their book should stimulate their lesser brethren to pause and ponder over many things.

Robert J. Kellar

### A Text-Book of Pathology: an Introduction to Medicine

William Boyd. Fifth edition. London: Henry Kimpton, 1947. 1049 pages; 500 illustrations; 30 coloured plates. 24 x 15 cm. £2 8s. [£2.4]

When this work first appeared in 1932 a reviewer in the *Lancet* wrote "The first reaction aroused by a new production is a guess as to its fate in competition with its established rivals. We predict that Professor Boyd's textbook will enjoy a considerable degree of popularity." Evidently the writer had the gift of prophecy, for some of those "established rivals" have now fallen into the limbo of "out-of-print" books while Professor Boyd's work continues to be in great demand.

It is addressed primarily to students, so the account of all the more important diseases is prefaced by a brief summary of the clinical symptoms to which they are related, and the whole presented in such a readable manner that one suspects that this readability is one of the secrets of the book's success. No fundamental changes have been made in the present edition, but the whole work has been brought up to date, and new references incorporated in the lists at the end of each chapter. New sections have been added on a variety of subjects, including the lipotropic factors in relation to liver diseases; and the part played by Vitamin C in wound repair is discussed. A rare condition in man, botryomycosis, appears for the first time, and old readers will welcome back the useful section on allergy, now entirely rewritten. Recent advances have necessitated such additions as folic acid in relation to macrocytic anaemia, and the rewriting of such sections as those on the Rh factor, and carcinogenesis in its relation to enzymes and viruses.

The book has sometimes been criticized on the ground that it contains "errors", a criticism that the author has apparently tried to meet, for he states in the preface that the "more glaring errors" have been corrected.

F. T.

### Ways to Better Hearing. A Practical Guide for Anyone with Defective Ears

Lowell Brentano. London: George Allen & Unwin Ltd., 1948. 212 pages; illustrations. 22 x 14 cm. 10s. 6d. [£0.525]

Written by an American, who is a "deafened" man, this book is intended primarily for those similarly handicapped, but it can also be recommended to doctors, teachers and welfare workers, who are, by the nature of their work, brought into contact with the deaf. In Part I the author shows how the obstacles to a full private and working life can be surmounted, and in Part II he gives useful chapters, accompanied by exercises, on lip reading, educating the hearing and improving the speech. There are

appendices contributed by American authorities, and one giving a list of approved British dealers in hearing aids. In the introduction, A. G. Wells briefly describes the work of the voluntary bodies in Great Britain, and quotes the relevant sections of the Disabled Persons (Employment) Act, 1944. This adds considerably to the value of the work for British readers, although it is still too early to delineate the role of voluntary and official organizations in the National Health Service.

H.M.C.

### Sizes of X-Ray Film and Intensifying Screens: British Standard 1443: 1948

British Standards Institution. London: British Standards Institution. 8 pages. 22 x 14 cm. 2s. [£0.1]

This British Standard was prepared by the Photographic Industry Standards Committee; it prescribes the sizes of x-ray sheet film and intensifying screens, and specifies the minimum internal sizes for cassettes intended to receive such films and screens. These standards are intended to serve as a basis for the standardization of features of x-ray equipment and of processing equipment.

D. F.

### The Distressed Mind: an Outline of Psychiatry

J. A. C. Brown. Second edition. London: Watts & Co., 1949. (The Thinker's Library, No. 115.) viii + 174 pages. 17 x 11 cm. 2s. 6d. [£0.125]

Writing in simple, lucid language, the author of *The distressed mind* has provided for the general reader a brief and interesting account of many aspects of psychology and psychiatry.

Starting on a historical basis, he describes the dawning of man's interest in mental activity, which eventually developed into the practice of psychiatry. A chapter on the nervous system is followed by an account of psychosomatic problems and a relatively large section of the book contains a useful analysis of the basic concepts of Freud, Adler and Jung.

S. S.

### British Surgical Practice. Volumes 2, 3, 4

Under the general editorship of Ernest Rock Carling & J. Paterson Ross. London: Butterworth & Co. Ltd., 1948. Vol. 2: xxvii + 540 + 35 pages; 318 illustrations; 4 coloured plates. 25 x 17 cm. Vol. 3: xxvi + 524 + 37 pages; 287 illustrations; 4 coloured plates. 25 x 17 cm. Vol. 4: xxvii + 436 + 32 pages; 261 illustrations; 2 coloured plates. 25 x 17 cm. £3 per volume.

Vols. 2 and 3 of this exhaustive survey of surgical practice deal alphabetically with subjects from "Backache to Bursae" and "Caesarean Section to Eyelids." More than ninety experts have contributed sections to these two volumes, each section being fully documented and profusely illustrated (there are more than 600 illustrations in the two volumes). The work maintains the superlative standard of production associated with Butterworth publications, with well-chosen and carefully reproduced illustrations and an excellent lay-out. One small criticism may be made regarding the summary of contents at the head of each chapter; this seems over-elaborate in including every subheading used, which, on consultation of the text, may sometimes prove to concern only two or three lines. In the

[For review of Vol. 5 of this series, see Book Reviews, page 116.—Ed.]

chapter on deformities this summary occupies 2½ pages, much of which might have been used for more text, for there is an exhaustive index to each volume. Similarly the list and description of contributors is lavishly set out; in Vol. 3, 12 pages are used to deal with 63 contributors. These are, however, minor criticisms of a work which, like its older brother the *British encyclopaedia of medical practice*, is sure to take a permanent place in medical literature.

The fourth volume of this imposing collective work covers alphabetically the subjects "Facial Palsy to Hiccup". With so many authoritative articles compressed into one volume it is not possible to mention more than a few of the individual contributions, but particularly notable is that dealing with facio-maxillary injuries and deformities by Rainsford Mowlem and B. W. Fickling, which occupies 42 well-illustrated pages. A careful account of the foot by T. T. Stamm precedes a full discussion of fractures and allied conditions by F. W. Holdsworth. J. B. Oldham contributes a useful account of surgical conditions involving the gall-bladder and bile ducts. C. G. Rob provides a chapter on gunshot wounds, based on personal experience in the 1939-45 war. There is a well-illustrated account of hand injuries by J. N. Barron, while the chapter on diaphragmatic hernia is particularly authoritative, coming from Sir Thomas Dunhill, who has made a particular study of this condition for a number of years.

This volume maintains the high standard of production of preceding volumes in the series.

L. T. M.

### Social History of the School Meals Service

F. Le Gros Clark. London: National Council of Social Service, 1948. 28 pages; illustrations. 21 x 14 cm. 2s. [£0.1]

Two benefits to the schoolchild arising from the institution of a school meals service have been the undeniable improvement in diet and the instruction in a higher standard of behaviour at table, and this booklet, published under the auspices of the London Council of Social Service, stresses the important part that social conditions can play in this particular aspect of school welfare.

The history of the service is traced from its early beginnings, when private charity provided free meals in some schools. Appointment of committees by the London School Board in 1894 to investigate dietary deficiency in children resulted in authoritative action with regard to a school meals service. Legislation provided the means by which this service could be maintained, and by 1930 more and more children were drinking milk in schools.

Complexities of organization were inevitably increased with the outbreak of the war in 1939, owing to the wholesale evacuation from large towns of Britain's schoolchild population, and to the air-raid disruption of transport facilities. However, in 1945, the emergence of the school dining-hall and kitchen as a self-contained unit became apparent, and the author feels that this trend is likely to continue for a while.

The school meals service is so closely tied up with our changing economic system that future social legislation may affect its development; at any rate, it has become an integral part of the present educational system.

### Practical Section Cutting and Staining

E. C. Clayden. London: J. & A. Churchill Ltd., 1948. vii + 129 pages; 21 figures. 21 x 14 cm. 9s. [£0.45]

Within the compass of this small book much valuable information is contained, valuable to the trainee who is in the process of acquiring a knowledge of histological technique but no less valuable, as a book of reference, to the trained technician.

The general plan of the book is good, the subject being introduced by reference to the principles of fixation and fixatives. Practical advice on the use of certain of the commoner fixatives, with comments on their advantages and disadvantages, should help the young technician to make a rapid appreciation of the relative merits of each and the tissues best suited to their use. Quite naturally the major portion of the book is devoted to the preparation of paraffin sections and the stains applied to them. The author, while including the usual routine stains, shows rare discrimination in the choice of staining procedures for specific purposes. The section on the care of microtome knives should be of great practical usefulness.

Although less expensive, the chapters dealing with the making of frozen sections and celloidin sections are adequate, and the practical help given the student should prove most useful. Here, too, the author shows commendable judgement in the selection of the staining methods detailed. With so many procedures to choose from, a nicely balanced selection has been made to cover the simple routine stains and the more intricate techniques employed in neuro-histology.

This valuable addition to the library of the histology worker has been written by a practical technician who is obviously a master of his craft and who, in addition, possesses the art of expressing himself briefly but clearly. Throughout the book there are many examples of the author's desire to give the student technician the utmost help by detailing what certain terms really mean, and thus greatly assisting towards a complete understanding of the subject. The preparation of good sections is an art which can be acquired only by diligent study and much practice, and this book goes a long way towards helping the laboratory worker to avoid or overcome many of the difficulties encountered in the cutting and staining of sections.

D. B. S.

### Dietetics in General Practice

Leslie Cole. Second edition. London: Staples Press Ltd., 1948. x + 160 pages. 16 x 10 cm. 8s. 6d. [£0.425]

This is the 2nd edition of a book which could have been made of great value; however, it does not appear to have been completely re-written since first published in 1938. A number of items of food appear which are not now readily available; for example, a distinction is made between red and white meat. The account of the vitamins is far from up to date; thus no mention is made of the difference in nutritional value between vitamin A and its precursor, carotene. The dietary treatment for a number of diseases is described, but in view of the above remarks it will be seen that the book is mainly of use in indicating the general principles involved. These principles are clearly stated. It is to be hoped the next edition will be completely revised, as a pocket volume on medical dietetics suitable for general practitioners is much needed.

Robert Cook

### Blindness in British African and Middle East Territories

Colonial Office. London: His Majesty's Stationery Office, 1948. xii + 99 pages. 24 x 15 cm. 2s. [£0.1]

This is a report of a Joint Committee appointed by the Colonial Office and the National Institute for the Blind, following a visit of a delegation to Africa

and certain Middle East territories between July 1946 and March 1947. It comprises a survey on the statistics of blindness, the causation, the social conditions, the present medical services, education and training facilities, in the areas visited. Certain recommendations are put forward for the prevention of blindness and for the education, training and employment of the young blind. For the older adults and aged possible voluntary enterprises are suggested.

M. M. T.

### Textbook of Medicine by Various Authors

Edited by John Conybeare. Ninth edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xvi + 875 pages; 28 figures; 31 x-ray plates. 24 x 17 cm. £1 10s. [£1.5]

This work was first published in 1929, and now appears in its 9th edition under the same editor, Sir John Conybeare, Physician to Guy's Hospital, London, and with almost the same team of experts as authors. It is in a new format, but the general character and scope of the book remain unaltered. Much new material has been incorporated in the text since the last edition in 1946, and some parts, such as the sections on haematemesis, carcinoma of the stomach, and cardiovascular diseases, amongst others, have been rewritten. Professor R. W. B. Ellis is now responsible for the section on diseases of infants. The book is well produced and senior students will find it an excellent textbook now as they have done in the past.

M. M. T.

### Diseases of the Chest: Described for Students and Practitioners

Robert Coope. Second edition. Edinburgh: E. & S. Livingstone Ltd., 1948. xv + 541 pages; 134 figures; 34 x-ray plates. 22 x 14 cm. £1 5s. [£1.25]

Those students who want a book on chest diseases which will tell how to elicit the main physical signs in the chest will find that this volume meets their needs. It is not intended to be an exhaustive textbook, but a selective one, and, judging from the demand for it, one of the most successful in its field. X-rays are not neglected, and the coloured plates showing microscopic appearances have been more carefully printed than is sometimes possible today.

In this new edition Dr. Coope has taken into account the recent work of Mr. R. C. Brock and others on the anatomy of the bronchial tree, and does not despise footnotes and an occasional reference. These are instructive and stimulating (if sometimes unusual, as when he quotes Chevalier's novel *Clochemerle*), but such quotations serve to garnish an eminently readable book.

F. T.

### L'Exploration Fonctionnelle des Reins, dans la Pratique Médicale

Jules Cottet. Paris: L'Expansion Scientifique Française, 1948. 207 pages. 18 x 14 cm. 400 fr.

This small volume gives a detailed description of the various tests of value in the clinical assessment of renal function and the indications for the choice of the most suitable. There is a preliminary chapter which deals with the physiology and pathology of renal function, and a final chapter criticizing and comparing the value of the various available tests. The detailed instructions concerning their clinical use will be a valuable source of information to clinicians. In discussing the discrepancies of these tests, the author concludes "que, dans l'état actuel

de nos connaissances, il n'y a pas, en matière d'exploration fonctionnelle des reins, une épreuve type, qui serve de pierre de touche pour contrôler la valeur des autres épreuves. Le seul critère... nous semble être la clinique qui, ici comme ailleurs, juge en dernier ressort."

D. F.

### The Biological Standardisation of the Vitamins

Katherine H. Coward. Second edition. London: Baillière, Tindall & Cox, 1947. vii + 224 pages; 38 figures. 22 x 14 cm. 16s. [£0.8]

The author of this monograph is Reader in Biochemistry in the University of London and Head of the Nutrition Department of the Pharmaceutical Society of Great Britain. She has written it for the use of workers engaged in the determination of vitamin content of foods, of preparations for therapeutic purposes and of products obtained in research into the chemical nature of the vitamins. The book is divided into two parts, Part I dealing with the general principles and methods used in the determination of the vitamins, and Part II with the mathematical side of the subject, that is, the estimation of the accuracy of the results of experiments. The adoption of the international standard of reference for vitamin E, and the introduction of methods of estimating fiducial limits of error, are among the many new developments since the 1st edition.

H. M. C.

### Pregnancy Diagnosis Tests: a Review

Alfred T. Cowie. Aberystwyth: Commonwealth Agricultural Bureaux, 1948. (Joint Publication No. 13.) 284 pages. 22 x 15 cm. 15s. [£0.75]

This book is No. 13 of the Commonwealth Agricultural Bureaux joint publications, and is a survey of all the important papers on the methods of diagnosis of pregnancy in women and domestic animals, except those concerned with the clinical methods in women. The author, who held a research grant from the Agricultural Research Council at the National Institute for Research in Dairying, Shinfield, Reading, has produced a useful comprehensive review and extensive bibliography of widely scattered literature, suitable especially for research workers in this subject.

M. M. T.

### Psychological Medicine. A Short Introduction to Psychiatry, with an Appendix on Psychiatry Associated with War Conditions

Desmond Curran & Eric Guttmann. Third edition. Edinburgh: E. & S. Livingstone Ltd., 1949. viii + 252 pages; 20 figures. 22 x 14 cm. 12s. 6d. [£0.625]

This introduction to psychiatry now appears in its 3rd edition, after revision by Dr. Curran alone, as his distinguished collaborator unfortunately died in 1948, while still at the height of his powers. The book's popularity may be gauged by the fact that both previous editions had to be reprinted soon after publication. The work forms a well-balanced introduction to a branch of medicine hitherto relatively neglected by the average medical man. The style is straightforward, readable and convincing, and is lightened here and there by a flash of wit or by the apt citation of an actual case. There is a valuable chapter on psychiatry associated with Service conditions on which Dr. Curran is well qualified to write, in view of his experience as

Consultant to the Royal Navy. For those who desire to study further, there is a carefully selected bibliography, including books on psychopathology and psychotherapy, subjects which in a book of this nature the authors could describe only on a restricted scale.

A. Spencer Paterson

### Chirurgie de la Surdit   (l'Op  ration de Lempert)

J. Salomon Danic. Paris: L'Expansion Scientifique Fran  aise, 1948. 112 pages; 11 figures. 21 x 13 cm. 250 fr.

The advances achieved in recent years in the surgery of deafness have given rise, among the uninitiated or insufficiently experienced, to false hopes and consequent disappointment and loss of confidence. The present work, therefore, by the assistant otolaryngologist to the H  pital Saint-Antoine, Paris, fulfils a need, in that it presents, clearly and without prejudice, the possibilities, difficulties and limitations of Lempert's fenestration operation for otosclerosis. The author emphasizes the delicacy of the operation and the need for extreme technical skill. After tracing the indications for, and the principles of, this particular type of surgery, he describes in detail the technique, after-effects and possible complications of the operation. He describes the results achieved, and compares them with those obtained by means of hearing aids. Finally, the prognosis of the operation is discussed and the author's general conclusions are summarized.

There is a bibliography of some 40 references. The sections on the principles and technique of the operation are illustrated by diagrammatic drawings and the audiograms of patients are also given. The quality of paper is good and the standard of printing high.

A. H.-S.

### The Practice of Industrial Medicine

T. A. Lloyd Davies. With a chapter on the hazards of coal mining by G. F. Keatinge. London: J. & A. Churchill Ltd., 1948. vii + 244 pages; 8 diagrams. 23 x 14 cm. 15s. [£0.75]

This book presents a good description of industrial medicine as practised by a progressive industrial medical officer. It is eminently suited for students of medicine and practitioners seeking to gain an acquaintance with this kind of work; but it will also prove useful and stimulating to experienced clinicians in other fields, affording as it does an insight into the problems of industrial medicine. The book is by no means comprehensive, but does succeed in dealing with essentials and in presenting much valuable material in little space. The presentation is coloured by the author's enthusiasm and material which might otherwise have been rather dull is made unusually readable.

The relationship between work and social conditions is well expressed; the book has been written from the point of view of the clinician rather than the hygienist, but is none the less valuable on that account. There are a few minor errors, mostly typographical, which can be easily rectified and do not detract seriously from the general value of the book. It is, of course, difficult to write with any permanence about the administrative side of work on this or any other facet of health services at the present time; there will be need for early revision in the light of new legislation.

T. F.

### Diphtheria. Report by the Infectious Diseases, Sub-Committee of the Scientific Advisory Committee

Department of Health for Scotland. Edinburgh: His Majesty's Stationery Office, 1948. 31 pages. 24 x 15 cm. 6d. [£0.025]

This report embodies the results of a study undertaken by the Sub-Committee on Infectious Diseases Research of the Department of Health for Scotland. In 1940, this Sub-Committee recommended that diphtheria immunization should be applied as a national measure in Scotland; it was consequently desirable to gain exact information on the way in which inoculation modifies the clinical course of diphtheria, admitting that it does not always prevent its occurrence. Data were gathered from 17 infectious diseases hospitals in Glasgow, Dundee, Aberdeen and Lanarkshire; the salient features of all cases accepted as suffering from diphtheria during 1942 were collected and submitted to extensive statistical analysis.

The study of 1023 inoculated and 3249 uninoculated patients showed that inoculation significantly modifies the course of the disease. The fatality rate of the inoculated group was 0.68 per cent (7 deaths) as against 3.69 per cent (120 deaths) in the uninoculated. In general, the complications and severity of the disease were less in the inoculated group.

D. F.

### An Introduction to the Prescribing and Fitting of Contact Lenses

Frank Dickinson & K. G. Clifford Hall. London: Hammond, Hammond & Co. Ltd., 1946. 168 pages; 65 plates; 33 figures. 22 x 14 cm. 2s. [£2.1]

This book is distinguished by the competence with which the subject is presented and by the moderation and balance of the claims made for contact lenses. It is probably the best introduction to contact lens fitting and prescribing hitherto published in the field of "spherical", "ground" or "machine-made" lenses, and the account is full and up to date. In the realm of taking moulds and fitting moulded lenses it is, perhaps, less adequate, largely on account of advances made since 1946. For this reason, also, anti-veiling devices are not discussed.

The optics of contact lenses are clearly stated with a minimum of mathematics, and include two valuable nomograms for effectivity and radii, prepared by A. G. Bennett. The text is unusually free from errors and is supported by 93 illustrations, including ten in colour illustrating the fluorescein technique, which are well planned and beautifully prepared and printed.

Frederick Ridley

### O Tratamento Cir  rgico da Hipertens  o do Sistema Porta por Anastomose Venosa Direta

Alvaro Dino de Almeida. S  o Paulo: "Revista dos Tribunais" Ltda., 1948. 261 pages; illustrations. 23 x 16 cm.

381 references to literature in several languages bear witness to the amount of research which forms the basis of this detailed account of the surgical treatment of portal hypertension, by Dr. Alvaro Dino de Almeida of the Department of Surgery in the Faculty of Medicine, S  o Paulo. The author classifies the effects of portal hypertension, with special reference to hepatic cirrhosis, oesophageal varices, ascites and the formation of collateral venous circulation. He analyzes the different methods of surgical treatment and, after a full discussion, concludes that left spleno-renal anastomosis is the best. Porto-caval anastomosis (Eck's fistula) is condemned.

Numerous diagrams, pictures and tables illustrate and explain the author's views, and summaries in English and German are included. From the long list of errata in the text, given on a separate sheet, one may assume that the editing has not been done with the meticulous care due to so painstaking and complete a work.

M. V. L.

### Obstetrics and Gynaecology. A Synoptic Guide to Treatment

Beatrice M. Willmott Dobbie. London: H. K. Lewis & Co. Ltd., 1948. xi + 338 pages; 22 figures. 22 x 14 cm. £1

This book is described on the cover as a "Synoptic Guide to Treatment" and Dr. Dobbie emphasises this in her preface; she has written it for the general practitioner and given a full measure of her experience in both obstetrics and gynaecology.

Her writing is forthright and emphatic with italics, capitals, do's and don'ts. On the whole it is well done even though there are parts where hyperbole is the order of the day. There is much that is useful and the chapters on "Telling the Patient" are especially good. Essentially this is a book based on Dr. Dobbie's own wide experience in practice and on the statistics of the Birmingham Maternity Hospital. A few parts could be improved. Thus, sulphadiazine is chosen for puerperal infection but there is no mention of the need for giving sufficient fluids and alkalis with it. Also puerperal thrombophlebitis is very inadequately discussed. The author commends radiography of the patient as useless unless "the position of the patient is so arranged that the rays are directed vertical to the planes both of the brim and the film" (her italics). This is a serious oversimplification of the whole problem of pelvimetry and cannot pass without challenge. In spite of such shortcomings this should prove a useful book for practitioners.

C. Scott Russell

### Manual of Obstetrics

Thomas Watts Eden & Eardley Holland. Ninth edition by Alan Brows. London: J. & A. Churchill Ltd., 1948. xii + 796 pages; 48 plates; 405 figures. 22 x 15 cm. £2 2s. (£2.1)

The 9th edition of Eden & Holland which reflects the practice of the London Hospital now reappears after eleven years, substantially revised by the Obstetrical and Gynaecological Surgeon of that hospital. The basic principles of obstetrics, recent researches and new methods of diagnosis and treatment are here presented in a simple and readable form. The changes in the text, too many to enumerate fully, include new material on exophthalmic goitre; abnormalities of the embryo and foetus; recent advances in bacteriological diagnosis of puerperal infections; physiotherapy in relation to pregnancy; and the researches of the late Dr. Joseph Barcroft on the development and initiation of pulmonary respiration in the sheep foetus, with their application to the diagnosis and treatment of asphyxia neonatorum.

Nine new coloured plates, 40 x-ray films, and 150 new drawings, charts and diagrams have been added to the text, and there is a "Guide to Further Reading" at the end of each part.

H. M. C.

### Mental Health. A Practical Guide to Disorders of the Mind

John H. Ewen. With a chapter on special treatments and their practical technique, by C. Friedman. London: Edward Arnold & Co., 1947. 270 pages. 22 x 14 cm. 12s. 6d. (£0.625)

This book is a compendium covering the entire field of psychiatry, including psychopathology, administrative and legal aspects. A chapter on physical methods of treatment is contributed by Dr. C. Friedman. In his preface the author appears to imply that his book is meant to serve as an introduction and guide to the subject of mental disorders for workers within the mental health services, and also for doctors beginning

mental hospital work. One wonders whether this purpose might not have been better served by a fuller treatment of fundamentals, while abandoning the attempt of covering the whole ground in an equally detailed, but necessarily dogmatic and conventional manner. The beginner will only be confused by such a concentrated presentation while, with present-day requirements for the Diploma in Psychological Medicine, the postgraduate student needs a much deeper grasp and broader knowledge than is imparted by this short book.

Felix Post

### Otitis Media en el Lactante. Estudio, Fisiopatológico y Clínico

Manuel Fairén. Saragossa: Publicaciones de Revista Española de Pediatría, III, 1947. 382 pages; 126 illustrations. 24 x 17 cm.

In an age of increasing specialization the need for monographs devoted to particular subjects is becoming more and more apparent. Upper respiratory infections are so common and troublesome that the third volume of the publications of *Revista Española de Pediatría* assumes a very real importance to all who are entrusted with the care of young children.

Manuel Fairén's work includes much more than the title might suggest. In a well-balanced account he deals with the development, anatomy, and bacteriology of the middle ear before passing to a consideration of its diseases. There is a very full account of the clinical manifestations. Every possible manner in which otitis media might be encountered in the very young is well described. The illustrations are carefully selected and to the point, the print good, and personal statistics enhance the value of the verbal text. Treatment by surgical and non operative procedures receives attention, while the bibliography forms a notable feature of this useful monograph.

N. M. Matheson

### Pharmacology

J. H. Gaddum. Third edition. London: Geoffrey Cumberlege, Oxford University Press, 1948. xvi + 504 pages; 75 figures. 22 x 14 cm. £1 5s. (£1.25)

The 3rd edition of this excellent textbook of pharmacology has been brought thoroughly up to date and continues to uphold the high standard set by the previous editions. It includes a preface on pharmacological literature which should serve as a useful guide for those who wish to pursue their studies further. The final chapter deals with general pharmacology, and contains important information on rate of absorption and combined effects of drugs, calculation of error, and methods of assay.

The author approaches the study of pharmacology from the physiological view-point, and at the beginning of each chapter describes the experimental methods employed to study the action of drugs on man and on laboratory animals.

It is possibly advantageous in a work of this type to omit details of dosage and individual drug preparations, but the inclusion of the dose of streptomycin and paludrine is inconsistent with the omission of any reference to the doses of the commonly used alkalis, alkaloids and glucosides. The reviewer feels that the inclusion of the dose of one important representative substance in every group of drugs would increase the value of this book. The dosage of sulphonamide preparations is very rightly discussed and the chapter on chemotherapy is one of the best in the book. All the latest sulphonamides receive mention, although nothing is said of the use of sulphonamide mixtures to potentiate action, increase solubility, and diminish toxicity.

The treatment of diabetic coma is discussed along conventional lines, glucose being advised in addition to insulin. Some authorities would consider the dosage of insulin to be too small for patients actually in coma (50-80 units at once, followed by 25-30 units with 25 g. glucose every 2 hours until ketosis disappears). However, it would be unwise to make further comment on this point as the treatment of this condition is now in the melting-pot.

More definite criticism may be made of the recommendation to implant subcutaneously 200 or 400 mg. of desoxycorticosterone acetate in the treatment of Addison's disease. The reviewer has seen hypertension and congestive cardiac failure result from the implantation of 200 mg and believes that 100 mg. is the correct dose. In his experience larger amounts do not increase or prolong the action.

This book should prove invaluable to the medical student in his clinical years and make pleasant and highly instructive reading for all clinicians, to whom the important references included in each chapter should especially appeal.

J. F. Goodwin

### The Queen Charlotte's Text-Book of Obstetrics

G. F. Gibberd et al. Seventh edition. London: J. & A. Churchill Ltd., 1948. xi + 572 pages; 289 figures. 24 x 15 cm. £1 8s. (£1.4)

"Queen Charlotte's" has long been worthy of the famous hospital whose name it bears, and the new edition will not disappoint its readers. An additional chapter gives a clear account of the Rh factor and its connexion with foetal haemolytic disease. Research workers, notably the late Sir Joseph Barcroft, and Barclay and his team, have added considerably to our knowledge of the physiology of the foetus since the last edition of "Queen Charlotte's" appeared in 1943. This work is summarized very well in the second chapter. The section on the baby has been re-written and contains a timely reminder on vaccination. "Recent outbreaks of smallpox in Great Britain mark the need for a more active propagandist attitude on the part of those concerned with the care of the newborn." The chapter on the premature baby, which includes the result of Sandifer's study at the hospital, also reveals that incubators are not used there, but "the simplest technique compatible with safety". It is also interesting to note that no mention is made of thyroid extract for failing lactation despite Dr. Margaret Robinson's results elsewhere.

The new edition has revived the popularity of the book with students and others. Now that the work has been brought up to date its readability, and modest price for its size, should sustain the initial demand.

F. T.

### Estudios sobre la Coca y la Cocaína en el Perú

Carlos Gutiérrez-Noriega & Vicente Zapata Ortiz. Lima: Ministerio de Educación Pública, 1947. 144 pages; 32 figures. 22 x 16 cm.

This book is based on four years' joint research by the authors, who are respectively director and director of research in the Institute of Pharmacology and Therapeutics of the Faculty of Medicine, Lima.

In reviewing the early history of coca addiction (in the form of coca-leaf chewing), the authors accept the view that in the Inca epoch the habit was a privilege of certain classes, but after the Spanish conquest it spread throughout the community—an event which is deplored in many Spanish writings of the period. Then and later, however, coca addiction found more advocates than opponents.

owing to its effects on endurance, and a favourable opinion of it prevailed as late as the early part of the present century.

The chapter on habituation to coca and cocaine contains an interesting account of experimental production of cocaine addiction in dogs, in which the authors state that when a painful electric shock was made the preliminary to a cocaine injection, most of the animals underwent this without compulsion or restraint rather than forego the drug.

Further chapters discuss sensitization to cocaine, its effects on the nervous system and mental activity and the relation of these to social backwardness and delinquency, its effects on metabolism, its action in promoting muscular activity and endurance, and its toxicity. The monograph has an adequate summary in English and a bibliography.

B. M. S.

### Recent Advances in Pathology

Geoffrey Hadfield & Lawrence P. Garrod. Fifth edition. London: J. & A. Churchill Ltd. 1947. viii + 363 pages; 60 illustrations. 21 x 14 cm. £1 ls. [£1.05]

The 5th edition of *Recent advances in pathology* contains only few, nevertheless significant, changes as compared with the preceding one. Perhaps the most important of these is the chapter on nephritis, in which the contributions of Ellis, Evans and Wilson, of the London Hospital, are presented. The twenty years' careful work of this group has cleared up much obscurity and confusion in the classification and understanding of the pathogenesis of nephritis; in importance, their work is justly placed beside that of Volhard and Fahr.

An entirely new chapter outlines the relationship between liver diseases and dietary deficiencies and gives an account of studies on infectious hepatitis. New additions have been made to the chapters on inflammation and on experimental cancer research, the chapter on the latter having also been rearranged.

All the new material presented has been written with the clarity and succinctness well known to the readers of this volume.

G. P.

### Materia Medica, Pharmacy, Pharmacology and Therapeutics

William Hale-White. Twenty-eighth edition, revised by A. H. Douthwaite. London: J. & A. Churchill Ltd., 1949. viii + 532 pages. 19 x 12 cm. 16s. [£0.8]

It is not often that it is possible to record an appreciable decrease in the size of a medical work, but the new edition of "Hale-White" has seventeen fewer pages than its predecessor. This is because many of the older preparations now seldom used, which the authors were sometimes criticized for retaining in the past, can now be excluded because they are no longer in the *British Pharmacopoeia*. As Dr. Douthwaite writes in his preface, "The reader will note with satisfaction the disappearance from official status of many useless preparations..." Changes of name in the new B.P. are also to be found incorporated in "Hale-White".

Many alterations and additions have been made necessary by recent advances. Some are quite small, such as the inclusion of procaine penicillin for the first time; others are more notable. Under streptomycin in the previous edition it is stated: "No cure [of tuberculosis] has yet been obtained by its use in the human being", but in the present edition this has had to be changed to "Many cases of acute tuberculosis in human beings have been cured by its use."

Unfortunately a printer's error in the 27th edition has been carried over into the 28th. In the chapter on digitalis glycosides it is stated that the rectal

dose of tincture of digitalis is less than the oral dose; 0.1 ml. per lb. body wt. in the former and 0.125 ml. per lb. body wt. in the latter case. This would mean a single oral dose of approximately 17 ml to a 140-lb. patient which, although doubtless the maximum safe dose by mouth, could be tolerated without risk if given per rectum.

A useful typographical change has been made. The opportunity of extensive revision has been taken to substitute "G" for "grm." previously used as the abbreviation for gram. Another welcome change is the substitution of milligrams (mg.) for fractions of a gram. Dr. P. M. F. Bishop is again responsible for the revision of the chapter on sex hormones.

"Hale-White" has long been a favourite with students and practitioners because of its wide range and its concise but adequate notes on the various drugs. The use made of heavy type, and the lay-out generally, also facilitates quick reference. This is the first edition since the appearance of the new *British Pharmacopoeia*, and should more than maintain "Hale-White's" popularity.

### Practical Histology for Medical Students

D. T. Harris. Fourth edition. London: H. K. Lewis & Co. Ltd., 1947. 36 pages; 2 plates. 25 x 20 cm. 12s. 6d. [£0.625]

This attractively produced guide to histological methods is written by the Professor of Physiology in the London Hospital Medical School. It sets out very clearly in the form of notes, often numbered with headings in heavy type, details of apparatus and technique, and this form makes it a most useful vade mecum in work at the bench. Elementary essentials are described for the beginner, such as the use of the microscope, the student's private apparatus and laboratory bench, the cleaning of slides and taking of blood samples. Points of interest in the examination of tissues of various parts of the body are briefly indicated and the preparation of stains and tissues is clearly described.

### A Study of Hospital Administration

Frank Hart & A. J. Waldegrave. London: Franks & Sons Ltd., 1948. ix + 188 pages. 22 x 14 cm. 15s. [£0.75]

This is a study of hospital administration in Britain immediately prior to the changes inaugurated by the National Health Service Act of 1946, which became operative in 1948. It is therefore in some respects already out of date, but it will be a valuable guide to those responsible for changes in the administrative machine. Future progress and improvement must depend to some extent on past experience, of which this book provides a very adequate account. It contains chapters on authorities and committees (of voluntary and public authority hospitals), the administrative background (co-ordination and control; stewards, domestic staff, maintenance, etc.), administrative aspects of the medical and nursing services, patients (admission and general well-being; pay-beds), ancillary services (after-care and records), supply and control of stores, catering, co-operation and co-ordination among hospitals, accounts, costing and statistics, and planning for the future.

L. T. M.

### The Practice of Mental Nursing

May Houlston. Edinburgh: E. & S. Livingstone Ltd., 1947. xi + 164 pages. 19 x 13 cm. 7s. 6d. [£0.375]

Here is a book to place in the hands of the junior mental nurse, for it affords the kind of help she badly

needs; it will help her to get to know all that is expected of her and will aid her to make herself really efficient. The language is clear, the style forthright, and the whole exposition lucid and convincing. Obviously stirred by the recent advances in the treatment of mental illness, the author has sailed into her task with a fine spirit of infectious optimism. The book is very attractively designed and printed; author and publishers alike are to be congratulated for so adequately filling a gap in the literature of mental nursing.

I. M. Sclere

### Short Textbook of Surgery

C. F. W. Illingworth. Fourth edition. London: J. & A. Churchill Ltd., 1947. viii + 680 pages; 227 figures; 12 plates. 24 x 15 cm. £1 10s. [£1.5]

No new edition of this work has appeared since 1942. The present volume therefore contains extensive changes and additions. Penicillin therapy has had to be considered, anti-coagulants, thiouracil, and the Rh factor. Of the completely new sections one notes with satisfaction those on arterial injuries and rehabilitation, and of those that have been re-written the one on burns deserves special mention.

A good book on surgery should be well illustrated, and this has been achieved despite the low price. The illustrations are drawn mainly from cases seen in recent years at the Edinburgh Western Hospital. The author states, "I have endeavoured to mould this book in a form suitable for undergraduate and postgraduate students", and the continuing demand from both classes of reader shows that he has succeeded. It is one of the best surgical textbooks published in one volume, and certainly the most modestly priced.

F. T.

### British Hospitals

A. G. L. Ives. London: Collins, 1948. 50 pages; 26 illustrations; 4 coloured plates. 22 x 16 cm. 5s. [£0.25]

This book, one of the Britain in Pictures series, covers the history of hospitals in Britain from A.D. 600 to the present day, describing the mediaeval period, the monastic foundations, the royal hospitals, the beginning of scientific medicine, the development of voluntary hospitals, anaesthesia, the work of Florence Nightingale, antiseptics, the discovery of x rays, and the application of bacteriology in medicine, besides other landmarks. Mention is made of the outstanding personalities responsible for the development of clinical medicine and teaching. The writer, who is secretary to the King Edward Hospital Fund for London, obviously has an intimate knowledge of his subject and of the literature concerning it. The illustrations interspersed throughout the book have been carefully selected and beautifully reproduced; they complete what must be one of the shortest and best histories of the subject yet produced.

L. T. M.

### Truby King—the Man

May King. London: George Allen & Unwin Ltd., 1948. 355 pages; 15 illustrations. 22 x 14 cm. 18s. [£0.9]

Sir Frederic Truby King, who was born in New Zealand in 1858 and died there in 1938, was internationally recognized as a pioneer in child welfare. His work to promote breast feeding and to lessen the mortality from infantile diarrhoea was so successful that he was encouraged to found institutes in New Zealand for training in his methods, which were soon imitated in most English-speaking countries throughout the world.

Truby King's adopted daughter Mary, who acted as his confidential secretary and assisted him in founding the Truby King Mothercraft Society in Australia, and who is well known for her manual entitled *Mothercraft*, which is based on his methods, has written this full-dress biography. It is well documented and copiously illustrated and will become the standard source of reference to Truby King. Written in a most interesting style, it well repays reading, and will be a source of inspiration to all those who are working for the welfare of the mother and child.

L. T. M.

### The Scotsman's Food. An Historical Introduction to Modern Food Administration

A. H. Kitchin & R. Passmore. Edinburgh: E. & S. Livingstone Ltd., 1949. v + 86 pages; 10 figures. 18 x 12 cm. 3s. 6d. [£0.175]

As a Scot I cannot but feel some disappointment with this little book. For *The Scotsman's food* is, and is admitted to be, no more than "An historical introduction to modern food administration."

The authors, understandably and quite rightly, are more familiar with, and more interested in, the present than the past. Within small compass they have given a fair and scientific presentation of modern problems of nutrition. And tacking their presentation on to the food habits of one nation is an ingenious device to bring home to readers the reality of the problem. But now, having thus cleverly made use of the Scot and his dietetic idiosyncrasies, will the authors not find time, as a relaxation from the present-day problems of nutrition, to expand the introductory section of their book into a scholarly study of food habits in Scotland? It is to be hoped that they will do so.

In the meantime they are to be congratulated on the writing of an interesting and useful primer, and their publisher deserves credit for keeping the price within the thrifty bounds traditionally associated with the Scot.

R. C. Garry

### La Streptomycine et ses Applications Thérapeutiques (Principalement dans la Tuberculose)

C. Levaditi. Paris: Presses Documentaires, 1948. 218 pages; 76 figures. 22 x 14 cm.

We welcome this survey of the history, problems and future possibilities of streptomycin from the pen of an eminent French authority. Professor Levaditi is the scientific director of the Institut Alfred Fournier, and his work on virology, both there and at the Institut Pasteur, where he was formerly a professor, is well known. As he tells us in his preface, he was able to obtain, early in 1946, through the courtesy of Mr. Selman A. Waksman, a small quantity of streptomycin, as well as a culture of *Actinomyces griseus*, from the United States, and with these conducted a series of experiments at his own institute which fully confirmed the American discoveries. The present book, therefore, in addition to reviewing the history and literature of the subject, describes the author's own investigations.

An introductory historical chapter is followed by chapters on the culture media of *Actinomyces griseus* and the factors affecting the elaboration of streptomycin. Next comes an account of the general properties of the latter, its purification, concentration, crystallization and chemical constitution. These chapters are followed by one on the industrial preparation of streptomycin, after which the estimation and range of its antibiotic

activity are described. Next the author studies the pharmacological aspect and the question of tolerance, and this leads to an account of the mode of action of the drug and a chapter on resistance to it. The following chapter, on resorption, circulation, dispersion and elimination, completes the first half of the book. The remaining chapters are devoted to problems of therapy—experimental, in human infections other than tuberculosis, and in human tuberculosis—and tolerance of the drug in human subjects. The therapeutic aspects are treated in great detail; the chapter on experimental therapy is subdivided according to the various types of infection, while the clinical chapters begin with sections on the basic principles of treatment and methods of administration and then consider each infection separately and in detail.

There is a bibliography of 334 references and the figures and tables are numerous and on the whole clear. The research, erudition and care expended on the preparation of the material for this book seem, at least to a British eye, to merit a better and more imposing physical presentation.

A. H.-S.

### Minor Surgery

R. J. McNeill Love. Third edition. London: H. K. Lewis & Co. Ltd., 1948. vii + 430 pages; 221 figures. 18 x 12 cm. £1 2s. 6d. [£1.125]

This popular work, as stated in the preface, is "intended to be a guide to hospital residents, and an aid to practitioners . . . called to deal with minor surgical problems or common surgical emergencies." New matter has expanded the book by 33 pages. Perhaps the most notable of the additions is the section on curare, as there is a need for a short summary of present knowledge, but the section on anaesthetics also includes for the first time the Junker bottle and Shipway's apparatus for the administration of chloroform. Penicillin is adequately covered for a book of this type, as there are two pages devoted to it and 11 entries elsewhere in the text. Sulphonamide therapy has also been brought up to date, and the whole work bears signs of the careful revision inferred in the preface.

If, as is stated on p. 127, "a granny knot should never be used", why print an illustration (fig. 46) showing how the knot is tied? Presumably some people must make granny knots without knowing it.

The new Love's *Minor surgery* should continue to be useful to all who need a clear, attractively printed guide to up-to-date methods in this subject.

F. T.

### Personality Projection in the Drawing of the Human Figure. (A Method of Personality Investigation)

Karen Machover. Springfield, Illinois: Charles C. Thomas, Publisher; Oxford: Blackwell Scientific Publications, Ltd., 1949. ix + 181 pages; illustrations. 22 x 14 cm. 17s. 6d. [£0.875]

This book is an attempt to present Dr. Machover's theory that the drawing of a male and a female figure can be used as a "projective" mechanism; in other words, she assumes that a person's attitudes, complexes, strivings, and so forth, are revealed in the kind of drawing he makes. This view is by no means a new one; the work of Waechner, Altschuler & Hattwick, Elksich, and many others, has already indicated that methods of this type may have a certain degree of validity. More recently still, Buck, in his House-Tree-Person (HTP) Test, has developed a well-articulated technique for analyzing the drawings of a house, a tree, and a person, which he asks his subjects to make.

Dr. Machover's book does nothing to establish the validity of the procedures suggested, nor does it offer any evidence of the reliability of the interpretations attempted. Most of her interpretations are of a type which will hardly stand a critical appraisal. Here, for instance, are the interpretations she makes of the hair style of a drawing: "The hair style is tight and compact (effort at restraint), but essentially fuzzy and very dark in line pressure (impulse to primitive and free sexuality turned into anxious aggression). The hair covers most of the forehead (suggests dependence upon sexual vitality and allure far social appeal rather than upon intellectual attainment)." As no evidence is offered for the validity of this type of interpretation, with the exception of a vague reference to some matching experiments, not described in any detail, it cannot be said that this book adds anything to our methods of assessing personality, but rather marks a reversal to intuitive and subjective ways, which, one had hoped, modern psychology had outgrown.

The book is attractively produced and will, no doubt, appeal to those who dislike a scientific approach to personality.

H. J. Eysenck

### Handbook of Practical Bacteriology. A Guide to Bacteriological Laboratory Work

T. J. Mackie & J. E. McCortney. Eighth edition. Edinburgh: E. & S. Livingstone Ltd., 1948. viii + 624 pages; illustrations. 22 x 14 cm. £1 5s. [£1.25]

The popularity of this book is demonstrated by the fact that no fewer than eight editions have been produced since its first appearance in 1925. It is a fairly comprehensive guide to bacteriological technique. Methods are described for most of the procedures carried out in a routine laboratory. As the methods are chosen with care they work, and as the descriptions are clear and precise they can be readily followed. The present edition has been enlarged and completely revised to bring the book up to date. Much additional information is given, some of which appeared in an appendix in the two wartime editions. The section on the cultivation of micro-organisms has been extended to give details of recently described culture media and that on the testing of antiseptics now includes an account of tests in connexion with sulphonamide and penicillin therapy. The chapter on filtrable viruses has also been considerably enlarged and is now a useful summary of our present knowledge on virus infections.

In order to include so much technical information in a bare 600 pages it has been necessary to prune theoretical considerations to a minimum, thus making the book somewhat lifeless and unsuitable as a textbook for undergraduate students. This, however, is of less importance to the laboratory worker, who will find the book's explicit technical instructions make it invaluable as a laboratory handbook.

Mary Barber

### El Inglés para Médicos y Estudiantes de Medicina. Curso Rápido de Lectura

R. Mackin & A. Weinberger. London: Longmans, Green & Co., 1949. ix + 143 pages. 19 x 13 cm. 7s. 6d. [£0.375]

This useful little book is designed for Spanish-speaking medical practitioners and students who wish to acquire a reading knowledge of English sufficient to give them access to professional literature. It consists of a graduated series of readings, all but the most elementary of which are

from standard English and American medical texts. Each reading is accompanied by a vocabulary and a full commentary on grammar and idioms. A general vocabulary, indexes of idioms, abbreviations, and points of grammar, and a list of weights and measures are useful additions to the work. The readings, chosen with much intelligence, cover a wide range of subjects: nutrition, anatomy, therapeutics, endocrinology, cardiology, the nervous system, general physiology, infectious diseases, serum sickness, diphtheria, circulatory disturbances, influenza, bronchitis, syphilis, nasal obstruction, chemical pathology, appendicitis, leucotomy, ring-worm, and pulmonary tuberculosis. English pronunciation is not discussed; the student with no previous knowledge of English will no doubt supply this omission for himself as a preliminary to the course.

B. M. S.

**The History of State Medicine in England: Being the Fitzpatrick Lectures of the Royal College of Physicians of London for the Years 1946 and 1947**

Arthur Salusbury MacNalty. London: The Royal Institute of Public Health and Hygiene, 1948. 82 pages. 25 x 19 cm. 12s. 6d. [£0.625]

Sir Arthur MacNalty's Presidential Address to the Royal Society of Medicine in 1946 on the evolution of preventive medicine in England is here used as an introduction to four lectures. In these he traces the history of state medicine in England from its beginnings at the accession of Queen Victoria in 1837 to the establishment of the Ministry of Health in 1919.

In the first lecture, the author describes the work of pioneers such as Chadwick, Shaftesbury and Southwood Smith, culminating in the formation of the General Board of Health and the appointment of the first medical officers of health. During this period, there were advances in epidemiological knowledge, and the second lecture outlines the investigations into disease undertaken by the Medical Department of the Privy Council, to which the duties of the General Board of Health were transferred in 1858. The events leading to the appointment of the Royal Commission of 1869-71, and the subsequent passing of the Public Health Act of 1875, are also described. The great advance in public health services under the Medical Department of the Local Government Board is the subject of the third lecture. The discoveries of medicine and bacteriology were applied to public health, and public health authorities played an increasingly important role in preventive medicine. The final lecture describes how in the 20th century, while advances were being made in disease control, the foundations of the national health services were laid: first, in the school medical service, and then in national health insurance, followed by the formation of the Medical Research Committee. Finally, in 1919, the Ministry of Health was established.

The story of eighty years' progress is enlivened by the author's learning in social history and literature; he has added biographical detail and quotations from original reports, which make the lectures fascinating reading. A bibliography is appended to each lecture.

H. M. C.

**Textbook for Almoners**

Dorothy Manchée. London: Baillière, Tindall & Cox, 1947. xii + 466 pages; 7 plates; 49 illustrations. 23 x 15 cm. £1 7s. 6d. [£1.375]

This book has suffered from delays, at present inevitable in Great Britain, in securing paper, and from other production difficulties. As a result, for students now in training or almoners going into practice here, it has serious disadvantages as a textbook, since much of the information is out of date; also a great deal of the information is of use only to those working in the London area.

In spite of this, those in other countries who are interested in the British almoner's methods will find that there are ample descriptions given of the history and development of the almoner's work, and of the immense variety of agencies—voluntary and official—upon which she can call for help in almost every conceivable need. They will find, too, an indication of the student's training and her function when employed, as well as an account of her office routine and of her working relationships with doctor, nurse, administrator, social worker and patient.

There is still more than a trace in this book of the bad old days when the almoner's proper work was hampered by the imposition upon her of the duty of assessing payments by patients. Happily, with the introduction of the National Health Service, that invidious task has now been taken away from British almoners.

The medical information given would have been better omitted. It is out of place and not impeccably accurate.

**Practical Food Inspection. Volume II. Fish, Poultry and other Foods**

C. R. A. Martin. Third edition. London: H. K. Lewis & Co. Ltd., 1948. vii + 284 pages; 59 figures. 22 x 14 cm. 18s. [£0.9]

The emphasis is again on the practical aspect of inspection in this second volume of "Martin", but it is nevertheless a repository of information concerning food. The imagination is captured in the first paragraph by references to the use of submarine detection apparatus and wireless by the fishing fleets, and throughout the book the author goes out of his way to make his subject attractive. For example, a food inspector does not need to know why a "Finnon" baddock is so called, but Mr. Martin enlightens him in his usual interesting fashion.

One would have liked to have read the author's views on dyed smoked fish, but he does not mention a matter which has been a controversial subject for a quarter of a century. The important question of the sewage pollution of shellfish is adequately discussed, and the sterilization of oysters by one of the methods described should be made compulsory. Public health workers will be particularly interested in the chapters on milk and milk products, and food poisoning. Legislation relating to the many subjects covered by the book is summarized, with long extracts, in the last chapter.

A great deal of the information presented should be popular with a wider public if published in a more general work. Many people must wonder how such typical British meat products as tripe and chitterlings are prepared; and how to recognize staleness in fish and other foods is of interest to every housewife.

F. T.

**A Textbook of Surgery for Dental Students**

G. Percival Mills & Humphrey Humphreys. Fifth edition. London: Edward Arnold & Co., 1948. vii + 368 pages. 82 figures. 22 x 14 cm. 18s. [£0.9]

The fact that a 5th edition of this book has been published since the first issue in 1913 speaks well

for its continued popularity. On this occasion it has been prepared by Professor H. Humphreys and Mr. W. G. Mills, F.R.C.S., as Mr. G. P. Mills has retired from practice. In carrying out an extensive revision and bringing the subject-matter up to date the authors have carefully preserved its original character and purpose, primarily those of a textbook for dental students. It is stated in the preface that the text covers the requirements in surgery of those examining bodies publishing a detailed syllabus.

The opening chapters extending over 210 pages are devoted to the fundamental principles of surgery and include a description of surgical bacteriology, inflammation, haemorrhage, surgical infectious diseases, tumours and cysts, fractures and dislocations, injuries and diseases of blood vessels, diseases of bone and the nervous system. An explanation is given of the various terms that are used, a feature which is helpful to the student. This section contains much that is instructive and, as would be expected, a number of conditions that are not usually encountered by the dentist.

The subsequent chapters deal with regional surgery, and include affections of the face, neck, mouth, throat, nose and accessory sinuses, diseases of the salivary glands, larynx, fractures of the facial bones and jaws, tumours of the jaws, diseases of the mandibular joint, the neck and eye. There is a concluding chapter on general anaesthetics in dentistry.

It is felt that some of the conditions described, such as diphtheria, scarlet fever and oral sepsis would more appropriately belong to the field of medicine. There are one or two points that might be criticized. Thus while it is agreed that lymphosarcoma of the tonsil is radiosensitive, it might have been emphasized that it is also markedly malignant. In addition there is some confusion over the terms "myeloid epulis"—which should be discarded—and "myeloma". Again it is felt that tracheotomy could have been described more fully and supported by illustrations.

But these points do not detract from the merits of the book, the size and purpose of which necessarily prevent the authors from going into any detail in most of the conditions that are described, and it will undoubtedly continue to be much used by dental students.

**Second Report of the Standing Committee on the Rehabilitation and Resettlement of Disabled Persons**

Ministry of Labour and National Service. London: His Majesty's Stationery Office, 1949. 20 pages. 25 x 15 cm. 9d. [£0.0375]

This Committee published its first report in November, 1946, and the present publication covers developments in the intervening period. During this time many of the emergency hospitals have closed and have given way to rehabilitation facilities, housed for the most part in hatted accommodation; there has been an extension of physiotherapy and occupational therapy facilities and gymnasia. The programme is still hampered by a shortage of auxiliary and medical personnel, and steps are being taken to remedy this. Among other measures, it is planned to open three new schools of physiotherapy.

The administrative arrangements under the National Health Service Act and the National Insurance Acts are outlined; these Acts have made possible a more integrated structure of the agencies dealing with rehabilitation problems. The schemes of rehabilitation for tuberculous patients, psychiatric patients, epileptics, and the blind are reported upon. The arrangements for the resettlement of the disabled under the D.R.O. (Disablement

Resettlement Officer) Service of the Ministry of Labour were strengthened in May 1946, by the appointment of 49 District D.R.O.'s. This Service is largely concerned with the economic resettlement of disabled persons, and through it an extensive programme of vocational guidance and further training is available. The quota scheme for the employment of registered disabled persons has worked so satisfactorily that in August 1948 less than one half of one per cent of these were unemployed.

Throughout, the report reflects the vigorous measures which are being taken to deal with the many problems of rehabilitation. The lessons learned by the rehabilitation services during the war period have not been without value.

### Report of the Departmental Committee on Industrial Diseases

Ministry of National Insurance. London: His Majesty's Stationery Office, 1948. 15 pages. 24 x 15 cm. 4d. [£0.0165]

A Departmental Committee on Industrial Diseases was appointed by the Ministry of National Insurance in March 1947, "to review, in the light of modern industrial conditions, the policy adopted in scheduling diseases as industrial diseases under the Workmen's Compensation Acts, and to advise as to the principles which should govern the selection of diseases for insurance under the National Insurance (Industrial Injuries) Act, having regard to the extended system of insurance to be set up by the National Insurance Act and any other relevant considerations."

The Committee, which was presided over by His Honour Judge Dale and on which there were four medical representatives, came to the conclusion that the tests which have hitherto been applied before a disease was scheduled by the Secretary of State under the Workmen's Compensation Acts are no longer appropriate. Under the Old Acts liability to pay compensation rested upon individual employers with separate interests; under a system of national contributory insurance circumstances are entirely different. Under Section 55(2) of the National Insurance (Industrial Injuries) Act 1946 the Minister is bound to satisfy himself, before prescribing a disease, that the attribution of particular cases to the nature of employment can be established or presumed with reasonable certainty; but otherwise he is given wide powers of discretion.

The Committee does not regard it as essential to prescription that a disease should be specific to employment, provided the employment necessarily implies a special exposure to the risk of the disease. This will appreciably enlarge the range of diseases which can be included, by enabling prescription of diseases that may occur in the general population.

Obviously such claims will need very careful scrutiny and the Committee recommends that a Standing Committee should be appointed by the Minister to advise on the selection of individual diseases for prescription.

T. F.

### Introductory Manual on the Control of Health Hazards from Radioactive Materials

Ministry of Supply, Atomic Energy Research Establishment. (Prepared for the Medical Research Council.) Issue No. 2. London: Medical Research Council, 1949. 15 pages. 24 x 18 cm.

This brief manual outlines the nature of the hazards to health attendant upon the use of radioactive materials in biological work and discusses the precautions which should be taken to safeguard the workers and prevent the falsification of

experimental results caused by uncontrolled and random radiation. Certain laboratory rules and procedures are necessary for the safe handling of these substances: these must be followed meticulously if disaster is to be avoided. A useful reference list is given. This manual will be of great value to those who contemplate working in the rapidly expanding field of radiobiology. Copies of it, together with its companion memorandum, the Seventh Revised Report of the Recommendations of British X-ray and Radium Protection Committee, may be obtained free on application to the Secretary, Medical Research Council, 38 Old Queen Street, London, S.W.1.

D. F.

### Textbook of Anaesthetics

R. J. Minnitt & John Gillies. Seventh edition. Edinburgh: E. & S. Livingstone Ltd., 1948. vii + 568 pages; 229 figures. 22 x 14 cm. £1 10s. [£1.5]

It is no exaggeration to say that this has become the most popular textbook of anaesthesia in Great Britain and it well deserves its enviable position. Every aspect of the subject is adequately covered in such a clear and lucid fashion that the argument can be followed by any intelligent medical student at the first reading. At the same time there is sufficient "meat" in the book to be acceptable to the resident anaesthetist and it is only when the aspiring specialist is reading for the second part of the Diploma in Anaesthetics that he will require further information.

The 7th edition has been brought up to date by a chapter on curare by Dr. T. C. Gray, and one on some legal aspects of anaesthesia by Mr. J. Crossley Vaines, LL.M. Mr. L. B. Wevill has enlarged his section on local analgesia so that it now describes the actual infiltration and block techniques which it formerly only outlined. Professor John Boyes has also revised the subsection on regional analgesia in dentistry.

The illustrations are well chosen and clearly reproduced, while the excellence of the paper and printing reflect great credit on the publishers. It is difficult to find any serious criticism of the book.

C. Langton Hewer

### The Clinical Examination of the Nervous System

G. H. Monrad-Krohn. Ninth edition. London: H. K. Lewis & Co. Ltd., 1948. xx + 459 pages, 131 illustrations. 19 x 13 cm. 16s. [£0.8]

During the 27 years since it first appeared, Monrad-Krohn's book has established itself as one of the most useful short accounts of the clinical examination of the nervous system. Much fresh material has been added to this new edition, including an account of electroencephalography and additions to the section on ventriculography and encephalography. Additions have also been made to the illustrations, which form a valuable supplement to the text. The book will be particularly useful to senior students and newly-qualified practitioners. Production maintains the high standard of previous editions.

L. T. M.

### The Doctor and the Difficult Child

William Moodie. Second edition. New York: The Commonwealth Fund; London: Geoffrey Cumberlege, Oxford University Press, 1947. xiv + 231 pages. 22 x 14 cm. 11s. 6d. [£0.575]

### The Doctor and the Difficult Adult

William Moodie. London: Cassell & Co., Ltd., 1947. vii + 296 pages. 22 x 14 cm. 15s. [£0.75]

The value of the child guidance clinic is no longer in dispute; it has won its place to the medical firmament, and, in the larger cities at least, has largely dispelled the doubts and fears of parents in seeking advice and expert guidance when faced with a childhood behaviour problem. From his rich experience as Medical Director of the London Child Guidance Training Centre, Dr. Moodie wrote the first edition of *The doctor and the difficult child* in 1940: he now has brought out a 2nd edition which is substantially unaltered. The crowded years of the war, though of course they profoundly altered the living conditions of British children, and in particular caused separation problems and increased the stresses to which children and their parents were subjected, brought with them little change in the fundamental principles of child guidance. The children remain the same, and the problems of adjustment in war time are only exaggerations of those met with before the war. Hence, Dr. Moodie has seen little reason to make any profound alterations in his book.

*The doctor and the difficult child* is a straightforward presentation of the subject of child guidance; the general practitioner will find it a useful help in his approach to problems of childhood maladjustment. Dr. Moodie approaches these problems in a commonsense way; the illustrative cases give the reader considerable insight into the genesis of behaviour problems; questions of treatment are not, perhaps, outlined in sufficient detail to be of much value to those who wish to put the author's methods into practice. The child psychiatrist will find little new in this volume, but it is not to him that it is primarily addressed.

*The doctor and the difficult adult* was published in 1947. The discursive style and the wide range of this volume prevent a logical development of its various topics: the book ranges over the whole field of psychiatry, and much of it is taken up with illustrative case histories. Here again, the case histories are extremely well written in that they give a vivid picture of the patients and their troubles, but the comment on them fails to elaborate the psychopathology involved and treatment is discussed only superficially.

Dr. Moodie takes exception to the views of the orthodox psychoanalysts. "The principles of psychoanalysis", he says, "cannot be applied directly to conscious thought or behaviour any more than those of Einstein and Rutherford can to the practical problems of physics." He sets up a category of Freudian enthusiasts which he calls Those Who Believe in Psychoanalysis; on these he pours his scorn. Yet it is clear that in his own clinical methods he daily employs Freudian principles.

However, Dr. Moodie's approach to the practical problems of psychiatry is refreshing and clear headed: the book is not intended for psychiatric specialists, but should be read with interest by general practitioners.

D. F.

### Manual of Leprosy

Ernest Muir. Edinburgh: E. & S. Livingstone Ltd., 1948. viii + 208 pages; 70 figures. 22 x 14 cm. 17s. 6d. [£0.875]

The production of a work on leprosy, comprehensive, accurate and interestingly written within the compass of 200 pages, could be carried out only by an enthusiast and an expert.

The author has been an ardent student of leprosy for many years in parts of the world where the disease is rife—in India, in Africa and in the West Indies. The book may, therefore, justly be called authoritative. The subject is dealt with in three parts, each with several chapters. In Part I, "The Nature of Leprosy", the author considers the bacteriology, mode of infection, the lepromin test,

the different types of the disease and their classification. Part II is on diagnosis by clinical and bacteriological examinations and skin tests. Exceptionally useful is a chapter on differential diagnosis. Treatment is included in Part II, in four chapters; one on the value and importance of good hygiene and the maintenance of a high general state of health, for resisting progress of the disease; hydriocarpus oil and the sulphones are then dealt with, and, finally, surgical measures. Part III describes anti-leprosy campaigns—the taking of a preliminary leprosy survey (data for an intensive survey are considered in an appendix), organizing control measures, establishing leprosaria and social and welfare services; the question of the healthy children of infected parents is discussed.

The work is embellished by excellent and well-selected photographs and photomicrographs, and the coloured plates depicting details are remarkably good. There is a carefully chosen bibliography for readers wishing for further information on the subject of each chapter, but no mention is found of the *Tropical Diseases Bulletin*, in which the literature of leprosy is reviewed and abstracted each month and there is every year a summary of the published work of the previous 12 months; this is of great help to anyone wishing to keep himself au courant with the advances in the subject.

To sum up: this book covers the ground efficiently and without redundancies; the author is to be congratulated on the successful result of his task and on having found a publisher who has done all that could be done in the way of quality of paper, printing and production to make the work attractive. For the practitioner going to a country where leprosy prevails there could be no better guide.

H. Harold Scott

### Genetics, Medicine, and Man

H. J. Muller, C. C. Little & Laurence H. Snyder. Ithaca, New York: Cornell University Press; London: Geoffrey Cumberlege, Oxford University Press, 1947. viii + 158 pages; 29 figures. 23 x 15 cm. 12s. 6d. [£0.625]

*Genetics, medicine, and man* consists of the Messenger Lectures on the Evolution of Civilization delivered at Cornell University in the autumn of 1945. An introductory preface has been contributed by R. A. Emerson of the same University, and the three authors, H. J. Muller, C. C. Little & Laurence H. Snyder, are all notable workers in the field of genetics in the USA. The book should be of wide interest; it serves as an introduction to the principles of heredity and shows how the results of recent experimental work in animals and plants have led to research in problems of human welfare. The book is divided into three parts; each author has contributed one section, which, in every case, is followed by a useful select bibliography and a list of references.

The first section, written by H. J. Muller, is a simple but comprehensive description of the nature of genes and of genetic activity. Clear diagrams of stages from the fertilization of the egg to the polarization of chromosomes in the dividing cell are useful adjuncts to the chapter on the work of the genes. This contribution, as a whole, shows the tremendous advances of genetics in less than 50 years.

C. C. Little, writing in the second section, on a definitive interpretation of genetics in relation to parental influence, says that this, indeed, is no field of this influence is demonstrated by a list of ways in which, in the mammal, it may be transferred to the offspring; and where, in the offspring, parental influence may show its effect. The following

chapter, on the influence of growth in cellular fission, describes the latent power of regeneration and the conflict arising between the organization of a cell community and the inherent factor of independent metabolism, within that community. Included in this chapter is a discussion on individuality, of which the author gives a definite genetic analysis.

The last section, by Laurence H. Snyder, is devoted to human heredity and the mutant gene in man. The author points out the difficulty of establishing genetic data in the human being, except in the cases of families with some exceptional physiological trait. After a consideration of practical applications and a list of hereditary traits, the author gives an account of the Rh factor. The location of genes, illustrated by several tentative maps of chromosomes, and the basic relations of the mutant gene, are described in the next chapter. A number of tables appear, containing lists of traits reported to be dependent upon certain types of genes.

S. S.

### Some Common Psychosomatic Manifestations

J. Barrie Murray. London: Geoffrey Cumberlege, Oxford University Press, 1947. xii + 101 pages. 18 x 12 cm. 7s. 6d. [£0.375]

This small book is devoted mainly to a description of "effort syndrome" or neurocirculatory asthenia; there is also a chapter on a less clearly defined condition described as the "low back syndrome". The author includes a number of original observations on the psychoneuroses as seen in military and civilian patients. The chief signs and symptoms of effort syndrome are discussed at length, and comparative figures are given for their incidence in groups of patients suffering from undifferentiated psychoneuroses, effort syndrome and the "low back syndrome". The symptoms may generally be regarded as physical expressions of anxiety or of other emotion. Possible predisposing causes and precipitating factors are enumerated; while the principle of multiple etiology is accepted, the importance of psychogenic factors is stressed. Dr. Murray points out that effort syndrome is common among civilian as well as military patients; it may also co-exist with tuberculosis, rheumatic carditis and other forms of organic disease, which then present a modified clinical picture. In the "low back syndrome" are included patients who complain of pain or other sensations in the lower part of the back or abdomen, or in the legs. Of those described as being in this category, 50% gave a past history of "nervous trouble", 38.5% complained of increased frequency of micturition, 54% showed hyperaesthesia to pin prick in the sacro-iliac region and 66% had anaesthesia of the skin in other regions.

Dr. Murray starts the chapter on treatment by saying: "The treatment of patients complaining of psychosomatic manifestations is obviously by psychotherapy." In considering physical exercise as a method of treatment he continues: "By graded exercises Lewis obviously treated his patients by mass psychotherapy, but obviously he was not entirely convinced of the purely psychiatric nature of the complaint and was prevented from treating it wholeheartedly by psychotherapy." Here, and elsewhere, Dr. Murray's long experience as a psychiatrist enables him to arrive at conclusions which may be less obvious to the ordinary medical reader and which would appear to merit a more critical examination. We are told that "... the eye signs in thyrotoxicosis are due to the emotional factor in this condition", but it is not made clear why the eye signs should be generally more marked

in thyrotoxicosis than in the affective states, where the emotional factor is presumably more prominent; nor is it clear how the emotional factor can account for the occurrence in thyrotoxicosis of unilateral exophthalmos. A further explanation of points of this kind would be of value.

The book will serve a useful purpose in drawing attention to the psychosomatic nature of some of the symptoms commonly encountered in ordinary medical practice. The format of the book is in keeping with the usual high standards of the Oxford University Press.

Derek Richter

### Thyroid Enlargement and Other Changes Related to the Mineral Content of Drinking Water. (With a Note on Goitre Prophylaxis)

Margaret M. Murray, R. A. Ryle, Beatrice W. Simpson & Dagmar C. Wilson. London: His Majesty's Stationery Office, 1943. (Medical Research Council Memorandum No. 12.) 39 pages. 24 x 15 cm. 9d. [£0.0375]

The work reported in this memorandum derives from the observation of an unusually high incidence of goitre in Oxfordshire noted during nutritional surveys early in the war. The purpose of the present study was to ascertain the relation between the iodine content of the drinking water supplied and the incidence of goitre; it was also hoped to study the relationship of endemic goitre with endemic fluorosis. This latter aim was not attained, because in England few areas exist with waters of sufficiently high fluoride content. Four areas of England were studied; in them 1,737 children, aged 11 to 15 years, were examined and the presence or absence of thyroid enlargement was graded on clinical grounds. The results confirmed the generally accepted view of the inverse relationship between thyroid enlargement and the iodine content of the drinking water.

Other surveys were made covering a wider area of England and Scotland. In these, nearly 4,000 children were examined, and it was found that the incidence of thyroid enlargement was greater in some areas of England, and less in some areas of Scotland, than would have been expected from the iodine content of the drinking water. Further investigation showed that this might be attributed to the degree of hardness of the English water as compared with the softness of the Scottish water.

The authors question whether clinical enlargement of the thyroid should ever be regarded as physiological: in areas with waters of high iodine content its incidence is very low. The prophylactic use of iodized salt is recommended.

D. F.

### Psychopathology: a Survey of Modern Approaches

J. Ernest Nicole. Fourth edition. London: Baillière, Tindall & Cox, 1946. vii + 268 pages. 22 x 14 cm. 15s. [£0.75]

This book has served many students as a guide to modern approaches to psychopathology since the 1st edition was published in 1930. The fields surveyed have, however, become so numerous and specialized that the student, contemplating the *hortus siccus* of theories and authors here displayed, might reasonably conclude that he was being given a lot of information about approaches but very little about how to arrive. The fault lies with psychopathology rather than with Dr. Nicole who has conscientiously set out the diverse opinions and observations published in the last forty years. He does not sit in judgement on them, even in respect of the amount of space they shall receive: the chapter called "Freud's Psychoanalysis", for example, takes up no more pages than are

given collectively to "Watson's Behaviourism", "Kempf's Psychopathology" and the "Endocrine Theories of Berman and Others"; yet it is evident from other chapters that Dr. Nicole rates the importance of Freud's work higher than this would suggest. Thirty pages of bibliography and an index containing a thousand names attest the wide range of the book, the author's fairness in including writers of very diverse standpoints, and his almost excessive concern to list even the minor contributors to some of the topics he deals with.

A. L.

### Hospital and Community. I. Hospital-treated Sickness amongst the People of Stirlingshire

Nuffield Provincial Hospitals Trust, London : The Nuffield Provincial Hospitals Trust, 1948. xii + 96 pages ; 3 maps. 24 × 16 cm. 3s. 6d. [£0.175]

The Glasgow Health and Sickness Bureau, founded some years ago by the Nuffield Provincial Hospitals Trust, attempted in this survey to assess the amount of hospital-treated sickness and thereby to fill a statistical gap in the Registrar-General's Annual Reports. The survey was, in itself, an experiment, primarily designed to ascertain hospital facilities and conditions throughout a given area. Stirlingshire was chosen as the area in which the survey was carried out, partly because it was believed that the several interests concerned would co-operate in such a survey, and partly because the population was of a reasonable size for investigation.

Information regarding natives of Stirlingshire being treated either as in- or out-patients in hospitals outside the county boundaries was collected, card-indexed and classified, together with hospital attendances in Stirlingshire itself. Many interesting facts were brought to light by these statistics, which include sex and age ratios, duration of hospital treatment and incidence of disease among certain population groups. The survey has also indicated a relationship between illness, social conditions, and industry. Respiratory and infectious diseases, for example, showed their strongest incidence in areas of over-crowding and housing shortage—conditions which are prevalent in Scotland generally. The lowest recorded number of patients per 1,000 of the population occurred in the western agricultural district of Stirlingshire. Results of hospital treatment and after-care were also given their places in this comprehensive survey. Supplementary notes in appendix form, at the end of the report, provide additional information on disease groups.

A history of the work done since 1889 in Falkirk Royal Infirmary, formerly known as Falkirk Cottage Hospital, forms the last chapter of this report and is entitled "The Growth of a District Hospital". The effect on the hospital of national health service schemes during half a century are described and statistics relating to patients during the same period are recorded.

S. S.

### Bacterial and Virus Diseases : Antisera, Toxoids, Vaccines and Tuberculin in Prophylaxis and Treatment

H. J. Parish. Edinburgh : E. & S. Livingstone Ltd., 1948. 168 pages ; illustrations. 19 × 13 cm. 7s. 6d. [£0.375]

The short title *Bacterial and virus diseases* appearing on the cover of this little book is very misleading as to the scope of the contents: this is, however, adequately described by the sub-title. Dr. Parish has worked for many years on the bacteriological side of the Wellcome Physiological Research Laboratories and knows intimately the

laboratory side of antisera, vaccines and so forth; he has further had much to do with their practical application in the field. As would be expected, he has been successful in bringing together in a small compass the practical information necessary for the senior student and practitioner. The book is rather a mixture of the elementary and the specialized. Thus under "Antitoxic Sera" one reads "Some organisms produce poisonous substances in the media in which they are grown" and is invited to admire coloured pictures of six common organisms. On the other hand most of the book is devoted to detailed practical instructions as to diagnostic and immunizing techniques.

C. H. Andrewes

### Diseases of the Eye

John Herbert Parsons & Stewart Duke-Elder. Eleventh edition. London : J. & A. Churchill Ltd., 1948. viii + 732 pages ; 21 plates ; 368 text-figures. 21 × 14 cm. £1 10s. [£1.5]

When does a textbook deserve to be called a "classic"? One may safely hazard the opinion that Parsons' *Diseases of the eye*, now jointly produced by Sir John Herbert Parsons and Sir Stewart Duke-Elder, which has been in the hands of every English-speaking ophthalmologist for the 41 years of its existence, has earned a place among the classics along with revered volumes such as that of Fuchs. Times change and the science of ophthalmology and—to a less extent—the art of ophthalmic practice change also, but "Parsons" goes on steadily and, in its 11th edition, continues to offer a firm and reliable foothold for the ophthalmic student and practitioner.

The present edition has been carefully revised and is brought up to date by the inclusion of much new matter, although a cautious and discreet conservatism in some respects—evidently intended by the authors—is apparent, especially in regard to recent developments in chemotherapy. The book is comprehensive in content, fully and excellently illustrated and indexed, and will receive a hearty welcome from all those who wish to make ophthalmology their life's work, for it provides a valuable, and indeed indispensable, introduction to the subject.

H. M. Traquair

### Nutrition and Diet Therapy

Agnes E. Pavey. London : Faber & Faber Ltd., 1948. 304 pages ; 1 chart. 21 × 13 cm. 12s. 6d. [£0.625]

A book from the author of *Clinical procedures* is always welcome, and her readers will find this one practical and informative. It is intended for nurses, but should appeal to a wider circle. The chapter headed "Diet in the Aged," for example, could be read with profit by all who have the care of the elderly. All those responsible for communal feeding should note her paragraph on the re-heating of green vegetables (p. 80). It is a familiar fact to many that vitamin C is lost in the process, but an attempt is not always made to "compensate for the defect" by including other suitable foods in the menu.

The second half of the book, on diet therapy, will probably appeal particularly to nurses. It is to be noted that the Meulengracht diet is well covered in two pages, and recent advances are not overlooked in the sections on vitamins and on coeliac disease. Some particularly attractive receipts for making refreshing drinks from easily obtainable ingredients are included in the section on beverages for the sick (pages 270–279). A rather unnecessary apology is made in the preface for inability "to set out menus in a spacious and attractive manner" owing to paper economy

standards. Though not "spacious" they are certainly "attractive", and the publisher is to be commended for producing such a well-printed, modestly priced book under present conditions. The historical circumstances behind the story of nutrition are unobtrusively introduced and lend interest to the book as a whole. Readers who wish to know the nutritive values of common foods will be pleased to see that these are included in the appendix.

F. T.

### Diseases of the Heart and Circulation

Albert A. Fitzgerald Peel. London : Geoffrey Cumberlege, Oxford University Press, 1947. xxi + 398 pages ; 61 figures. 22 × 14 cm. £1 15s. [£1.75]

Intended for students as well as for practitioners, *Diseases of the heart and circulation* is based primarily on the notes of lectures; a fact which may account for its somewhat rambling and discursive style. There are many rather tedious accounts of cases and references to the author's experience. The illustrations are often poor, the captions tend to be far too long, and many of the cardiograms are of poor quality. Examples are given of various artefacts, but these are so common in the other curves that they are superfluous. As regards the subject-matter, there is much to criticize. The account of dyspnoea is far from adequate; such an important symptom needs clearer and more up-to-date exposition. The same applies to cardiac pain. The description of gallop rhythm and the various abnormalities in the heart sounds is thoroughly confusing; "Osler's nodes" surely deserve a better account in an Oxford publication. The diversity of opinion as to left bundle-branch block referred to in the caption to fig. 23C has surely been long dispelled. One finds practically no reference to digoxin; cardopbylin is not mentioned.

This book has but little to commend it; there are too many obscurities, inaccuracies and omissions. The student will, however, find a fair amount of the usual facts which appear in all textbooks on this subject.

### The Pharmaceutical Pocket Book

Pharmaceutical Society of Great Britain. Fifteenth edition. London : Pharmaceutical Press, 1948. x + 427 pages. 18 × 12 cm. 12s. 6d. [£0.625]

Two circumstances have combined to make this edition of more than usual interest: the inauguration of the National Health Service in July 1948, and the publication of the seventh *British Pharmacopoeia*. The one involves many changes in the daily routine of the pharmacist; the other reflects the great advances in medical science and practice in the past decade and a half. The 15th edition of *The pharmaceutical pocket book* has been extensively revised to meet the changed conditions; it will continue to serve its dual purpose both as an introductory text for the student of pharmacy and as a practical manual for the practising pharmacist.

D. F.

### Disorders of Sex and Reproduction: Aetiology, Diagnosis and Treatment

A. P. Pillay. London : H. K. Lewis & Co. Ltd., 1948. xiv + 299 pages ; 2 plates ; 2 graphs. 22 × 14 cm. 18s. [£0.9]

The author has here not written a book primarily for the specialist, but a guide for the general practitioner. It does not claim to be complete, but will be useful to those who wish to treat the many thorny problems relating to sex. The work

is largely based on the author's own case records, which make useful and illuminating reading. Dr. Pillay has found that the majority of male sex disorders, exclusive of sterility, are caused by psychic factors, so that the family doctor, with his constant and close contact with his patients, and his sound common sense, is well suited to treat the type of case described in this work.

It is obvious that some of the cases quoted are non-European, and the case on p. 31, which the author quotes to illustrate sterility due to ignorance, would be difficult to parallel in Britain where even adolescents are taught, or have some knowledge of, what are popularly called "the facts of life".

Every attempt has been made to be as up to date as possible. There are no less than three chapters on endocrines in sex disorders, and the technique and history of artificial insemination are dealt with in the concluding chapter. But it is the psychological aspect with which the author is most at home, and it is fitting that the book is dedicated to Havelock Ellis.

F. T.

### Diccionario Inglés-Español y Español-Inglés de Términos Médicos y Biológicos

F. Plens y Sanz de Bremond & C. G. Turner. Madrid: Librería Editorial Científico Médica, 1947. 776 pages. 16 x 11 cm. 90 ptas.

This dictionary is the joint work of a philologist and a surgeon; the latter, Dr. C. Gil Turner, is a member of the Madrid medical faculty and an assistant professor of surgery.

The need for more and better Spanish-English and English-Spanish medical dictionaries is considerable, and even modest vocabularies, carefully compiled and edited, can play a useful part in meeting it. It is disappointing, therefore, that the present work cannot altogether be reckoned among these.

Some 19,000 Spanish-English equivalents, and a rather larger number of English-Spanish ones, are given. The biological terms specially mentioned in the title seem to be those which are normally included in any fairly comprehensive medical dictionary. In dealing with Spanish terms which have both medical and non-medical equivalents, the latter might well have been omitted in favour of some examples of the use of the former; e.g., for "Contador", the equivalents given are "Accountant, counter", for "Cardenal", "Ecclesiast, cardinal of the church", without distinction in either case. These same non-medical equivalents are in turn listed in the English-Spanish section. Instances are "Goblin", a non-medical equivalent of "Coco", and "Parish [sic] priest", an equivalent of "Cura". It is less easy to guess how "Gay dog", "Mother-in-law", "Packs of hounds", "Pastry-cook's shop", and "Roast beef" appeared on the medico-biological scene.

It is also clear that the compilers are not well acquainted with the ordinary arrangement of an English dictionary. Seven terms are alphabetized under the indefinite article "a", one under "an", and six under "the"; while "Each division of an orange" makes an unexpected beginning for the letter "E".

The Spanish-English section is, naturally, free from these defects, and constitutes a reasonably comprehensive and useful word-list. Mistakes in English spelling, which unhappily abound in both sections, are less important here as they do not affect alphabetical order.

B. M. S.

### Medical Education

Ffrangcon Roberts. London: H. K. Lewis & Co. Ltd., 1948. xv + 172 pages. 22 x 14 cm. 12s. 6d. [£0.625]

Not all will agree with Ffrangcon Roberts' views on the vexed questions of medical education, but most will feel that he has achieved a realistic and common-sense appraisal of the problem of what and how to teach medical students. He takes the view that medicine is essentially a vocational study; in the nature of things, most of its graduates will be general practitioners; the general plan of medical education must, therefore, be adapted to the needs of these. He feels that success in the practice of medicine "... depends largely on a knowledge of human nature and a sense of proportion, attributes which the increasing pressure of formal studies tends to extinguish." Reform of the medical curriculum has been a more or less continuous process for the past sixty years; the accelerating rate of the increase of scientific knowledge again makes an overhaul desirable.

This pragmatic approach carries with it certain implications as to the content and emphasis of premedical, preclinical and clinical teaching, and these the author explores to the full. He would reduce the volume of facts taught by rigidly excluding certain subjects such as comparative anatomy and certain parts of histology, and in general by restricting the facts taught to those necessary for medical practice. He is an enthusiastic advocate of the wider use of medical films, and would apply progressive methods such as the Dalton Plan to the teaching of physiology; in this plan small groups of students restrict their studies to intensive work on a prescribed topic; this requires the detailed consultation of the original literature and confirmatory and original laboratory experiment. It is claimed to allow every student the opportunity of developing his special inclinations, and to encourage independent judgement.

Dr. Roberts extends his study to clinical and hospital teaching; though sharply critical of certain aspects of present-day practice in this field, he is, in the end, a constructive critic. There is a lucid chapter on hospital training and another on the comparison of the types of cases seen in hospital with those seen in practice. This comparison underlines the limitations of hospital experience in the training of general practitioners.

Dr. Roberts' book is one which should be read by all those concerned with medical education: even those who disagree with his remedies will profit by exposure to his criticisms.

D. F.

### Recent Advances in Sex and Reproductive Physiology

J. M. Robson. Third edition. London: J. & A. Churchill Ltd., 1947. xii + 336 pages; 65 figures. 21 x 14 cm. £1 1s. [£1.05]

A glance at the long lists of references appended to the end of each chapter is sufficient to indicate the wide reading on which this work is based. As Professor Crew states in the foreword: "Its author knows his subject and, what is equally important, enjoys discussing it." Much of the work really is "recent" and includes references to writings published in the same year as the publication of this book.

The chapter entitled "Clinical Applications" should appeal particularly, and contains a good summary of the various pregnancy tests. There is also a useful table, showing relative doses, in the section of the clinical use of oestrogens. Hormones are well represented and progesterone has a chapter to itself.

The book will be found useful as a reference work, particularly when a short paragraph is desired on a subject not easily accessible in the ordinary textbook, e.g., body temperature and the menstrual cycle, or an authoritative review of present knowledge on

such a topical but controversial subject as artificial insemination. It may be said that a rather unwieldy mass of material has been summarized with no mean skill, for which others besides gynaecologists, physiologists and endocrinologists will be grateful to the author.

F. T.

### The Science and Practice of Surgery. Volumes I & II

W. H. C. Romanis & Phillip H. Mitchiner. Eighth edition. London: J. & A. Churchill Ltd., 1948. Vol. I: General surgery. vi + 892 pages; 20 plates; 439 text-figures. 24 x 16 cm. Vol. II: Regional surgery. vii + 955 pages; 8 plates; 316 text-figures. 24 x 16 cm. £1 5s. per volume [£1.25]

This standard and deservedly popular textbook of surgery reaches its 8th edition on its twenty-first birthday and the authors are to be congratulated on the continued success of their work. Their work to a very large extent it remains, although a few chapters are contributed by other writers. A chapter on diseases of the eye has been omitted from this edition, but new chapters on plastic surgery and x-ray therapy have been added. Both of these are excellent. The other contributed chapter (on anaesthetics) and the section on venereal disease have been revised and brought up to date.

The excellence of these contributed chapters and of their illustrations tempts comparison with other sections of the book and raises the question as to whether in the now highly specialized state of surgery a textbook of the size of this one can in fact be kept thoroughly up to date by one or two authors, particularly when a new edition is called for every two or three years. While the authors state that the whole work has been thoroughly revised, careful perusal reveals some weak points in the revision. It is surprising, for example, to find no mention of high subcutaneous injection of phenol in oil as a treatment of haemorrhoids while "the regular introduction of a rounded vulcanite or ebony rod of the type of the 'Little Wonder', which is rubbed up and down" is advocated as a possibly successful treatment in early cases! Some of the illustrations are out of date and might with advantage be changed.

These however are minor criticisms. This is an excellent textbook for the use of students and practitioners. Due regard is paid to pathology, and in the regional section excellent descriptions of the appropriate anatomy and physiology are given in each chapter and a brief but adequate description of the main operative procedures adds to the value of the work and gives it a completeness often lacking in similar textbooks.

T. M. Miller

### Post-Mortem Appearances

Joan M. Ross. Fifth edition. London: Geoffrey Cumberlege, Oxford University Press, 1949. ix + 303 pages. 17 x 11 cm. 8s. 6d. [£0.425]

The demand for a 5th edition of this small book, since its first publication in 1925, is a proof of its general usefulness. Apart from minor alterations and additions, this edition is similar to the preceding one. This is what one might expect, since even with the advance of knowledge only the interpretation of some of the post-mortem appearances would require revision. Perhaps the only factor, apart from new industrial diseases and the effects of modern warfare, which has brought about changes during the past 20 years in post-mortem findings, is the development of chemotherapy. For example, classical lobar pneumonia has become

very rare; on the other hand, renal failure caused by sulphonamides has become known.

According to the author this volume "has been a veritable passport" for her; one might say confidently that it has served and it will continue to serve a like good purpose for its readers.

G. P.

### The Nomenclature of Disease. Drawn up by a Joint Committee Appointed by the Royal College of Physicians of London

Royal College of Physicians of London. Seventh edition. London: His Majesty's Stationery Office, 1948. xiv + 386 pages. 24 x 15 cm. 8s. 6d. [£0.425]

Extensive changes are apparent in the 7th edition of the *Nomenclature of disease*, recently issued by the Joint Committee appointed by the Royal College of Physicians, and drawn up with the assistance of a Sub-Committee on Classification. The number of entries is almost double that in the previous edition, and the new edition adheres very closely in some respects to the *Standard nomenclature of disease* published by the American Medical Association. In the first section is given an etiological classification of disease, which is then applied to the body as a whole and to its systems. A new feature is a list of medical eponyms, one of the most comprehensive so far available, although the compilers wisely recommend the use of the synonyms proposed for them. The index to a nomenclature of disease is always an important section; in the present publication the index forms a third of the book and comprises more than 17,000 entries. The very low price is no doubt due to the intervention of His Majesty's Stationery Office as publishers.

L. T. M.

### Vade Mecum of Medical Treatment

W. Gordon Sears. Fifth edition. London: Edward Arnold & Co., 1947. vii + 407 pages. 18 x 11 cm. 10s. 6d. [£0.525]

This work continues to be deservedly popular with the busy practitioners and senior students for whom it is written. The alphabetical arrangement of the sections facilitates quick reference, and the revision they have undergone in this edition (notably those on Addison's disease, gonorrhoea and purpura) has increased their usefulness. Where necessary the background to treatment is briefly indicated in the opening paragraph in a clear, easy style. Mention must be made of the appendices on the sulphonamides and penicillin, and of the many useful tables. Printed on thin paper, unlike the pre-war editions, it can easily be slipped into the pocket.

F. T.

### Textbook of Gynaecology

Wilfred Show. Fifth edition. London: J. & A. Churchill Ltd., 1948. vii + 660 pages; 4 colour plates; 292 text-figures. 22 x 14 cm. £1 5s. [£1.25]

An up-to-date British textbook on gynaecology (the 4th edition of this work was first issued in 1945) is badly needed, so a revised edition of one of the best of the established textbooks is doubly welcome. New knowledge has been incorporated in the present edition, and the whole work drastically revised and in part re-written. Gynaecology is admirably surveyed in 26 chapters in the clear, easy style that has established this book as a firm favourite among practitioners and students since it first appeared in 1936.

Penicillin is now well established in the treatment of gonorrhoea and is dealt with in Chapter 6. Incidentally, penicillin does not appear as a heading in the index though the sulphonamides are included. Readers who recall the author's contributions on ovarian tumours to past editions of *Recent advances in obstetrics* will be pleased to see the corresponding section in the textbook, which includes the new classification (p. 584). Special mention must also be made of the chapter on radiological treatment in gynaecology, and one is glad to note that the author decided to retain his own photomicrographs. The new edition should maintain the popularity of the work as a standard textbook.

F. T.

### Food and Health

Henry C. Sherman. Second edition. New York, The Macmillan Company, 1947. x + 290 pages. 22 x 15 cm. £1

This book is a completely revised and reset edition of the author's very useful and semi-popular account of food in relation to human health. In its pages there is amply demonstrated the contributions made by recent work in this most vital of all topics, but in such a fashion as not to embarrass the lay reader with the exact details of the biochemistry and physiology of nutrition. Comparison between the 1st and 2nd editions indicates the very considerable amount of new knowledge that has resulted from the investigation of the years between.

As in all preventive medicine, stress is rightly laid on the positive aspect of health—not merely freedom from disease but buoyant health. While the original character of the work is preserved, four additional chapters have been added: three of these arise from partitioning the former chapter on the place of different foods in the dietary, and the fourth concerns "How Foods affect Health and Efficiency through Nutrition."

The expert as well as the lay reader will find concise summaries of various aspects of nutrition written in a lucid and attractively plain style. Those which relate to the beneficial effects that may be expected to accrue from optimal nutrition should be read by those who administer food policy.

The closing chapter is followed by the full text of the United States National Research Council's *Recommended dietary allowances* and this by a table which gives the nutritive values of a liberal number of typical foods so that the reader can translate these recommended allowances into actual meals. British experience does not substantiate all these recommendations and a measure of healthy scepticism about their adoption should be in our minds when reading these closing chapters.

There is a well-selected bibliography for those who wish to read more deeply on this most entrancing and topical subject.

D. P. Cuthbertson

### Les Algies des Amputés

A. Sliaberg. Paris: Masson & Cie, 1948. 110 pages; 17 figures; 1 plate. 25 x 16 cm. 300 fr.

This study is based on the author's own observations of 217 patients, on a thesis by another worker, and on dossiers supplied by the Fédération des Amputés de Guerre de France. 196 of the author's cases were casualties of the two World Wars, the remainder being attributable to earlier campaigns, accidents and to infectious processes.

The author states that his aim is to give as complete a clinical picture as possible of pain following amputation, and to abstain from any discussion of pathogenesis except where it contributes to the understanding of the clinical and therapeutic

aspects. He first describes the phantom limb, its incidence, postoperative date of appearance, apparent position, size, sensations of heat and cold, and involuntary movements, and the evolution of all these variable phenomena. The localization and general characteristics of pain in the phantom limb and stump are described at length, with short chapters on tonic and clonic contractions of the stump, radiating and referred pain, and precipitating and aggravating factors. Reflex disturbances of the circulatory, digestive and nervous systems are also discussed, and a chapter is devoted to the clinical examination of the stump. The results are recorded of treatment by medication, physiotherapy, and surgery. Prophylactic techniques in the actual amputation are also briefly mentioned.

The monograph is illustrated with drawings, charts, and tables; there is also one plate, which, however, adds little to the rest, as the theme of the work is hardly "photogenic". There is a bibliography of 126 references.

B. M. S.

### A Short History of Ophthalmology

Arnold Sorsby. Second edition. London: Staples Press Ltd., 1948. 103 pages; 7 illustrations. 19 x 12 cm. 8s. 6d. [£0.425]

The 2nd edition of Professor Sorsby's well-known and well-written short history of ophthalmology is substantially unchanged, although the opportunity has been taken to correct a few minor errors and make good some omissions. Although an exhaustive history of ophthalmology cannot be expected in a hundred pages, the author has managed, by careful and lucid writing, to include a great deal of information, and his book remains the most valuable short account of the subject available.

### Physics and the Surgeon

H. S. Souttor. Oxford: Blackwell Scientific Publications, 1948. vii + 60 pages; 41 figures. 22 x 14 cm. 7s. 6d. [£0.375]

The purpose of this small volume is to help the surgeon to understand the human body as a physical mechanism and also to give some insight into the more recent advances in physical science which underlie radiology and radiobiology. In the first part examples of muscle action are used to illustrate the principles of classical physics, and short sections deal with the resistance of the skull to external force, the absorption of heat, the effects of pressure on the circulation and in the tissues, and the principles of electrotherapy. The second section gives a simplified outline of the atomic theory, radiation phenomena, and isotopes and their properties. It is clearly and interestingly written, but the scope of the book, together with its small size, precludes other than a simplified and superficial treatment of the subject-matter.

### Clinical Chemistry in Practical Medicine

C. P. Stewart & D. M. Dunlop. Third edition. Edinburgh: E. & S. Livingstone Ltd., 1949. vii + 324 pages; 30 figures. 22 x 14 cm. 17s. 6d. [£0.875]

To cover a wide field in a short, clear book demands some degree of selection and dogmatism. That is to say no more than that this book must have the defects of its merits; but the merits themselves are now well established.

The book is conveniently and compactly arranged and has a good index. A short introduction stresses the need for a close relationship between the biochemist and the clinician, and appraises the value of biochemical methods in diagnosis, prognosis and control of treatment. Chapters are devoted to the basal metabolic rate; the mechanism of neutrality regulation; tests of renal, gastric, pancreatic and hepatic function; the proteins of blood plasma; the cerebrospinal fluid; calcium and phosphorus; and salt and water metabolism. In a final chapter brief sections are given to the erythrocyte sedimentation rate; phosphatase activity; uric acid; 17-ketosteroids; pregnadiol; nutritional deficiency; and the biological control of the use of powerful therapeutic agents.

In an appendix of 40 pages laboratory methods are described. A second appendix tabulates the normal chemical composition of human urine and its variation in disease; a third appendix deals similarly with the chemical composition of human blood.

### Treatment of Some Chronic and 'Incurable' Diseases

A. T. Todd. Second edition. Bristol: John Wright & Sons Ltd., 1947. xi + 324 pages. 22 x 14 cm. £1 5s. [£1.25]

The 2nd edition of this work by the Honorary Physician of the Bristol Royal Infirmary appears 10 years after the 1st, and has been completely revised and largely re-written to add data obtained in the intervening years of medical practice. Much new material is included, especially relating to experience gained in the treatment of chronic mental illness. The author demonstrates the weakness of a system of therapeutics of chronic or incurable diseases based upon anatomical designations and outlook, and upon an attempt to unify the etiology of a disease. Chronic and incurable diseases must be considered as complex processes; they cannot be treated by simple and rapid methods. A description of procedures is given, some slow and difficult, but all proved effective by the author.

### Haven Products. A Scottish Experiment in the Employment of Severely Disabled Men

A. E. Turner, T. A. Stirrat & T. Ferguson. London: Nuffield Provincial Hospitals Trust [no date]. 27 pages; illustrations. 31 x 24 cm.

This brochure is the story of the organization of a specially equipped factory for the employment of severely disabled men in Glasgow, described by the authors, one of whom is Professor Ferguson of the Public Health Department in the University of Glasgow, as an important experiment in social medicine. At the workshop, which is the outcome of the idea and work of industrialists and medical social workers, 45 disabled men are employed in a non-profit making concern. The methods by which this is done are described in detail, and the success of the venture is analyzed and judged accordingly to the regularity of attendance, output, financial stability of the enterprise and the effect on the men themselves. The authors maintain that this experience of two years has shown that many disabled men can work under certain special conditions, and their productive output compares favourably with that of normal workers.

### Intelligence Tests for Children

C. W. Valentine. Third edition. London: Methuen & Co. Ltd., 1948. xiii + 60 pages; illustrations. 19 x 13 cm. 5s. [£0.25]

It has been the intention of the author of this little book to provide, for use with children from 2 to 15 years of age, a series of intelligence tests which require little or no apparatus. Owing to the comprehensive instructions given, they will be of particular value to those who have had no previous experience in testing. It has, however, been pointed out in the preface to the 1st edition that an expert tester is necessary when individual cases demand greater exactitude of I.Q. assessment. Regular testing during each stage of a child's school life has also been advocated.

The tests have been designed primarily to give some indication of general intelligence, but, as the author says, they also have a bias towards the detection of special abilities. Therefore a child's apparent failure in one particular age-group test does not necessarily indicate general dullness, but may be only a sign of backwardness in some aspect of his mental make-up, such as slowness in learning to speak. The tests follow a very similar formula, especially those designed for children between 6 and 15 years of age, becoming progressively more difficult through the age-groups. Mazes, analogies and opposites are common features of most tests, and examples for the assessment of reasoning powers occur more frequently in the testing of older children.

A small bibliography has been prepared for further study in mental testing.

### Modern Treatment Year Book 1948: A Year Book of Diagnosis and Treatment for the General Practitioner

Edited by Cecil Wakeley. London: The Medical Press, 1948. xxv + 344 pages; 26 figures. 22 x 14 cm. 15s. [£0.75]

Readers who have searched the textbooks for the most up-to-date therapy and turned disappointed away will welcome the present volume. It is designed to bridge the otherwise unavoidable gap between the latest treatment and the latest textbook without scouring the periodical literature. Such diverse subjects as asthma, Ménière's disease, bronchiectasis, peptic ulcer, glaucoma, and breech presentation are surveyed in 38 articles. These are not arranged according to any rigid plan, but are written primarily to meet the needs of the busy general practitioner, needs which the editor has presumably assessed from the letters of those "innumerable doctors who have written . . . constructive criticisms of what is required by the average medical man" (Preface). The arrangement of the articles encourages the casual reader, while the index ensures that this does not detract from the value of the book as a work of reference. From the latter point of view it is a pity that only some of the articles have lists of references appended; these stimulate further reading.

The type of reader addressed is apparent in the scope of the contributions. Dr. Terence East on hypertension, for example, devotes most of his space to mental adjustment, life and habits, special symptoms, and drugs, discussing surgical treatment only in order to give the doctor a guide to the selection of patients who might benefit.

In conclusion, the price is very low, and the production admirable.

## Bronchography

made at King Edward VII Sanatorium, Midhurst, Sussex, 1949; owned by the British Council; technical adviser, Dr. Foster-Carter; produced by Gaumont British Instructional Ltd.; available in 16 and 35 mm. sound, 1,338 feet [408 m.] and 3,346 feet [1,020 m.] respectively; black and white; 37 minutes

Bronchography is usually done by the house physician rather than by the consultant. It is a procedure for which a good technique is far better than good luck if useful radiographs are to be obtained regularly. The subject is an excellent choice for a film.

The film starts with a demonstration of the bronchial tree and of the advantages of having lateral and oblique views in addition to antero-posterior or postero-anterior views. Various methods of introducing the radio-opaque oil into the bronchial tree are then considered. Injection through the crico-thyroid membrane or trachea is taken as the standard method; the technique of injection is demonstrated, and the positioning required for filling the bronchial tree of each lung and the specific bronchi. Advice on exposure needed for taking the x-ray plates is given.

Instillation via mouth and nose is demonstrated and finally the method for young children, in whom general anaesthesia and intubation is recommended. Models and animated diagrams are used throughout to elucidate the principles and mechanisms employed, and the film ends with a recapitulation of the recommendations. The film is well photographed, and the recording of Alvar Liddell's reading of the commentary was, on the 35 mm. copy heard, excellent.

There is a great deal of detailed technique to be learnt by a beginner in this art and much of it is easily and best conveyed by film, but for other aspects the film will need to be reinforced by a leaflet if an adequate recollection is to be retained by the viewer who intends to go away and do bronchography without a tutor. The model used of the bronchial tree might well have been replaced, for all but the introductory shots, by a much simpler one showing only the main branches. The choice of the pertracheal technique as the standard method will not meet with universal approval even in this country. That it is occasionally followed by accident was noted. In view of the many possible accidents, which rarely may even be fatal, after injection through the tracheal wall or crico-thyroid membrane, it is probably best to avoid that technique wherever possible, especially as—with a good technique of positioning—satisfactory results are obtained after instilling the oil through the nose or mouth.

The method of doing the pertracheal injection is very well conveyed by the film. The great advantages of a three-ring syringe over the ordinary syringe might have been emphasized to those about to take up this work. The technique of positioning used after giving the oil and before taking the radiographs decides whether good bronchograms will be obtained regularly, and the film deals with this thoroughly. An exact memory of the steps which have to be followed might have been more easily retained if the demonstration on the patient had been reinforced with one on a manikin or a model, or if cine-radiography on an animal or a model had been used. A table of the successive positions and times for which they are held might have been recited, or shown being built up in a succession of sub-titles as each stage was performed. The practitioner seeing the film would then more easily carry away a clear idea.

This film deals with an eminently cinematic subject which is eminently worth doing in a thorough fashion. As an entertainment for medical audiences it is less successful than the film "The Technique of Artificial Pneumothorax" (British Council, 1946), but the necessary information on the subject is included. Those who will be learning from the film alone, and it is presumably for them that it is primarily made, will be glad to see it through several times.

## Polio—Diagnosis and Management

made at Wingfield Morris Orthopaedic Hospital, Oxford, Isolation Hospital, Abingdon, and West London County Council Hospital, 1948; owned by Central Office of Information; technical advisers, Professor H. J. Seddon, Dr. W. H. Kelleher, Dr. W. H. Bradley, Dr. T. S. R. Fisher & Dr. J. H. Fisher; directed by Geoffrey Innes; unit, Crown Film Unit; distributed by Central Film Library; available in 35 and 16 mm. sound, 5,508 feet [1,679 m.] and 2,278 feet [694 m.] respectively; monochrome; 60 minutes

In 1947 there was an epidemic of acute anterior poliomyelitis in England and at its height a 20-minute film, "Poliomyelitis 1947", dealing with early diagnosis, was issued and seen in three weeks by 17,000 general practitioners and as many nurses. The welcome it received suggested to the Ministry of Health that a more detailed film would be welcomed by the profession. A more reasonable decision, however, would have been to make a number of 20-minute films dealing with other topical and ever-present medical problems, for as a result of the interest aroused by the epidemic, and from numerous articles and the short film, most general practitioners in England had by then acquired a satisfactory working knowledge of poliomyelitis.

"Polio—Diagnosis and Management" starts with a review of the statistical aspects and then discusses the epidemiology of a family outbreak which included mild, non-paralytic as well as paralytic cases. The case of a young man is followed from the doctor's surgery to his home and on to hospital. The importance of early diagnosis is stressed and differential diagnosis discussed. An excellent point made is the reassurance of the patient's household and the instructions to them in taking simple precautions against the spread of the disease, though rather surprisingly the doctors take a cup of tea in the infected house from unboiled cups.

A rather lengthy sequence follows showing various muscle palsies in early cases in hospital. The young man's progress through various stages of treatment and rehabilitation is shown, in hospital, on his return home, while under the care of his own doctor and of the Ministry of Labour Disablement Resettlement Officer, and finally in an after-care clinic. This demonstrates the value that its control of time gives to the film as a teaching medium.

This film is designed for the medical profession and in particular for general practitioners. As an instructional film its great value is that it gives a view of the whole problem, so that the general practitioner may better understand the management of, and more actively help in, the patient's restoration to full health. As a formal instructional film it is lacking in a clear pattern that the viewer can carry away to help him recall the details of examination. It would, also, be better if it were shorter, in order to leave time for discussion and questions. But considered as a documentary film on the diagnosis and management of the disease in Britain today it deserves a warm welcome.

## The Multiple Pressure Technique of Vaccination

made and produced by Dr. Brian Stanford, 1949; owned by A. de St. Dalmas & Co. Ltd. of Leicester; technical adviser, Dr. W. H. Bradley; available in 16 mm. silent, 350 feet [107 m.]; colour; 10 minutes at 24 frames per second

This short coloured film demonstrates with great clarity the technique of vaccination by the multiple pressure method. This technique has been widely used in North America and certain advantages for it are claimed as compared with scratch technique: it is painless, equally rapid, and gives a higher percentage of satisfactory results. The film shows the technique as used in a four-months-old infant vaccinated at home and as practised on an adult re-vaccinated at the clinic. It should be used as a teaching aid; there is no sound track and it should be shown in conjunction with a brief lecture by an expert to elucidate the various points, or, alternatively, with a script to be read by the

audience. Certain points, such as the details of the skin preparation and the choice of agents for this are deliberately not detailed in the film itself, and the advantages of the multiple pressure technique are similarly omitted. It is hoped to add a sound track to the film, which will materially enhance its value. The film has been included in the Ministry of Health Film Library.

## Your Children's Meals

made in London in private houses, 1946; owned by Central Office of Information; technical advisers, Dr. G. Macdonald, Dr. H. A. Magee and Dr. Rachael Elliott; directed by Alex. Strasser; unit, Realist Film Unit; distributed by Central Film Library; available in 35 mm. and 16 mm. sound, 1,212 feet [369 m.] and 501 feet [153 m.] respectively; monochrome; 15 minutes

## Your Children's Sleep

made in London in private houses, 1947; owned by Central Office of Information; technical adviser, Dr. D. W. Winnicott; directed by Brian Smith; unit, Realist Film Unit; distributed by Central Film Library; available in 35 mm. and 16 mm. sound, 2,093 feet [638 m.] and 840 feet [256 m.] respectively; monochrome; 15 minutes

"Your Children's Meals" and "Your Children's Sleep" are two more films in the series made for the Ministry of Health. The earlier trio, "Your Children's Eyes," "Your Children's Ears" and "Your Children's Teeth,"<sup>1</sup> gave straightforward accounts of the how-they-work and how-to-keep-them-working-well type.

"Your Children and You"<sup>2</sup> led the way into the psychological field and the two films reviewed are further excursions there. It is clearly a wise plan to teach child-rearing because, while there has been a fall in child mortality and morbidity of recent years, it remains true that children are often less happy than they could be, and the rise in delinquency is disquieting. Contributions to the proper care of children, even though not of great immediate effect, are to be welcomed.

"Your Children's Meals" shows how appetite may be affected by the mental state of the child—when he is excited, tired or upset. The situation may be met by smaller helpings of food, by having company to meals, and so on. The value of a cheerful atmosphere, of food that looks attractive, and of punctuality and regularity, is shown by clever photography and effects.

This film has many good qualities and will be useful for showing to parents and others who are concerned in child care, provided that someone is there to introduce and to discuss the film after it has been shown. The film leaves a rather muddled impression as it refers to the need for firmness in insisting that children eat what is provided, even when this consists of green vegetables cooked until they lose all taste and food value. The error of forgetting to insist that children's food should be tasty is the more surprising when the director has wisely drawn attention to the need for meals to look attractive. The film has so many good points presented in so fascinating a way that it is a pity that better advice was not obtained at the stage of script writing. An experiment conducted in Chicago in 1935 showed that even very young children spontaneously select a balanced diet, and the general tendency of management of children at their meals has changed of recent years; while we still appreciate that the child lives in a community, we agree that his preferences need not be ignored.

"Your Children's Sleep" starts by reminding us that when a grown-up or child does not sleep it is for some cause. For example, a woman may be worried because she has lost her purse. Excitement and worry or tension from a feeling of failing to reach

a parent's ideals may all keep the child awake. There are excellent sequences to illustrate these points: some of them will be very easily remembered by anyone who has seen the film—the boy whose fantasies of success run on or the girl whose mother sets an adult standard of behaviour impossible for the child to attain, wakes screaming or relapses to bed-wetting. In addition there are sequences of symbolic shapes, representing the conquest of fears. These shapes mean a great deal to the man who evolved them but they do not, unfortunately, convey very much on a first showing. The fact that children's anxieties are as real as adults' is extremely well brought out. They are more intensely felt because children cannot consciously remind themselves that morning will come and the fears will go. The film ends by showing what can be done to help to ensure easy sleeping.

The whole film is polished, lucid, tranquil and persuasive. Its content is excellent and all who combined to make it are to be highly congratulated. One would guess that a very wise and experienced children's doctor or psychologist has helped in its making. The technical advisers' names should appear on the credit title of all films. Only so can they receive the blame or credit which is their due, and only so can the good advisers be asked to help with further films.

1412

## Know Your Baby

made at Ottawa, Canada, 1947; owned by National Film Board of Canada; unit, Crawley Films Ltd.; available in 16 mm. sound, 394 feet [120 m.]; colour; 10 minutes

This film illustrates how best to deal with the arrival of a baby into the family circle, and lays special emphasis on the necessity for satisfying the emotional needs, both of the baby and of the older children.

We are shown a mother expecting a third child and, in order that the other children may have a proprietorial interest in it and consequently be less jealous, she involves them in preparations for the baby, including the painting of its cot. When the baby arrives he is shared by all, and the older children are given extra attention to reassure them of their parents' continuing love. The older children may regress to behaviour they had grown out of, wanting to be fed, or wetting the bed, but these are temporary troubles, to be solved by convincing the children that their parents still value and want them.

Details of bathing and of feeding technique are shown. Breast-feeding is an emotional feast as well as an occasion for taking food: when bottle-feeding is necessary the same close contact at feed-times is desirable. Advice is given as to the right clothes to wear in hot weather and also on how to keep children satisfactorily occupied.

The atmosphere in this film is very good. The attention paid to emotional needs is due to the help and advice received from psychiatrists interested in the aims of the film; the wisdom of the producer or sponsor in deciding to draw on this source of help is evident. The treatment of the subject is light, straightforward and unassuming, but very persuasive.

Child care, however, is a very large subject and the treatment here is not comprehensive. Though good as far as it goes, the film tries to deal with rather too much and so is overcrowded with information. It should therefore be seen several times. It is a mistake, too, to dismiss breast-feeding with such perfunctory praise. It is a pedagogic error to show the mother, with whom the audience tends to identify itself, feeding the child in an unacceptable fashion; she should be shown breast-feeding and another mother bottle-feeding.

The colour is good and useful, but the music is unnecessary and the reviewer found it unpleasant. The film is a very useful one for the general public, especially for young parents and those about to enter that category. It should be seen by all doctors, nurses and health visitors working in infant welfare centres and by all medical students and nurses during their training.

- The surgical treatment of carcinoma of the pancreatoduodenal area. (R. B. Cattell) 197-205  
 Facial pain. (C. Symonds) 206-212  
 Pott's disease and Pott's paraplegia. (G. R. Girdlestone) 214-231  
 The pathology of blunt head injury. (K. Simpson) 232-241  
 High voltage X-rays in the treatment of malignant tumours at a depth. (D. W. Smithers) 242-256

## Annals of Tropical Medicine and Parasitology

## 42 : April 1948

- The action *in vitro* of some aromatic diamidines on a Sudan strain of *Leishmania infantum*. (S. Adler, I. Tchernomoretz & M. Ber) 1-4  
 The growth of *Anopheles gambiae* Theobald (Diptera, Culicidae), with special reference to the growth of the analpapillae in varying salinities. (D. S. Kettle) 5-29  
 A note on the effect of high temperature on the pupal stage of *Glossina* in relation to the transmission-rate of trypanosomes. (T. A. M. Nash) 30-32  
 The pathology of an experimental amoebic infection in the rat. (G. T. Stewart & W. R. Jones) 33-45  
 Observations on the use of cercarial antigen in the diagnosis of schistosomiasis. (D. M. Blair & W. F. Ross) 46-51  
 Leishman's stain adapted for use with histological sections. (R. H. Black) 52-53  
 A simple technique for the microscopy of living tissues *in situ*, with some observations on the splenic circulation. (D. Gall) 54-66  
 Some species of *Culicoides* (Diptera, Ceratopogonidae) from the State of Chiapas, Mexico. (J. W. S. Macfie) 67-87  
 The cultivation of exoerythrocytic forms of *Plasmodium gallinaceum*. I. A preliminary note. (G. Gramiccia & R. H. Black) 88-89  
 The resorption of haemoglobin by the renal tubules in haemoglobinuria. (R. H. Black) 90-94  
 The pathogenesis of the liver lesion due to the administration of carbon tetrachloride. (W. H. H. Andrews & B. G. Macraith) 95-100  
 Infection of reticulocytes by *Plasmodium falciparum* and *Plasmodium malariae* in hyperendemic indigenous malaria. (L. J. Chwatt) 101-112  
 Discussion of methods for differentiating tick-borne louse-borne relapsing fever spirochaetes. (N. F. Coghill & R. M. Gambles) 113-117

## 42 : September 1948

- The English pond snail. (F. L. Vanderplank) 130-152  
 Malaria and blackwater fever in Macedonia and Thrace in relation to DDT. (H. Foy, A. Kondi, C. Damkas, M. Depanian, T. Lefepoulou, L. G. Bach, R. Dax, J. Pichford, P. Shiele & M. Langton) 153-172  
 Fruit-eating bats and paralytic rabies in Trinidad. (J. L. Pawan) 173-177  
 Observations on a strain of *Leishmania tropica* after prolonged cultivation: notes on infectivity and immunity. (S. Adler & A. Zuckerman) 178-183  
 A new *Aedes* from the Cameroons, *A. (Aedimorphus) bonellii* s. sp. *kumbae* s. sp. nov. (L. J. Chwatt) 184-189  
 Studies on synthetic antimalarial drugs. XX. The blood concentrations and physiological distribution of some homologues of paludrine in relation to their antimalarial activities. (A. Spinks) 190-197  
 The rôle of bacteria in intestinal amoebiasis in man. (G. T. Stewart) 198-206  
 Sylvatic plague in South Africa: history of plague in man, 1919-43. (D. H. S. Davis) 207-217  
 Implication of the mosquito *Aedes (Stegomyia) africanus* Theobald in the forest cycle of yellow fever in Uganda. (A. J. Haddow, K. C. Smithburn, G. W. A. Dick, S. F. Kitchen & W. H. R. Lumsden) 218-223  
 Activation of latent kala-azar and malaria by battle experience. (N. L. Corkill) 224-229  
 Activation of latent kala-azar by malaria and relapsing fever. (N. L. Corkill) 230-235  
 Haemoglobin stains adapted for use with thin blood films. (R. H. Black) 236-237  
 A nomogram for the preparation of standard inocula to the Davey chick test of antimalarial activity. (J. Williamson) 238-240  
 Acquired paludrine-resistance in *Plasmodium gallinaceum*. II. Failure to produce such resistance by prolonged treatment of latent infections. (I. M. Rollo, J. Williamson & E. M. Lourie) 241-248  
 Observations on the occurrence of larvae of *Oestrus ovis* in the nasal cavities and frontal sinuses of goats in Nigeria. (K. Unsworth) 249-250

## 42 : December 1948

- Anopheline larvae collected in Arabia. (H. S. Leeson) 253-255  
 Experimental studies on the therapy of schistosomiasis. (W. Kikuth & R. Gönner) 256-267  
 The action of miracidia in *Schistosoma japonicum* infections in laboratory animals. (H. Vogel & W. Minning) 268-270  
 Catches of biting Diptera in Uganda, with anaesthetized monkeys as bait. (A. J. Haddow & G. W. A. Dick) 271-277  
*Phlebotomus perniciosus* as a famine food in L. Corkill) 278-287  
 Gambles & N. F. Coghill) 288-303  
 drugs in Egypt. (A. Halawani, I. Baz & F. Moreos) 304-311  
 Records of filaria infections in mosquitoes in Ceylon. (H. F. Carter) 312-321  
 Taxonomy of the Ethiopian sandflies (*Phlebotomus*). III. New species and records: alterations and additions to the keys. (R. Kirk & D. J. Lewis) 322-333  
 The mechanisms by which mosquitoes and tsetse-flies obtain their blood-meal, the histology of the lesions produced, and the subsequent reactions of the mammalian host; together with some observations on the feeding of *Chrysops* and *Cimex*. (R. M. Gordon & W. Crewe) 334-356  
 Melarsen oxide in the treatment of human trypanosomiasis. (E. A. H. Friedheim) 357-363  
 The results of a preliminary entomological survey of loiasis at Kumba, British Cameroons, together with a description of the breeding-places of the vector and suggestions for future research and possible methods of control. (R. M. Gordon, L. J. Chwatt & C. M. Jones) 364-376  
 Observations on *Litomosoides carinii* (Travassos, 1919) Chandler, 1931. I. The development of the first-stage larva. (W. E. Kershaw & R. L. Plackett) 377-399

## Archives of Disease in Childhood

## 23 : June 1948

- Studies in prematurity. Part 4. Development and progress of the prematurely born child in the pre-school period. (C. M. Driffield) 69-83  
 On the cause of nuclear jaundice in neonatal sepsis with jaundice. (J. I. De Bruyne & S. van Crevelde) 84-86  
 Cause and significance of seasonal variation in the haemorrhagic tendency in the newborn. (E. Kerpel-Fronius, F. Varga & E. K. Pál) 87-89  
 An epidemic of glandular fever. (F. R. Buckler) 90-92  
 The place of oral penicillin in paediatrics. (J. H. Moseley) 93-97  
 Amino acids in the feeding of infants. (J. M. Smellie) 98-101  
 Septicaemia of the newborn. A clinical study of fifteen cases. (R. M. Todd) 102-106  
 A study of neonatal infections in the nurseries of a maternity hospital. (M. J. L. Frazer) 107-113  
 The occurrence of oedema in infantile gastro-enteritis. (J. Berkeley) 114-118  
 Giardiasis lamblia. The incidence and results of infestation of children in residential nurseries. (E. H. Brown) 119-128  
 Erb's palsy. (B. Wolman) 129-131  
 Two cases of congenital disease of the heart with sub-diaphragmatic situs inversus. (R. H. Hardy) 132-136  
 Radial nerve paralysis in the newborn. (L. Morgan) 137-139

## 23 : September 1948

- Milk: a European child health problem. (H. F. Helmholz) 149-155  
 Complete heart block in children. Report of three cases possibly attributable to measles. (N. S. Clark) 156-162  
 Splenic panhaematopenia. (S. van Crevelde) 163-170  
 The nutritional state of children with chronic rheumatic heart disease. (J. Benn) 171-175  
 Observations on the metabolism of potassium from a study of the renal clearance. (H. E. C. Wilson) 176-182  
 Erythema exudativum multiforme in childhood. (A. V. Neale) 183-189  
 Congenital skin defect of the newborn. (O. D. Beresford & P. D. Samman) 190-194

A case of lymphosarcoma of the intestine in a child. (K. J. Guthrie) 195-200  
Isolated (Fiedler's) myocarditis. (H. E. Jones & A. G. Marshall) 201-204  
H. influenzae meningitis. (I. A. B. Cathie & S. D. V. Weller) 205-209  
Congenital atresia of posterior choanae. (D. W. Ashcroft & A. P. Norman) 210-211

## 23 : December 1948

Antecedents of infantile cerebral palsy. (P. R. Evans) 213-219  
Folic acid in coeliac disease. A study of its administration in twenty-two cases. (J. D. Hay) 220-224  
The nitrogen partition in newborn infants' urine. (A. Barlow & R. A. McCance) 225-230  
Perinatal deaths in Czechoslovakia. (H. Šikl) 231-236  
On the relationship between maternal conditions during pregnancy and congenital malformations. (B. Landtman) 237-246  
The radiology of intestinal obstruction in children and infants. (J. H. Middlemiss) 247-253  
Pneumonia in the newborn resulting from the inhalation of gastric contents. (K. Rhaney & A. R. Macgregor) 254-258  
Juvenile thyrotoxicosis treated with thiouracil. (J. W. Farquhar) 259-265  
Acute neurotic breakdown in children with refusal to go to school. (W. Warren) 265-272  
Erythema nodosum in children following administration of sulphathiazole. (S. A. Doxiadis & D. McLean) 273-280  
The historical background of convulsions in childhood. (R. A. Shanks) 281-289  
Sclerema adiposum: a case with unusual features in an infant. (D. N. Nicholson & A. E. Claireaux) 290-293  
Chronic hypoplastic anaemia arising in infancy. (T. Robson & P. J. Sweeney) 294-296  
Infective granuloma of the genitals in children. (G. H. V. Clarke) 297-299

## 24 : March 1949

Malignant disease in infancy and childhood. (W. F. Gaisford) 1-6  
Bromsulphalein excretion in the newborn. (P. L. Mollison & M. Cutbush) 7-11  
Liver function in newborn infants: with special reference to excretion of bromsulphalein. (S. Yudkin, S. S. Gellis & F. Lappen) 12-14  
Liver damage in gastro-enteritis. (B. Schlesinger, W. W. Payne & E. D. Burnard) 15-24  
Spina bifida cystica. (A. P. Norman) 25-28  
Pulmonary collapse in pertussis. (D. P. Nicholson) 29-40  
Arobin in the treatment of infantile gastro-enteritis: a clinical trial. (D. Beynon) 41-44  
Epidemic gastro-enteritis of infants in Aberdeen during 1947. (C. Giles, G. Sangster & J. Smith) 45-53  
Roseola infantum: an outbreak in a maternity hospital. (U. James & A. Freier) 54-58

## Biochemical Journal

42 : 1948

Obituary notice: Frederick Gowland Hopkins, 1861-1947. (M. Stephenson) 161-169  
The selective inhibition of cholinesterases. (D. H. Adams & R. H. S. Thompson) 170-175  
The formation of nicotinamide from nicotinic acid by the rat. (P. Ellinger) 175-181  
Electrophoretic studies on human serum. (H. Hoch) 181-190  
The use of phenol glucuronide in the assay of  $\beta$ -glucuronidase. (L. M. H. Kerr, A. F. Graham & G. A. Levvy) 191-194  
Studies in vitamin A. 4. Spectrophotometric determination of vitamin A in liver oils. Correction for irrelevant absorption. (R. A. Morton & A. L. Stubbs) 195-203  
A high-speed tissue homogenizer. (S. J. Folley & S. C. Watson) 204-206  
Component acids of the lipids of human tubercle bacilli. Part I. (N. Polgar) 206-211  
The determination of glutathione and other substances contained in yeast. (T. Astrup & V. Øhlenschläger) 211-214  
Preliminary experiments in the study of the respiratory activity of micro-organisms suspended in thin films of fluid adhering to solid surfaces. (G. Ellinger & J. H. Quastel) 214-218  
Further tests on human enamel protein. (P. Pincus) 219-221  
Properties of glucose oxidase (notatin). (D. Keilin & E. F. Hartree) 221-229  
The use of glucose oxidase (notatin) for the determination of glucose in biological material and for the study of glucose-producing systems by manometric methods. (D. Keilin & E. F. Hartree) 230-238  
Filter-paper partition chromatography of sugars. 1. General description and application to the qualitative analysis of sugars in apple juice, egg white and foetal blood of sheep. (S. M. Partridge & R. G. Westall) 238-250  
Filter-paper partition chromatography of sugars. 2. An examination of the blood group A specific substance from hog gastric mucus and the specific polysaccharide of *Bacterium dysenteriae* (Shiga). (S. M. Partridge) 251-253  
Urinary elimination of synthetic oestrogens and stilboestrol glucuronide in animals. (A. E. W. Smith & P. C. Williams) 253-257  
The isolation and properties of the monoglucuronides of stilboestrol, hexoestrol and dienoestrol. (S. A. Simpson & A. E. W. Smith) 258-260  
The preparation and some properties of hyaluronic acid from human umbilical cord. (Z. Hadidian & N. W. Pirie) 260-265  
The effects of serum and of hyaluronic acid derivatives on the action of hyaluronidase. (Z. Hadidian & N. W. Pirie) 266-274  
The fate of certain organic acids and amides in the rabbit. 3. Hydrolysis of amides by enzymes *in vitro*. (H. G. Bray, S. P. James, B. E. Ryman & W. V. Thorpe) 274-281  
Leaf protease of tobacco and other plants. (M. V. Tracey) 281-287  
The free amino groups of haemoglobins. (R. R. Porter & F. Sanger) 287-294  
Metabolism of acetoacetate in animal tissues. 2. (H. A. Krebs & L. V. Eggleston) 294-305  
The isolation of hydroxyllysine picrate from a gelatin hydrolysate. (J. G. Heathcote) 305-308  
The reaction of nucleic acids with mustard gas. (D. T. Elmore, J. M. Gulland, D. O. Jordan & H. F. W. Taylor) 308-316  
The component acids of herring visceral fat. (T. P. Hilditch & S. P. Pathak) 316-320

42 : 1948

Studies in the biochemistry of micro-organisms. 76. Mycelianamide,  $C_{11}H_{19}O_2N_2$ , a metabolic product of *Penicillium griseo-fulvum* Dierckx. Part I. Preparation, properties, and breakdown products. (A. E. Oxford & H. Rastick) 323-329  
Biochemistry of the wood-rotting fungi. 5. The production of D-threitol (L-erythritol) by *Armillaria mellea* (Vahl) Quellet. (J. H. Birkinshaw, C. E. Stickings & P. Tessier) 329-332  
An alkali-producing mechanism in macerated leaves. (M. Holden) 332-336  
Effects of organic arsenicals on enzyme systems. (J. J. Gordon & J. H. Quastel) 337-350  
The metabolism of sulphonamides. 5. A study of the oxidation and acetylation of sulphonamide drugs and related compounds in the rabbit. (J. N. Smith & R. T. Williams) 351-356  
Studies in detoxication. 15. On the glucuronides of stilboestrol, hexoestrol and dienoestrol. (K. S. Dodgson, G. A. Garton, A. L. Stinbs & R. T. Williams) 357-365  
The estimation of a fraction resembling pregnadiol glucuronide in human urine. (N. G. Bisset, B. W. L. Brookshank & G. A. D. Haslewood) 366-371  
Relations between potassium and sodium levels in mammalian muscle and blood plasma. (E. J. Conway & D. Hingsen) 372-376  
The microbiological degradation of steroids. 4. Fission of the steroid molecule. (G. E. Turfitt) 376-383  
The mechanism of the effect of X-rays on bacterial toxins. (E. Ephraïm) 383-389  
The purification of antitoxic plasmas by enzyme treatment and heat denaturation. (J. H. Harms) 390-397  
Fructose and glucose in the blood of the foetal sheep. (J. S. D. Bacon & D. J. Bell) 397-405  
Physicochemical observations on some glycogens. (D. J. Bell, H. Gutfreund, R. Cecil & A. G. Ogston) 405-408  
Partial amino-acid compositions of some plant-leaf protein preparations: the arginine, histidine and lysine contents. (J. W. H. Lugg & R. A. Weller) 408-412  
Protein in senescent leaves of *Trifolium subterraneum*: partial amino-acid composition. (J. W. H. Lugg & R. A. Weller) 412-414  
Nicotinic acids in cereals. 1. The effect of germination. (C. Klatzkin, F. W. Norris & F. Wokes) 414-420  
A polarographic study of some stilbene derivatives of biological interest. (F. Goulden & F. L. Warren) 420-424  
An electrophoretic study of dipthiric acid preparations. (P. A. Charlwood) 425-428  
New Zealand fish oils. 4. Observations on the oil content of fresh water eels. (F. B. Shorland & J. Russell) 429-433  
The fate of certain organic acids and amides in the rabbit. 4. The aminobenzoic acids and their amides. (H. G. Bray, H. J. Lake, F. C. Neale, W. V. Thorpe & P. B. Wood) 434-443  
Separation of acidic amino-acids by means of a synthetic anion exchange resin. (R. Consden, A. H. Gordon & A. J. P. Martin) 443-447  
The polarographic estimation of steroid hormones. 4. Determination of 3(a)- and 3( $\beta$ )-hydroxy-17-ketosteroids. (W. R. Butt, A. A. Henly & C. J. O. R. Morris) 447-452  
Studies in human mineral metabolism. 1. The effect of bread rich in phytate phosphorus on the metabolism of certain mineral salts with special reference to calcium. (A. R. P. Walker, F. W. Fox & J. T. Irving) 452-462  
 $\beta$ -glucuronidase and cell proliferation. (G. A. Levvy, L. M. H. Kerr & J. G. Camphell) 462-468  
The use of radioactive isotopes in immunological investigations. 1. Precipitation reactions with ovovitellin containing  $P^{32}$ . (G. E. Francis & A. Wormald) 469-474  
 $N^1$ -diethylsulphanilamide: a reagent for the colorimetric estimation of thyroxine. (D. Winikoff & V. M. Trikojus) 475-480

42 : 1948

The reactivity of the combined cystine of proteins other than wool. (H. Lindley) 481-485  
Preparation and antibacterial action of some compounds structurally related to glutamic acid. Their application in microbiological determination of small quantities of glutamine. (J. A. Roper & H. McIlwain) 485-492  
Relationships in streptococci between growth and metabolism of glutamine. (H. McIlwain, J. A. Roper & D. E. Hughes) 492-503  
The estimation of the leucine isomers in protein hydrolysates by infrared analysis. (S. E. Darmon, G. B. M. Sutherland & G. R. Tristram) 503-516  
Studies on vitamin A. 5. The preparation of retinene<sub>1</sub>-vitamin A aldehyde. (S. Ball, T. W. Goodwin & R. A. Morton) 516-523  
Proteolytic activity of preparations of crystallized ribonuclease. (A. Kleczkowski) 523-527  
The effects of various organic materials on soil nitrification. (H. Lees) 528-531  
The immobilization of mineral nitrogen in soils by different organic materials. (H. Lees) 531-534  
The effects of zinc and copper on soil nitrification. (H. Lees) 534-538  
Studies in detoxication. 16. The metabolism of acetanilide in the rabbit. (J. N. Smith & R. T. Williams) 538-544  
The molecular weight of insulin and its dependence upon pH, concentration and temperature. (H. Gutfreund) 544-548  
The distribution of acid-soluble phosphates in the fatty liver. (A. H. Ennor & L. A. Stocken) 549-557  
The estimation of creatine. (A. H. Ennor & L. A. Stocken) 557-563  
The fermentation of cellulose *in vitro* by organisms from the rumen of sheep. (H. R. Marston) 564-574  
The estimation of suramin in plasma. (J. C. Gage, F. L. Rose & M. Scott) 574-577  
Sexual differences in the storage and metabolism of iron. (E. M. Widdowson & R. A. McCaice) 577-581  
A synthesis of *dl*-hydroxyacetic acid. (D. G. M. Diaper & J. C. Smith) 581-583  
The absorption of ammonia from the rumen of the sheep. (I. W. McDonald) 584-587  
The biochemistry of bacterial toxins. 2. The enzymic specificity of *Clostridium welchii* lecithinase. (M. G. Macfarlane) 587-590  
The biochemistry of bacterial toxins. 3. The identification and immunological relations of lecithinases present in *Clostridium oedematis* and *Clostridium sordellii* toxins. (M. G. Macfarlane) 590-595  
The effect of alcohols on the hydrolysis of sodium phenolphthalein diphosphate by prostatic extracts. (J. Appleyard) 596-597

- Reversibility of a phosphoroclastic reaction. (J. Wilson, L. O. Krampitz & C. H. Werkman) 598-600
- The infrared examination of compounds related to ascorbic acid. (I. F. Trotter, H. W. Thompson & F. Wokes) 601-602
- The *in vitro* synthesis of glycogen in the diaphragms of normal and alloxan-diabetic rats. (E. Tuerkischer & E. Wertheimer) 603-609
- Hydrochloric acid production by isolated gastric mucosa. (R. E. Davies & F. J. W. Roughton) 609-621
- Production of ulcers in isolated frog gastric mucosa. (R. E. Davies & N. M. Longmuir) 621-627
- The isomeric transformation of urea into ammonium cyanate in aqueous solutions. (P. Dirnhuber & F. Schütz) 628-632
- The complexity of the hyaluronidases produced by micro-organisms. (H. J. Rogers) 633-640

## 43 : 1948

- A note on the estimation of vitamin B<sub>1</sub> in urine. (E. H. Mawson & S. Y. Thompson) 2-5
1. Influence of some bacterial polysaccharides on (M. J. Geoghegan & R. C. Brian) 5-13
2. Influence of various carbohydrates and proteins (M. J. Geoghegan & R. C. Brian) 14
- Antipyretic action and catalase activity. (J. Williamson & E. A. Rudge) 15-16
- Note on the manometric determination of succinic and  $\alpha$ -ketoglutaric acids. (H. A. Krebs & L. V. Eggleston) 17-18
- New Zealand fish oils. 5. Composition of the fats of the school shark (*Galeorhinus australis*, Macleay) (A. P. Oliver & F. B. Shorland) 18-24
- Studies on suramin (antrypol, Bayer 205). 6. Further observations on the determination of suramin in whole blood and serum. (H. M. Dewey & A. Wormald) 24-27
- The fractionation of potato starch. (R. H. Hopkins & B. Jelinek) 28-32
- The action of  $\beta$ -amylase on potato amylose. (R. H. Hopkins, B. Jelinek & L. E. Harrison) 32-38
- The distribution and interrelationships of the alkaloids in the bark of *Cinchona ledgeriana*. (H. F. Birch & L. R. Doughty) 38-44
- The effect of some thiol compounds upon trypsin, chymotrypsin and chymotrypsinogen. With an addendum on examination of chymotrypsin in the ultracentrifuge. (R. A. Peters, R. W. Wakelin & R. Cecil) 45-51
- Quantitative determination of glutamine and glutamic acid. (H. A. Krebs) 51-57
- The recovery of *l*-nicotine from animal tissues and its colorimetric micro-estimation. (A. R. Trim) 57-60
- Decomposition and synthesis of cozymase by bacteria. (H. McIlwain & D. E. Hughes) 60-70
- The amylose content of the starch present in the growing potato tuber. (T. G. Halsall, E. L. Hirst, J. K. N. Jones & F. W. Sansome) 70-72
- The sorption of DDT and its analogues by chitin. (K. A. Lord) 72-78
- Studies on biological methylation. 11. The action of moulds on inorganic and organic compounds of arsenic. (M. L. Bird, F. Challenger, P. T. Charlton & J. O. Smith) 78-83
- The chemical and immunological properties of phosphorylated proteins. (J. C. Boursnell, H. M. Dewey & A. Wormald) 84-90
- Studies in the biochemistry of micro-organisms. 77. A survey of fungal metabolism of inorganic sulphates. (H. Raistrick & J. M. Vincent) 90-99
- Studies on ruminant saliva. 1. The composition and output of sheep's saliva. (E. I. McDougall) 99-109
- Studies in vitamin A. 6. Conversion *in vivo* of vitamin A aldehyde (retinene<sub>1</sub>) to vitamin A<sub>1</sub>. (J. Glover, T. W. Goodwin & R. A. Morton) 109-114
- The composition and reactivity of medullated keratins. (S. Blackburn) 114-117
- Studies on the liver catalase of normal and cancerous rats. (H. Weil-Malherbe & R. Schade) 118-125
- The  $\beta$ -glucuronidase activity of ox spleen and the assay of  $\beta$ -glucuronidase preparations. (G. T. Mills) 125-132
- The colorimetric estimation of stilboestrol, hexoestrol and their glucuronides in urine. (F. H. Malpress) 132-136
- The fifth coagulation factor ('Factor V'). Preparation and properties. (P. A. Owen) 136-139
- The detection of creatine and creatinine by partition chromatography. (G. A. Maw) 139-142
- The fate of ingested creatinine in the rat. (G. A. Maw) 142-146
- The effect of fertilizers on the levels of nitrogen, phosphorus, protease, and pectase in healthy tobacco leaves. (M. Holden & M. V. Tracey) 147-151
- The effect of infection with tobacco-mosaic virus on the levels of nitrogen, phosphorus, protease, and pectase in tobacco leaves and on their response to fertilizers. (M. Holden & M. V. Tracey) 151-156
- Glycerophosphorylcholine and choline glycerophosphate. (M. Aloisi & P. Bufa) 157-160

## 43 : 1948

- Studies on the activation and purification of blood fibrinolysin. (M. Rocha e Silva & C. Rimington) 163-168
- A study of the behaviour of some sixty amino-acids and other ninhydrin-reacting substances on phenol-'collidine' filter-paper chromatograms, with notes as to the occurrence of some of them in biological fluids. (C. E. Dent) 169-180
- Some factors affecting the extraction of nitrogenous materials from leaves of various species. (E. M. Crook & M. Holden) 181-185
- An manometric method for the estimation of milligram quantities of uronic acids. (M. V. Tracey) 185-189
- The preparation of sodium phosphocreatine. (A. H. Ennor & L. A. Stocken) 190-191
- The isolation of coproporphyrin III from *Corynebacterium diphtheriae* culture filtrates. (C. H. Gray & L. B. Holt) 191-193
- Crystalline bacterial catalase. (D. Herbert & J. Pinsent) 193-202
- Crystalline human erythrocyte catalase. (D. Herbert & J. Pinsent) 203-205
- Examination of crystalline catalases in the ultracentrifuge. (R. Cecil & A. G. Ogston) 205-206
- Studies in detoxication. 17. The fate of catechol in the rabbit and the characterization of catechol monoglucuronide. (G. A. Garton & R. T. Williams) 206-211
- Metabolism of derivatives of toluene. 1. The metabolism of acetotoluides in the rabbit. (H. G. Bray & W. V. Thorpe) 211-216
- Studies in the biochemistry of micro-organisms. 78. The molecular constitution of mycophenolic acid, a metabolic product of *Penicillium brevicompactum* Dierckx. Part 2. Possible structural formulae for mycophenolic acid. (H. Raistrick) 216-223
- The effect of some bacterial polysaccharides on (M. J. Geoghegan & R. C. Brian) 223-231

- The steroids of pregnant mares' urine. 1. A method for the extraction of steroid sulphates and the isolation of *allopreg-16-en-3(β)-ol-20-one* sulphate. (W. Klyne, B. Schachter & G. F. Marrian) 231-234
- The effect of thyroxine on the metabolism of lactating cows. 1. General results and nitrogen metabolism. (E. C. Owen) 235-243
- The effect of thyroxine on the metabolism of lactating cows. 2. Calcium and phosphorus metabolism. (E. C. Owen) 243-247
- Lignins in young plants. (A. Bondi & H. Meyer) 248-256
- Penicillin: analysis of the crude product by means of a modified partition chromatogram. 1. Theory and use of the chromatogram. (A. A. Levi) 257-261
- Penicillin: analysis of the crude product by partition chromatography. 2. Chromatographic analysis of the penicillins from two strains of *Penicillium notatum*. (W. R. Boon, C. T. Callam, H. Gudgeon & A. A. Levi) 262-265
- Studies on the metabolism of semen. 4. Aerobic and anaerobic utilization of fructose by spermatozoa and seminal vesicles. (T. Mann & C. Lutwak-Mann) 266-270
- Tropomyosin: a new asymmetric protein component of the muscle fibril. (K. Bailey) 271-279
- Molecular weight of tropomyosin from rabbit muscle. (K. Bailey, H. Gutfreund & A. G. Ogston) 279-281
- An X-ray and electron microscope study of tropomyosin. (W. T. Astbury, R. Reed & L. C. Spark) 282-287
- A comparison of the decomposition of hydrogen peroxide by catalase, ferrous and ferric ions, haemin and ferrous phthalocyanine. (P. George) 287-295
- Studies in detoxication. 18. A study of the relation between conjugation and deamination of *p*-hydroxybenzylamine and related compounds in the rabbit. (R. L. Hartley & R. T. Williams) 296-303
- Further observations on the proteolytic enzymes in rat skin. (D. Neville-Jones & R. A. Peters) 303-308
- Separation and estimation of saturated C<sub>2</sub>-C<sub>4</sub> fatty acids by buffered partition columns. (V. Moyle, E. Baldwin & R. Scarsbrick) 308-317
- Experimental evidence that the stem-end blackening pigment of potatoes is a compound of iron. (H. G. Wager) 318-320

## 43 : 1948

- Relations between hydrochloric acid secretion and electrical phenomena in frog gastric mucosa. (E. E. Crane, R. E. Davies & N. M. Longmuir) 321-336
- The effect of electric current on HCl secretion by isolated frog gastric mucosa. (E. E. Crane, R. E. Davies & N. M. Longmuir) 336-342
- Studies in the nitrogen metabolism of the apple fruit. Changes in the nitrogen metabolism of the apple during the normal and ethylene-induced climacteric rise in rate of respiration. (A. C. Hulme) 343-349
- The algae. 4. The lipochromes of the male and female gametes of some species of the Fucaeae. (P. W. Carter, L. C. Cross, I. M. Heilbron & E. R. H. Jones) 349-352
- Quantitative-micro-analysis of amino-acid mixtures on paper partition chromatograms. (A. J. P. Martin & R. Mittelmann) 353-358
- The amino-acid composition and titration curve of collagen. (J. H. Bowes & R. H. Kerten) 358-365
- The effect of alkalis on collagen. (J. H. Bowes & R. H. Kerten) 365-372
- The nutrition of the larva of *Aedes aegypti* Linnaeus. 3. Lipid requirements. (L. Golberg & B. De Meillon) 372-379
- The nutrition of the larva of *Aedes aegypti* Linnaeus. 4. Protein and amino-acid requirements. (L. Golberg & B. De Meillon) 379-387
- The chemistry of connective tissues. 1. The state of combination of chondroitin sulphate in cartilage. (S. M. Partridge) 387-397
- The influence of bactericidal agents and of the absence of L-ascorbic acid on the accumulation of hydroxyphenyl compounds in the large intestine of guinea pigs after the consumption of high doses of L-tyrosine. (H. A. Painter & S. S. Zilva) 398-404
- Pipette for use with the Van Slyke-Neill manometric apparatus. (J. C. Eatoo) 405-406
- Synthesis of glutamic acid in animal tissues. (H. A. Krebs, L. V. Eggleston & R. Hems) 406-414
- The determination of quinine degradation product in blood, and its absorption in the chick. (P. B. Marshall & E. W. Rogers) 414-416
- The relationship between losses in labile liver cytoplasm and urinary nitrogen excretion. (R. M. Campbell & H. W. Kosterlitz) 416-419
- An improved diacetyl reaction for the estimation of urea in blood. (V. R. Wheatley) 420-422
- The chemical conversion of nicotinic acid and nicotinamide to derivatives of N-methyl-2-pyridone by methylation and oxidation. (W. I. M. Holman & C. Wiegand) 423-426
- Absorption of 3-methylglucose from the small intestine of the rat and the cat. (P. N. Campbell & H. Davson) 426-429
- Determination of traces of iron and copper in culture media prepared in enzymic digestion of muscle protein. (W. A. Jones) 429-433
- Synthesis of a sulphur-containing analogue of thyroxine. (C. R. Hariogtoo) 434-437
- The action of alkalis on wool. 3. The action of alkalis on deaminated wool. (R. Cockburn, B. Drucker & H. Lindley) 438-444
- The effects of progressive nutritional hypoproteinaemia on the extracellular-fluid phase and plasma colloid osmotic pressure in rats. (S. E. Dicker) 444-453
- Changes in the extracellular- and intracellular-fluid phases of tissues during water diuresis in normal and hypoproteinaemic rats. (S. E. Dicker) 453-461
- Chemical constitution and insecticidal action. 1. Organic sulphur compounds. (W. H. Davies & W. A. Sexton) 461-467
- Chemical constitution and insecticidal action. 2. Substituted n-aminonitriles. (A. D. Ainley & W. A. Sexton) 468-474
- The occurrence of phenolic substances in arthropods. (R. H. Hackmann, M. G. M. Pryor & A. R. Todd) 474-477
- The effect of high blood urea on the acid-base balance of serum of dogs. (T. F. Nicholson) 478-480

## 43 : 1948

- The influence of some synthetic oestrogens and related substances upon the succinoxidase system of rat liver. (E. M. Case & F. Dickens) 481-487
- The apparent arginine content of human plasma proteins by the Sakaguchi reaction. (J. W. Keyser) 488-491
- Amino-acid metabolism of tissue cells *in vitro*. (A. Fischer) 491-497
- Studies in penicillin production by *Penicillium notatum* in surface culture. 2. Further studies in the metabolism of sulphur. (D. J. D. Hockenbuhl) 498-504

- Studies in vitamin A. 7. Carotene metabolism in herbivores. (T. W. Goodwin & R. A. Gregory) 505-512
- Studies in vitamin A. 8. Conversion of  $\beta$ -carotene into vitamin A in the intestine of the rat. (J. Glover, T. W. Goodwin & R. A. Morton) 512-518
- The use of radioactive isotopes in immunological investigations. 2. The fate of injected  $^{32}\text{P}$ -containing proteins. (T. E. Banks, J. C. Boursnell, H. M. Dewey, G. E. Francis, R. Tupper & A. Wormald) 518-523
- p*-Ethylphenylsulphuric acid in goat urine. (J. K. Grant) 523-524
- Inhibition of carbonic anhydrase by sulphonamides. (H. A. Krehls) 525-528
- Studies in the biochemistry of micro-organisms. 79. Fuscine, a metabolic product of *Oidiendendron fuscum* Rohak. Part 1. Preparation, properties and antibacterial activity. (S. E. Michael & S. Marcus) 528-533
- Metabolism of fluorene in the rabbit. (W. J. P. Neish) 533-537
- Determination of the arginase activities of homogenates of liver and mammary gland: effects of pH and substrate concentration and especially of activation by divalent metal ions. (S. J. Folley & A. L. Greenbaum) 537-549
- Carbonic anhydrase as a tool in studying the mechanism of reactions involving  $\text{H}_2\text{CO}_3$ ,  $\text{CO}_2$ , or  $\text{HCO}_3^-$ . (H. A. Krehls & F. J. W. Roughton) 550-555
- Electrophoretic studies on human serum albumin. (C. Hoch-Ligeti & H. Hoch) 556-560
- The fate of certain organic acids and amides in the rabbit. 5. *o*- and *m*-hydroxybenzoic acids and amides. (H. G. Bray, B. E. Ryman & W. V. Thorpe) 561-567
- Growth factors for *Lactobacillus casei*. (F. W. Chattaway, D. E. Dolby & F. C. Hapgood) 567-573
- Lipids of normal brain. (A. C. Johnson, A. R. McNabb & R. J. Rossiter) 573-577
- Lipids of peripheral nerve. (A. C. Johnson, A. R. McNabb & R. J. Rossiter) 578-580
- Effect of adrenalectomy on the arginase levels of liver, mammary gland and kidney in lactating rats studied by the paired feeding technique. (S. J. Folley & A. L. Greenbaum) 581-584
- Vitamin C in the walnut. (*Juglons regio*). (F. Wokes & R. Melville) 585-592
- The accuracy of the Svedberg oil-turbine ultracentrifuge. (R. Cecil & A. G. Ogston) 592-598
- Synthesis and resolution of 2:5-dihydroxyphenylalanine. (A. Neuberger) 599-605
- The preparation of homogenitic acid and of 2:5-dihydroxyphenylethylamine. (G. Leaf & A. Neuberger) 606-610
- The steroids of pregnant mares' urine. 2. Isolation of uranediol sulphate. (W. Klyne) 611-614
- The steroids of pregnant mares' urine. 3. Isolation of *allopregnan-3(β)-ol-20-one* sulphate. (J. Y. F. Paterson & W. Klyne) 614-616
- Carbon dioxide fixation in animal tissues. (J. R. Stern) 616-624
- The copper-retaining powers of different cacao soils. (H. Lees) 624-626
- The secondary oxidation of amino-acids by the catechol oxidase of belladonna. (W. O. James, E. A. H. Roberts, H. Beevers & P. C. de Kock) 626-636
- The behaviour of secondary and tertiary amines in the presence of catechol and belladonna catechol oxidase. (H. Beevers & W. O. James) 636-639
- 44 : 1949
- The isolation and chemical properties of trichothecin, an antifungal substance from *Trichothecium roseum* Link. (G. G. Freeman & R. I. Morrison) 1-5
- The nucleoprotein content of fibroblasts growing *in vitro*. 4. Changes in the ribonucleic acid phosphorus (RNAP) and deoxyribonucleic acid phosphorus (DNAP) content. (J. N. Davidson, I. Leslie & C. Waymouth) 5-17
- The irreversible combination of formaldehyde with proteins. (W. R. Middlebrook) 17-23
- Studies on the fermentation of Ceylon tea. 8. Further observations on the relationship of tea fermentation to normal respiration. (H. B. Sreerangachari) 23-27
- The K-toxin (collagenase) of *Clostridium welchii*. 2. The effect of alkaline pH and heat. (E. Bidwell) 28-32
- The sedimentation constant, diffusion constant and molecular weight of lactoglobulin. (R. Cecil & A. G. Ogston) 33-35
- The estimation of peroxidase activity. (J. Etori) 35-38
- The fate of certain organic acids and amides in the rabbit. 6. Nitrobenzoic acids and amides. (H. G. Bray, W. V. Thorpe & P. B. Wood) 39-45
- Studies in detoxication. 19. The metabolism of benzene. I. (a) The determination of phenol in urine with 2:6-dichloroquinonechloroimide. (b) The excretion of phenol, glucuronic acid and ethereal sulphate by rabbits receiving benzene and phenol. (c) Observations on the determination of catechol, quinol and muconic acid in urine. (J. W. Porteous & R. T. Williams) 46-55
- Studies in detoxication. 20. The metabolism of benzene. II. The isolation of phenol, catechol, quinol, and hydroxyquinol from the ethereal sulphate fraction of the urine of rabbits receiving benzene orally. (J. W. Porteous & R. T. Williams) 56-61
- The characterization of the esterases of human plasma. (D. H. Adams & V. P. Whittaker) 62-70
- Studies on histaminase. (R. Kappeller-Adler) 70-77
- Nicotinamide metabolism in mammals. (P. Ellinger & M. M. A. Kader) 77-87
- Sulphur compounds of the genus *Allium*. Detection of *n*-propylthiol in the onion. The fission and methylation of diallyl disulphide in cultures of *Scopoloropsis brevicaulis*. (F. Challenger & D. Greenwood) 87-91
- The effect of L-glutamic acid and other amino-acids in hypoglycaemia. (W. Mayer-Gross & J. W. Walker) 92-97
- Studies on the metabolism of semen. 5. Citric acid in semen. (G. F. Humphrey & T. Mann) 97-105
- A note on the disturbance of the haemoglobin metabolism of the rat by sulphaphenamide. (J. W. Legge) 105-111
- Acid-soluble pigments of shells. 1. The distribution of porphyrin fluorescence in molluscan shells. (A. Comfort) 111-117
- Characterization of sugar components of proteins. (R. Friedmann) 117-126
- Fractionation of oxidized insulin. (F. Sanger) 126-128
- 44 : 1949
- The formation of hydrogen carriers by haematin-catalyzed peroxidations. 1. Hydrogen carriers from certain acridine and quinoline compounds. (A. Albert & J. E. Falk) 129-136
- Metabolism of derivatives of toluene. 2. Nuclear methyl-substituted derivatives of *N*-phenylurea. (H. G. Bray, H. J. Lake & W. V. Thorpe) 136-142
- The effect of deamination and esterification on the reactivity of collagen. (J. H. Bowes & R. H. Kerten) 142-152
- The behaviour of *Lactobacillus arabinosus* towards nicotinic acid and its derivatives. (H. McIlwain, D. A. Stanley & D. E. Hughes) 153-158

- Distribution of glutamine and glutamic acid in animal tissues. (H. A. Krehls, L. V. Eggleston & R. Hems) 159-163
- A method for determining the sedimentation constant of material of low molecular weight: studies on oxidation products of insulin. (H. Gutfreund & A. G. Ogston) 163-166
- Protease inhibitors. 1. Assay and nature of serum antiprotease. (E. S. Duthie & L. Lorenz) 167-173
- Protease inhibitors. 2. Bacterial proteases and their inhibitors. (E. S. Duthie & L. Lorenz) 173-178
- The measurement of radioactive sulphur ( $^{35}\text{S}$ ) in biological material. (L. Young, M. Edson & J. A. McCarter) 179-185
- A method for the colorimetric micro-estimation of thymine. (D. L. Woodhouse) 185-187
- Anaerobic leakage of potassium from brain. (K. C. Dixon) 187-190
- The activation of phosphoglucomutase by metal ions. (L. H. Stickland) 190-197
- The effect of the peroxide concentration and other factors on the decomposition of hydrogen peroxide by catalase. (P. George) 197-205
- Activity of the succinic dehydrogenase-cytochrome system in different tissue preparations. (D. Keilin & E. F. Hartree) 205-218
- The component acids of some seal blubber and liver fats. (T. P. Hilditch & S. P. Pathak) 218-224
- The action of trypsin on insulin. (J. A. V. Butler, E. C. Dodds, D. M. P. Phillips & J. M. L. Stephen) 224-227
- Studies in the biochemistry of micro-organisms. 80. The colouring matters of *Penicillium isidonicum* Sopp. Part 1. 1:4:5-Trihydroxy-2-methylanthraquinone. (B. H. Howard & H. Raistrick) 227-233
- Studies in detoxication. 21. The fates of quinol and resorcinol in the rabbit in relation to the metabolism of benzene. (G. A. Garton & R. T. Williams) 234-238
- Studies in detoxication. 22. The metabolism of phenacetin (*p*-ethoxyacetanilide) in the rabbit and a further observation on acetanilide metabolism. (J. N. Smith & R. T. Williams) 239-242
- Studies in detoxication. 23. The fate of aniline in the rabbit. (J. N. Smith & R. T. Williams) 242-250
- Studies in detoxication. 24. The metabolism of *p*-phenetidine (*p*-ethoxyaniline) with some observations on the anisidines (methoxyanilines). (J. N. Smith & R. T. Williams) 250-255
- A method of continuous graphic recording of radioactive tracer concentrations from various body regions simultaneously. (M. Reiss, F. E. Badrick, J. M. Halkerton & J. H. White) 255-256

## Brain

## 71 : March 1948

- Microgliomatosis. A form of reticulosis affecting the brain. (D. S. Russell, A. H. E. Marshall & F. B. Smith) 1-15
- Gustatory sweating. (H. A. Haxton) 16-25
- The influence of alterations in posture of the limbs on cortically induced movements. (E. Gellhorn) 26-33
- Observations on cutaneous hyperalgesia, with notes on related reactions. (J. A. Harpman) 34-47
- On the central mechanism of some optic reactions. (G. G. J. Rademaker & J. W. G. Ter Braak) 48-76
- Electroencephalography with pharyngeal electrodes. (J. Roubicek & D. Hill) 77-87
- The distribution of sympathetic fibres in the brachial plexus in man. (S. Sunderland) 88-102

## 71 : June 1948

- The grasp reflex and the instinctive grasp reaction. (H. Seyffarth & D. Denny-Brown) 109-183
- Referred pain and associated phenomena. (D. C. Sinclair, G. Weddell & W. H. Feindel) 184-211
- Studies on copper metabolism in demyelinating diseases of the central nervous system. (B. M. Mandelshrot, M. W. Stanier, R. H. S. Thompson & M. N. Thruston) 212-228

## 71 : September 1948

- Aphasia and artistic realization. (T. Alajouanine) 229-241
- The iatrogenic topography of the sciatic nerve and its popliteal divisions in man. (S. Sunderland & L. J. Ray) 242-273
- Lumbar puncture headache. (G. W. Pickering) 274-280
- Observations on the foramen of Magendie in a series of human brains. (M. L. Barr) 281-289
- Projection of the centromedian nucleus of the human thalamus. (T. McLardy) 290-303
- Demonstration of A and C fibre components in the Babinski plantar response and the pathological flexion reflex. (E. Kugelberg) 304-319
- The mode of representation in the motor cortex. (G. Clark) 320-331
- Responses elicited from the cortex of monkeys by electrical stimulation through fixed electrodes. (G. Clark & J. W. Ward) 332-342

## 71 : December 1948

- Oligo-ponto-cerebellar atrophy. (M. Critchley & J. G. Greenfield) 343-364
- Suhacut inclusion encephalitis (Dawson type). (W. R. Brain, J. G. Greenfield & D. S. Russell) 365-385
- Thrombosis of intracranial veins. (D. Kendall) 386-402
- The effect of the intracisternal injection of saline solutions on the pressure of the cerebrospinal fluid of the dog. (T. H. B. Bedford) 403-409
- The copper and iron content of brain and liver in the normal and in hepatolenticular degeneration. (J. N. Cumings) 410-415
- On a possible relationship between hereditary ataxia and peroneal muscular atrophy; with a critical review of the problems of "intermediate forms" in the degenerative disorders of the central nervous system. (M. Roth) 416-433
- The lipidoses and the central nervous system. (A. Bird) 434-450
- Sarcoidosis with involvement of the nervous system. (J. Colover) 451-475

## British Dental Journal

## 84 : 2/4/48

- Congenital cleft palate. A case of congenital cleft palate which required the fitting of a special appliance. (C. K. McNeil) 137-141
- Penicillin in dental operations. A second report. (K. L. Peter & K. M. Little) 141-145

84 : 16/4/48

- Investing in vacuum. (J. Campbell) 159-162  
 On anaesthetising children for dentistry. (S. Coffin) 162-164  
 Hereditary opalescent dentine. (R. Sclaire) 164-166  
 The effect of the Education Act on the school dental service. (J. Fletcher) 166-170

84 : 7/5/48

- The . . . . . (E. B. Manley) 183-189  
 Oste . . . . . per jaw and osteoporosis circumscripta of the  
 sk . . . . .

84 : 21/5/48

- An anthropological investigation in Central Australia. (J. Heath) 207-210  
 An . . . . . for the performance of replantation. (H. Krömer) 210-213  
 Direct acrylic fillings. (S. A. Leader) 214-215  
 Current political issues affecting the public dental service. (D. E. Mason) 215-218

84 : 4/6/48

- Prosthesis of cleft palates. (R. J. Fowler) 231-236  
 Operative correction of recession of the mandible. (P. Clarkson & H. R. B. Fenn) 236-238  
 Impressions of a short visit to Stockholm. (G. H. Leatherman) 238-239  
 Health Service Superannuation Scheme: rights of dental profession. (H. Keast) 239-241

84 : 18/6/48

- The gingival sulcus and the epithelial attachment. (J. R. Toller) 255-260  
 A section cutting machine. (H. F. Atkinson) 260-261  
 Fluorosis in domestic animals. (G. F. Boddie) 261-263

85 : 2/7/48

- The gingival sulcus and the epithelial attachment. (J. R. Toller) 1-7  
 Progress in the School Dental Service. (A. T. Wynne) 7-11

85 : 16/7/48

- Presidential address. (P. G. Capon) 23-27  
 Valedictory address. (E. Samson) 27-29  
 The narrative charm with special reference to the cure of toothache. (B. R. Townend) 29-34

85 : 6/8/48

- Should dentine be desensitised? (E. B. Manley & J. L. Hardwick) 47-52  
 The "press button" plate. (H. C. Visick) 52-56

85 : 20/8/48

- Dental anaesthesia for children. (J. Halton) 69-77  
 Operative correction of congenital open bite. (P. Clarkson & W. E. Herbert) 77-78  
 An evaluation of two methods of caries degree estimation. (D. Jackson) 79-81

85 : 3/9/48

- Capacity and opportunity. (E. Matthews) 93-96  
 The social aspects of dental education. (R. Cocker) 96-98  
 Dental radiography. (D. A. Imrie) 99-100  
 Public Dental Service in Sweden. From a correspondent. 101-103

85 : 17/9/48

- The first permanent molar again. (A. A. Wilkinson) 121-128  
 The screw pressure crown. (J. W. McLean) 128-133

85 : 1/10/48

- Dental sepsis in children. (G. E. M. Hallett) 145-151  
 Clasp design in partial dentures. (E. Matthews) 152-158

85 : 15/10/48

- Vital pulpotomy in the treatment of fractured incisors. A preliminary report. (G. L. Slack) 169-176  
 The operative correction of gross asymmetrical recession and malocclusion of the mandible. (P. Clarkson & R. E. Rix) 176-179  
 Vitallium as a substitute for dental gold casting alloys. (E. A. Smith) 180-181

85 : 5/11/48

- The development and function of the dental follicle. (J. H. Scott) 193-199  
 Enamel protein in some animals. (P. Pincus) 199-200  
 The development of social dental service. (W. G. Senior) 200-204  
 On caravans and clinics. (H. D. Hall) 204-205

85 : 19/11/48

- Investigation and survey of malocclusion and ear symptoms, with particular reference to otitic barotrauma (pain in ears due to change in altitude). (W. Harvey) 219-225  
 A contribution to the histo-pathology of pulp "polypl," especially of temporary teeth. (H. Frey) 225-230  
 Soft tissue representation by liquid latex on teaching models. (P. A. Trotter) 230-232  
 A Victorian scheme of dental aid for the Army. (D. Stewart) 232-233

85 : 3/12/48

- Stress studies in acrylic resins. (W. Johnson & E. Matthews) 245-249  
 Investigation and survey of malocclusion and ear symptoms, with particular reference to otitic barotrauma (pain in ears due to change in altitude). (W. Harvey) 249-255  
 Quo vadis. (D. E. Mason) 255-257

85 : 17/12/48

- The broken needle in inferior dental injections. (A. D. McIntyre) 271-274  
 The amalgam restoration. (G. H. Leatherman) 275-278  
 Xylocaine: a new local anaesthetic. (G. Bremer, S. Ekmanner, H. Persson & N. Strandberg) 278-281  
 Trichlorethylene in dental anaesthesia. (E. Schofield) 281-282  
 The dental treatment of the young child. (N. M. Poulter) 282-284

86 : 7/1/49

- A modification of the double-embedding method specially adapted for the preparation of decalcified sections of developing teeth. (E. B. Manley & E. B. Brain) 1-3  
 Case report of an endosteal fibroma of the mandible. (A. H. R. Champion, A. W. Moule & F. C. Wilkinson) 3-6  
 Unrupted teeth associated with minor developmental defects in the skull and spine. (A. C. W. Hutchinson) 6-9  
 Hypertrophy of the gum associated with epanutin therapy. (A. F. Stammers & J. F. Bromley) 10-12  
 The permeability of human enamel: notes on section cutting. (H. F. Atkinson) 12-13

86 : 21/1/49

- Stereoscopic intra-oral radiography. (F. L. Ingram) 29-31  
 An injection moulding technique for acrylic crowns and bridge pontics. (J. K. Holt & E. Rosenstiel) 31-33  
 Particle size of dental amalgam alloys. (E. A. Smith) 34-36  
 The Institute of Dental Surgery and the Eastman Dental Clinic. (A. C. Deverell) 36-38  
 Getting together. (A. T. Wynne) 38-41  
 A treatise of meats . . . and a discourse of the pain in the teeth. Thomas Tryon, 1682. A contribution to dental bibliography. (R. A. Cohen) 41-43

86 : 4/2/49

- Dentistry in hospitals. (J. P. Cocker) 55-60  
 Some aspects of the orthodontic problem of to-day. (K. C. Smyth) 60-64  
 Transverse tests on denture base materials. (J. Osborne) 64-67

86 : 18/2/49

- On local anaesthesia. (F. N. Doubleday) 79-83  
 The operating headlamp. (R. Cutler) 83-88  
 Dental education: an aspect of fit with reference to the American training. 88-90  
 The mucoseal seal technique for retention in full lower dentures. (J. D. Riddell & G. W. Davidson) 90-92

86 : 4/3/49

- The fibre-structure at the gingival attachment of deciduous teeth. (M. A. Rushton) 105-108  
 Secondary sarcomata presenting the clinical appearance of fibrous epulides. (F. G. Hardman) 109-111  
 Vacuum testing and its relation to cast surfaces. (J. Ireland) 111-118

86 : 18/3/49

- An experimental investigation of internal strains in polymerised methyl methacrylate as revealed by polarised light. (E. Horton) 133-142  
 An investigation into the permeability of human deciduous enamel. (H. F. Atkinson & E. Matthews) 142-145  
 Random thoughts on orthodontics. (B. R. Townend) 146-149  
 Eye prosthesis. (E. B. Mackenzie) 149-152

86 : 1/4/49

- An investigation into the organic components of the human tooth: a study of sound and carious dentine. (H. F. Atkinson & E. Matthews) 167-171  
 Observations on the appearance of dental enamel in an endemic fluorosis area, with particular reference to deciduous teeth. (H. Coumoulos) 172-176  
 An experimental investigation of internal strains in polymerised methyl methacrylate as revealed by polarised light. (E. Horton) 176-180  
 The present position of . . . . . (P. J. Pretty, S. D. Bradley & K. G. Hyland) 180-182

86 : 14/4/49

- The influence of general health supervision on the frequency of dental caries in groups of Norwegian children. (G. Toverud) 191-197  
 Facial neuralgias. (S. Behrman) 197-203  
 Twenty-five dental cases treated with absorbable alginate wool. (J. F. S. Rumble) 203-205

## British Heart Journal

10 : January 1948

- Angina in women. (V. K. Summers) 4-8  
 Clinical value of unipolar chest and limb leads. (C. W. C. Bain & E. M. Redfern) 9-25  
 Two cases of temporal arteritis: one with angina of effort. (L. Cole) 26-28  
 Hypertension due to syphilitic occlusion of the main renal arteries. (R. K. Price & R. Skelton) 29-33  
 Ball thrombus of the heart. (M. E. Evans) 34-38  
 Mass thrombus of the left auricle. (W. Evans & R. Benson) 39-47  
 The variation of casual, basal, and supplemental blood pressures in health and in . . . . . (A. Kilpatrick) 48-56  
 Cardiac . . . . . electro-convulsive therapy. (R. Kauntze & G. . . . .)

10 : April 1948

- International Conference of Physicians—Section of Cardiology.  
 The surgery of congenital heart disease. 65-79  
 Pulmonary heart disease, acute and chronic. 80-87  
 The clinical value of chest leads. 88-91  
 The use of the phonocardiograph in clinical cardiology. 92-98  
 . . . . . 102  
 Rapid . . . . . P. Dick & B. Evans) 103-121  
 The re . . . . . preparations in heart failure with auricular fibrillation. (P. Dick) 122-124  
 The heart in rheumatoid arthritis. (E. J. Fischmann & F. J. Gwynne) 125-134

## 10 : July 1948

- Pathogenesis of left bundle branch block. (H. Rasmussen & T. Moe) 141-147  
 Erosion of ribs in coarctation of the aorta. A note on the history of a pathologic sign. (W. Dock) 148-149  
 Coarctation of the aorta: review of twenty-three service cases. (M. Newman) 150-157  
 The right precordial lead. (H. Vessell & B. Shorr) 158-164  
 Coronary artery aneurysm with occlusion due to a calcified thrombus. (N. Ashton & M. Munro) 165-166  
 Heart block in osteitis deformans. (C. V. Harrison & B. Lennox) 167-176  
 Ventricular complexes in heart block. (H. B. Kay) 177-187  
 The regenerative capacity of mammalian heart muscle. (E. W. Walks) 188-190  
 Incipient symmetrical peripheral gangrene complicating paroxysmal tachycardia. (D. G. Abrahams) 191-194  
 Tuberculous pericarditis. (A. A. F. Peel) 195-207

## 10 : October 1948

- Auscultation of the heart. (S. A. Levine) 213-228  
 Heart-vector and leads. Part III. Geometrical representation. (H. C. Burger & J. B. van Milaan) 229-233  
 Ventricular escape in acute rheumatism. (A. C. Kirby) 234-238  
 Dissecting aneurysm of the interventricular septum. (A. A. F. Peel) 239-243  
 Long survival with a cardiac aneurysm. (A. Codounis) 244-246  
 U Wave inversion. (J. H. Palmer) 247-251  
 Cardiac lesions in thiamin deficiency. (J. F. Pantridge) 252-262  
 Cardiac pain with recovery of the T wave. (T. East & S. Oram) 263-281  
 The heart in the pneumoconiosis of coalminers. (A. J. Thomas) 282-292

## 11 : January 1949

- The relationship between electrical and mechanical events in the cardiac cycle of man. (B. Coblenz, R. M. Harvey, M. I. Ferrer, A. Courmand & D. W. Richards) 1-22  
 R Waves interrupting T waves. (F. H. Smirk) 23-36  
 Lay cardiologists. (T. East) 37-40  
 The duration of normal heart sounds. (A. A. Luisada, F. Mendoza & M. M. Alimurung) 41-47  
 A loud-speaker stethoscope for clinical teaching. (A. F. Phillips) 48-54  
 The effect of adenosine triphosphate on the electrocardiogram of man and animals. (E. J. Wayne, J. F. Goodwin & H. B. Stoner) 55-67  
 Familial cardiomegaly. (W. Evans) 68-82  
 The effect of digitalis on the venous pressure. (P. Wood & J. Paulett) 83-91

## British Journal of Cancer

## 2 : March 1948

- Secondary malignant disease of the heart. (R. W. Raven) 1-7  
 The prognosis of carcinoma of the breast in relation to the type of operation performed. (D. H. Patey & W. H. Dyson) 7-13  
 The excretion of 17-ketosteroids in men of different age-groups, with special reference to prostatic cancer. (A. M. Robinson) 13-16  
 The effects of chloroethylamines on tumours, with special reference to bronchogenic carcinoma. (E. Boyland, J. W. Clegg, P. C. Koller, E. Rhoden & O. H. Warwick) 17-29  
 Culture of human leukaemic blood cells *in vitro*; technique and the growth curve. (F. W. Gunz) 29-41  
 Culture of human leukaemic blood cells *in vitro*. Normal and abnormal cell division and maturation. (F. W. Gunz) 41-48  
 Incidence of carcinoma in transmissible papillomatosis of the domestic rabbit. (F. R. Selbie & R. H. M. Robinson) 48-59  
 Observations on the nature of the oestrous cycle and on the effect upon it of the milk factor, in mice of two inbred strains, differing in mammary cancer incidence. (E. C. Armstrong) 59-69  
 Biological tests with cholesterol esters of unsaturated acids. (A. H. M. Kirby) 70-74  
 Factors determining the action of colchicine on tumour growth. (R. J. Ludford) 75-86

## 2 : June 1948

- Role of genes and their relationship to extrachromosomal factors in the development of mammary gland tumours in mice. (W. E. Heston) 87-90  
 Genetically determined differences in hormone production a possible factor influencing the susceptibility to mammary cancer in mice. (R. Korteweg) 91-94  
 Mammary tumour inducing factor and genetic constitution. (L. Dmochowski) 94-102  
 The significance of studies with transplanted tumours. (P. A. Gorer) 103-107  
 Genetic studies on leukaemia in mice. (G. Hogrefe) 108-114  
 Mutations induced by carcinogens. (M. Demerec) 114-117  
 The plasmagene theory of the origin of cancer. (C. D. Darlington) 118-126  
 "Infective" transformations of cells. (R. E. Billingham & P. B. Medawar) 126-131  
 Chemically induced mutation. (J. G. Carr) 132-134  
 Indications of the heritable nature of non-susceptibility to Rous sarcoma in fowls. (A. W. Greenwood, J. S. S. Blyth & J. G. Carr) 135-143  
 Heredity in human cancer. (T. Kemp) 144-149  
 Inheritance of xeroderma and its chromosome mechanism. (P. C. Koller) 149-155  
 Twin studies and other genetic investigations in the Danish Cancer Registry. (T. Busk, J. Clemmesen & A. Nielsen) 156-163  
 Family histories of 459 patients with cancer of the breast. (D. W. Smithers) 163-167  
 A genetic study of human mammary cancer. (L. S. Penrose, H. J. Mackenzie & M. N. Karn) 168-176

## 2 : September 1948

- The racial and social incidence of cancer of the uterus. (E. L. Kennaway) 177-212  
 A statistical report on 2,529 cases of cancer of the breast. (W. L. Harnett) 212-239  
 The duodenal spread of pyloric carcinoma. (J. H. Fodden) 239-249  
 Squamous cell carcinoma occurring in asbestosis of the lung. (R. J. R. Cureton) 249-253  
 Haemagglutination by extracts of tumours and of some normal tissues. (M. H. Salaman) 253-267  
 Oestrogen-induced fibroids of the thoracic serosa. (S. Bruzzone, H. Elgueta R. Iglesias & A. Lipschutz) 267-272

- The role of initiating and promoting factors in the pathogenesis of tumours of the thyroid. (W. H. Hall) 273-280  
 Some effects of thiol compounds on tumour induction by carcinogenic hydrocarbons. (H. G. Crabtree) 281-289  
 Further experiments in mice with *p*-diazaminobenzene. (A. H. M. Kirby) 290-294  
 The action of 2-aminofluorene in three pure strains of mice. (A. H. M. Kirby) 294-300  
 The metabolism of 3 : 4-benzpyrene in human beings after intravenous injection. (S. Iversen) 301-308

## 2 : December 1948

- The carcinogenic hydrocarbons: chemical constitution and carcinogenic activity (G. M. Badger) 309-350  
 Clinical trials of tetra-sodium 2-methyl-1 : 4-naphthohydroquinone diphosphate, in conjunction with X-ray therapy. (J. S. Mitchell) 351-359  
 Polarographic analysis of normal and pathological sera. (A. M. Robinson) 360-368  
 The effect of acridine derivatives on growth and mitosis of cells *in vitro*. (I. Lasnitzki & J. H. Wilkinson) 369-375  
 Shope papilloma virus: reversion of adaptation to domestic rabbit by passage through cottontail. (F. R. Selbie, R. H. M. Robinson & R. E. Shope) 375-380  
 Lung adenomas induced by urethane in CBA mice. (F. R. Selbie & A. C. Thackray) 380-385  
 Influence of testosterone propionate on the induction of subcutaneous tumours in mice by 20-methylcholanthrene. (J. Flaks) 386-394  
 The inhibitory influence of 20-methylcholanthrene on the action of chorionic gonadotrophin on the ovaries of immature mice. (J. Flaks) 395-401

## British Journal of Dermatology and Syphilis

## 60 : March 1948

- Some observations on neurodermatitis of the scalp, with particular reference to tinea amiantacea. (W. H. Brown) 81-90  
 Mepacrine dermatitis. (I. Singh) 90-105

## 60 : April 1948

- Vitamin D<sub>2</sub> in the treatment of cutaneous tuberculosis. (J. Charpy) 121-127  
 Vitamin D in the treatment of cutaneous tuberculosis. (G. B. Dowling) 127-131  
 Vitamin D therapy in cutaneous tuberculosis. (S. Lomholt) 132-139  
 Leprosy in British nationals. (S. Gold) 139-143

## 60 : May 1948

- The treatment of *Impus vulgaris* with large doses of calciferol: clinical and biochemical appraisal. Part I. Clinical. (J. T. Ingram & S. T. Anning) 159-164  
 Part 2. Biochemical. (J. Dawson) 164-168  
 Calciferol for lupus and other conditions. (D. E. Macrae) 168-173  
 Calciferol in the treatment of tuberculosis. (S. Gauvain) 174-178  
 Histological changes in lupus during calciferol treatment. (W. Freudenthal) 178-180  
 Three cases of Hodgkin's disease with predominantly cutaneous localization. (L. Van der Meiren) 181-184

## 60 : June 1948

- Psoriasis of the nails. (J. Alkiewicz) 195-200  
 Pityriasis rosea sparing tanned areas of skin: a report of two cases. (J. Kinnear) 200-202  
 Erythrosis pigmentosa peribuccalis. (E. L. Cohen) 203-211  
 Report on a case of leukaemia cutis. (H. D. Chambers) 211-213

## 60 : July-August 1948

- Detection of primary cases of syphilis without clinical symptoms by serological tests only. (J. Desneux) 235-238  
 An attempt to investigate fungus cultures in the banging drop. Preliminary report. (A. A. Zimerinov & S. M. Rafalovich) 238-243  
 Tubercloid leprosy: warty leproide. (O. G. Costa & H. B. Aleixo) 243-248  
 Lichen planus of alimentary canal and tympanic membranes. (R. P. Warin, P. Hall-Smith & F. O'N. Daunt) 249-250

## 60 : September 1948

- Some observations on keratobyalin in warts. (E. Meirrowsky, G. Behr & S. Keys) 275-278  
 Inginal adenitis in primary syphilis in the male. (W. Fowler) 279-282  
 Epithelioma following the local treatment of pruritus ani with liquor picis carbonis. (G. Hodgson) 282  
 Dermatological experiences in Prague during the two World Wars. (E. Petráček) 283-288

## 60 : October 1948

- Multiple primary, self-healing squamous epithelioma of the skin. (J. F. Smith) 315-318  
 Sunlight and skin cancer in Kenya. (F. Piers) 319-332

## 60 : November 1948

- Brazilian pemphigus foliaceus. (Wild fire). (O. G. Costa) 359-367  
 Generalized angiomatosis simplex cutis following an erythema morbilliforme probably caused by the use of pyribenzamine. (M. Oppenheim & W. A. Yacullo) 368-371  
 A case of unilateral lentiginos with mental deficiency. (D. Cappon) 371-374  
 Cutaneous hypersensitivity to penicillin. (B. Phillips) 375-378

## British Journal of Experimental Pathology

## 29 : February 1948

- The experimental production and development of diffuse hepatic fibrosis ("porta cirrhosis"). (L. E. Glynn, H. P. Himsword & O. Lindan) 1-9  
 The survival of the virus of foot-and-mouth disease in blood at 37°C. (J. B. Brooksby) 10-19  
 The enhancement of bacterial infections by adrenaline. (D. G. Evans, A. A. Miles & J. S. F. Niven) 20-39

The pathology of phenyldichloroarsine poisoning in rabbits. (J. Dekanski) 39-47  
 Anthranilic acid as an intermediate in the biosynthesis of tryptophan by *Bact. typhosum*. (H. N. Rydon) 48-57  
 Immunity to homologous grafted skin. III. The fate of skin homografts transplanted to the brain, to subcutaneous tissue, and to the anterior chamber of the eye. (P. B. Medawar) 58-69  
 The epizootic behaviour of mouse-pox (infectious ectromelia). (F. Fenner) 69-91

## 29 : April 1948

The prolonged administration of thyroxine to cows, with particular reference to the effects on thyroid function and on pituitary thyrotrophic hormone. (M. T. McQuillan, V. M. Trikolus, A. D. Campbell & A. W. Turner) 93-106  
 Rift Valley fever. Isolation of the virus from wild mosquitoes. (K. C. Smithburn, A. J. Haddow & J. D. Gillett) 107-121  
 Bodily reactions to trauma. The effect of ischaemia on muscle protein. (H. B. Stoner & H. N. Green) 121-132  
 Influenza A in Great Britain 1946-47. (J. A. Dudgeon, H. Mellanby, R. E. Glover & C. H. Andrewes) 132-141  
 The antigenic efficiency of *Cl. welchii* epsilon toxin and toxoid after treatment with trypsin. (I. Baitty & A. T. Glenn) 141-148  
 The effects of short-term changes in dietary protein on the response of the liver to carbon tetrachloride injury. (R. M. Campbell & H. W. Kosterlitz) 149-159  
 The detection of a product of the blood group O gene and the relationship of the so-called O-substance to the agglutinogens A and B. (W. T. J. Morgan & W. M. Watkins) 159-173  
 The fibrin barrier regarded as a filter in inflammation. (W. H. Hughes) 173-180  
 Virulence and toxigenicity of different serological types of *C. diphtheriae*. (L. F. Hewitt) 181-189

## 29 : June 1948

On the synergism of some gram-positive cocci and vaccinia virus. (C. H. Lack) 191-202  
 Antagonization of the antibacterial action of neoparsphenamine, penicillin and streptomycin by -SH compounds. (R. D. Simon) 202-215  
 The effect of stroma-free haemoglobin on the ischaemic kidney of the rabbit. (A. W. Badenoch & E. M. Darnady) 215-223  
 The relationship between nitrate and tetrahydrozine adaptation and cell growth. (M. R. Pollock & S. D. Wainwright) 223-240  
 "Training" or mutation of bacteria. (P. Fildes & K. Whitaker) 240-248  
 Experimental nephritis: an attempt to demonstrate a nephrotoxic substance in the serum of acute nephritis. (R. Reader) 248-255  
 Serum complement in acute nephritis. (R. Reader) 255-263  
 The synthesis of "folic acid" by *Streptobacterium plantarum* and its inhibition by sulphoamides. (R. H. Nimmo-Smith, J. Lascelles & D. D. Woods) 264-281

## 29 : August 1948

The application of paper partition chromatography to the production of diphtheria toxin. (F. V. Linggood & A. J. Wolwood) 283-289  
 Protection by streptomycin, penicillin and licheniformin against *C. diphtheriae* infections. (L. F. Hewitt) 289-295  
 Studies on a factor in normal allantoic fluid inhibiting influenza virus haemagglutination. Occurrence, physico-chemical properties and mode of action. (A. Svedmyr) 295-308  
 Studies on a factor in normal allantoic fluid inhibiting influenza virus haemagglutination. Virus-inhibitor interaction. (A. Svedmyr) 309-321  
 The pathogenic effect of phtholic acid and its synthetic analogues. (J. Ungar, C. E. Coulhard & L. Dickinson) 322-328  
 Vaccinia and ectromelia in the mouse. (C. H. Andrewes, W. J. Elford & J. S. F. Niven) 329-335  
 The preparation of purified and concentrated diphtheria toxoid from a semi-synthetic medium. (L. B. Holt) 335-346  
 The immunological relationships of strains of alastrim virus. (E. S. Horgan, M. A. Haseeb & M. H. Satti) 347-355

## 29 : October 1948

The inhibition of pertussis haemagglutinin by extracts of erythrocytes. (S. Fisher) 357-363  
 Investigation into the production of bacteriostatic substances by fungi. Preliminary examination of the ninth 100 species, all basidiomycetes. (W. H. Wilkins) 364-366  
 Immunization against louping-ill. Vaccines prepared from chick embryos. (D. G. ff. Edward) 367-372  
 Immunization against louping-ill. Immunization of mao. (D. G. ff. Edward) 372-378  
 Immunity to anthrax. Production of the cell-free protective antigen in cellophane sacs. (G. P. Gladstone) 379-389  
 The growth cycle of influenza virus A. A study of the relations between virus, soluble antigen and host cell in fertile eggs inoculated with influenza virus. (L. Hoyle) 390-399  
 Changes in the concentration and histological distribution of the ascorbic acid in ovaries, adrenals and livers of rats during oestrous cycles. (C. Hoch-Ligeti & G. H. Bourne) 400-407  
 The action of tetanus toxin on the acetylcholine and cholinesterase contents of the rabbit's iris. (N. Ambache, R. S. Morgan & G. P. Wright) 408-418  
 Bodily reactions to trauma. A possible role of nucleotides in cardiac ischaemia. (H. B. Stoner, H. N. Green & C. J. Threlfall) 419-446  
 Effect of chemotherapeutic agents on *C. diphtheriae*, with special reference to the diamidines. (L. F. Hewitt) 447-452  
 An antibiotic from *Bacillus mesentericus*. (J. Miller & D. Rowley) 452-457  
 Distribution of antitoxin in the tissues of animals immunized with *Cl. welchii* toxin. (J. Keppie & M. G. Macfarlane) 458-466  
 Antibiotic-producing organisms in faeces and sewage. (T. L. Su) 466-473  
 Micrococci. An antibacterial substance formed by a strain of *Micrococcus*. (T. L. Su) 473-481

## 29 : December 1948

Pathogenesis of renal lesions in weanling and young adult rats fed choline-deficient diets. (W. S. Hartroft) 483-494  
 The staining of the duodenal mucosa of rats following the injection of solutions of tannic acid. (J. M. Barnes) 495-500  
 An investigation of immunological relationships between the viruses of variola, vaccinia, cowpox and ectromelia by neutralization tests on the chorio-allantois of chick embryos. (K. McCarthy & A. W. Downie) 501-510

Transportation of the anaphylactogenic property by eosinophil. (Z. Z. Godlowski) 511-524  
 Electrophoretic studies on the serum of golden hamsters infected with *Leishmania donovani*. (G. Ada & J. D. Fulton) 524-529  
 Reactivation of neutral mixtures of influenza virus and serum by virus inactivated by heat. (A. Isaacs) 529-538  
 Changes in the metaphysis of the long bones during the development of rickets. (J. M. Bailie & J. T. Irving) 539-546  
 Mengo encephalomyelitis virus: isolation and immunological properties. (G. W. A. Dick, K. C. Smithburn & A. J. Haddow) 547-558  
 Mengo encephalomyelitis virus: pathogenicity for animals and physical properties. (G. W. A. Dick) 559-577  
 The antigenic function of... with chemical reactivity... Physical properties of the... (W. J. Elford, C. M. Ch... 590-599  
 Immunization against louping-ill. Immunization of cattle. (D. G. ff. Edward) 600-607

## British Journal of Industrial Medicine

### 5 : April 1948

Eye hazards and safety practice: a review of 14,722 eye accidents in the Wearside shipyards: preliminary report. (A. Kefalas) 51-69  
 Fibrosis in the lungs of a silver finisher. (H. E. Harding) 70-72  
 The toxicology of zircon: preliminary report. (H. E. Harding) 75-76, 73-74  
 Studies in occupational morbidity (2). (I. Sutherland & G. P. B. Whitwell) 77-87  
 Boils and infected hands: an epidemiological investigation. (G. P. B. Whitwell & I. Sutherland) 88-92

### 5 : July 1948

The Disabled Persons (Employment) Act, 1944: some medical implications. (W. Taylor) 107-116  
 Poisoning by methyl mercury compounds. (A. Ahlmark) 117-119  
 Pneumoconiosis of coal-miners. A study of the disease after exposure to dust has ceased. (A. Stewart, I. Davies, L. Dowsett, F. H. Morrell & J. W. Pierce) 120-140  
 The health of plumbago workers in Ceylon. (W. L. P. Dassanayake) 141-147  
 Diatomaceous earth silicosis. (E. C. Vigliani & G. Mottura) 148-160

### 5 : October 1948

The British tradition in industrial health. (E. R. A. Merewether) 175-179  
 Early Scottish essays in industrial health. (T. Ferguson) 180-184  
 Victuals and ventilation and the health and efficiency of seamen. (F. P. Ellis) 185-197  
 Dust sampling to a haematite mine with the P.R.U. hood pump. (H. H. Watson) 198-203  
 The evaluation of skin cleansers and protective creams for workmen exposed to mineral oil. (C. N. D. Cruickshank) 204-212

### 6 : January 1949

Chemical carcinogenesis: a review. (I. Hieger) 1-23  
 Fluctuating atmospheric pressures: a novel environmental variant observed in submarines. (F. B. Ellis) 24-30  
 Health and environmental conditions in brickworks. (G. F. Keatinge & N. M. Potter) 31-44

### 6 : April 1949

Vesical tumours induced by chemical compounds. (M. W. Goldblatt) 65-81  
 Manganese pneumonitis: further clinical and experimental observations. (T. A. L. Davies & H. E. Harding) 82-90  
 Changes in the lungs produced by natural graphite. (H. E. Harding & G. B. Oliver) 91-99  
 Sickness absence due to peptic ulcers. (R. Doll & M. M. Buckatzsch) 100-102

## British Journal of Nutrition

### 2 : 1948

The synthesis of ascorbic acid in the rat deprived of vitamin A with and without addition of chlorotone. (L. W. Mapson & S. E. Walker) 1-14  
 Comparison of eye changes in riboflavin deficiency and in tryptophan deficiency in the rat. (A. Pirie) 14-20  
 Heats of combustion of leaf proteins, and incidentally of linseed mucilage and citrus pectin. (J. W. H. Lugg & P. Stanley) 21-26  
 The digestibility and absorption of the calories, proteins, purines, fat and calcium in wholemeal wheat bread. (R. A. McCance & C. M. Walsham) 26-41  
 The absorption of vitamin A from colostrum by lambs. (E. Eden) 42-46  
 Famine oedema. (J. Beattie, P. H. Herber & D. J. Bell) 47-65  
 Further studies of the rachitogenic effect of dried yeast in pig diets. (R. Braude, K. M. Henry & S. K. Kon) 66-75

### 2 : 1948

Comparison of results obtained by different methods of individual dietary survey. (E. R. Bransby, C. G. Daubney & J. King) 89-110  
 Lesions of the gum and alveolar bone, due to calculus or other debris, in the golden hamster (*Cricetus auratus*). (J. D. King & A. P. Gimson) 111-118  
 Tuxford's index of nutrition: a convenient nomogram. (F. W. Campbell & J. B. de V. Weir) 119-122  
 The determination of total metabolism in the mouse. (A. D. Dewar & W. H. Newton) 123-141  
 The relationship between food intake and respiratory quotient in mice. (A. D. Dewar & W. H. Newton) 142-145

### 2 : 1948

Further observations on the nutritive value of the proteins contained in wheat flours of different extraction rates. (H. Chick & E. B. Slack) 205-213  
 Composition of rats fed on diets containing wheat flours of different percentage extraction. (E. B. Slack) 214-220  
 The energy value of oatmeal and the digestibility and absorption of its proteins, fats and calcium. (R. A. McCance & E. M. Glaser) 221-228

Ascorbic acid and epithelial regeneration. (N. M. Galloway, R. C. Garry & A. D. Hitchin) 228-232  
Comparison of nutrient values of individual diets found by calculation from food tables and by chemical analysis. (E. R. Bransby, C. G. Daubney & J. King) 232-236  
The distribution of vitamin B<sub>1</sub> in the rice grain. (J. J. C. Hinton) 237-241  
The thermal destruction of vitamin B<sub>1</sub>. The influence of the concentration of neurina and coarboxylase on their own rates of destruction. (K. T. H. Farrer) 242-248

## British Journal of Ophthalmology

32 : March 1948

A further case of iridoschisis. (A. Loewenstein, J. Foster & S. K. Sledge) 129-134  
A cross-sectional view of injuries in an ophthalmic practice in Eire. (E. Maxwell) 134-153  
A note on intra-vitreous penicillin. (T. S.-B. Kelly) 153-160  
A complication of intracapsular cataract extraction. (F. A. Williamson-Noble) 161-162  
An attempt to treat a perforated eye with subconjunctival penicillin. (F. R. Neuber) 162-163  
The use of anti-allergic drugs in the treatment of phlyctenular ophthalmia. (C. F. Bowers) 163-164  
Intra-mural new vessels in an occluded retinal vein. A clinical description. (I. C. Michaelson) 164-166  
An implant with bridges for attachment of muscles. (E. Rosen) 166-170  
Pathology of mucous and salivary gland tumours in the lacrimal gland and the relation to extra-orbital mucous and salivary gland tumours. (Studies on orbital tumours—3.) (E. Godfredsen) 171-179  
A case of sympathetic ophthalmitis of unusual onset responding satisfactorily to treatment. (A. W. Siebel & J. G. Louw) 180-184  
An eye speculum with different blades for upper and lower lids. (B. S. Hylkema) 184-186  
Use of polarized light in scotometry with binocular fixation. (U. Halldén) 186-188

32 : April 1948

Clinical report on miners' nystagmus. (D. A. Campbell) 193-198  
The dark adaptation of coal miners suffering from nystagmus. (F. W. Sharpley) 199-204  
A comparison of dark adaptation in miners with their nutritional state. (D. A. Campbell & E. Tonks) 205-208  
The psychiatric aspect of miners' nystagmus. I. (E. S. Stern) 209-224  
A comparison of dark adaptation with the psychological state in miners. (D. A. Campbell) 225-226  
Binocular vision in miners. (D. A. Campbell, R. Harrison & J. Vertigen) 226-232  
Slit-lamp microscopy. (J. H. Doggart) 232-247  
Post-operative intra-ocular infection controlled by penicillin. (F. S. Lavery) 247  
The optics of contact lenses. (A. G. Bennett) 257-272  
Observations on the pulse and retinal arterial pressure. (W. Kapuściński) 273-300  
Anterior lentiglobus. An atypical case. (K. Sen) 305-311  
On genesis and operation of senile entropion. (A. Kettesy) 311-313  
A note on the physiology of the aqueous humour. (E. Bárány & H. Davson) 313-314

32 : June 1948

Ox vitreous humour. I. The residual protein. (A. Pirie, G. Schmidt & J. W. Waters) 321-339  
Variation of pupil size with change in the angle at which the light stimulus strikes the retina. (K. H. Spring & W. S. Stiles) 340-346  
Apparent shape and size of the pupil viewed obliquely. (K. H. Spring & W. S. Stiles) 347-354  
The alteration in size of the normal optic disc cup. (R. Pickard) 355-361  
A portrait of Richard Banister. (A. Sorsby & W. J. Bishop) 362-366  
Some new points in the technique of implant in Tenon's capsule after enucleation. (A. Favory) 366-372

32 : July 1948

Denig's operation for trachomatous pannus. (N. Pines) 385-394  
Hydrid of the orbit. (H. Holland) 395-396  
A low power infra-red microscope. (T. S.-B. Kelly) 396-397  
Xeroderma pigmentosum with affection of the eye. (J. Szabo) 398-411  
The present state of the problem of retinitis pigmentosa. (I. Bird) 411-415  
A case of keratomalacia cured by penicillin and vitamin A. (K. Rizk) 416-419  
On genesis and operation of the cicatricial (trachomatous) entropion of the upper lid. (A. Kettesy) 419-423  
Contribution to data on sight disturbances caused by proliferation of pigment epithelium. (An unusual complication after cataract extraction.) (M. Radnóti) 423-426  
A case of pyocyanous ring abscess of the cornea treated with streptomycin. (J. Maschler) 426-428  
Operative treatment of five cases of iridodiolysis. (S. Görden) 429-435  
Six cases of scleritis abscesses. (S. Görden) 435-439  
Congenital cataract and orbital cyst (together with other developmental anomalies) on the same side of the face. (F. Panolczy) 439-443

32 : August 1948

Intravitreal streptomycin: its toxicity and diffusion. (P. A. Gardiner, I. C. Michaelson, R. J. W. Rees & J. M. Robson) 449-456  
An analysis of fibre-size in the human optic nerve. (L. W. Chacko) 457-461  
Acute retinopathy without hyperlipidemia in diabetic pregnancy. (R. D. Lawrence) 461-465  
Crater-like holes in the optic disc. (E. Rosen) 465-478  
A case of a Grönblad-Strandberg syndrome, with disciform degeneration of the macula. (G. Hibbert) 478-485  
A myxo-haemangioma simplex of the conjunctiva bulbi. (A. Bakker) 485-488  
The prognosis of severe infected corneal ulcers by subconjunctival injections of penicillin twice daily without hospitalization, with short review of other methods. (K. Rizk) 497-504  
Operation for persistent pupillary membrane. Notes on a case. (Z. Báthón) 505-507

32 : September 1948

Sir John Herbert Parsons. An appreciation. (E. D. Adrian) 517-519  
Sir John Herbert Parsons. An appreciation. (J. van der Hoeve) 520  
Developmental aphasia. Also known as congenital word-blindness and sometimes referred to as alexia or dyslexia. (A. H. H. Sinclair) 522-531  
Histological findings in a case of angiod streaks. (F. H. Verheeff) 531-544  
A contribution to the microscopical anatomy of the sympathizing eye. (R. A. Greeves) 545-550  
The off/on-ratio of the isolated on-off-elements in the mammalian eye. (R. A. 550-554  
The present position of the problem of the intra-ocular fluid and pressure. (S. Duke-Elder & H. Davson) 555-569  
Participation of the ocular appendages in sympathetic ophthalmia and its bearing on enucleation. (B. Samuels) 569-575  
Lindau's disease—progression in affected family. (A. E. MacDonald) 575-581  
Methods of investigating eye movements. (H. Hartridge & L. C. Thomson) 581-591  
Tissue cultures of mouse lens epithelium. (J. Mann) 591-596  
Colour vision, 1868 and 1948. (W. D. Wright) 597-601  
The first Irish ocular pathologist: Arthur Jacob—(1790-1874). (L. B. Somerville-Large) 601-617  
Radiotherapy of malignant intra-ocular neoplasms. (H. B. Stallard) 618-639  
A point for consideration in the use of the stereoscope. (F. W. Law) 639-644  
The effect of age and illumination upon visual performance with close sights. (H. C. Weston) 645-653  
Sideglights on the inferior oblique muscle. (J. R. Anderson) 653-668  
Some unusual cases of Sjögren's syndrome. (H. Coverdale) 669-673  
Adaptation to environment. (F. A. Williamson-Noble) 673-677  
Angiomatosis retinae, with report of pathological examination. (H. Neame) 677-689  
Visual protection in aerial warfare. (P. C. Livingston) 689-700  
Goniotomy for the relief of congenital glaucoma. (O. Barkan) 701-728

32 : October 1948

Prognosis in uveal melanoma. (B. Benjamin, J. N. Cumings, A. J. B. Goldsmith & A. Sorsby) 729-747  
Double staining for bulk specimens of retina and choroid. (A. Loewenstein) 748-753  
Anterior flap sclerotomy with basal iridencleisis. (A preliminary note.) (H. B. Stallard) 753-759  
Allergic conditions of the eye. 1. Keratitis rosacea. (V. B. Walker) 759-764  
Allergic conditions of the eye. 2. Migraine. (V. B. Walker) 764-767  
The effects of various types of penicillin injected into the vitreous. (P. A. Gardiner, I. C. Michaelson, R. J. W. Rees & J. M. Robson) 768-775  
Hernia and prolapse of the vitreous and prolapse of the iris in connection with the cataract operation. (M. Vannas) 776-782

32 : November 1948

Visual purple and the photopic luminosity curve. (H. J. A. Dartnall) 793-811  
Scleral resection in the treatment of retinal detachment. (A preliminary report.) (S. Philips) 811-818  
Fatty embolism of the retinal artery found in eyes after enucleation and orbital exenteration. (A. Loewenstein & J. Foster) 819-823  
Atrophy of the choroid and retinae. (J. Seab) 824-847  
Intra-ocular phakomata—a report of three cases. (R. F. Lowe) 847-853

32 : December 1948

Intravitreal injection of penicillin: study on the levels of concentration reached and therapeutic efficacy. (A. Sorsby & J. Ungar) 857-864  
Distribution of penicillin in the eye after injections of 1,000,000 units by the subconjunctival, retrobulbar and intramuscular routes. (A. Sorsby & J. Ungar) 864-873  
The control of experimental infections of the anterior chamber and of the vitreous by subconjunctival and retrobulbar injections of crystalline penicillin in doses of 1,000,000 units. (A. Sorsby & J. Ungar) 873-878  
Preliminary note on the treatment of hypopyon ulcer by crystalline penicillin in adrenalin in doses in excess of 50,000 units injected by subconjunctival or retrobulbar routes. (A. Sorsby & J. Ungar) 878-881  
On symptoms of the pulse in the central retinal artery. (W. Kapuściński) 881-885  
A case of pigmented leiomyoma of the iris. (N. Fleming) 885-892  
Observations on experimental pneumococcal infection of the rabbit's cornea and on their treatment with penicillin. (J. Macaskill & M. Weatherall) 892-899  
Scleral degenerations—a case of scleromalacia perforans. (S. N. Mitter) 899-904  
Technique of iridencleisis. (L. Weekers & R. Weekers) 904-910  
Carbonic anhydrase and cataracta lentis. (A. Bakker) 910-912  
On the measure of the stereoscopic acuity of vision. (J. W. Nordenson) 913-914  
A case of spontaneous exophthalmos during delivery. (J. Goldberger) 914-915

33 : January 1949

The rupture of the zonule in intracapsular cataract extraction—a new method. (D. B. Kirby) 3-21  
Studies on the intra-ocular fluids. 1. The reducing substances in the aqueous humour and vitreous body. (S. Duke-Elder & H. Davson) 21-33  
The stabilisation of the refraction and its rôle in the formation of ametropia. (A. Kettesy) 39-47  
Pigment-anomalouscopy: a new procedure for testing the colour-sense. (A. Kettesy) 47-54  
A new method of applying the screen test for inter-ocular muscle balance. (V. T. Lees) 54-59  
A fundus dystrophy with unusual features. (A. Sorsby, M. E. J. Mason & N. Gardner) 67-97  
A theoretical plan of a method for removing non-ferro-magnetic metallic intra-ocular foreign bodies by means of electro-magnetic forces. (P. M. Endt & J. ten Doornik) 97-100  
Notes on 221 intra-capsular cataract extractions performed in three weeks at Kharipur in 1947. (H. Holland & R. W. B. Holland) 101-105  
An ophthalmologist in Budapest and Prague. (L. B. Somerville-Large) 106-109

Ocular complications in erythema exudativum multiforme with mucous membrane lesions. (J. E. Wolff) 110-120  
Conical contact lenses. (G. D. McKellen) 120-127  
Post-operative security in cataract operation. (T. G. W. Parry) 128-129

### 33 : March 1949

The eyes in mongolism. (R. F. Lowe) 131-174  
Some considerations on the salt content of fresh and old ox corneae. (H. Davson) 175-182  
An advocacy of external dacryocystorhinostomy. (F. N. Shuttleworth) 183-187  
Visits to continental ophthalmic clinics, 1948. 187-193  
Eyeball rotating forceps. (R. Lindsay-Rea) 193

### 33 : April 1949

Experimental studies on the pathogenesis and treatment of ocular tuberculosis. (A. C. Woods) 197-228  
The vascular action of pilocarpine, eserine, adrenaline and atropine, and their influence in primary chronic glaucoma. (G. Cristini) 228-242  
Slit-lamp examination of the vitreous and the fundus. (H. Goldman) 242-247  
Blood-vessel formation in the cornea. (F. W. Campbell & I. C. Michaelson) 248-255

## British Journal of Pharmacology and Chemotherapy

### 3 : June 1948

A study of anthelmintic potency in relation to chemical constitution. (E. Baldwin) 91-107  
Acetylcholine antagonists: a comparison of their action in different tissues. (F. J. de Elío) 108-112  
The anticholinergic activity of eserine on the superior cervical ganglion of the cat. (T. C. Chou & F. J. de Elío) 113-115  
The effect of environmental temperature on the toxicity of BAL. (F. F. McDonald) 116-117  
The toxicology and pharmacology of methyl fluoroacetate (MFA) in animals, with some notes on experimental therapy. (G. L. Foss) 118-127  
Quantitative studies of procaine metabolism in the cat. (A. S. V. Burgen & C. A. Keele) 128-136  
Effects of BAL and BAL glucoside in acute lead acetate poisoning. (M. Weatherall) 137-145  
Studies in the chemotherapy of tuberculosis: Part I. Sulphonamides. (E. Hoggarth & A. R. Martin) 146-152  
Studies in the chemotherapy of tuberculosis: Part II. Sulphonamides. (E. Hoggarth, A. R. Martin & E. H. P. Young) 153-155  
Studies in the chemotherapy of tuberculosis: Part III. Antimalarial compounds. (E. Hoggarth & A. R. Martin) 156-159  
Studies in the chemotherapy of tuberculosis: Part IV. Diamino methylpyrimidines and related compounds. (E. Hoggarth, A. R. Martin, M. F. C. Paigc, M. Scott & E. Young) 160-162  
The instability of sulbamidine. (A. J. Henry) 163-166  
Miracil D, its toxicology, absorption, and excretion in animals and human volunteers. (F. Hawking & W. F. Ross) 167-173  
Comparisons of various histamine antagonists. (J. J. Reuse) 174-180

### 3 : September 1948

Nitroakridin 3582: a compound possessing chemotherapeutic activity against the viruses of psittacosis and lymphogranuloma venereum. (E. W. Hurst) 181-186  
The toxic principle of *Courbonia virgata*: its isolation and identification as a tetramethylammonium salt. (A. J. Henry) 187-188  
Injections of adrenaline and noradrenaline, and further studies on liver sympathin. (G. B. West) 189-197  
Circulatory properties of amidine derivatives. I. Pressor analogues of methyl isothiourea. (F. N. Fastier) 198-204  
Circulatory properties of amidine derivatives. II. Potentiation of the vasoconstrictor action of adrenaline. (F. N. Fastier & C. S. W. Reid) 205-210  
Diamidines as antibacterial compounds. (R. Wien, J. Harrison & W. A. Freeman) 211-218  
The action of the venom of a Mexican scorpion (*Centruroides noxius*, Hoffmann) on cholinesterases. (E. C. del Pozo) 219-222  
The acute distribution of intravenously administered lead acetate in normal and BAL-treated rabbits. (M. Ginsburg & M. Weatherall) 223-230  
The effect on gastric secretion of different rates of histamine infusion and of "neoantergan." (D. R. Wood) 231-236  
The pharmacological properties of conessine, isoconessine and neoconessine. (R. P. Stephenson) 237-245  
The action of substances which antagonize acetylcholine on the body temperature of mice, before and after adrenalectomy. (N. K. Dutta) 246-250  
The influence of potassium and calcium ions on the action of procaine. (H. J. Bein) 251-253  
The change in pharmacological action produced by the introduction of a methyl group into priscol. (C. W. Gowdey) 254-262  
Analysis of antimetabolic action of certain quinones. (E. Friedmann, D. H. Marrian & I. Simon-Reuss) 263-270

### 3 : December 1948

A simple recording impulse counter. (R. H. Thorp) 271-272  
Systemic effects of adenosine triphosphate. (N. Emmelin & W. Feldberg) 273-284  
The maintenance of a filarial infection (*Limotomoides carlini*) for chemotherapeutic investigations. (F. Hawking & P. Sewell) 285-296  
Phenylthioureas as local anaesthetics. (Y.-T. Huang, Y.-W. Yieh & I. Chang) 297  
Curare-like action of polymethylene bis-quaternary ammonium salts. (R. B. Barlow & H. R. Ing) 298-304  
The antibacterial activity of some synthetic compounds related to penicillin. (G. Brownlee & M. Woodbine) 305-308  
Studies on the blood-brain barrier. I. The basis of dosage for animals of various weights. (O. L. Davies & E. W. Hurst) 309-314  
The decarboxylation of  $\beta$ -3: 4-dihydroxyphenylserine (noradrenaline carboxylic acid). (H. Blaschko, P. Holton & G. H. S. Stanley) 315-319  
Activation of paludrine. (F. Hawking & W. L. M. Perry) 320-325  
A comparison of the irritant action of conessine, isoconessine, and neoconessine. (R. P. Stephenson & N. K. Dutta) 326-327

A modification of the method of Dale and Laidlaw for standardization of posterior pituitary extract. (P. Holton) 328-334  
Sulphydryl addition compounds of some quinones and related substances in their action on the growth of normal cells. (E. Friedmann, D. H. Marrian & I. Simon-Reuss) 335-340  
The action of choline derivatives on isolated rabbit auricles when arrested by paludrine. (J. R. Vane) 341-345  
The inhibitory action of paludrine on the secretion of gastric juice. (J. H. Burn & J. R. Vane) 346-349  
The effect of paludrine on gastric secretion in man. (J. R. Vane, J. M. Walker & C. B. W. Parry) 350-351  
The effect of paludrine on human gastric secretion. (R. Doll & R. Schneider) 352-353  
The action of antagonists of acetylcholine on the vessels of the rabbit's ear. (J. H. Burn & N. K. Dutta) 354-361

### 4 : March 1949

Actions of sodium azide. (J. D. P. Graham) 1-6  
A kymographic study of the action of drugs on the liver fluke (*Fasciola hepatica*). (M. R. A. Chance & T. E. Mansour) 7-13  
Some pharmacological actions of paludrine. (J. R. Vane) 14-21  
The action of ganglia bot on skeletal muscle and sympathetic tubocurarine. (H. Bülbirg & T. C. Chou) 29-32  
The action of local anaesthetics and *d*-tubocurarine on the isolated intestine of the rabbit and guinea-pig. (W. Feldberg & R. C. Y. Lin) 33-44  
The effect of N-methylation on certain iminazolines. (C. W. Gowdey) 45-50  
The toxicity of vesicants and some other compounds to the pyruvate oxidase system (brain). (R. A. Peters & R. W. Wakelin) 51-62  
The vasodepressor action of noradrenaline. (G. B. West) 63-67  
Miracil. Clinical trial on patients infected with *Schistosoma haematobium* and *S. mansoni*. (D. M. Blair, F. Hawking, C. V. Meeser & W. F. Ross) 68-80  
Antimalarial compounds as antagonists of adenosine. (J. Madinaveitia & J. Raventos) 81-92  
The effect of hepatectomy on the action of certain anaesthetics in rats. (J. M. Walker & C. B. W. Parry) 93-97  
The pharmacology of the optical isomers of amidone (2-dimethylamino-4: 4-diphenylheptan-5-one). (R. H. Thorp) 98-104  
Antimitotic action of maleimide and related substances. (E. Friedmann, D. H. Marrian & I. Simon-Reuss) 105-108  
"Constant flow" organ-bath techniques. (F. N. Fastier & C. S. W. Reid) 109-110

## British Journal of Physical Medicine

### 11 : March-April 1948

Physics in the life of a surgeon. (H. S. Souttar) 34-40  
Physical medicine and geriatric problems. (T. H. Howell) 40-42  
Post-surgical rehabilitation. (S. A. S. Malkin) 42-43  
Osteoarthritis in industry. (O. Savage) 43-47  
Rehabilitation after injury. Some problems in an engineering works. (G. F. Keatinge) 47-48  
British doctors visit Czechoslovakia. (B. Kiermander) 49-51  
The spa and the patient. Principles of selection. (P. Mayer) 52-53  
Suggested improvements in terminology. (W. Summer) 53-55  
The complex behaviour of high-frequency currents in simple circuits. (P. Bauwens) 55

### 11 : May-June 1948

Muscle action potentials used in the study of dynamic action. (C. E. L. Allen) 66-73  
The mind-body relationship. (W. Barlow) 74-80  
The treatment of cerebral palsy. (J. H. Crosland) 81-85  
Some efficacious methods in physical medicine. 1. Shoulder raising and neck exercises in the treatment of brachial neuralgia. (K. N. Lloyd) 85-87  
2. Remedial exercises in postural defects of the feet. (D. M. Baker) 87-88

### 11 : July-August 1948

General medicine and the locomotor disorders. (Horder) 98-101  
Thermionic valve stimulators: their value and limitations. (A. E. Ritchie) 101-109  
Use of the traxator in non-articular rheumatism: a clinical assessment. (F. Bach & L. N. Yhap) 110-113  
The physical treatment of certain functional disorders of the intestinal tract. (N. Kellgren) 113-115  
An electronic method for immediate visual recording of the pulse rate. (W. Rotherham) 115

### 11 : September-October 1948

Electromyography. (P. Bauwens) 130-136  
Osteoarthritis and its treatment. (E. Fletcher) 136-140  
The epileptic in industry. (J. T. Fox) 140-144  
Manual vibrations and nerve frictions: with special reference to peripheral facial paralysis. (E. Cyriax) 144-146

### 11 : November-December 1948

Rehabilitation of the elderly patient. (T. H. Howell) 161  
Geriatric rehabilitation. The contribution of physical medicine. (L. Z. Cosin) 162-167  
Physical medicine in geriatrics. (M. W. Warren) 167-169  
tation of quadriplegics  
(H. A. Burt) 173-177  
Social and economic aspects of the rheumatic diseases. (J. M. Mackintosh & J. Knowelden) 177-183  
other painful conditions.

### 12 : January-February 1949

Physical disability in industrial recruits. (J. V. Manning) 2-6  
Domiciliary physiotherapy. (F. Bach) 6-10  
Rheumatoid arthritis. (W. S. Tegner) 10-13

## 12 : March-April 1949

- Physical medicine in Canada. (T. H. Coffey) 30-34  
 Epidermophytosis: preventive measures at pit-head baths. (J. B. Adamson & W. G. Annan) 34-37  
 Medical electronics: report of an international congress. (M. Michaelis) 38-42  
 Hydrotherapy. (M. B. Ray) 43-46

## British Journal of Plastic Surgery

## 1 : April 1948

- Plastic surgery in the training of a surgeon. (J. P. Ross) 4-7  
 Congenital absence of the penis. (H. Gillies) With embryological considerations. (R. J. Harrison) 8-28  
 Deformities of the male urethra. (A. McIndoe) 29-47  
 The treatment of lymphoedema. (R. Mowlem) 48-55  
 Pollicisation of the index finger. Report of a completed case utilising a normal index finger. (J. B. Cuthbert) 56-59  
 The technique of pollicisation of the index finger. (F. T. Moore) 60-68  
 The "horse-shoe" web flap in the treatment of syndactyly. (M. C. Oldfield) 69-72

## 1 : July 1948

- Ectropion corrected by bridge-pedicle graft. (H. B. Stallard) 77-80  
 Some observations on anaemia in patients with burns. (F. Braithwaite & F. T. Moore) 81-86  
 A case of anal reconstruction by means of local skin flaps. (J. Penn) 87-88  
 Reduplication of mouth, tongue, and mandible. (C. R. McLaughlin) 89-95  
 An unusual leg flap. (A. C. Buchan) 96-98  
 Breast reduction and lactation. (A. Ragnell) 99-103  
 A visit to the annual meeting of the American Association of Plastic Surgeons. (R. P. Osborne) 104-109  
 Zigzag modification of the tubed-pedicle flap. (J. Penn) 110  
 Columella reconstruction. A case of nasal deformity resulting from syphilis. (M. H. Shaw & S. R. Fell) 111-116  
 Serial excision (as applied to a naevus of the cheek). (J. S. P. Wilson) 117-118  
 Notes on the reconstruction of the thumb. (H. E. Blake) 119-122  
 Fractures of the malar-zygomatic compound. A review of the results of treatment in 153 consecutive patients. (O. T. Mansfield) 123-126  
 A case of ankylosis of the left temporo-mandibular joint of thirty years' duration. (W. Bakewell) 127-130  
 Comparison of the cutaneous sensory pattern of different regions of the body. A preliminary note. (J. Hutchison, J. S. Tough & G. M. Wyburn) 131-144

## 1 : October 1948

- Observations on hypospadias: including the late results of Ombrédanne's nethroplastic operation. (A. M. Loughran) 147-158  
 A simple method of estimating blood flow with special reference to the circulation in pedicled skin flaps and tubes. (W. Hynes) 159-171  
 Facial injuries followed by meningitis, with recovery: case report. (A. J. B. Phillips) 172-175  
 Repair of nasal defects with free auricular grafts. Report of four cases. (J. Szlczak) 176-180  
 Plastic surgery in the treatment of malignancy. (H. P. Pickerill) 181-186  
 Studies in cellular growth. (M. Maltz) 187-205  
 Melanosis of the eyelids. (F. Braithwaite) 206-211  
 The subcutaneous transplantation of skin. (S. Gordon) 212-216

## 1 : January 1949

- Prefabricated autogenous ear cartilages. (H. E. Blake) 220-231  
 Treatment of burns. A return to basic principles. (A. B. Wallace) 232-244  
 Osteoporosis following burns. (N. Owens) 245-256  
 Complications and sequelae of untreated fractures of the facial bones and their treatment. (F. T. Moore & T. G. Ward) 257-267  
 Pressure sores in paraplegic patients. (R. Bault) 268-273  
 Operative treatment of abdominal obesity, especially pendulous abdomen. (J. Foged) 274-283  
 Some observations on Curling's ulcer. (F. Braithwaite & P. H. Beales) 284-287

## 2 : April 1949

- The use of fluorescein in estimating the blood flow in pedicled skin flaps and tubes. (W. Hynes & A. G. Macgregor) 4-12  
 Malignant disease of the face and scalp: excision and repair. (G. M. FitzGibbon & D. C. Bodenham) 13-20  
 Some observations on the treatment of the dorsal burn of the hand. (F. Braithwaite & J. Watsoo) 21-31  
 Measurement of joint ranges: suggestions for simplicity. (J. P. Reidy) 32-37  
 A report on three unusual cleft lips. (F. Braithwaite & J. Watsoo) 38-49  
 Haemangiomas. (J. P. Reidy) 50-56  
 Clinical observations on the use of dibromopropamide (M & B 1270) for surface infections, with particular reference to *B. Proteus vulgaris* and *Ps. pyocyanea*. (A. H. Champion & A. McDowall) 57-60  
 Absence of the septal cartilage with retarded nasal development. (C. R. McLaughlin) 61-64  
 A new instrument for rhinoplastic surgery. (S. S. Tausend) 65-66  
 A case of turban tumour. (D. C. Bodenham) 67-70

## British Journal of Radiology

## 21 : April 1948

- Ossifying haematoma and other simple lesions mistaken for sarcoma. The responsibility of biopsy. (J. F. Brailsford) 157-170  
 The significance of certain measurements of the skull in the diagnosis of basilar impression. (M. McGregor) 171-181  
 Observations on the development of graphite pneumoconiosis. (L. Dunner) 182-185  
 Accuracy in radon work. (H. C. Webster) 186-188  
 The presentation and analysis of the results of radiotherapy. (J. W. Boag) 189-203  
 A viscous diiodo as a substitute for iodised oil. (M. W. H. Mackay) 204-205

## 21 : May 1948

- Gamma-ray protection in radium therapy. (C. W. Wilson & J. R. Greening) 211-220  
 The value of platelet counts in radiotherapy. (W. M. C. Brown) 221-225  
 Radiology in heart surgery. (T. H. Sellors) 226-235  
 Engelmann's disease: osteopathia hyperostotica scleritiformis multiplex infantilis. Report of a case. (H. R. Sear) 236-241  
 Tibia vara. A case of doubtful aetiology. (H. Morris) 242-243  
 Experimental X irradiation of the rat thyroid. (A. E. Bender) 244-248  
 Mammary cancer: the place of surgery and of radiotherapy in its management. Part II. Radiotherapeutic procedures. (G. E. Richards) 249-258

## 21 : June 1948

- The effect of beta rays on cells cultivated *in vitro*. (I. Lasnitzki) 265-269  
 The treatment of cancer of the maxillary antrum by radium. (M. C. Tod) 270-275  
 A theoretical study of the results of ionization measurements in water with X-ray and gamma-ray beams. (L. F. Lamerton) 276-286  
 Plain radiography of the skull in the diagnosis of intracranial tumours. (D. Stenhouse) 287-300  
 A simple apparatus for making rapid serial radiographs of small objects. (G. E. H. Foxon) 301-304  
 Some aspects of radiology in war-time Germany. (G. E. Donovan) 305-308  
 Carcinoma of the duodenum. (K. Mendl & C. H. Tanner) 309-310

## 21 : July 1948

- Advances in the design of X-ray diagnostic equipment. (A. Nemet) 319-329  
 The chromophobe adenoma of the pituitary. An evaluation of its treatment and some case reports. (W. G. Evans & G. Picciotto) 330-336  
 Vacuum intervertebral discs. (E. Samuel) 337-339  
 Case for diagnosis. (F. Retief) 340-341  
 Armillifer armillatus. A note on three cases of calcification of the cysts in man. (G. M. Ardran) 342-345  
 Volvulus of the caecum. (H. Jungmann) 346  
 A Geiger-Müller counter for measuring the beta-ray activity of liquids, and its application to medical tracer experiments. (N. Veall) 347-351  
 A theoretical study of the results of ionization measurements in water with X-ray and gamma-ray beams. Part II. Discussion on results of calculations and comparison with experiment. (L. F. Lamerton) 352-364

## 21 : August 1948

- The place of physics in the training of the medical radiologist. Presidential address. (G. Stead) 373-379  
 Angiocardiography in the diagnosis of congenital heart disease. (K. D. Keele) 380-393  
 Angiocardiography applied to congenital heart disease: observations on the radiology and technique. (J. A. Brocklebank) 393-397  
 Calcified splenic infarctions. Report of a case. (G. L. Hardman) 398-399  
 Multiple tuberculous lesions of the spine. (J. L. Feuchtwanger) 400-405  
 The irradiation treatment of carcinoma of the breast. (F. M. Allchin & C. W. Wilson) 406-413  
 Time-intensity factors in X-irradiation. (E. Paterson & M. V. Thompson) 414-419  
 A negative feed-back dosage-rate meter. (R. J. Herbert) 420-424  
 A note on a self-sealing insulator for a high pressure ionization chamber. (J. Read) 425-426

## 21 : September 1948

- The röntgen ray examination of the paranasal sinuses with particular reference to the frontal sinuses. (S. Welin) 431-437  
 The pathological gall bladder. (F. Greenwood & E. Samuel) 438-445  
 Radiological determination of the level of the diaphragm in emphysema. (M. Grossmann & H. Herxheimer) 446-448  
 A further report on factors in the aetiology of osteochondritis of the spine. (F. H. Kemp & D. C. Wilsoo) 449-451  
 Note on a type of flexion fracture of the spine. (G. Q. Chance) 452-453  
 Approximate theoretical solution of a problem of scattering of soft X-rays ( $\lambda$  between 0.25 and 0.56 Å) and its consequences in medical radiology. (R. H. de Waard) 454-463  
 Radiation myelitis of the cervical spinal cord. (G. Boden) 464-469  
 A method of checking the centring of X-ray tubes. (A. D. O'Connor & L. F. Lamerton) 470-471  
 Angiocardiographic experiments on the pathogenesis of adrenalectomy pulmonary oedema in rabbits. (A. Elkeles) 472-476

## 21 : October 1948

- Observations upon the lymphopenia of X-ray irradiation. (C. H. G. Price) 481-493  
 Surface and emergent doses in radiotherapy. (J. R. Clarkson & R. J. T. Herbert) 494-500  
 Radiotherapy in dermatological conditions. (R. T. Brain) 501-507  
 Penetrating ulcer of the descending duodenum with severe secondary anaemia caused by a foreign body. (A. Elkeles) 508-510  
 Note on an apparatus for angiocardiography. (T. H. Hills) 511-512  
 Some observations on certain congenital abnormalities of the hand in African natives. (J. H. Smitham) 513-518  
 Gastric varices. (E. Samuel) 519-522  
 Appendix situated within the thorax. (R. Fawcitt) 523-525  
 Appendiceal calculus. (G. R. Airth) 526-527

## 21 : November 1948

- Some tracer and therapeutic studies with artificial radioactivity. Sir James Mackenzie Davidson Memorial Lecture. (J. H. Lawrence) 531-543  
 Microradiography applied to botany. (A. E. Barclay & D. Leatherdale) 544-551  
 Radioactive iodine as a diagnostic aid for intra-thoracic goitre. (G. Ansell & J. Rotblat) 552-558  
 The relation of radiosensitivity and radiocurability to the histology of tumour tissue. (A. Glücksmann) 559-566  
 A preliminary note on some biological effects of alpha radiation on the frog tadpole. (K. Tansley, L. H. Gray & F. G. Spear) 567-570  
 Vertical fracture of the patella. (G. F. Jommesse & M. H. Feinsinger) 571-574  
 Radiological demonstration of ascari infestation. (C. Strang & C. K. Warrick) 575-578

# GUIDE TO THE JOURNALS

1413

21 : December 1948

- Carcinoma of the breast: Symposium.  
I. Results from statistical research. (J. Clemmesen) 583-590  
II. "Precancerous conditions" of the breast. (E. K. Dawson) 590-594  
III. Prognosis in carcinoma of the breast. (R. W. Scarff) 594-596  
IV. Discussion on carcinoma of breast. (S. Cade) 596-599  
V. The value of simple mastectomy and radiotherapy in the treatment of cancer of the breast. (R. McWhirter) 599-610  
VI. The surgical aspect of carcinoma of the breast. (R. C. B. Ledlie) 610-617  
VII. The surgical projection from the mediastinum: a radiographic appearance of the thymus gland. (F. H. Kemp) 618-624  
VIII. A sail-like triangular projection from the mediastinum: a radiographic appearance of the thymus gland. (F. H. Kemp) 618-624  
IX. The radiological diagnosis of chronic amoebic colitis. (E. Samuel) 625-631  
X. A mobile Geiger-Müller tube counting system and some of its medical applications. (R. C. Turner & W. K. Sinclair) 632-637

22 : January 1949

- The Mackenzie Davidson Memorial Lecture, 1948. "... The future comes apace. What shall defend the interim?" (E. R. Carling) 1-10  
Radiological diagnosis of intestinal obstruction by means of direct radiography. (J. H. Middlemiss) 11-24  
Some aspects of the mucosal pattern in the diagnostic study of carcinoma of the stomach. (G. Steiner) 25-32  
An investigation into some factors affecting X-ray dose distribution and its measurement. (R. Oliver & L. A. W. Kemp) 33-43  
Report on the installation of a ten gramme telradium unit. (J. H. Martin, T. J. Tulley & E. B. Harris) 44-48  
A further survey of radiation sickness with particular reference to its treatment by pyridoxine. (L. M. Shorvon) 49-55

22 : February 1949

- The vascularisation of the human stomach: a preliminary note on the effect of trauma. (A. E. Barclay & F. H. Bentley) 62-67  
The diagnosis of chronic subdural haematoma in children and adolescents. (J. W. D. Bull) 68-80  
An aluminium filter for use in localisation of the placental site. (F. Reid) 81-83  
Cysticercosis: discussion and presentation of a case. (W. H. McMenemy & A. A. Vickers) 84-87  
Chordomata: with report of a sacro-coccygeal case. (H. Halper) 88-89  
The influence of tumour histology, duration of symptoms and age of patient on the radiocurability of cervix tumours. (M. Gilmour, A. Glücksmann & F. G. Smead) 90-95  
The integral dose received from a uniformly distributed radioactive isotope. (F. Bush) 96-105  
Some experiments with a 14 Mev. betasynchrotron. (D. J. Allen-Williams & R. K. Appleby) 106-109  
A method of estimating the time at which a counting rate changes, using a Geiger-Müller counter. (S. B. Osborn & H. P. Wright) 110-116

22 : March 1949

- Radiographic studies showing the induction of a segmentation pattern in the small intestine in normal human subjects. (A. C. Frazer, J. M. French & M. D. Thompson) 123-136  
Bronchography—the methods by which it may be performed and the factors influencing the choice of method employed. Part I. (A. A. Vickers) 137-151  
Pulmonary actinomycosis. (S. F. Oosthuizen & M. H. Fainsinger) 152-155  
Note on the estimation of the bi-spinous diameter in pelvimetry. (J. B. Hartley) 156-157  
A simple apparatus for aimed exposures. (S. D. Kilner) 158-159  
Clinical radiation dosage. (L. Cohen) 160-163  
A radon purification apparatus. (H. C. Sutton) 164-168  
The construction and performance of a high pressure condenser ionization chamber. (F. W. Spiers) 169-172  
A note on tangential irradiation without the use of bolus packing. (J. R. Clarkson) 173-176

22 : April 1949

- Small field X-ray therapy for deep-seated tumours, with special reference to the use of the Compton scattering of photons by electrons. (P. R. Stead, A. D. O'Connor, L. F. Lamerton, J. G. Wilson & D. W. Smithers) 185-209  
The use of X-ray films in the direction for X-ray therapy. (W. A. Copcutt) 210-214  
A note on the Klein-Nishina formulae for the Compton scattering of photons by electrons, with table. (R. K. Appleby & D. J. Allen-Williams) 215-223  
The use of CO<sub>2</sub> and air as antispasmodics. (F. Cave) 224-233  
Bronchography—the methods by which it may be performed and the factors influencing the choice of method employed. Part II. (A. A. Vickers) 234-244  
A home-made viewing box employing fluorescent illumination. (J. Aspio) 245-253

## British Journal of Social Medicine

2 : January 1948

- A study of the incidence of disease in a whaling expedition to the Antarctic pelagic whaling grounds. (R. A. M. Case) 1-17  
Army experience of syphilis therapy. (C. C. M. James, D. G. Mackay & J. T. Wright) 18-28  
Studies on puberty. Part I. (H. Hogben, J. A. H. Waterhouse & L. Hogben) 29-42

2 : April 1948

- Bed-states in the Dominions. (R. Padley) 45-52  
The Swedish bed-state. (G. Dahlberg) 53-54  
Returns of sickness from ships of the Royal Navy (1945-46): a contribution to medical climatology. (J. A. F. Roberts) 55-65  
Social and nutritional factors in adolescent osteochondritis of the spine. (F. H. Kemp, D. C. Wilson & E. Emrys-Roberts) 66-70  
Hereditary mesodermal dystrophy. (F. H. Kemp, D. C. Wilson, W. M. Fish & W. Stobie) 71-73

2 : July 1948

- American medical services. (T. McKeown) 77-105  
The significance of nuptiality with respect to interpretation of sex differences. (M. M. Johnstone & M. E. Hosker) 106-122

2 : October 1948

- Sickness and stress in operational flying. (D. D. Reid) 123-131  
The gerontological aspects of atheroma. An approach to a pathology of senescence. (E. Geiringer) 132-138  
An application to a laboratory problem of discriminant function analysis involving more than two groups. (R. F. Jennison, J. B. Penfold & J. A. F. Roberts) 139-148  
The statistical specificity of a code personnel cypher sequence. (L. Hogben & K. W. Cross) 149-152

3 : January 1949

- Biological factors affecting family size. (F. A. E. Crew) 1-9  
Studies of the diet of students at Edinburgh University. (A. H. Kitchin, R. Passmore, M. Pyke & G. M. Warnock) 10-28  
Mortality from rheumatic heart disease in children and young adults in England and Wales. (J. Kooowelden) 29-41

## British Journal of Surgery

35 : April 1948

- A study in intravascular thrombosis with some new conceptions of the mechanism of coagulation. (H. Cummine & R. N. Lyons) 337-363  
The surgery of duodenal ulcer. (C. Wells & A. C. Brewer) 364-374  
Some interesting gastrojejunal lesions. (J. Moroney) 374-376  
The surgical treatment of anastomotic ulcer. An analysis of thirty-eight cases. (F. S. A. Doran) 377-382  
An important anomaly of the right hepatic duct and its bearing on the operation of cholecystectomy. (M. Paul) 383-385  
Occult bone metastases. (R. Shackman & C. V. Harrison) 385-389  
Whole skin-graft repair of inguinal hernia. An account of 163 operations, with a follow-up of 136 operations at 12 months. (C. M. Marsden) 390-394  
Indirect inguino-femoral hernia. (T. A. Quilliam) 395-396  
Trauma of the hand. (J. M. Duncan) 397-406  
Perineal tumours: with a report of a further case of perineal fibrosarcoma. (H. G. Hanley) 406-410  
An osseous dystrophy with many pseudo-fractures. (J. F. Curr) 411-414  
I. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 415-426  
II. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 427-438  
III. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 439-448  
IV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 449-458  
V. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 459-468  
VI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 469-478  
VII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 479-488  
VIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 489-498  
IX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 499-508  
X. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 509-518  
XI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 519-528  
XII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 529-538  
XIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 539-548  
XIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 549-558  
XV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 559-568  
XVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 569-578  
XVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 579-588  
XVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 589-598  
XIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 599-608  
XX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 609-618  
XXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 619-628  
XXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 629-638  
XXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 639-648  
XXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 649-658  
XXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 659-668  
XXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 669-678  
XXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 679-688  
XXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 689-698  
XXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 699-708  
XXX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 709-718  
XXXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 719-728  
XXXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 729-738  
XXXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 739-748  
XXXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 749-758  
XXXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 759-768  
XXXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 769-778  
XXXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 779-788  
XXXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 789-798  
XXXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 799-808  
XL. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 809-818  
XLI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 819-828  
XLII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 829-838  
XLIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 839-848  
XLIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 849-858  
XLV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 859-868  
XLVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 869-878  
XLVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 879-888  
XLVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 889-898  
XLIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 899-908  
L. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 909-918  
LI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 919-928  
LII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 929-938  
LIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 939-948  
LIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 949-958  
LV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 959-968  
LVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 969-978  
LVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 979-988  
LVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 989-998  
LIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 999-1008  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1009-1018  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1019-1028  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1029-1038  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1039-1048  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1049-1058  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1059-1068  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1069-1078  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1079-1088  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1089-1098  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1099-1108  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1109-1118  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1119-1128  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1129-1138  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1139-1148  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1149-1158  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1159-1168  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1169-1178  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1179-1188  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1189-1198  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1199-1208  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1209-1218  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1219-1228  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1229-1238  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1239-1248  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1249-1258  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1259-1268  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1269-1278  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1279-1288  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1289-1298  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1299-1308  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1309-1318  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1319-1328  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1329-1338  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1339-1348  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1349-1358  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1359-1368  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1369-1378  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1379-1388  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1389-1398  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1399-1408  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1409-1418  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1419-1428  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1429-1438  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1439-1448  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1449-1458  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1459-1468  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1469-1478  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1479-1488  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1489-1498  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1499-1508  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1509-1518  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1519-1528  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1529-1538  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1539-1548  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1549-1558  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1559-1568  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1569-1578  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1579-1588  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1589-1598  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1599-1608  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1609-1618  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1619-1628  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1629-1638  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1639-1648  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1649-1658  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1659-1668  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1669-1678  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1679-1688  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1689-1698  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1699-1708  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1709-1718  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1719-1728  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1729-1738  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1739-1748  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1749-1758  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1759-1768  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1769-1778  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1779-1788  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1789-1798  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1799-1808  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1809-1818  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1819-1828  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1829-1838  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1839-1848  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1849-1858  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1859-1868  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1869-1878  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1879-1888  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1889-1898  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1899-1908  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1909-1918  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1919-1928  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1929-1938  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1939-1948  
LXIV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1949-1958  
LXV. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1959-1968  
LXVI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1969-1978  
LXVII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1979-1988  
LXVIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1989-1998  
LXIX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 1999-2008  
LX. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 2009-2018  
LXI. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 2019-2028  
LXII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G. Macleod & R. J. G. Sinclair) 2029-2038  
LXIII. A case of Paget's disease of the bone. (J. J. R. Duthie, J. G.

- Pulmonary resection for metastatic malignancy. Three cases secondary to hyper-nephroma. (D. Robb) 200-202  
 Spontaneous rupture of the splenic artery. (J. F. E. Gillam) 203-204  
 Duodenocolic fistula complicating carcinoma coli. (E. P. H. Drake & J. F. Goodwin) 204-208  
 Glossopharyngeal neuralgia: extracranial neurectomy. (J. T. Morrison) 208-209

## 36 : January 1949

- Plain radiography in intraspinal protrusion of lumbar intervertebral disks: a correlation with operative findings. (A. C. Begg & M. A. Falconer) 225-239  
 Thorotrast pyogranuloma in cerebral abscess. (G. K. Tutton & W. H. T. Shepherd) 240-256  
 A study of post-operative pulmonary atelectasis. (J. Goodwin) 256-263  
 Some observations on the functional anatomy of inguinal hernia and its bearing on the operative treatment. (D. H. Patey) 264-267  
 Total denudation of the penis. (A. R. Banham) 268-270  
 Thymoma: with a report of 5 cases. (H. Reid & R. Marcus) 271-279  
 The anal intermuscular septum. (F. R. Wilde) 279-285  
 Investigation and treatment of arterial disturbances in the lower limbs. (C. Jones & R. E. Steiner) 286-294  
 Injection treatment of varicose veins. Radiological and histological investigations of methods. (J. B. Kinnmonth & D. J. Robertson) 294-300  
 Spontaneous herniation through the transverse mesocolon. A review of the literature and the report of a case. (H. W. Gallagher) 300-305  
 A case of osteitis fibrosa cystica. (E. W. Thomas) 306-309  
 Traumatic false aneurysm simulating bone sarcoma. (D. C. Bowie & A. W. Kay) 310-311  
 The solitary thyroid nodule and thyrotoxicosis. (H. L. M. Roualle) 312-314  
 Pott's puffy tumour. (L. Rogers) 315-316  
 Foam-cell granuloma in chronic pyonephrosis simulating tuberculosis. (H. J. Barrie) 316-319  
 Localized diverticulitis in the transverse colon. (H. E. Lockhart-Mummery) 319-321  
 A case of thymolipoma. With observations on a possible relationship to intra-thoracic lipomata. (G. F. M. Hall) 321-324  
 Two cases of persistent jejunitis following partial gastrectomy. (J. L. Stephen) 325-326  
 A complication of cholecystgastrostomy. Fruit skins in the gall bladder. (J. Borrie) 326-327  
 Spontaneous ventral hernia. Two cases of para-inguinal hernia. (J. Grierson & A. Leacock) 327-328  
 A radiological appearance of the papilla Vateri in pancreatic disease. (N. M. Matheson & K. D. Keele) 329-331  
 Chronic non-specific ulceration of caecum. (A. H. Sangster) 331-332

## British Journal of Tuberculosis and Diseases of the Chest

## 42 : January 1948

- Sarcoidosis. (L. M. Pautrier) 1-7  
 On the Kveim reaction in Boeck's disease. (H. Haxthausen) 7-11  
 Sarcoid. (W. Freudenthal) 11-16  
 Scrofula pneumocele and inguinal hernia complicating pneumoperitoneum therapy. (M. M. Nagley) 17-20

## 42 : April 1948

- Extrapleural pneumonolysis with lucite plombage. (J. B. Grow & R. E. Dwork) 25-31  
 Myocardial metastasis by bronchial carcinoma and other neoplasms. (J. E. G. Pearson) 31-38  
 Serous tuberculosis in East African natives. (S. R. Wood) 38-45  
 Thoracoplasty in the tubercle gravaide. (J. P. McIntyre) 45-47

## 42 : July 1948

- Open intra-pleural pneumonolysis in the treatment of pulmonary tuberculosis. (R. A. Smith) 51-58  
 Pneumoperitoneum: its place in treatment. (R. Y. Keers) 58-66  
 Polyarteritis nodosa with pulmonary manifestations and cardiac failure. (M. S. R. Hunt) 66-70  
 Scrofula pneumocele complicating artificial pneumoperitoneum. (H. Meltzer) 70-72

## 42 : October 1948

- Recent advances in rehabilitating the tuberculous. (F. Heaf) 75-83  
 The chick-embryo in sanatorium practice. (J. Cuthbert & G. G. Davidson) 83-89  
 Alveolar cell tumour of the lung. Report of a case. (R. I. McCallum) 90-97

## 43 : January 1949

- Pulsus paradoxus and pleurisy. (W. E. Gibb) 1-6  
 Tuberculosis of the lung masquerading as encysted pleural effusion. (N. Wynn-Williams) 6-11  
 A key to the classification of pulmonary tuberculosis. (M. Sekulich) 12-17  
 Pneumomediastinum complicating artificial pneumoperitoneum. (J. B. Morrison) 18-19

## British Journal of Urology

## 21 : March 1949

- British Association of Urological Surgeons, Annual Meeting, 1948:  
 Aetiological and therapeutic experiences concerning kidney and ureteric stones. (J. Hellström) 9-16  
 Bilateral renal calculi. (J. T. Tait) 17-19  
 Vesical calculus in Norfolk. (J. M. R. Thomas) 20-23  
 Radioscopy in nephrolithotomy. (N. J. Nicholson) 24-26  
 Tubular calcification in the kidney. (L. N. Pyrah) 27-29  
 The urinary citrate excretion in patients with renal calculi. (N. S. Conway, A. I. L. Maitland & J. B. Rennie) 30-38  
 Discussion on urinary calculus. 39-46  
 The technique and results of ureterocolic anastomosis by the extraperitoneal route. (E. W. Riche) 51-63  
 Simultaneous bilateral ureterocolic anastomosis. (B. B. Hickey) 64-67  
 Streptomycin in non-tuberculous urinary infections. (C. A. Wells & R. Marcus) 68-77

## British Journal of Venereal Diseases

## 24 : June 1948

- The treatment of early syphilis with penicillin, neoarsphenamine, and bismuth. (G. L. M. McElligott, F. J. G. Jefferies & R. R. Willcox) 45-49  
 The significance of pleuropneumonia-like or "L" organisms in non-gonococcal urethritis, Reiter's disease, and bacterial pyuria. (A. H. Harkness & A. Henderson-Begg) 50-58  
 The psychological aspects of venereal disease. (E. D. Wittkower) 59-64  
 Discussion on the psychological aspects of venereal disease. 64-67  
 The laboratory aspects of sexual crime. (H. S. Holden) 68-69  
 Discussion on the laboratory aspects of sexual crime. 70-71  
 The Laughlin test: with particular reference to its suitability as a preliminary screen test. (B. R. Sandiford & A. M. Khal) 72-75

## 24 : September 1948

- The treatment of neurosyphilis with penicillin. (J. P. Martin) 89-100  
 Discussion on the treatment of neurosyphilis with penicillin. 100-103  
 Gangrene of the toes in syphilis. Description of a case with a critical review of the literature. (E. J. Moynahan) 104-108  
 Non-bacterial infection of the urinary tract. (W. E. Coutts) 109-120  
 Discussion on non-bacterial infection of the urinary tract. 120-123

## 24 : December 1948

- The pathology of gonorrhoea. (A. H. Harkness) 137-147  
 Syphilis, tuberculosis, and sickle-cell anaemia: report of a case. (A. I. Suchett-Kaye) 148-150  
 The Hôpital Saint-Lazare in Paris: its past and present history. (P. Blum) 151-152  
 Some account of the history of the treatment of syphilis. (J. J. Abraham) 153-161

## 25 : March 1949

- Granuloma inguinale. (P. A. Clearkin) 1-8  
 The use of vaginal and rectal cultures in the management of gonorrhoea in the female. (A. E. Wilkinson) 9-12  
 The problem of the homosexual with venereal disease. (F. G. Macdonald) 13-15  
 The teaching of venereology. (R. Lees) 16-25  
 Impressions of postgraduate teaching on venereology in Paris: gonorrhoea. (G. Fayner) 26-27  
 Venereal disease in the Bible. (R. R. Willcox) 28-33

## British Medical Journal

## 1 : 3/4/48

- The Public Health Laboratory Service. (G. S. Wilson) 627-631  
 Identification of medical documents. (L. Hogben & M. M. Johnstone) 632-635  
 Treatment of hyperidrosis. (H. A. Haxton) 636-638  
 Immediate prostatectomy for retention of urine. (G. A. B. Walters) 638-640  
 Some simple observations on transfusion reactions. (J. Wallace & R. D. Richards) 640-643  
 Iso-immunization by the blood factor N. (L. De Kromme & L. A. M. Van Der Spek) 643-644

## 1 : 10/4/48

- Surgical teaching in America. (A. E. Porritt) 673-677  
 The Public Health Laboratory Service. Origin and development of public health laboratories. (G. S. Wilson) 677-682  
 The Guterman test in threatened abortion. A report based on 100 consecutive cases. (S. Bender) 683-684  
 The Guterman test for pregnancy. (W. H. H. Merivale) 685-686  
 Hydrolysis of protein in cartilage and bone. (P. Pincus) 687-689  
 The yearly re-examination of a factory group by mass miniature radiography. (W. P. Dick) 689-691

## 1 : 17/4/48

- Chemotherapy of cholera with a new sulphonamide compound ("6257"): laboratory investigations and field trials. (S. S. Bhatnagar, J. de Sa, F. Fernandes & P. V. Divekar) 719-723  
 Treatment of ringworm of the scalp. (R. T. Brain, K. Crow, H. Haber, C. McKenny & J. W. Hadercraft) 723-726  
 Prevention of ringworm in the tropics. (H. R. Jolly) 726-728  
 Effects of sex and thyroid hormones on the process of ageing in female rats. (V. Korenchevsky) 728-731  
 Serum iron in normal women. (S. Dahl) 731-733  
 Refractory iron-deficiency anaemia treated with intravenous saccharated oxide of iron. (L. S. P. Davidson & R. H. Girdwood) 733-734

## 1 : 24/4/48

- Folic acid. (J. F. Wilkinson) 771-776  
 Acute intussusception in childhood. (B. Morrison & D. Court) 776-780  
 An unusual case of adrenal carcinoma: with a note on the application of a new colour test. (L. R. Broster & J. Patterson) 781-782  
 Adrenal feminism due to carcinoma of the adrenal cortex. A case report and review of the literature. (C. N. Armstrong & J. Simpson) 782-784  
 Idiosyncrasy to d-tubocurarine chloride. (T. C. Gray & J. Halton) 784-786

## 1 : 1/5/48

- Fernicious anaemia of pregnancy and the puerperium. (L. S. P. Davidson, R. H. Girdwood & J. R. Clark) 819-822  
 Folic acid. (J. F. Wilkinson) 822-827  
 Congenital megacolon: results of treatment by spinal anaesthesia. (E. D. Telford & H. A. Haxton) 827-828  
 Megaloblastic anaemia of pregnancy: report of an unusual case. (M. Gillespie & A. M. Ramsay) 828-830  
 Hereditary oedema (Milroy's disease). (J. Braham & G. Howells) 830-832  
 Two cases of periarteritis nodosa: with observations on aetiology, diagnosis, and treatment. (J. M. Sutherland) 832-835  
 Accidental syphilis. (R. R. Willcox) 850-851

## 1 : 8/5/48

- Histamine. (J. H. Gaddum) 867-873  
 "Antistim" in dermatology. (J. Overton) 874-876  
 "Anthisan" in treatment of asthma and hay-fever. (N. Southwell) 877-880  
 Chiasma lesion due to fall in epileptic fit. (R. Klein & P. P. O'Mallie) 880-881  
 Juvenile general paralysis. A case with a spontaneous but short-lived remission. (W. L. Milligan) 881-882  
 The centenary of British public health. Rise of health legislation in England and in London. (E. A. Underwood) 890-892

## 1 : 15/5/48

- Aetiology, diagnosis, and treatment of early vitamin-deficiency states. (Z. A. Leitner) 917-922  
 The treatment of neurosyphilis with penicillin. (J. P. Martin) 922-926  
 A case of acute porphyria. (E. Petrie) 926-929  
 A case of acute mononitrobenzene poisoning. (J. D. N. Nabarro) 929-931  
 Heterotopic ossification of an appendicular mucocele. (I. Juvara & U. Borcescu) 931-933

## 1 : 22/5/48

- Pulmonary oedema. (G. R. Cameron) 965-972  
 A new conception of angina pectoris. (R. Wyburn-Mason) 972-975  
 Tolerance limits to radiant heat. (D. I. ... 975-978  
 Sudden death after intravenous sodium ... 978-979  
 A case of murine typhus in London.  
 Two cases of tetanus neonatorum. (C. A. St. Hill & H. Lederer) 980-981  
 The working of a hearing-aid clinic. (R. S. Stevenson) 990-992

## 1 : 29/5/48

- Pneumoconiosis of coal-miners. (C. M. Fletcher) 1015-1022  
 Deficiency scrotal dermatitis in P.O.W.s in the Far East. (A. W. Frankland) 1023-1026  
 Streptomycin in bubonic plague. (C. Haddad & A. Valero) 1026-1027  
 Solitary myeloma of the mandible. (R. Spitzer & L. W. Price) 1027-1028  
 Significance of the gram test for bacteria in relation to penicillin bacteriostasis. (M. George & K. M. Pandalai) 1028-1029  
 Lugol's solution in failing lactation. (D. P. Nicholson) 1029-1030

## 1 : 5/6/48

- The lipotropic factors in experimental cirrhosis. (E. A. Sellers, C. C. Lucas & C. H. Best) 1061-1065  
 Pneumoconiosis of coal-miners. (C. M. Fletcher) 1065-1074  
 Intestinal lesions in malignant hypertension, with report of a case. (G. J. Cunningham) 1075-1077  
 Siliceous granuloma due to talc. A cause of post-operative peritoneal adhesions. (W. A. Mackay & J. B. Gibson) 1077-1078  
 "Tuberculosis" (coexistent with carcinoma of the uterus) shown to be siliceous granuloma. (G. H. Smith) 1078-1079  
 Siliceous granuloma due to surgical talc as a cause of peritoneal adhesion. (W. Walker) 1079  
 The liver in infective hepatitis. (K. Damodaran) 1079-1082  
 Torula histolytica infection of central nervous system. (F. R. Magarey & P. H. Denton) 1082-1083  
 Problems of international travel. (H. S. Gear) 1092-1094

## 1 : 12/6/48

- Pulmonary valvulotomy for the relief of congenital pulmonary stenosis. Report of three cases. (R. C. Brock) 1121-1126  
 B.C.G. vaccination: is it of any value in control of tuberculosis? (A. Wallgren) 1126-1129  
 The efficacy of B.C.G. vaccination ... 1132  
 Exposure to D.D.T. (A. ... 1132-1134  
 Traumatic pseudo-cyst of ... Report of two cases. (B. J. Bickford) 1134-1135  
 Balanced-pulse galvanism. Application of a new principle avoiding ionization effects. (C. E. G. Wickham) 1136-1137

## 1 : 19/6/48

- The lymphatic connexions of the subarachnoid space. An experimental study of the dispersion of particulate matter in the cerebrospinal fluid, with special reference to the pathogenesis of poliomyelitis. (E. J. Field & J. B. Brierley) 1167-1171  
 Epidemiology of the 1947 outbreak of poliomyelitis in Eccles. (W. P. Sweetnam) 1172-1175  
 The ecology of poliomyelitis in a military camp in 1947. (G. J. Dixon) 1175-1178  
 Aberrant endometrial tissue and intussusception. (E. M. Southern) 1178-1180  
 Neonatal *Bact. coli* meningitis after prolonged labour. (H. R. Duval & J. T. Burrows) 1180-1182  
 Cervical sympathetic paralysis (J. D. Craig & R. C. Fuller) 1182-1184  
 Day nurseries and the man-power problem. (W. E. Cavenagh) 1184-1185  
 Weight and blood pressure. (R. A. M. Scott) 1195-1196

## 1 : 26/6/48

- Modern therapy in benign tertian malaria. (J. F. Monk) 1221-1225  
 Demonstration of a persisting exo-erythrocytic culce in *Plasmodium cynomolgi* and its bearing on the production of relapses. (H. E. Shortt & P. C. C. Garnham) 1225-1228  
 Bilharzial affection of the ureter. A study of 110 consecutive necropsies showing vesical bilharzias. (M. Gelfand) 1228-1230  
 Recent trends in treatment of prostatic obstruction. (A. Jacobs) 1231-1234  
 Lower-segment caesarean section. A new head extractor. (B. C. Murless) 1234-1235  
 Papillomata of bladder treated with podophyllin. Preliminary report. (J. E. Sample) 1235-1237  
 Case of sarcoma of the larynx. (E. Broughton-Barnes, E. S. Duthie & B. Jolles) 1237  
 An international standard for stretchers. (R. T. Wells) 1246

## 2 : 3/7/48

- (L. Whitby) 1-6  
 (A. S. MacNalty) 6-9  
 R. Boland) 9-19  
 The health and municipal hospital services of London. (A. Daley) 19-22  
 The end of "compulsory" vaccination. (M. Greenwood) 22-24  
 The role of the part-time consultant. (G. Lowe & T. N. Rudd) 24-26

## 2 : 10/7/48

- Thiouracil and its derivatives in the routine treatment of thyrotoxicosis. (H. P. Himsforth) 61-64  
 Liver function tests in cases treated with thiouracil compounds. (J. Goodwin) 64-67  
 (H. Warshaw) 68-70  
 Foreman) 71-72  
 Iatrogenic hypersplenism: report of a case. (R. Semple) 72-74  
 Peptic ulcer during pregnancy: with a report of a case of perforation. (D. W. James) 74-75  
 Aplastic anaemia in Simmond's disease: report of a case. (A. Bloom & C. C. Bryson) 75-77

## 2 : 17/7/48

- Agents determining and influencing the functions of the pars nervosa of the pituitary. (E. B. Verney) 119-123  
 The use of post-pituitary extract in physiological amounts in obstetrics. A preliminary report. (G. W. Theobald, A. Graham, J. Campbell, P. D. Gange & W. J. Driscoll) 123-127  
 Subtotal colectomy and colectomy in ulcerative colitis. (H. Devine & J. Devine) 127-131  
 Death from inhibition, and its relation to shock. A critical survey. (A. I. Kayssi) 131-134  
 The cremasteric vessels and the repair of indirect inguinal hernia. (E. S. R. Hughes & J. T. Fathi) 135  
 Hodgkin's disease: an unusual case with spinal symptoms. (O. D. Beresford & N. G. B. McLetchie) 136-137

## 2 : 24/7/48

- Some aspects of the treatment of skin diseases. (J. T. Ingram) 187-191  
 Globin insulin: a clinical study. (G. M. Wauchope) 191-194  
 Renal complications in diabetes mellitus: with special reference to the Kimmelstiel-Wilson lesion. (W. R. Gauld, A. L. Stalker & A. Lyall) 194-200  
 Diabetic coma. (R. H. Micks) 200-203  
 Treatment of chronic varicose ulcers by lumbar sympathectomy. (J. Borrie & E. V. Barling) 203-205  
 Treatment of anxiety states in general practice. (C. A. H. Watts) 214-216

## 2 : 31/7/48

- Continued hypertension. Prognosis for surgically treated patients. (R. H. Smithwick) 237-243  
 The sphenoid sinus. (A. W. Proetz) 243-245  
 The surgical anatomy of the parotid gland. (H. Bailey) 245-248  
 Acute uraemia. (S. G. Zondek) 248-251  
 Fibrositis. (J. Cyriax) 251-255

## 2 : 7/8/48

- Antihistamine substances. (H. Dale) 281-283  
 Caffeine and gastric secretion. (D. R. Wood) 283-285  
 Rectal cancer and preservation of function. (E. G. Muir) 286-290  
 The clinical features of mustard-gas poisoning in man. (D. C. Sinclair) 290-294  
 Treatment of typhoid carriers with penicillin and sulphathiazole. (R. M. Fry, R. E. Jones, B. Moore, M. T. Parker & S. Thomson) 295-296  
 Paratyphoid osteomyelitis. Report of two cases. (R. Rozansky, E. N. Ehrenfeld & V. Matoth) 297-298  
*Salm. oranienburg* septicaemia. Report of a further case. (C. N. Parington & T. V. Cooper) 298-299  
 The question of lay psycho-analysis. (E. Glover) 308-309

## 2 : 14/8/48

- Recent advances in our knowledge of the Rh factor. (D. F. Cappell) 323-326  
 Preliminary note on influence of heterospecific immunization of production of Rh antibodies. (J. J. van Loghem) 326-328  
 How important is transfusion as a cause of haemolytic disease of the newborn? (G. Discombe & H. O. Hughes) 329-330  
 The evolution of gastric and duodenal ulceration. (J. D. Craig) 330-334  
 Some problems of causalgia pain. A clinical and experimental study. (J. A. W. Bingham) 334-338  
 A fatal case of myelitis after anti-rabic vaccine. (I. Ansell) 338-340  
 Peritoneoscopy. (J. Hosford) 348-349

## 2 : 21/8/48

- Tubercles of the choroid. (R. S. Illingworth & T. Wright) 365-368  
 due to pitch and tar. (P. Ross) 369-374  
 ous meningitis in childhood: with special reference to J. Craig) 374-378  
 Stainless steel wire for closing abdominal incisions and for repair of hernia (A. L. Abel & A. H. Hunt) 379-382  
 "Mushroom" poisoning due to *Amanita phalloides*. (D. Lewes) 383-385  
 Treatment of genu valgum. The discarded iron. (H. A. Brittain) 385-387  
 A case of skin sensitization to streptomycin. (C. Stringfellow) 387-388  
 Gangrene after scorpion sting. (M. Y. Ansari) 388

## 2 : 28/8/48

- The reduction in dental caries in 5-year-old London school-children (1929-47). (M. Mellanby & H. Mellanby) 409-413  
 Sturge-Kalischer-Weber syndrome of bilateral distribution. (C. Worster-Drought) 414-416  
 Polio-encephalitis. (E. G. Brewis & C. Neubauer) 416-417  
 on an experimental clinic.  
 The value of a new transport  
 Moffett, J. L. Young & R. D.  
 Summary 421-424

The role of abdominal trauma in acute appendicitis. (W. R. Black) 424-425  
A case of intrauterine amputation due to external trauma. (R. F. Lawrence & D. Sherman) 425

2 : 4/9/48

Accident and opportunism in medical research. (H. Dale) 451-455  
The problems of clinical research. (L. J. Wits) 455-459  
Medical research in the laboratory. (C. Harrington) 459-462  
The structure and functions of the Medical Research Council. (F. H. K. Green) 462-466  
The statistician and medical research. (M. Greenwood) 467-468  
Research in general practice. (W. N. Pickles) 469-471  
Medical education in the United States. (R. Whitehead) 471-474  
John Williams and the early history of yellow fever. (G. M. Findlay) 474-476

2 : 11/9/48

Human relations in industry. (G. Schuster) 505-510  
Rat-bite fever due to *Streptobacillus moniliformis*. (I. W. R. Lominski, A. S. Henderson & J. W. McNeel) 510-511  
A case of acute dermatomyositis. (J. M. Holmes) 511-514  
Post-prandial symptoms following partial gastrectomy. (W. T. Irvine) 514-515  
Puerperal septicæmia due to *Ps. pyocyanea*: failure with streptomycin. (H. Sobhi & O. Khairat) 516  
Laurence-Moon-Biedl syndrome. (G. H. Anderson) 517-518  
The factory nurseries. (W. E. Cavanagh) 526-527

2 : 18/9/48

Lowered incidence of sensitization through use of sulphonamide combinations. A new concept. (D. Lehr) 543-548  
Purpura fulminans complicating scarlet fever. (T. Anderson, M. S. Ferguson & J. B. Landsman) 549-550  
Rhabdomyosarcoma of the urinary bladder. (C. H. Vipond) 551-552  
Streptomycin in non-tuberculous infections. Summary of a report to the Medical Research Council. (C. Wilson) 552-553  
"C.B.17": a new analgesic drug. Preliminary communication. (W. M. Wilson & R. B. Hunter) 553-554  
Asphyxia of the newborn treated by rocking. (F. C. Eve & N. C. Forsyth) 554-555  
Gynatresia: report of three uncommon clinical types. (R. G. Maliphant) 555-558  
Medicine as a planned economy. The biochemist's view. (E. B. Hendry) 567-568

2 : 25/9/48

The present position of neurosurgery in gynaecology. (A. Davis) 585-590  
Pethidine and scopolamine in labour. (H. Roberts) 590-593  
Coeliac disease. (W. Sheldon) 594-597  
A study of breast-feeding in a mining town. (E. L. Hughes) 597-599  
Surgical significance of aortic dissecting aneurysms. Report of three personal cases with two correct ante-mortem diagnoses. (D. P. van Meurs) 599-601  
Liquor picis carbonis (B.P.). A carcinogenic agent. (I. Berenblum) 601  
WHO and WMA. Some points in common. (F. A. Calderone) 610-611  
Industrial medicine: International Congress. 612

2 : 2/10/48

Present state of our knowledge of the anatomy of the primates. (F. W. Jones) 629-631  
Carcinoma of the breast and its treatment. (C. Wakeley) 631-635  
Early diagnosis and treatment of carcinoma of the breast. (V. Riddell) 635-639  
Papilloedema in emphysema. (T. Simpson) 639-641  
Out-patient electric convulsion treatment. (W. P. Mallinson) 641-645  
A case of gross overdosage of soluble phenytoin. (T. N. Nauth-Misir) 646

2 : 9/10/48

Surgery of congenital heart disease. (M. Campbell) 669-671  
Large-intestine colic due to sympathetic deprivation. A new clinical syndrome. (H. Ogilvie) 671-673  
Some causes of slight cardiac enlargement. (R. Hartley) 673-676  
Congenital heart disease simulating foetal distress. A report of two cases. (A. O. Sankey) 676-677  
Some aspects of morbidity surveys. (E. R. Bransby) 678-680  
Epilepsy and tetany. (J. E. G. Pearson) 680-681

2 : 16/10/48

An inquiry into the effect of H 11 in the treatment of malignant disease. Report of a committee appointed by the Medical Research Council. 701-708  
Deficiency of vitamin A in university students. (S. Doraiswami & J. Yudkin) 708-710  
The dietary intake of a class of students. (R. P. Cook) 711  
Congenital occlusion of the duodenum. (S. Glaser) 712-713  
Ureteric calculus causing anuria. (N. J. S. Nathan & C. Josephs) 713  
Functioning tumours of the ovary. (E. Novak) 720-721

2 : 23/10/48

The significance of proteins in nutrition. Their particular importance during convalescence. (D. P. Cuthbertson) 731-737  
Bronchial carcinoma. (R. C. Brock) 737-739  
Primary post-partum hæmorrhage. (J. B. Joyce & G. G. Lemmon) 740-743  
A review of femoral hernia with special reference to the recurrence rate of the low operation. (A. G. Butters) 743-745  
Repair of femoral hernia by a "postage stamp" fascial graft. (H. A. Kidd) 745-746  
The structure of medicine. (F. M. R. Walshe) 753-754  
Aspects of rheumatic disorder: Dr. Philip Hench's lectures. 754-756

2 : 30/10/48

Streptomycin treatment of pulmonary tuberculosis. A Medical Research Council investigation. 769-782  
Sudden death due to ependymoma of cerebello-pontine angle. Report of two cases. (N. E. France) 782-783  
Skin tests for sensitivity to liver. (P. C. Reynell) 784  
Hereditary hæmorrhagic telangiectasia. (C. P. Petch) 785  
Intussusception in adults due to carcinoma of the colon. (R. A. C. Owen) 786

2 : 6/11/48

Ethinyl-oestradiol. (T. N. A. Joffe, U. M. Lister, B. Hargreaves & H. Roberts) 809-812  
Menière's syndrome. Successful treatment by surgery on the sympathetic. (E. R. G. Passe & J. S. Seymour) 812-816  
"Rheumatoid disease" with joint and pulmonary manifestations. (P. Ellman & R. E. Ball) 816-820  
Cord complications during pregnancy and labour. (J. Morgan) 820-822  
Hodgkin's disease confined to the jejunum. (G. L. Robinson) 822-823  
The practitioner's part in the anti-tuberculosis scheme. A plea for prompt radiography. (P. Stradling) 832-833

2 : 13/11/48

The role of special diets in the treatment of female infertility. (M. Barton & B. P. Wiesner) 847-851  
The histological aspect in treatment of the infertile marriage. (R. C. Brown) 851-853  
Ringworm of the scalp in the Eastern Region of Scotland, 1946-7. (J. Kinnear & J. Rogers) 854-858  
Cirrhosis of liver presenting as severe anaemia. Report of two cases. (P. N. Coleman) 858-859  
Treatment of abortion fever with sulphonamides and blood transfusions. (J. M. Holmes & R. Hughes) 859-860

2 : 20/11/48

The physiological bases of neuromuscular disorders. (H. Dale) 889-892  
Flocculation tests: chemical and clinical significance. (N. F. MacLagan) 892-896  
The conservative treatment of placenta prævia. (W. G. Mills) 896-899  
The diagnosis of latent tetany with observations on the effect of calciferol. (D. K. O'Donovan) 900-902  
Pathogenic staphylococci. Detection of  $\alpha$ -lysin production on rabbit- and sheep-blood-agar plates. (J. A. W. Miller & J. K. Drucquer) 904  
A case of dicoumarol poisoning. (J. A. W. Miller & J. K. Drucquer) 904

2 : 27/11/48

Pharmacology of the failing human heart. (J. McMichael) 927-933  
Procaine penicillin: effect of single daily injections. (P. F. Jones & R. A. Shooter) 933-934  
Crystalline anti-pernicious-anaemia factor in treatment of two cases of tropical macrocytic anaemia. (J. C. Patel) 934-935  
Inoculation hepatitis. (H. Malmros, O. Wilander & B. Herner) 936-938  
Syringe-transmitted jaundice. An inquiry and a plea. (R. S. Morton) 938-939  
Interminable abdominal operation. Report of a case subsequently fitted with a prosthesis. (D. Mitchell & J. A. Baird) 940-941  
Spontaneous rupture of muscle as a complication of rheumatoid arthritis. (G. D. Kersley) 942

2 : 4/12/48

"Towards a lower paediatric mortality." (W. Gaisford) 969-972  
Temperature recording in sick children. (A. Moncrieff & B. J. Hussey) 972-973  
Infantile diarrhoea and vomiting: a review of 456 infants treated in a hospital unit for enteritis. (M. B. Alexander) 973-978  
Multiple myeloma treated with stilbamidine and pentamidine. (A. E. Brewer) 978-982  
Sepsis in relation to tumours: clinical implications of an experimental study. (P. Browning) 983  
Antihistamine drugs and radiation sickness. (W. M. C. Brown & R. B. Hunter) 984  
Patency of veins after a new technique of cutting-down for transfusion. (A. J. Palmer & A. H. C. Walker) 985

2 : 11/12/48

Prophylaxis of virus infections, with special reference to the use of vaccines. (C. H. Andrews) 1007-1009  
Streptomycin resistance in pulmonary tuberculosis. (J. Crofton & D. A. Mitchison) 1009-1015  
Streptomycin in gonorrhoea: with its effects upon dark-field positive lesions of syphilis. (R. F. Willcox) 1015-1018  
Laryngeal paralysis associated with cardiac hypertrophy. Report of four cases. (F. T. Land) 1018-1019  
Purpura hæmorrhagica as a complication of pregnancy. (J. A. Chalmers) 1020-1021  
Polymyositis: effect of exertion during the pre-paralytic stage. (E. R. Har- greaves) 1021-1022  
Treatment of advanced rheumatoid arthritis. A few practical points. (T. H. Palmer & A. H. C. Walker) 1029-1030

2 : 18/12/48

The incidence and treatment of infective ear disease in factory employees. (C. M. Johnston) 1049-1059  
Vitamin D in treatment of Boeck's sarcoidosis. (R. F. Robertson) 1059-1061  
Arsenical encephalopathy during treatment of tropical eosinophilia. (B. Singh) 1061-1062  
Aortic coarctation with patent ductus arteriosus. (H. A. Haxton & M. L. Thompson) 1062-1063  
Steroid metabolism and frontal lobes. (F. Reitman) 1064  
The end of compulsory vaccination. (C. K. Millard) 1073-1075

2 : 25/12/48

The nervous and humoral control of gastric secretion. (G. Kahlson) 1091-1095  
Results of partial gastrectomy for peptic ulcer. (T. W. Mimspriss & St. J. M. C. Birt) 1095-1099  
The streptomycin-sulphadiazine treatment of undulant fever. (E. F. Scowen & L. P. Garrod) 1099-1101  
The treatment of anuria. (D. A. K. Black & S. W. Stanbury) 1101-1105  
Splenic aneurysm and splenic enlargement in pregnancy. (H. L. Sheehan & N. M. Falkner) 1105-1106  
Calcified cyst of spleen. (J. H. Donovan) 1106-1107  
Health regulations for air travel (II). (J. Kyle) 1115

## 1 : 1/1/49

- Clinical and social problems of epilepsy. (F. J. Nattrass) 1-6  
 Antihistamine drug treatment of acute nephritis. (J. Craig, N. S. Clark & J. D. Chalmers) 6-9  
 Cerebral embolism following contusion of the heart. (G. Parsons-Smith & D. Williams) 10-12  
 Antihistamine drugs in treatment of nausea and vomiting due to streptomycin. (J. R. Bignall & J. Crofton) 13-14  
 Tetany following removal of a parathyroid adenoma with bone disease: finally alleviated with calciferol. (N. S. Conway) 14-15  
 Agglutinin anti-P in pregnancy. Report on two cases. (I. Dunsford) 15-16  
 The human louse in transmission of *T. duttoni* in nature. (R. B. Heisch) 17  
 Meningococcal conjunctivitis. (J. D. A. Gray & R. A. Lambert) 17-18

## 1 : 8/1/49

- Clinical and social problems of epilepsy. (F. J. Nattrass) 43-48  
 Diabetic fertility, maternal mortality, and foetal loss rate. (J. A. L. Gilbert & D. M. Dunlop) 48-51  
 Pregnancy complicated by diabetes mellitus. (H. H. F. Barns & M. E. Morgans) 51-54  
 The relation of *Staph. pyogenes* to dental caries. (E. Matthews, H. F. Atkinson, P. Saunbury & H. W. Clegg) 54-56  
 Senile deterioration of the central nervous system. A clinical study. (T. H. Howell) 56-58

## 1 : 15/1/49

- Pulheems: a new system of medical classification. (R. T. Fletcher) 83-88  
 "Paludrine" (proguanil) in prophylaxis and treatment of malarial infections caused by a West African strain of *P. falciparum*. (G. Covell, W. D. Nicol P. G. Shute & M. Maryon) 88-91  
 Intravenous "paludrine" (proguanil). (R. N. Chaudhuri & H. Chakravarti) 91-93  
 Plasma-cell mastitis. Report of a case with bilateral involvement. (M. Cutler) 94-96  
 Two common non-malignant conditions of the breast. The clinical features of cystic disease and the pain syndrome. (D. H. Patey) 96-99  
 Amethocaine hydrochloride: severe toxic effects when used for bronchoscopy. (C. A. Jackson) 99-101  
 "Gammaxane" and the mosquito control in the Belgian Congo. (G. Davidson) 101-102  
 Haematemesis and melaena. (N. C. Tanner) 110-111

## 1 : 22/1/49

- Haemolytic disease of the newborn: criteria of severity. (P. L. Mollison & M. Cutbush) 123-130  
 Chemoprophylaxis of experimental filariasis in the cotton-rat. (W. E. Kershaw, J. Williamson & D. S. Bertram) 130-132  
 Infected intervertebral disk after lumbar puncture. (L. L. Bromley, J. D. Craig & A. W. L. Kessel) 132-133  
 Cough fracture of ribs. (R. C. Cohen) 133-135  
 Cough fracture in late pregnancy. (J. W. Paulley, D. H. Lees & A. C. Pearson) 135-137  
 Lymphoblastic leukaemia treated with urethane. (D. Pullen) 137-138  
 Modern languages in the service of medicine. (R. Whitehead) 147-149

## 1 : 29/1/49

- The use of sex hormones in therapeutics. (P. M. F. Bishop) 165-169  
 Alternating orthostatic hypotension and hyperthyroidism of probable hypophysial-hypothalamic origin. (F. V. Diaz) 169-171  
 Oral reactions to penicillin. (W. G. Cross) 171-173  
 Carriage of penicillin-resistant *Staph. pyogenes* in healthy adults. (T. D. M. Martin & I. E. M. Whitehead) 173-175  
 Infected hands treated with systemic penicillin. (G. A. Barclay) 175-179  
 Chronic urethral obstruction in children. (R. J. Last) 179-181  
 Nephrocalcinosis infantum with hyperchloraemic acidosis. (H. J. Boutourline-Yung) 181-183

## 1 : 5/2/49

- Tuberculosis at the crossroads. (C. O. Stallybrass) 207-213  
 An analysis of 200 cases of ankylosing spondylitis. (N. R. W. Simpson & C. J. Stevenson) 214-216  
 Significance of clubbing of the fingers. (W. P. U. Jackson) 216-217  
 A case of congenital tuberculosis. (J. W. Jordan & H. Spencer) 217-219  
 The meat ration and blood levels. Investigation of Indian soldiers in Persia and Iraq, 1944. (G. F. Taylor, P. N. Chhuttani & S. Kumar) 219-221  
 Total cystectomy. (B. R. Sworn) 221-223

## 1 : 12/2/49

- The surgeon in industry. (H. E. Griffiths) 255-260  
 5,000 consecutive deliveries without a maternal death due to pregnancy. (N. Emblin) 260-263  
 A statistical and clinical review of 107 cases of ectopic gestation. (J. S. MacVine & D. H. Lees) 263-266  
 Endogenous gas gangrene complicating carcinoma of colon. Report of a case. (A. L. Wyman) 266-267  
 Enteritis necroticans due to *Clostridium welchii* type F. (J. Zeissler & L. Rassfeld-Sternberg) 267-269  
 The toxins of *Cl. welchii* type F. (C. L. Oaklly) 269-270  
 Recovery of *Cl. welchii* type F from preserved cultures. (C. Dieckmann) 270  
 Origin of *Cl. welchii* type F infection. (E. Hain) 271  
 On the occurrence of *Cl. welchii* type F in normal stools. (E. Hain) 271

## 1 : 19/2/49

- The cost of the National Health Service. (F. Roberts) 293-297  
 Peptic ulcer in Glasgow: a hospital survey. (R. A. Jamieson, W. E. Smith & L. D. W. Scott) 298-300  
 The diet, haemoglobin values and blood pressures of Olympic athletes. (W. T. C. Berry, E. R. Bransby, J. B. Beveridge, B. N. Needham, H. E. Magee, H. S. Townsend & C. G. Daubney) 300-304  
 Sjögren's disease, with dryness of the bronchial mucosa and uncertain lung lesion. (P. Eliman & F. P. Weber) 304-305  
 Illness in general practice. (J. Pemberton) 306-308  
 Afebrile cases of melioidosis. (R. Green & D. S. Mankikar) 308-311

## 1 : 26/2/49

- Pain in childbirth. Report of the subcommittee of the Medical Women's Federation:  
 Statistical analysis of some replies to the questionnaires. (K. K. Conrad) 333-337  
 Tuberculous meningitis: early diagnosis, and a review of treatment with streptomycin. (J. Rubie & A. F. Hohn) 338-345  
 Nasal carriers and streptococcal tonsillitis. (G. T. Cook & D. Munro-Ashman) 345-348  
 Spontaneous perforation of the oesophagus: surgical repair, with recovery. (J. Scholefield) 348-350  
 Rupture of intestine due to non-penetrating injury: unusual accidents from a mechanical saw. (H. L. M. Roualle) 350-351

## 1 : 5/3/49

- John Hunter the observer. (H. S. Souttar) 379-383  
 Haematemesis, with special reference to chronic peptic ulcer. (D. C. Lewia & S. Truelove) 383-386  
 Punch prostatectomy. (H. T. Cox) 386-389  
 Osteitis fibrosa disseminata. (D. J. MacRae) 389-392  
 Occupational diseases of the lens and retina. (J. Minton) 392-394  
 Frequency of penicillin-resistant staphylococci. (A. Vourekka & W. H. Hughes) 395  
 The Rh factor. (A. S. Wiener) 404-405

## 1 : 12/3/49

- Hypertension of renal origin in rats following less than one week of choline deficiency in early life. (W. S. Hartroft & C. H. Best) 423-426  
 Severe hypertension with recovery after nephrectomy. (A. I. L. Maitland) 426-428  
 Blood changes in luminizers using radioactive material. (E. Browning) 428-431  
 Acute idiopathic pulmonary haemosiderosis. (L. Nangekivell) 431-433  
 Disseminated ossification of the lungs in association with mitral stenosis. (H. M. Lawson) 433-434  
 Pulmonary lesions in rheumatoid arthritis. (D. G. Leys & P. N. Swift) 434-435  
 Endometriosis of the groin, report of three cases. (G. E. Moloney) 435-437  
 Solitary plasmacytoma of bone: report of a case. (H. Holden) 437-438  
 Infant mortality. (W. J. Martin) 438-441

## 1 : 19/3/49

- Paralytic poliomyelitis: the early symptoms and the effect of physical activity on the course of the disease. (W. R. Russell) 465-471  
 The mind and the skin. (J. B. Sneddon) 472-475  
 Treatment of skin lesions caused by mustard gas. (D. C. Sinclair) 476-478  
 Incidence of diabetes mellitus in children and need for hostels. (P. Henderson) 478-479  
 Simultaneous embolism in both arms. (J. V. Fiddian) 480  
 Ketouria in a child with cirrhosis of the liver. (G. T. Rutherford) 480-481  
 The economical use of the hospital bed and of the nurse. (E. B. Brooke & J. P. Wettenhall) 491-493

## 1 : 26/3/49

- The propagation of mouse tumours by means of dried tissue. (W. E. Gye) 511-515  
 Long-term cardiac observation of children. (R. K. Price) 515-519  
 Hog-stomach extract and casein hydrolysate in peptic ulcer. (A. W. Kay, R. A. Jamieson & W. E. Smith) 519-520  
 Hyperinsulinism due to an islet-cell adenoma. A cure, with metabolic studies before and after operation. (W. G. D. Murray) 521-523  
 Ringworm of the scalp: treatment by X-ray epilation without subsequent local application. (F. L. Lydon, T. Stephanides & T. M. Robb) 523-524  
 Fulminating meningococcal septicaemia. An account of three cases, with one recovery. (P. Turner & R. V. Dent) 524-526  
 Nomograms for sling and Assmann psychrometers. (J. B. de V. Weir) 527

## 1 : 2/4/49

- Whither medicine? (Horder) 557-560  
 Venous thrombosis and anticoagulants. (K. P. Ball) 560-565  
 Diabetic coma: treatment with and without the early administration of glucose. (J. Lee, D. Naidop & J. A. Torrens) 565-568  
 Subacute pancreatitis. (I. Macnab) 568-571  
 Report on an outbreak of influenza in the Army. (D. G. Milne & J. D. Cruikshank) 571-572  
 Spontaneous intra-abdominal haemorrhage. (A. L. Woolf & H. R. Thomson) 572-574  
 Effect of pressure cooking on vitamin C content of vegetables. (G. M. Chappell & A. M. Hamilton) 574-575  
 Spermatolysis: a cause of male sterility. (C. Yildiran) 575-576

## 1 : 9/4/49

- Medical fitness for air travel. (H. Whittingham, A. B. Barbour & J. C. Macgown) 603-607  
 The physiological basis of vagotomy. (A. D. Beattie) 607-610  
 Notes on experiments illustrating normal temperature regulation in young men. (S. Wright) 610-613  
 Use of diparcol in Parkinsonism. (R. S. Duff) 613-615  
 Successful treatment of typhoid carrier with penicillin and sulphamerazine. (C. A. Rumball & L. G. Moore) 615-616  
 "Myanesis" in the treatment of tetanus. (M. H. A. Davison, A. B. Ward & E. A. Pask) 616-618  
 A "minor" injury of the terminal phalanx. (F. I. Powell) 618

## 1 : 16/4/49

- In praise of idleness. (H. Ogilvie) 645-651  
 The discomforts of childbirth. (G. D. Read) 651-654  
 Non-specific effects of impure penicillin. (J. Ungar) 654-657  
 Needle biopsy of the liver, with special reference to a modified Gillman instrument technique. (R. Terry) 657-660  
 Severe renal failure after administration of apparently compatible blood. (A. C. Buchan & J. Wallace) 660-662  
 Dysentery in South Persia. (I. S. Stewart) 662-663

Further experiences with ethinyl oestradiol in the suppression of lactation. (T. N. A. Jeffcoat & B. Hargreaves) 664-665  
Metatarsus quintus valgus. (H. Davies) 664-665  
Some observations on the teaching of pathology in the U.S.A. (K. R. Hill)

1 : 23/4/49

Women war captives in Russia. (R. F. A. Dean) 691-695  
A method of increasing the lung blood supply in cyanotic congenital heart disease. (N. R. Barrett & R. Daley) 699-702  
The association of maternal obesity, large babies, and diabetes. (J. A. L. Gilbert) 702-704  
Glossitis in Addisonian pernicious anaemia: effect of synthetic vitamins of the B complex. (A. Brown) 704-706  
Unusual symptoms in petrol-tank cleaners. (I. Singh) 706-710  
Staphylococci in the newborn: their coagulase production and resistance to penicillin and streptomycin. (G. Martyn) 710-712

1 : 30/4/49

Basal-cell carcinoma (rodent ulcer), with special reference to lesions on neck, trunk, and limbs. (C. Wakeley & P. Childs) 737-741  
Streptomycin treatment of tuberculous bronchopneumonia in childhood. (R. M. Todd) 741-747  
Some practical problems of tuberculosis in childhood. (F. M. B. Allen) 747-750  
The effect of endocrines on fibro-adenosis. (H. J. B. Atkins) 750-752  
Cure-modified electric convulsion therapy in cases with physical disease. (P. D. W. Shepherd & D. C. Watt) 752-756  
Acting as an aid to therapy in a neurosis centre. (M. Jones) 756-758

### Bulletin of Hygiene\*

23 : March 1948

Persopectives in venereology, 1947. A critical review of papers published or abstracted during the year. (R. R. Willcox) 135-144

23 : October 1948

Varicella minor. A personal analysis of 13,686 cases. (J. P. Marsden) 735-746  
Immunization of travellers. (L. H. Murray) 909-913

### Clinical Science

7 : July 1948

On the behaviour of deep and cutaneous sensibility during nerve blocks. (J. H. Kellgren & A. J. McGowan) 1-11  
On deep hyperalgesia and cold pain. (J. H. Kellgren, A. J. McGowan & E. S. R. Hughes) 13-27  
Evidence on the origin of leiomyomata of the skin obtained by pharmacological studies. (W. J. Senter) 29-33  
Cardiac output and peripheral bloodflow in arteriovenous aneurysm. (S. M. Cohen, O. G. Edholm, S. Howarth, J. McMichael & E. P. Sharpey-Schafer) 35-47  
The effect of 2-thiouracil on the creatinuria of thyrotoxicosis, and its use in the diagnosis of hyperthyroidism. (I. Sebbire) 49-63  
Transfusion of saline-washed red cells in nocturnal haemoglobinuria. (Marchiafava-Micheli disease.) (J. V. Dacie) 65-75  
Postural proteinuria. (G. M. Bull) 77-108

7 : December 1948

Desoxycorticosterone-like activity induced by adrenocorticotrophin in man. (F. T. G. Prunty, P. H. Forsham & G. W. Thorn) 109-120  
The investigation and diagnosis of steatorrhea. (L. P. R. Fourman, G. Higgins, P. Quelch, J. R. P. O'Brien & L. J. Wills) 121-134  
A comparison of estimates of circulating red blood cell volume given by the Ashby marked red cell method and the T 1824-haematocrit method in man. (D. W. H. Barnes, J. F. Loutit & E. B. Reeve) 135-154  
Observations on the estimate of the circulating red blood cell volume in man given by T 1824 and the haematocrit, with special reference to uncorrected dye loss from the circulation. (D. W. H. Barnes, J. F. Loutit & E. B. Reeve) 155-173  
Capillary strength tests in scurvy and their reactions to vitamin C and vitamin P therapy. (S. Lazarus, H. N. Munro & G. H. Bell) 175-184

7 : April 1949

The measurement of the total lung volume and breathing capacity. (J. C. Gilson & P. Hugh-Jones) 185-216  
The labile neurogenic component of hypertension. A comparison of the effects of tetra-ethyl-ammonium bromide and a rapidly acting barbiturate (seconal). (J. L. Frew & M. L. Rosenheim) 217-229  
A simple method of estimating clot retraction with a survey of normal values and the changes that occur with menstruation. (J. F. Ackroyd) 231-247  
The pathogenesis of thrombocytopenic purpura due to hypersensitivity to sedormid (allyl-isopropyl-acetyl-carbamide). (J. F. Ackroyd) 249-285  
Liver and muscle glycogen in normal subjects, in diabetes mellitus and in acute hepatitis. Part I. Under basal conditions. (J. A. Hildes, S. Sherlock & V. Walshe) 287-295  
Liver and muscle glycogen in normal subjects, in diabetes mellitus and in acute hepatitis. Part II. The effects of intravenous adrenaline. (J. A. Hildes, S. Sherlock & V. Walshe) 298-314

### Dental Record

68 : March 1948

Dental medicine. Protein and serum colloids in relation to dental disease. (R. G. Torrens) 54-63  
Subcutaneous medication. (L. Lindsay) 63-64  
Cases of etiological and diagnostic interest. (H. Chapman) 65-73

\* [Journals marked with an asterisk in this Guide consist mainly of abstracts and are listed only when they include original articles.—Ed.]

68 : April 1948  
Some aspects of antero-posterior growth of the mandible. (M. A. Rushton) 80-87  
Neural effects associated with dental causes. (D. L. Goodridge) 88-91  
Two cases of late orthodontic treatment. (E. K. Breakspear) 91-95

68 : May 1948

Bite-taking for full dentures. (M. Meyer) 106-110  
Drugs in dentistry. (H. T. Roper-Hall) 111-113  
A new investment technique for acrylic crowns. (C. Levy) 114-116

68 : June 1948

Some bases for aetiology and diagnosis in orthodontics. (C. F. Ballard) 133-145  
Regional anaesthesia for children. (S. M. Harrison) 146-155  
Modified lower inclined plane. A lower inclined plane with buccal extensions for the treatment of linguoversion of maxillary incisors and typical and atypical class III. (S. Levy) 158-162

68 : July 1948

Some aspects of aetiology, pathology and therapy of Vincent's infection. (H. Frey) 164-172  
Retention of deciduous molars. (M. Dechaume & J. Cauhépe) 173-175  
A contribution to the history of physiotherapeutics in maxillo-facial orthopaedics. (F. M. Watry) 192-196

68 : August-September 1948

Induction of anaesthesia in children. (A. Tindal) 220-227  
Fluorine: a consideration of its literature. (C. H. Kemball) 228-234

68 : October 1948

Relationship of occlusion and parodontal disease in sheep. A preliminary report on an investigation. (A. D. Hitchin) 251-254  
The significance of "bite-analysis" in modern dentistry. (G. Lindblom) 254-262  
Unilateral roentgenographic atrophy of the ramus. (M. Dechaume & J. Cauhépe) 262-265

68 : December 1948

Studies on the growth of the upper jaw. (J. H. Scott) 277-291  
The care and correction of dental defects in children. (L. M. Clinch) 293  
Pain. Presidential Address delivered before the Liverpool and district Odontological Society, 18th October 1948. (G. G. Macpherson) 294-304  
Parodontal treatment. (D. McNair) 305-308  
The masticatory face and the voice. (J. C. Juste) 309-310

69 : January 1949

Impression materials and impression taking. (W. M. Gibson) 1-5  
Recording centric occlusion for edentulous cases. (J. Osborn) 6-12  
Tooth placement in full denture construction. (E. Matthews) 13-17  
Polymerisation of acrylic resins. (A. C. Deverell) 17-19

69 : February 1949

Heredity versus practice. (L. Lindsay) 31-40  
Flavazole with penicillin dental cerate dressings in surgical extraction wounds. (A. D. Hitchin) 41-42

69 : March 1949

The effect of organic acids on human tooth enamel. (R. P. McGlynn) 60-63  
Practical observations. (H. Chapman) 64-73  
Migration of teeth. (S. Friel) 74-84

### Guy's Hospital Reports

96 : 1947

Studies in lung abscess. (R. C. Brock) 141-163  
On the formation of substantives from Greek in the medical vocabulary. (H. St. H. Vertus) 169-185  
Dysphagia lusoria: right-sided aortic arch. (W. N. Mann) 186-193  
Heart disease and pregnancy. A study of 100 pregnancies. (P. R. C. Evans) 194-207  
Inguinal hernia and the Guy's tradition. (H. F. Lunn) 203-213  
Asiley Cooper on hernia. (R. C. Brock) 214-225  
Chronic relapsing pancreatitis. Some notes on its pathology, diagnosis and treatment. (R. E. Horton) 226-236  
A case of *Staphylococcus aureus* septicaemia with multiple haematogenous pneumoniae areas, spontaneous pneumothorax, pyaemic abscess in medulla: recovery under penicillin therapy. (H. Stevenson) 237-243  
A case of hyperparathyroidism with renal symptoms and no bony changes. (C. Bucknall & A. J. Drew) 244-247  
The influence of the osmotic pressure of ingested solutions on the absorption of sulphaguanidine from the stomach of man. (J. N. Hunt) 248-257

97 : 1948

The Blalock-Taussig operation for mortus coeruleus. (M. Campbell) 1-47  
Anaesthesia for operations for the relief of congenital pulmonary stenosis. (E. H. Rink, P. J. Helliwell & A. M. Hutton) 48-63  
Four cases of polypoid tumour ("myxoma") within the left auricle of the heart. (T. B. Brewin) 64-74  
Studies in lung abscess. (R. C. Brock) 75-86  
A student health service. (W. N. Mann) 87-101  
Note on the problems raised by the finding of radiological evidence of tuberculosis in the routine examination of the Students' Health Service. (E. R. Boland) 102-107  
Primary decortication in the treatment of acute empyema. Report of a case. (I. K. Fry) 108-112  
A case of rhesus sensitization in a multigravida, with anticipated foetal haemolytic disease treated by premature section and transfusion. (A. Hill) 113-123  
Ankylosing spondylitis with peripheral arthritis. (A. G. C. Cox) 124-131

## Journal of Anatomy

82 : April 1948

- J. P. Hill. A biographical sketch of his career and an appreciation of his work, together with a bibliography of his published writings. 3-8  
 The synovial joints of the skate (*Raja*). (D. V. Davies) 9-20  
 The changes occurring in the ovary of the goat during the estrous cycle and in early pregnancy. (R. J. Harrison) 21-48  
 Histophysiology of the limb-bud of the fowl during its early development. (P. B. v. Weel) 49-57  
 The comparative anatomy of the inguinal ligament. (H. F. Lunn) 58-67  
 Observations on the innervation of blood vessels. (J. W. Millen) 68-80  
 Alkaline phosphatase and vitamin C deficiency in regeneration of skull bones. (G. H. Bourne) 81-87  
 Changes in the vocal folds in humming low and high notes. A radiographic study. (A. G. H. Mitchinson & J. M. Yofey) 88-92  
 Dendritic cells. (R. E. Billingham) 93-109  
 Internode length and fibre diameter in developing and regenerating nerves. (A. D. Vizoso & J. Z. Young) 110-134

82 : July 1948

- Quantitative histology of Wallerian degeneration. II. Nuclear population in two nerves of different fibre spectrum. (G. A. Thomas) 135-145  
 Changes in nuclear population following twenty-one days' degeneration in a nerve consisting of small myelinated fibres. (J. Joseph) 146-152  
 The connexions of the spinal sub-arachnoid space with the lymphatic system. (J. B. Brierley & E. J. Field) 153-166  
 Vascular morphogenesis in the retina of the cat. (I. C. Michaelson) 167-174  
 Observations on the initial stages of ossification *in vitro*. (H. Rodová) 175-182  
 The parotid gland in relation to the facial nerve. (J. McKenzie) 183-186

82 : October 1948

- The post-natal development of renal tubules in the rat. (J. S. Baxter & J. M. Yofey) 189-197  
 The lymphatic drainage of the spinal nerve roots in the rabbit. (E. J. Field & J. B. Brierley) 198-206  
 Cyclic changes in the uterine mucosa of *Balaenopteridae* whales. (L. H. Matthews) 207-232  
 The local action of the parathyroid and other tissues on bone in intracerebral grafts. (N. A. Barnard) 233-248  
 The stomach in South African insectivora, with notes on the organization of mammalian gastric glands. (A. C. Allison) 249-261  
 The effect of pressure on nerve fibres. (G. Causey) 262-270

83 : January 1949

- Spinal origin of the ventral supraoptic decussation (Gudden's commissure) in the spider monkey. (H.-T. Chang & T. C. Ruch) 1-9  
 Alkaline phosphatase in the uterine epithelium of the rat. (J. J. Pritchard) 10-24  
 Some observations upon the granules of the oxyntic cells of normal rats. (G. McIntosh) 25-32  
 A new histochemical method for glycogen. (J. J. Pritchard) 30-31  
 The effect of peripheral connexions on the maturation of regenerating nerve fibres. (H. T. Aboon) 32-43

## Journal of Bone and Joint Surgery

30B : February 1948

- Recurrent dislocation of the shoulder. (W. E. Gallie & A. B. Le Mesurier) 9-18  
 Humeral dislocation of the shoulder. The Putt-Platt operation. (H. Osmond-Carson) 19-25  
 Recurrent dislocation of the shoulder. (J. C. Adams) 26-38  
 Recurrent dislocation of the shoulder. Lesions discovered in seventeen cases, surgery employed, and intermediate report on results. (A. L. Eyre-Brook) 39-46  
 Discussion on recurrent dislocation of the shoulder. 46-48  
 Nerve in recurrent dislocation of the shoulder joint. Superior approach causing only failure in fifty-two operations for repair of the labrum and capsule. (A. Watson-Jones) 49-52  
 The bone block method for recurrent dislocation of the shoulder joint. (I. Palmer & A. Widen) 53-58  
 Excision of mould arthroplasty of the hip joint. (M. N. Smith-Petersen) 59-75  
 Post-operative study of vitallium mould arthroplasty of the hip joint. (W. A. Law) 76-83  
 Plantar digital neuritis. Morton's metatarsalgia. (K. I. Nissen) 84-94  
 Arthrodesis in tuberculosis of the hip joint. An analysis of fifty cases. (J. Dohson) 95-105  
 The behaviour of penicillin in synovial cavities. (G. B. Jones) 106-109  
 Haematogenous osteitis in children. Preliminary report on treatment with penicillin. (W. M. Dennison) 110-123  
 Plasma cell tumours. (G. Lunn & T. M. Prosser) 124-152  
 Recurrent osteochondral fracture of the patella. (H. M. Coleman) 153-157  
 Excision of patella for recurrent dislocation. (B. McFarland) 158-160  
 Congenital coxa vara. (F. C. Golding) 161-163  
 From an atlas of general affections of the skeleton. Osteogenesis imperfecta and osteogenesis imperfecta cystica. (H. A. T. Fairbank) 164-186

30B : May 1948

- Paraplegia in cervical spine injuries. (R. Barnes) 234-244  
 Paraplegia in hyperextension cervical injuries with normal radiographic appearances. (A. R. Taylor & W. Blackwood) 245-248  
 Pressure at the cervico-brachial junction. An operative and anatomical study. (E. D. Telford & S. Mottershead) 249-265  
 Fatigue fractures of the fibula. (H. J. Burrows) 266-279  
 The management of acute circulatory failure in an injured limb. (D. L. Griffiths) 280-289  
 The clinical diagnosis of fat embolism. (P. H. Newman) 290-297  
 Plastic splints and appliances in orthopaedic surgery. (W. Herschell & J. T. Seales) 298-308  
 Traumatic uraemia. A collective review. (E. M. Darmady) 309-321  
 The movements of bones and joints. 1. Fundamental principles with particular reference to rotation movement. (M. A. MacConaill) 322-326

- Pott's disease of the spine with rupture of the aorta. (E. W. Somerville & J. Wishart) 327-332  
 Congenital absence of the humeral head. Report of two cases. (A. T. Andersen) 333-337  
 Nail in the skull. (E. L. Robert) 338  
 From an atlas of general affections of the skeleton. 2. Osteopetrosis. Osteopetrosis generalisata, marble bones, Albers-Schönberg's disease, osteosclerosis fragilis generalisata. (H. A. T. Fairbank) 339-356

30B : August 1948

- Infections of the hand. (J. B. Loudon, J. D. Miniero & J. C. Scott) 409-429  
 Traumatic dislocation of the hip joint. Review of one hundred and one dislocations. (J. R. Armstrong) 430-445  
 Denervation of the hip joint in osteoarthritis. (J. D. Mulder) 446-448  
 Treatment of pathological dislocation of the hip joint after suppurative arthritis in infants. (A. F. Bryson) 449-453  
 Fracture-sluxations of the shoulder. (T. J. Fairbank) 454-460  
 Dislocation and fracture-dislocation of the pelvis. (F. W. Holdsworth) 461-466  
 Causalgia: diagnosis and treatment. (C. H. Cullen) 467-477  
 Positive pressure in arthrodesis of the knee joint. (J. C. Charnley) 478-486  
 The conservative treatment of sciatic pain by immobilisation in a plaster jacket. (F. C. Durbin) 487-489  
 Bone lengthening. (F. G. Allan) 490-505  
 Arthrodesis of the ankle joint. Experiences with the transfibular approach. (J. C. Adams) 506-511  
 A simple method. (V. J. Kinsella) 512-514  
 as a source of segmental pain. (D. C. Sinclair, & M. A. Falconer) 515-521  
 Benign giant-cell synovoma and its relation to "xanthoma." (M. J. Stewart) 522-527  
 Rupture of extensor tendons by attrition at the inferior radio-ulnar joint. Report of two cases. (O. J. Vaughan-Jackson) 528-530  
 Recurrent posterior dislocation of the shoulder joint. (F. R. Zadik) 531-532  
 From an atlas of general affections of the skeleton. 3. Melorheostosis. Synonym—Léri type of osteopetrosis: osteosis chumizante monomelia (Putti). 4. Osteopoikilosis. Synonym—osteopathia condensans disseminata. (H. A. T. Fairbank) 533-545

30B : November 1948

- Ischaemic necrosis of the anterior tibial muscles due to fatigue. (J. R. Hughes) 581-594  
 Developmental coxa vara. (A. B. Le Mesurier) 595-605  
 Congenital elephantiasis associated with constriction by anomalous bands. (A. W. Farmer) 606-612  
 Spinal extradural cysts. (J. G. du Toit & M. H. Fainsinger) 613-618  
 Arthrodesis of the ankle joint. (W. E. Gallie) 619-621  
 Fatigue fracture of the ulna. (I. D. Kitchin) 622-623  
 Etiology of peroneal spastic flat foot. (R. J. Harris & T. Beath) 624-634  
 Denervation of the elbow joint for the relief of pain: a preliminary report. (J. E. Bateman) 635-641  
 Ischio-femoral arthrodesis. (H. A. Brittain) 642-650  
 Posterior dislocation of the shoulder joint. (C. K. Warrick) 651-655  
 Squamous-celled carcinoma of the nail bed. (V. H. Ellis) 656-658  
 Horizontal approach to the medial semilunar cartilage. (J. Charnley) 659-663  
 Knee joint changes after meniscectomy. (T. J. Fairbank) 664-670  
 The congenital discoid meniscus. (I. S. Smilie) 671-682  
 Some anatomical details of the knee joint. (R. J. Last) 683-688  
 From an atlas of general affections of the skeleton. 5. Dyschondroplasia. Synonym—Ollier's disease, multiple enchondromata. (H. A. T. Fairbank) 689-704  
 6. Metaphyseal dysostosis. (H. A. T. Fairbank) 705-708

31B : February 1949

- The scientific approach to orthopaedic surgery. (S. A. S. Malkin) 5-9  
 Traction injuries of the brachial plexus in adults. (R. Barnes) 10-16  
 Open wounds of the brachial plexus. (D. M. Brooks) 17-33  
 An operative approach to supraclavicular plexus injuries. (J. E. Bateman) 34-36  
 Cervical plexus injuries as an extension of brachial plexus injuries. (A. S. Kerr) 37-39  
 Late spinal paralysis after avulsion of the brachial plexus. (W. Penfield) 40-41  
 The treatment of residual paralysis after brachial plexus injuries. (A. M. Hendry) 42-49  
 Arthroplasty of the knee joint. Late results. (J. E. Samson) 50-52  
 Arthroplasty of the knee; a follow-up study. (J. S. Speed & P. C. Trout) 53-60  
 Isthioradic dislocation of the humerus. (E. S. West) 61-62  
 Premature epiphyseal fusion at the knee joint in tuberculous disease of the hip. (W. Parke, G. S. Colvin & A. H. G. Almond) 63-73  
 Retrosternal dislocation of the clavicle. (J. C. Kennedy) 74-75  
 Fractures of the patella. (J. C. Scott) 76-81  
 Arterial supply to the femoral head and its clinical importance. (F. R. Tucker) 82-93  
 Alkaline phosphatase and the mechanism of ossification. (I. J. Lorch) 94-99  
 The movements of bones and joints. 2. Function of the musculature. (M. A. MacConaill) 100-104  
 From an atlas of general affections of the skeleton. 7. Diaphyseal aclerosis. Synonym—multiple exostoses. (H. A. T. Fairbank) 105-113.  
 8. —suppl epiphyses, chondrodyst. (H. A. T. Fairbank) 114-122

## Journal of Clinical Pathology

1 : May 1948

- Normal and abnormal blood coagulation: a review. (R. G. Macfarlane) 113-143  
 The determination of packed cell volume from blood and plasma gravities in Indian soldiers. (H. Lehmann) 144-149  
 Suppurative meningitis in the newborn due to coliform bacilli. (K. J. Randall) 150-155  
 The use of intrathecal heparin in conjunction with streptomycin in the treatment of tuberculous meningitis: preliminary report. (C. A. St. Hill, C. Riley & J. H. Gifford) 157-161, 156  
 A standardized modification of the Laughlin test for syphilis. (J. S. Stevenson) 162-166

- Single-sample tests in the differential diagnosis of jaundice. (C. A. Mawson) 167-172
- Technical methods: The estimation of potassium by a micro-method. (J. N. Cumings) 173-174. The enumeration of blood platelets. (H. S. Baar) 175-176. Modifications of the Weinbach method for the determination of sodium in serum. (F. S. Fowweather & W. N. Anderson) 177-178

## 1 : August 1948

- Giant-cell or temporal arteritis: a review. (C. V. Harrison) 197-211
- Temporal arteritis: a report of three cases. (H. Cohen & C. V. Harrison) 212-216
- The gastric neutral-red excretion test. (S. Sevti & R. P. Jepson) 217-225
- The Feulgen reaction applied to clinical haematology. (C. Gardikas & M. C. G. Israëls) 226-228
- Haemostasis with an easily prepared stable thrombin solution. (L. A. Sternberger) 229-231
- Serological aspects of Weil's disease. (J. C. Broom) 232-236
- Salmonella birkenhead*: a new *Salmonella* type causing food-poisoning in man. (J. Taylor & S. H. Douglas) 237-239
- Penicillin blood levels after injection of solid and semi-fluid oily suspensions of penicillin. (J. Ungar) 240-243
- Embolism after penicillin-oil-beeswax. (A. W. Frankland) 244-245
- Another way of applying immersion oil. (J. S. Faulds) 246
- An emergency bottle for dried plasma. (W. Koch) 247
- Estimation of streptomycin and penicillin in blood. (W. A. Gillespie & V. G. Alder) 248-249

## 1 : November 1948

- The errors of some haematological methods as they are used in a routine laboratory. (R. Biggs & R. L. Macmillan) 269-287
- The error of the red cell count. (R. Biggs & R. L. Macmillan) 288-291
- A further case of anti-Lutheran immunization, with some studies on its capacity for human sensitization. (U. R. Mainwaring & M. M. Pickles) 292-294
- Some observations on thiolacil neutropenia, with special reference to the sternal marrow. (E. K. Blackburn) 295-301
- Congenital defects following rubella. Reports of two cases, one of which shows a hitherto undescribed lesion. (I. Mackenzie, A. P. Prior & A. Holzel) 302-305
- Studies on tetanus prophylaxis. (H. Ericsson) 306-310
- The value of liquid for blood culture. (R. D. Stuart) 311-314
- The use of the selective inhibitory action of toluene on coliform bacilli in routine cultures. (K. B. Rogers & W. Heslop) 315-317

## 2 : February 1949

- Erythropoiesis with particular reference to its study by biopsy of human bone marrow: a review. (J. V. Dacie & J. C. White) 1-32
- Estimation of prothrombin in dicoumarol therapy. (R. Biggs & R. G. Macfarlane) 33-44
- Prothrombin time in dicoumarol therapy. (G. A. James) 45-48
- Cellular analysis of the aspiration lung biopsy from normal and some pathological conditions. (Z. Z. Goldowski) 49-54
- The influence of anticoagulants on fibrin network formation. (K. Rejsek & M. Kuhlík) 55-59
- Intra-medullary cyst of the spinal cord due to the cestode *Multiceps multiceps* in the coenurus stage: report of a case. (J. W. Landells) 61-63
- The albumin/globulin ratio: a technical study. (N. H. Martin & R. Morris) 64-66
- Measurement of the glomerular filtration rate and the effective renal plasma flow using sodium thiosulphate and *p*-amino-hippuric acid. (A. Dick & C. E. Davies) 67-72
- Bacterial fibrinolysin, its possible therapeutic application in tuberculous meningitis. (I. A. B. Cathie) 73-76

## Journal of Endocrinology

## 5 : June 1948

- The influence of testosterone propionate on pigmentation of the mammary nipples in female mice. (J. Flaks) 259-262
- The influence of gonadal hormones on the composition of the blood and liver of the domestic fowl. (R. H. Common, W. Bolton & W. A. Rutledge) 263-273
- Creatine-creatinine metabolism in adult and juvenile hyperpituitarism. (I. Schrire) 274-281
- Adrenalectomy and replacement therapy in lactating rats. 5. The effect of adrenalectomy on lactation studied in pair-fed rats. (A. T. Cowie & S. J. Folley) 282-289
- The action of thiouracil upon the spurs of the domestic fowl. (M. Juhn) 290-292
- The effect of testosterone propionate on the liver of adult female rats. (G. L. M. Mannerfelt) 293-296
- Sebaceous glands. 1. The effect of sex hormones on the sebaceous glands of the female albino rat. (F. J. Ehling) 297-302
- The role of the adrenal glands in protein catabolism following trauma in the rat. (R. L. Nohle & C. G. Tolny) 303-313
- Further notes on the action of oestrogen and relaxin on the pelvis of the spayed mouse, including a single-dose test of potency of relaxin. (K. Hall) 314-321

## Journal of General Microbiology

## 2 : January 1948

- Observations on the differential inhibition of coliform bacilli and rough variants of intestinal pathogens. (J. Brodie) 1-7
- Studies on giant amoeboid organisms. 1. The distribution of *Leptomyxa reticulata* Goodey to soils of Great Britain and the effect of bacterial food on growth and cyst formation. (B. N. Singh) 8-14
- The effect of pH at different temperatures on the growth of *Bacterium coli* with a constant food supply. (R. C. Jordan & S. E. Jacobs) 15-24
- The relation of pantothenic acid to acetylcholine formation by a strain of *Lactobacillus plantarum*. (E. Rowatt) 25-30
- The serology of *Pseudomonas pyocyanea*. (A. Mayr-Haring) 31-39
- The histological assay of streptomycin by a modified cylinder plate method. (K. A. Brownlee, C. S. Delves, M. Dorman, C. A. Green, E. Grenfell, J. D. A. Johnson & N. Smith) 40-53
- A technique for the quantitative estimation of soil micro-organisms. (P. C. T. Jones, J. E. Mollison & M. H. Quenouille) 54-69

- The production of spores by *Penicillium notatum*. (M. C. Frank, C. T. Calam & P. H. Gregory) 70-79
- An asporogenous variant of *Streptomyces griseus*. (J. C. Appleby) 80-82
- The cytology of smooth and rough variation in bacteria. (K. A. Bisset) 83-88
- Studies on giant amoeboid organisms. 2. Nuclear division and cyst formation in *Leptomyxa reticulata* Goodey with remarks on the systematic position of the organism. (B. N. Singh) 89-96
- The rules of nomenclature for micro-organisms. (G. C. Ainsworth) 97-102
- Infections by *Leishmania danovani* in the cotton rat. (J. D. Fulton & L. P. Joyner) 103-109

## 2 : May 1948

- The inhibition of *Fusarium oxysporum* var. *cubense* by musarin, an antibiotic produced by *Meredithia* actinomycete. (H. R. V. Arnstein, A. H. Cook & M. S. Lacey) 111-122
- An apparatus made from meccano parts for the preparation of roll-tube cultures. (A. Hirsch) 123-125
- The cytology of the gram-positive cocci. (K. A. Bisset) 126-130
- A method for the measurement of mutation rate from phage sensitivity to phage resistance in *Escherichia coli*. (G. H. Beale) 131-142
- The isolation and some properties of a virus-inhibiting protein from *Phytolacca esculenta*. (B. Kassanis & A. Kleczkowski) 143-153
- The bacteriophages of *Pseudomonas pyocyanea*. 1. The effect of various substances upon their development. (L. Dickinson) 154-161
- Some factors affecting the growth and sporulation of *Chaetomium globosum* and *Memnoniella echino*. (H. W. Buston & S. N. Basu) 162-172
- Variations in the properties of potato virus X and their effects on its interactions with ribonuclease and proteolytic enzymes. (F. C. Bawden & A. Kleczkowski) 173-185
- Synthesis and breakdown of glutamine by various micro-organisms. (H. McIlwain) 186-196
- Recent experiences in the rapid identification of *Bacterium coli* Type I. (E. F. W. Mackenzie, E. W. Taylor & W. E. Gilbert) 197-204
- The influence of antibacterial substances on the interaction of bacteria and bacteriophages. 1. The influence of penicillin. (W. J. Elford) 205-219
- The influence of antibacterial substances on the interaction of bacteria and bacteriophages. 2. Optical studies of the penicillin effect. (J. Smiles, F. V. Welch & W. J. Elford) 220-227
- The absence of soluble antibacterial inhibitors in *Clostridium* spp. (G. Belyavin) 228-229

## 2 : September 1948

- The breakdown of phenols and related compounds by bacteria. (J. W. Czekałowski & B. Skarzynski) 231-238
- The incidence and character of vibrios in British waters. (R. Jackson) 239-247
- Nuclear fusion and reorganization in a lactobacillus and a streptococcus. (K. A. Bisset) 248-251
- Differentiation of the vegetative and sporogenous phases of the actinomycetes. 3. Variation in the *Actinomyces coelicolor* species-group. (D. Erikson) 252-259
- The action of lysozyme on heat-killed gram-positive micro-organisms. (M. Webb) 260-274
- The influence of magnesium on cell division. 1. The growth of *Clostridium welchii* in complex media deficient in magnesium. (M. Webb) 275-287
- Preparation of cell-free bacterial extracts with powdered alumina. (H. McIlwain) 288-291
- A critical study of factors influencing the microbiological assay of nicotinic acid. (E. Kodicek & C. R. Pepper) 292-305
- The microbiological estimation of nicotinic acid and comparison with a chemical method. (E. Kodicek & C. R. Pepper) 306-314
- The mechanical destruction of bacteria. (H. K. King & H. Alexander) 315-324
- Nuclear changes in *Bacillus anthracis* and their relation to variants. (T. H. Flewett) 325-333
- The egg-yolk reaction of aerobic sporing bacilli. (C. A. McGaughey & H. P. Chn) 334-340
- Gladiolic acid, an antibiotic substance produced by *Penicillium gladioli* McCall & Thom. (P. W. Brian, P. J. Curtis & H. G. Hemming) 341-355

## 3 : January 1949

- Occurrence of the M substance of type 28 group A in streptococci of Lancefield groups B, C and G. (W. R. Maxted) 1-6
- The drying and preservation of bacterial cultures. (H. Proom & L. M. Hemmons) 7-18
- The production of penicillin in surface culture, using chemically defined media. (C. T. Calam & J. D. Hockenbuhl) 19-31
- Development of bacteria in waters stored in glass containers. (C. B. Taylor & V. G. Collins) 32-42
- A note on morphological differences between strains of *Streptococcus cremoris*. (H. R. Whitehead & G. J. E. Hunter) 43-45
- The isolation and cultivation of sulphate-reducing bacteria. (K. R. Budin, M. E. Adams & M. Thomas) 46-59
- Some biological properties of trichothecin, an antifungal substance from *Trichothecium raseum* Link. (G. G. Freeman & R. L. Morrison) 60-68
- Outline classification of *Bacterium* and *Staphylococcus*. (S. T. Cowan & C. Shaw) 69-73
- Further observations on the differential inhibition of coliform bacilli and rough variants of intestinal pathogens. (J. Brodie & W. Shepherd) 74-79
- The streptococci of group D: the serological grouping of *Streptococcus bovis* and observations on serologically refractory group D strains. (P. M. F. Shattock) 80-92
- Observations upon the cytology of corynebacteria and mycobacteria. (K. A. Bisset) 93-96
- The serological comparison of strains of influenza virus. (F. Fulton & K. R. Dumbell) 97-111
- The use of Nile blue in the study of tetrathionase activity. (W. H. H. Jebb) 112-116
- The control of the swarming of *Proteus vulgaris* by boric acid. (J. A. Sykes & R. Reed) 117-121
- Auaraographic techniques in biochemical genetics. (G. Pontecorvo) 122-126
- The assimilation of amino-acids by bacteria. 7. The nature of resistance to penicillin in *Staphylococcus aureus*. (E. F. Gale & A. W. Rodwell) 127-142
- The utilization of pyridine by micro-organisms. (F. W. Moore) 143-147
- Clostridium welchii* iota toxin: its activation by trypsin. (H. E. Ross, M. E. Warren & J. M. Barnes) 148-152

## Journal of Hygiene

46 : March 1948

- An outbreak of infantile gastro-enteritis in Aberdeen. The association of a special type of *Bact. coli* with the infection. (C. Giles & G. Sangster) 1-9  
(S. A. Barnett) 10-18  
Epidemics in India and British tropical  
ta. (L. Rogers) 19-33  
Combined active and passive immunization against diphtheria. (A. W. Downie,  
A. T. Glenny, H. J. Parish, E. T. C. Spooner, R. L. Vollum & G. S. Wilson)  
34-41  
Studies on vaccinia haemagglutinin. I. Some physico-chemical properties.  
(C. M. Chu) 42-48  
Studies on vaccinia haemagglutinin. II. Some immunological properties.  
(C. M. Chu) 49-59  
The inhibitory action of the monoethyl esters of *S-n*-alkylthiomalic acids and the  
monoethyl esters of alkane sulphonyl succinic acids on the growth of *Mycobacterium tuberculosis*. (P. A. McNally) 60-61  
Bacterial lysis and antiseptics. (R. J. V. Pulvertaft & G. D. Lumb) 62-64  
The labile antigens of *Shigella dysenteriae* Shiga. (M. Shelubsky & L. Olitzki)  
65-69  
The production of H<sub>2</sub>S-negative strains of *Salmonella*. (W. J. Wilson) 70-73  
Investigations on the typing of staphylococci by means of bacteriophage. I. The  
origin and nature of lysogenic strains. (H. W. Smith) 74-81  
Investigations on the typing of staphylococci by means of bacteriophage.  
II. The significance of lysogenic strains in staphylococcal type designation.  
(H. W. Smith) 82-89  
*Entanveba histolytica* in wild rats caught in London. (R. A. Neal) 90-93  
Seasonal changes in the normal bacterial flora of fresh-water fish. (K. A. Bisset)  
94-97  
The diagnostic value of the Widal test in the inoculated. (R. H. Mole) 98-100  
Infective hepatitis among civilians in Palestine. (L. Olitzki, R. Bachi &  
G. Kallner) 101-116

46 : July 1948

- Combined *Pertussis*-diphtheria prophylactic antigens. An experimental study  
to determine the specific immunizing value of these antigens used in combination. (D. Ordman & E. Grassett) 117-122  
Seven-year study of pneumococcus type incidence in the Royal Hospital for  
Sick Children, Glasgow. (K. J. Gairnie & G. L. Montgomery) 123-128  
Some observations on the relation between horse serum and a pool of rabbit  
antihorse serum. I. The relative inhibitory effect of excess antigen and excess  
antiserum. (G. R. E. Naylor) 129-135  
Studies in the dynamics of disinfection. XII. The effect of variation in pH on  
the rate of disinfection at 51° C. of standard cultures of *Bact. coli*. (R. C.  
Jordan, S. E. Jacobs & C. F. Lee) 136-147  
A food-borne outbreak of streptococcal infection. (P. C. Reynell) 148-150  
An outbreak of gastro-enteritis due to *Salmonella derby*. (R. Mushin) 151-157  
Cross-infection in hospital due to *Salmonella derby*. (S. D. Rubbo) 158-163  
An outbreak of typhoid fever in the Middle East. (E. S. Anderson & H. G. H.  
Richards) 164-172  
Nuclear reorganization in non-sporing bacteria. (K. A. Bisset) 173-175  
Submarine escape breathing air. (K. W. Donald, W. M. Davidson & W. O.  
Shelford) 176-183  
Formation of cyanogen chloride during chlorination of certain liquids: toxicity  
of such liquids to fish. (L. A. Allen, N. Blizard & A. B. Wheatland) 184-193  
The absorption of fat during the consumption of diets rich in whole-grain and  
white breads. (A. R. P. Walker) 194-197  
A dietary and clinical survey of pregnant women with particular reference to  
toxaemia of pregnancy. (W. Hobson) 198-216  
The toxicity of methyl chloride and methyl bromide towards white rats.  
(S. van Tiel) 217-221  
A study of the serological type differentiation of *Staphylococcus pyogenes*. (B. C.  
Hobby) 222-238

46 : September 1948

- Agglutination of red blood cells of different animal species by influenza and  
Newcastle disease viruses. (C. M. Chu) 239-246  
Inactivation of haemagglutinin and infectivity of influenza and Newcastle disease  
viruses by heat and by formalin. (C. M. Chu) 247-251  
Femoral and chronic carriers of *Salmonella typhi* and *Salmonella paratyphi* B.  
(T. M. Vogelsang & J. Bae) 252-261  
The bacteriological interpretation of vaginal smears. (N. Laughton) 262-263  
Observations upon the bacterial nucleus. (K. A. Bisset) 264-266  
Nasal antibodies in the blood serum of fresh-water fish. (K. A. Bisset) 267-268  
A study of coliform organisms in the Melbourne water supply and in animal  
faeces, with observations on their longevity in faeces and in soil. (D. A.  
Bardsley) 269-279  
Studies in the dynamics of disinfection. XIII. The nature of the probit-log  
survival-time relationship in disinfections of standard cultures of *Bact. coli* at  
51° C. under various conditions of pH. (R. C. Jordan & S. E. Jacobs) 280-288  
Studies in the dynamics of disinfection. XIV. The variation of the concentration  
exponents for hydrogen and hydroxyl ions with mortality level, using standard  
cultures of *Bact. coli* at 51° C. (R. C. Jordan & S. E. Jacobs) 289-295  
The conglutination phenomenon. IV. The importance of the choice of complement  
when examining antisera for the presence of complement-fixing or  
complement-absorbing antibodies. (R. R. A. Coombs & N. H. Hole) 296-310  
Notes on climate and morbidity. (R. W. Parrell) 311-314  
The feeding and breeding of laboratory animals. VII. Methods of testing the  
adequacy of diets for breeding mice. (H. M. Bruce & C. W. Emmens) 315-324  
Wartime rationing and nutrition in pregnancy. First communication.  
(E. Oehmer) 325-330  
Experiments on adaptive variation and rejuvenation. *Bacillus dysenteriae* Flexner,  
grown on media containing sulphanilamide, acriflavine, argyrol, neosalvarsan  
and no drug. (F. H. Stewart) 331-344  
Capsules and mucoid envelopes of bacteria. (E. Klieneberger-Nobel) 345-348

## Journal of Laryngology and Otology

62 : April 1948

- A contribution to the question of otitis media in infants. (A. Mares) 207-230  
The turning test with small regulable stimuli. III. The advantages of cupulo-  
metria over the classic technique of Bárány. (J. J. Groen & L. B. W. Jongkees)  
231-235

The turning test with small regulable stimuli. IV. The cupulogram obtained  
by subjective angle estimation. (J. J. Groen & L. B. W. Jongkees) 236-240  
Neurinoma in the nasal cavity. (G. Révész) 241-244

62 : May 1948

- Audiograms in otosclerosis. (W. McKenzie) 267-277  
Cerebellar abscess, acute, otogenic. A note on the early diagnosis and drainage  
with some case records. (N. Asherson) 278-307  
A new method of demonstrating the labyrinth, together with those related structures  
which lie within the petrous portion of the temporal bone. (O. Gray)  
308-309

62 : June 1948

- The phylogeny of the mammalian tympanic cavity and auditory ossicles.  
(J. Gerrie) 339-357  
Aural trauma caused by gunfire. Report on a clinical investigation of 108  
soldiers exposed to gunfire who, on some occasion, had complained of injury  
to their ears. (E. G. Collins) 358-390  
A case of otitic hydrocephalus. (W. McKenzie) 391-393

62 : July 1948

- Surgery of aural suppuration after radical mastoidectomy. (J. A. Harpman)  
435-439  
A new method of transverse pharyngotomy. (A. Réthi) 440-446  
The treatment of inflammation of the inner ear by sulfa-drugs. (A. A. J. van  
Egmond & L. B. W. Jongkees) 447-459  
A case of gas-filled abscess in the temporal lobe. (W. McKenzie) 460  
A case of submucous abscess of the oesophagus. (J. V. Clark) 461-464

62 : August 1948

- Experimental studies on the reliability of audiometry. (R. E. C. Brown) 487-524  
Metastatic brain abscesses and encephalitis of otitic origin. (P. G. Gerlings)  
525-532  
A note on the articulations of the auditory ossicles and related structures.  
(D. V. Davies) 533-536

62 : September 1948

- Penicillin treatment in acute suppurative otitis media with special reference to  
long-term hearing. (A. Young & I. S. Hall) 551-556  
Cavernous haemangioma of the frontal bone. (G. Kelemen & E. M. Holmes)  
557-563  
Radiology of the temporal bone. Some anatomical aspects. (J. F. O. Mitchell  
& R. Astley) 564-567  
The radical mastoid operation: a pre- and post-operative audiometric statistical  
survey of hearing loss in chronic otorrhoea. (N. Asherson) 568-602  
Response of observed otitic encephalitis to penicillin and chemotherapy.  
(T. B. Hutton) 603-605  
The post-operative treatment of the radical mastoid operation. (G. Glass)  
606-607

62 : October 1948

- Further operative results of carcinoma of the larynx. (T. D. Demetriades &  
D. Ioannovich) 613-620  
The treatment of laryngeal papillomatosis in childhood. (H. Zalin) 621-626  
Ménière's disease. (H. Brunner) 627-638  
Gradenigo's syndrome and report of two cases. (S. Horowitz) 639-647

62 : November 1948

- Otosclerosis in childhood. (W. McKenzie) 661-670  
Observations upon the loudness recruitment phenomenon, with especial reference  
to the differential diagnosis of disorders of the internal ear and VIIIth nerve.  
(M. R. Dix, C. S. Halpike & J. D. Hood) 671-686  
On the phylogeny of the mammalian auditory ossicles. (A. Tumarkin) 687-690  
On the evolution of the auditory perilymphatic system. (A. Tumarkin) 691-701  
Osteomata of the external auditory meatus. A case report. (A. Belaf) 702-703

62 : December 1948

- Pins in the periphery of the lung. (G. Glass) 715-720  
The practical application of clinical audiometry. (B. Warshaw) 721-734  
The effects of streptomycin on the eighth nerve system. (M. R. Dix) 735-745  
Head noises of muscular origin: audible or objective tinnitus. (H. W. Schwartz)  
746-751  
Hirudo medicinalis (medical leech) in the larynx: an interesting clinical condition  
found in Iraq. (D. S. Ali) 752-753  
Formation of cholesteatoma around a deposit of sulfa-powder. (L. B. W.  
Jongkees) 754-755

63 : January 1949

- Broncho-oesophagology in Great Britain—the decline of a science—a plea for  
better co-operation and teaching. (G. E. Martin) 1-16  
Radon therapy of nasopharyngeal lymphoid hypertrophy in children. (E. G.  
Collins, I. S. Thomson & G. E. Swindell) 17-23  
Mucocels. (M. J. Tamari & J. J. O'Neill) 24-30  
A case of nasopharyngeal chordoma. (A. S. Handousa) 31-33  
A case of non-metallic foreign body in the ethmoidal sinus. (H. C. P. Gunewardene) 34-35  
Treatment of maxillary sinusitis by instillation of penicillin. (A. Walford) 36

63 : February 1949

- Lempert fenestra nov-ovalis for the restoration of practical unaided hearing in  
clinical otosclerosis: its present status. (J. Lempert) 57-69  
Mucocel of the frontal sinus. Some notes on its aetiology, pathology and  
diagnosis. (E. F. Stewart) 70-78  
Stapediotomy (stapedius tenotomy). (L. R. S. Taylor & G. H. Bateman) 79-80  
A case of lipiodosis simulating double mastoiditis. (A. S. Handousa) 81-84  
"Simple" ulceration of the external auditory meatus. (W. M. Mollison) 85-86

63 : March 1949

- The end of an era: a retrospect and a prospect. (W. Howarth) 107-114  
Septicaemia after tonsil operations. (F. W. Williams) 115-118  
On the evolution of the auditory conducting apparatus. I. A new theory based  
on functional considerations. (A. Tumarkin) 119-140

- Some observations on antro-choanal polypus. (A. R. Dingley) 141-143  
The clinical aspect of perceptive deafness—so-called nerve or internal ear deafness. (E. D. D. Davis) 144-153  
Associated oesophageal and gastric strictures following swallowing of caustic soda. (G. H. Caiger) 154-158

## 63 : April 1949

- The otologist and rehabilitation of the deaf. (R. S. Stevenson) 179-192  
On the evolution of the auditory conducting apparatus—II. (A. Tumarkin) 193-216  
Some rare anomalies of the oesophagus, with discussion of their aetiology. (A. S. Handousa) 217-224  
Changes in vestibular reactions after the fenestration-operation. (L. B. W. Jongkees & J. Hulk) 225-232  
A case of osteomyelitis of the superior maxilla treated with penicillin. (T. M. Banham) 233-234  
A case of accessory sinus tuberculosis. (W. G. R. Hore & W. Kirchenherger) 235-236

## Journal of Mental Science

## 94 : January 1948

- The twenty-first Maudsley Lecture: nosophobia. (J. A. Ryle) 1-17  
Psychiatric hypothesis and practice. (D. Henderson) 18-32  
Psychiatric disorders among the chronic sick in hospital. (J. W. Affleck) 33-45  
The syndrome of visual alexia with colour agnosia. (E. Stengel) 46-58  
The syndrome of alexia and amnesic aphasia. Subarachnoidal haemorrhage with symptom of partial occlusion of the spinal subarachnoidal space. (R. Klein & J. H. Attlee) 59-69  
Histopathological findings in general paresis after penicillin treatment: report on 4 cases. (R. H. F. Smith & V. de Moraes) 70-76  
Some observations on the analytical group treatment of a phobic patient. (F. Kräupl) 77-88  
Pupillary abnormalities in schizophrenia and during muscular effort. (P. R. A. May) 89-98  
Modern trends in the planning of mental hospitals and other psychiatric units in England. (F. C. Webster) 99-106  
The planning of modern psychiatric units. (J. J. O'Reilly) 107-113  
A method for determining the typicality of personality description. (Applied to assessing the noticed after-effects of prefrontal leucotomy.) (J. C. Raven) 114-117  
Cerebral physiology and psychiatry. (W. W. Gordon) 118-132  
Normal changes in the mental abilities of adults as age advances. (G. A. Foulds & J. C. Raven) 133-142  
The place of psychiatry in medicine. (N. Harris) 143-147

## 94 : April 1948

- Psychiatric ruminations. (W. G. Masefield) 217-224  
The identity of Alzheimer's disease and senile dementia and their relationship to senility. (R. D. Newton) 225-249  
Genetics in relation to mental disorders. (F. J. Kallman) 250-257  
Mental deficiency and social medicine. (E. O. Lewis) 258-265  
Social surveys. (E. Strömberg) 266-276  
Psychopathic personality as a genetic concept. (E. T. O. Slater) 277-282  
The modern approach to juvenile delinquency: observation centres. (A. Kennedy) 283-304  
The significance of the home for the child's emotional development during the first six years. (K. Friedlander) 305-313  
Dynamics of creative activity. (F. Reitman) 314-320  
The Medea Complex: the mother's homicidal wishes to her child. (E. S. Stern) 321-331  
The effect of leucotomy on creative personality. (E. L. Huttoo & M. Bassett) 332-350  
The mental health of British troops in the Far East. (R. F. Tredgold) 351-391  
Physiological and psychological responses to stress in neurotic patients. (M. Jones) 392-427  
Personality change and prognosis after leucotomy. (G. Garmany) 428-438  
Delinquency and epilepsy: a clinical and electrophysiological note. (R. S. Hodge) 439-443  
Suggestibility and persistence in epileptics and mental defectives. (M. Brady) 444-451  
The Kent and other tests used on the same subjects. (G. de M. Rudolf) 452-458  
The management of chronic mental patients. (A. P. Tait) 459-464

## 94 : July 1948

- Post-hypoglycaemic encephalopathy in Sakel's insulin treatment. (A. M. Spencer) 513-554  
Posterior cuts in prefrontal leucotomy: a clinico-pathological study. (A. Meyer & T. McLardy) 555-564  
A psychiatric review of fifty cases of gunshot wounds self-inflicted. (R. F. Fidler) 565-574  
The results of treatment of a thousand cases of schizophrenia. (L. A. Finiefs) 575-580  
Observations in electrically-produced epileptic convulsions. Part I. Tonic neck and labyrinthine reflexes upon the eyes. (R. Klein & D. F. Early) 581-589  
Periodic catatonias. (J. S. B. Lindsay) 590-602  
Misinterpretation of mirror image of self in presenile cerebral atrophy. (R. E. Hemphill) 603-610  
Contribution to the dressing disability as a focal sign and to the imperception phenomena. (R. E. Hemphill & R. Klein) 611-622  
The community and the aggressive child. (J. D. W. Pearce) 623-628  
The ephedrine treatment of nocturnal enuresis. (G. de M. Rudolf) 629-640  
Further aspects of brief retrograde amnesia. (G. de M. Rudolf) 641-649  
Some clinical observations on the psychodynamic relationship between depression and obsessive-compulsive symptoms. (E. Stengel) 650-652  
Lung abscess following electro-convulsive therapy: description of a case. (H. Conway & H. Osmond) 653-656

## 94 : October 1948

- Love deprivation and the hysterical personality. (O. W. S. FitzGerald) 701-717  
An interpretation of play therapy by the psychosomatic theory of family sexuality. (C. E. H. Turner) 718-732  
Observations on the use of tridione in disturbed psychotics. (E. P. Hall) 733-736

- The use of music in group therapy. (S. D. Mitchell & A. Zanker) 737-748  
The measurement of the structure and behaviour of therapeutic groups. (R. A. Sandison) 749-763  
The application of psychoanalytical principles to hospital in-patients. (J. Rickman) 764-766  
Application of psychoanalytical principles to the treatment of in-patients in mental hospitals. (W. C. M. Scott) 767-772  
The application of psychoanalytical principles to the hospital in-patient. (E. Stengel) 773-781  
Homicidal incidence in the depressive psychoses. (J. C. Batt) 782-792  
Electronarcosis, with special reference to the treatment of paranoid schizophrenia. (R. W. Medicott) 793-798  
Psychiatric treatment outside mental hospitals. (D. E. Sands) 799-804  
Observations on the electrically-produced epileptic convulsion. Part II: Pupillary phenomena in normal and pathological pupils. (R. Klein & D. F. Early) 805-808  
Experiments in the improvement of reading in a group of educationally sub-normal boys. (H. C. Günzburg) 809-833  
Leucotomy in the treatment of psychopathic feeble-minded patients in a State mental deficiency institution. (G. W. Mackay) 834-843  
Prefrontal leucotomy in mental defectives. (M. Engler) 844-850

## 95 : January 1949

- What the patient thinks. The Presidential Address delivered at the one hundred and seventh annual meeting of the Association on Wednesday, July 7th, 1948. (W. Rees-Thomas) 1-9  
Morale and flying experience: results of a wartime study. (D. Stafford-Clark) 10-50  
Electric anaesthesia and electro-narcosis. (E. O. Longley) 51-79  
Forecasting the incidence of neurosis in officers of the Army and the Navy. (W. Mayer-Gross, J. N. P. Moore & P. Slater) 80-100  
Leucotomy in the periodic psychoses. (G. N. Jones & P. K. McCowan) 101-114  
Results of isolation of the orbital lobes in leucotomy. (G. Egan) 115-123  
The environment as a factor in the aetiology of criminal paranoia. (K. O. Milner) 124-132  
The psychiatric aspects of tropical service in the Navy. (K. Cameron) 133-139  
Pupillary phenomena on application of a strong constant electric current as used in electroconvulsive treatment. (R. Klein & D. F. Early) 140-142  
The nasopalpebral reflex: its application to neuro-psychiatry, particularly to insulin shock treatment. (F. F. Kins) 143-147  
A note on the ammonia and glutamine content of the cerebrospinal fluid. (D. Richter, R. M. C. Dawson & L. Rees) 148-152  
Adrenal cortical steroids and the metabolism of glutamic acid in gluconeogenesis. (W. R. Ashby) 153-161  
Physiological concomitants of electronarcosis. (L. Rees) 162-179  
Nucleoprotein in the nerve cells of mental patients: a critical remark. (A. Meyer & M. Meyer) 180-181  
Anatomical correlates of improvement after leucotomy. (T. McLardy & A. Meyer) 182-196  
Transorbital leucotomy. (G. W. T. H. Fleming & D. G. Phillips) 197-202  
Chess as a form of recreational therapy. (R. Pakenham-Walsh) 203-204

## Journal of Neurology, Neurosurgery and Psychiatry

## 11 : May 1948

- Primary sensory neuropathy with muscular changes associated with carcinoma. (D. Denny-Brown) 73-87  
Phantom limbs. (W. R. Healderson & G. E. Smyth) 88-112  
Pain sensibility in deep somatic structures. (W. H. Feindel, G. Weddell & D. C. Sinclair) 113-117  
Physiological mechanisms underlying the electrical activity of the brain. (M. A. B. Brazier) 118-133  
The role of acetylcholine in synaptic transmission: a critical review. (D. Whitteridge) 134-140

## 11 : August 1948

- The treatment of purulent pachymeningitis and subdural suppuration with special reference to penicillin. (F. Schiller, H. Cairns & D. S. Russell) 143-182  
Necrosis of the brain due to radiation therapy: clinical and pathological observations. (J. Pennybacker & D. S. Russell) 183-193  
Haemangiomas involving the spinal epidural space. (A. N. Gutkelch) 199-210  
The laminar pattern of the lateral geniculate body in the primates. (L. W. Cbacko) 211-224

## 11 : November 1948

- Intravenous methylene blue for experimental studies on the central nervous system. (W. H. Feindel, A. C. Allison & G. Weddell) 227-242  
Neurovascular relations and anomalies at the base of the brain. (S. Sunderland) 243-257  
Diabetes insipidus following closed head injury. (R. J. Porter & R. A. Miller) 258-262  
Cerebral thrombophlebitis and fibrinogen B. (G. Phillips) 263-266  
Epileptic response to peripheral injury. (G. Parsons-Smith) 267-270  
Psychological effects in depressive patients of the marijuana homologue synhexyl. (D. A. Pond) 271-279  
Cystic pituitary adenomata. (J. E. Paterson) 280-287  
Case report: abnormal innervation of the sphincter pupillae and ciliary muscle following third-nerve regeneration. (W. R. Russell & M. H. Wright) 288-290  
A case of cerebral amoebic abscess treated by modern chemotherapy. (E. A. Turner) 291-293

## 12 : February 1949

- A study of post-iscbaemic paraesthesiae. (W. R. Merrington & P. W. Nathan) 1-18  
Some experimental and clinical observations on the anticonvulsive action of paraldehyde. (F. J. de Elío, P. G. de Jaló & S. Obrador) 19-24  
Syncope and seizures. (J. Kershman) 25-33  
The intelligence of patients with Friedrich's ataxia. (D. L. Davies) 34-38  
Developmental defects of the cisterna magna and dura mater. (E. G. Robertson) 39-51  
Crushing injuries to the skull: clinical and experimental observations. (W. R. Russell & F. Schiller) 52-60  
Platybasia: with case report. (C. Mayersky) 61-65  
Virus diseases of the central nervous system: a review. (J. Gear) 66-76

## GUIDE TO THE JOURNALS

Journal of Obstetrics and Gynaecology of the British Empire  
55 : April 1948

- Relief of severe stress incontinence. Technique and anatomy of two suprapubic fascial operations. (C. M. Marshall) 126-134  
 Virilizing tumours of the ovary: with report of a case associated with pregnancy. (W. N. Searle, M. Haines & J. K. Baker) 135-141  
 Calcium and phosphorus metabolism in pregnancy: (a survey under war- and post-war conditions). V. Calcium and phosphorus balances and labour findings. (E. Obermer) 142-148  
 A case of partial atresia of the vagina. (G. B. Thomas) 149-151  
 Haemoglobin values in pregnant women. (A. Sadovsky, W. Koch, R. Toaff & D. Kaplan) 152-154  
 Fibromyoma of the Fallopian tube. (J. A. Chalmers) 155-158  
 Investigations into the determination of pregnandiol according to the Guterman method. (S. Kullander) 159-170  
 Facts and fantasy in the study of female infertility. (J. Stallworthy) 171-180  
 A case of adenomyosis of the uterus with tuberculous infection. (R. de Solderhoff) 180-183  
 Heart disease in pregnancy. (D. J. MacRae) 184-198

## 55 : June 1948

- The use of the "phase-contrast" microscope in clinical gynaecology. A preliminary report. (A. Culiner & J. Gluckman) 261-267  
 Proctiditis complicated by intestinal strangulation in a pouch of Douglas hernia. (T. F. Redman) 268-269  
 Hysterosalpingography employing a water-soluble contrast medium. (D. Jefferiss) 270-272  
 Inactivation of oestrogenic hormone by women with vitamin B deficiency and Zondek & A. Brzezinski) 273-280  
 Evolution and growth of tadpoles of the superficial veins in the pregnant folliculin. (L. Lajos & F. Szontagh) 281-284  
 Demonstration by infra-red photography of the superficial veins in the pregnant and non-pregnant woman. (K. Bowes, S. H. Riterband & J. E. Andrews) 293-302  
 William Harvey—"the father of British midwifery." (R. W. Johnstone) 293-302  
 Vaginal hysterectomy for cancer of the uterus and vagina. (J. Trapl) 303-308  
 "Mesodermal mixed" tumour of uterus. (C. E. M. Blumer & J. L. Edwards) 309-311  
 Sir Frances Champneys, Bt., M.A., M.D., F.R.C.P. (W. F. Shaw) 312-317  
 The difficult dilatation. (A. E. Chisholm) 317  
 A case of extrauterine pregnancy. (P. Dingle & K. A. D. Drury) 318-321  
 Hydatidiform mole in the Fallopian tube. (J. A. Chalmers) 322-324  
 Acute crises in chronic haemolytic anaemia induced by pregnancy. (Y. M. Bromberg, R. Toaff & E. Ehrenfeld) 325-329

## 55 : August 1948

- The investigation and treatment of 'border-line' cases of contracted pelvis. (J. M. M. Kerr) 401-417  
 Pregnancy associated with a septate uterus, double vagina and other congenital abnormalities. (J. R. C. Burton-Brown) 418-422  
 A further case of stromal endometriosis. (W. W. Park & R. A. Tennent) 423-427  
 Angina of effort in pregnancy: report of a case. (A. Schott) 428-431  
 Heart block and pregnancy (a review). (R. Mowbray) 432-437  
 Congenital complete heart block complicating pregnancy (a report of three cases). (R. Mowbray & C. C. Bowley) 438-441  
 The vernix caseosa and subnormal temperature in premature infants. (C. Saunders) 442-444  
 Thoracoplasty and pregnancy—with special reference to childbirth (a preliminary report). (J. P. McIntyre) 445-448  
 Prediabetic pregnancy. (H. H. F. Barnes & M. E. Morgans) 449-454  
 Pneumo-pyosalpinx. (R. W. K. Purser & J. Young) 455-458  
 Spina bifida occulta and nulliparous prolapse (with notes on the incidence of certain abnormalities of the sacrum). (A. A. Gemmell, P. H. Whitaker & R. L. Plackett) 459-463  
 Erythrocyte sedimentation velocity (B.S.R.) in normal pregnancy. (E. Obermer) 464-469  
 Placenta praevia accreta. (W. N. Chisholm) 470-472

## 55 : October 1948

- On the choice of treatment of individual carcinomas of the cervix based on the analysis of serial biopsies. (A. Glucksmann & S. Way) 573-582  
 The vascular pattern of the placenta and its development in the rat. (R. P. Holmes & D. V. Davies) 583-607  
 The vaginal bacterial flora and ovarian dysfunction. (N. Loughton) 608-613  
 External version under anaesthesia. (J. H. Peel & S. G. Clayton) 614-623  
 Child-bearing in the tuberculous gravidae. (J. P. McIntyre & W. C. Armstrong) 624-629  
 Cerebral venous thrombosis in pregnancy. (A report of two possible cases.) (J. McNairn) 630-634  
 Some principles of myomectomy. (N. C. Louros) 635-641  
 The care of the eyes at birth. (M. D. Taylor & R. M. Calman) 642-645  
 Breast hypertrophy and pregnancy. (G. Bankoff) 646-649  
 A case of elephantiasis vulvae. (A. Mackenzie & P. R. Mitchell) 653-663  
 Intestinal obstruction in pregnancy. (S. Matthews & a ruptured enterocoele. (W. Thompson) 664

## 55 : December 1948

- Functioning tumours of the ovary, with special reference to pathology and histogenesis. (E. Novak) 725-738  
 Primary carcinoma of the vagina. (S. Way) 739-755  
 Aetiology of eclampsia. (J. C. Baker) 756-765  
 Obstructed labour due to septate vagina. (H. R. Arthur) 766-769  
 A new contrast medium (rayopaque) for hysterosalpingography. (A. Sharman) 770-773  
 Rhesus factor iso-immunization and haemolytic disease of the newborn. (N. W. Philpott) 774-786  
 Massive lymphangioma of the foetal trunk and shoulders causing dystocia. Report of a case. (R. B. Mitchell & D. B. Stewart) 787-790  
 Calcium and phosphorus metabolism in pregnancy. A survey under war and post-war conditions. (E. Obermer) 791-797

Normal pregnancy in a case of thrombosis of the inferior vena cava. (J. F. Foulkes) 798-802  
 Dysgerminoma ovarii. Report of a case. (H. Sobhi & H. K. Topozada) 803-808

## 56 : February 1949

- The pathology and repair of genital prolapse. (K. Pacey) 1-15  
 Natural childbirth in a teaching clinic. (H. Thoms) 18-21  
 A review of a series of 100 cases of vesicovaginal fistulae. (R. G. Krishnan) 22-27  
 Anaemia simulating pre-eclamptic toxemia. (J. M. Scott & A. D. T. Govan) 28-35  
 Measurement of the rate of venous blood-flow in the legs of women at term and in the puerperium, using radioactive sodium. (H. P. Wright, S. B. Osborn & D. G. Edmonds) 36-40  
 The treatment of carcinoma of the body of the uterus. (B. Rickford) 41-45  
 Pulmonary embolism by amniotic fluid (a report of a fatal case, together with a review of the literature). (D. M. Shotton & C. W. Taylor) 46-53  
 Morphine mucate in labour and obstetric practice: preliminary communication of results in a series of 170 injections. (W. F. Flinn) 54-57  
 Locked twins (report of 3 cases). (R. F. Lawrence) 58-63  
 Papan's stain for vaginal smears. (W. S. Bullough) 64-66  
 A contribution to the historical record of monstrous births. (J. F. D. Shrewsbury) 67-85  
 Meigs' syndrome with a granulosa-cell tumour. (A. G. Marshall) 86-88  
 A case of conjoint thoracopagus twins with obstructed labour and delivery by caesarean section. (N. H. North, J. B. Dawson & W. D. Trotter) 89-94  
 Some observations on the aftercoming head. (J. Baxter) 95-106  
 Chronic lymphatic leukaemia presenting as neoplasm of the cervix uteri. (L. Stein) 107-108

Journal of Pathology and Bacteriology  
60 : January 1948

- The cytoplasmic basophilia of marrow cells: the distribution of nucleic acids. (J. N. Davidson, I. Leslie & J. C. White) 1-20  
 Melanin-forming epidermal tumours of the skin: a study of 57 personally observed cases. (M. J. Stewart & G. M. Bonser) 21-33  
 A new Salmonella type: *Salmonella chittagong*. (J. Taylor, W. Hayes, J. Freeman & E. S. Anderson) 35-42  
 An analysis of certain factors associated with the production of experimental dissection of the aortic media, in relation to the pathogenesis of dissecting aneurysm. (J. S. Robertson & K. V. Smith) 43-49  
 Massive colony formation of *Bacterium friedländeri* in the liver in agranulocytosis. (J. I. Davidson) 51-56  
 Thrombosis as a factor in the pathogenesis of aortic atherosclerosis. (J. B. Duguid) 57-61  
 The nature of anaemia in leukaemia. (D. H. Collins & W. M. Rose) 63-74  
 The mechanism of parenchymatous degeneration produced by diphtheria toxin. (G. Popják) 75-85  
 The effect of temperature upon antibody production in cold-blooded vertebrates. (K. A. Bisset) 87-92  
 A new mycobacterial infection in man: I. Clinical aspects. (P. MacCallum & G. Buckle) 102-110. II. Pathology of the experimental lesions in the rat. (H. A. Sissons) 110-116. III. Cultivation of the new mycobacterium. (G. Buckle & J. C. Tolhurst) 116-122  
 The antibody response in cases of radiation lymphopenia, and in the reticuloses. (R. W. Evans) 123-130  
 Leucocytes and bacteria in human semen. (M. Svendsen) 131-135  
 Catalase production by gram-positive cocci: a simple test for differentiating enterococci from micrococci. (A. Isaacs & J. M. Scouller) 135-136  
 Further consideration of some of the factors concerned in intracutaneous injection of cattle. (W. M. Henderson) 137-139  
 Haemolysis in fresh blood films. (J. G. Thomson) 140-141

## 60 : April 1948

- The incidence of pathogenic staphylococci in the throat, with special reference to glandular fever. (A. C. P. Campbell) 157-169  
 Urease and other biochemical reactions of the Proteus group. (G. T. Cook) 171-181  
 Rapid identification of the jaw with pulmonary metastases. (G. E. Waterworth & T. H. Pullar) 193-197  
 Anti-haemolytic action of *viridans* (α) variants of haemolytic streptococci. (A. Isaacs) 199-204  
 Bullet embolism: a case of pulmonary embolism following the entry of a bullet into the right ventricle of the heart. (D. H. Collins) 205-210  
 The pathogenesis of glomerulo-nephritis: a re-investigation of the auto-immunisation hypothesis. (J. H. Humphrey) 211-218  
 Immunological studies with group-B streptococci. (I. H. Pattison) 219-237  
 The effect of castration on the action of some barbiturates. (G. R. Cameron, G. H. Cooray & S. N. De) 239-246  
 Clotting of human citrated plasma by gram-negative organisms. (E. M. Harper & N. S. Conway) 247-251  
 Anthrax in a laboratory worker, with observations on the possible source of infection. (M. A. Solty) 253-257  
 The lining of bealed but persistent abscess cavities in the lung with epithelium of the ciliated columnar type. (D. M. Pryce) 259-264  
 The influence of cultural conditions on the morphology of *Bacterium aerogenes* with reference to nuclear bodies and capsule size. (J. P. Duguid) 265-274  
 Function and arrangement of bacterial flagella. (T. Y. K. Boltjes) 275-287  
 Experimental pulmonary arteriosclerosis. (C. V. Harrison) 289-293  
 The large-cell small-acinar thyroid tumour of Langhans and the incidence of related cell groups in the human thyroid. (B. Lennox) 295-305  
 Agglutination of coliform bacilli by normal rabbit serum. (A. H. Emslie-Smith) 307-313  
 The quantitative description of the fragility of the erythrocyte and its application to the study of acholuric jaundice. (G. Discombe) 315-322  
 Addison's disease due to congenital hypoplasia of the adrenals in an infant aged 33 days. (H. Sisk) 323-324

- The histological demonstration of glycogen in necropsy material. (J. Vallance-Owen) 325-327  
 A simple method for testing dye sensitivity of *Brucella* species. (J. C. Cruickshank) 328-329  
 Squamous metaplasia in the prostate as a result of stilboestrol therapy. (A. Inglis) 330-332  
 Marrow biopsy in laboratory animals. (A. J. S. McFadzean) 332-333  
 Observations on fragments of gastric mucous membrane found in aspirated resting gastric juice. (J. C. Hawksley & G. H. Cooray) 333-336  
 The chemotherapy of *Trypanosoma concolor* infection with phenanthridinium compounds etc. (C. H. Browning, K. M. Calver & H. Adamson) 336-339  
 The cultivation of *Trepanema pallidum* in tissue culture. (W. L. M. Perry) 339-442  
 Siderocyte counts in the blood of normal and premature infants. (H. P. Wright & D. G. Edmonds) 342-344  
 A case of primary sarcoma of the heart. (W. W. Adamson) 344-346

## 60 : July 1948

- The causation of acute arterial necrosis in hypertensive disease. (F. B. Byrom & L. F. Dodson) 357-368  
 Mutation in a single-cell culture of *Corynebacterium diphtheriae*. (W. Goldie, M. Gordon & K. I. Johnstone) 369-377  
 Trilocular heart with bilateral aneurysmal dilatation of the pulmonary arteries. (G. J. Cunningham) 379-386  
 Epstein's anomaly of the tricuspid valve. (K. Walton & A. G. Spencer) 387-393  
 Slide agglutination of *Bacterium coli* var. *neapolitanum* in summer diarrhoea. (J. Bray & T. E. D. Beavan) 395-401  
 Starch-fermenting gelatin-liquefying corynebacteria isolated from the human nose and throat. (W. H. H. Jebb) 403-412  
 Fibrinolysis and the fluidity of the blood *post mortem*. (R. H. Mole) 413-427  
 Epithelial lesions in the respiratory tract in human influenza pneumonia. (M. Straub, J. Mulder, A. Arends, J. A. R. van Bruggen & L. Bijlmer) 429-434  
 The effects of kaolin on the lungs of rats. (E. J. King, C. V. Harrison & G. Nagelschmidt) 435-440  
 Tissue changes in mice treated with pentose nucleotides and related compounds. (T. H. Barakan, G. R. Barker, J. M. Gulland & L. D. Parsons) 441-459  
 Observations on the hepatotoxic action of the carcinogen *p*-dimethylaminoazobenzene. (J. W. Orr & D. E. Price) 461-469  
 Canine beta haemolytic streptococci. (N. Laughton) 471-476  
 Idiopathic ("isolated") myocarditis in infancy. (C. Raeburn) 477-481  
 Liposarcoma arising in a simple lipoma. (C. J. E. Wright) 483-487  
 Disseminated focal necrosis with eosinophilia and arteritis in a case of asthma (? Löfller's syndrome). (J. F. Smith) 489-494  
 The kappa and lambda antigens of *Clasitridium welchii*. (C. L. Oakley, G. H. Warrack & M. E. Warren) 495-503  
 A case of cerebral cysticercosis. (E. W. Gault & M. Balasubrahmanyam) 505-506  
 A study of the intestinal flora of *Blattella americana*. (J. F. D. Shrewsbury & G. J. Barson) 506-509  
 A note on the intestinal flora of *Melalanthia vulgaris*. (J. F. D. Shrewsbury & G. J. Barson) 510  
 A sebaceous gland in the cervix uteri. (C. M. Dougherty) 511-512  
 Fallopian tube granuloma. (A. G. ... ) 512-515  
 A method for the demonstration of ... paraffin sections. (A. H. E. Marshall) 515-517  
 Effect of castration upon the induction of mammary tumours by oestrogen in male mice of the Strong A strain. (E. C. Armstrong & G. M. Bonser) 517-519  
 Bronchiectasis in laboratory rats. (A. H. Cruickshank) 520-521  
 A non-gas-producing variant of *Bacterium coli* induced by growth in glycine. (J. Gordon) 521-522

## Journal of Pharmacy and Pharmacology

## 1 : January 1949

- The antihistamine drugs. (D. M. Dunlop) 1-10  
 Hydrolytic changes in solutions of stilbamidine. (J. D. Fulton & T. W. Goodwin) 11-16  
 The inhibition of adrenaline by spasmolytic agents. (J. D. P. Graham) 17-27  
 The preparation and resolution of acridyl(5)-N-alanine ethyl ester. (W. H. Linnell & M. J. H. Smith) 28-33  
 Palbén senna as an adulterant of Indian senna leaves. (J. L. Forsdike) 34-37

## 1 : February 1949

- Some recent developments in the pharmacology of the anti-thyroid compounds. (W. R. Trotter) 65-77  
 Assay of the curative action of neosarphenamine by time-mortality data. (A. Liljestrand) 78-86  
 The determination of alkaloids by exchange of ions. (A. Jindra) 87-94  
 The effect of drugs on the motility of isolated strips of human stomach muscle. (J. D. P. Graham) 95-102  
 The evaluation of tragacanth by means of the apparent viscosity determined in a standard U-tube viscometer. Part II. Whole gum. (W. P. Chambers) 103-107

## 1 : March 1949

- Synthetic oestrogens. (E. C. Dodds) 137-147  
 Synthetic compounds related to the cardiac glycosides. Part I. *p*-Hydroxyphenyl- $\Delta\alpha$ : $\beta$ -butenolide glucoside. (W. H. Linnell & F. Said) 148-150  
 Synthetic compounds related to the cardiac glycosides. Part II. (W. H. Linnell & F. Said) 151-155  
 The histology of belladonna root. Part IV. The differential value of the fibre/vessel ratio. (C. Melville) 156-163  
 The pharmacological actions of the crystalline principles of *Anni Vismaga* Linn. (G. V. Anrep, G. S. Barsom & M. R. Kenawy) 164-176  
 The coronary vasodilator action of the crystalline principles of *Anni Vismaga* Linn. (M. M. Bagouri) 177-180

## 1 : April 1949

- The chemical estimation of digitalis and strophanthins glycosides. (T. Canbäck) 201-210  
 Synthetic oestrogens. (E. R. Clark & W. H. Linnell) 211-218  
 The pharmacological actions of erythraea spicata. (H. F. Farrag & M. A. F. Sherif) 219-223

- The determination of amino-compounds occurring as impurities in pharmaceutical chemicals. Part II. 3-Amino-4-hydroxyphenylarsonic acid in acetarsol. (C. W. Ballard) 224-229  
 Synthetic compounds possessing corticosterone-like activity. (R. A. Khan & W. H. Linnell) 230-234  
 Synthesis of monomeric forms of  $\alpha$ -hydroxy- $\beta$ -methoxypropionaldehyde and 1:3-dimethoxypropanone-2. (Y. M. Abouzaid & W. H. Linnell) 235-238

## Journal of Physiology

## 107 : June 1948

- The effects of sucrose upon guinea fractional test meals. (J. N. Hunt & W. R. Spurrell) 245-250  
 The influence of thyroxine and adrenal cortical extract on the oxygen consumption of adrenalectomized rats. (F. Hoffmann, E. J. Hoffmann & J. Talesnik) 251-264  
 The influence of ovarian hormones on the transmission of the activity of the sympathetic nerves of the cat. (J. Secker) 265-271  
 The relationship between the change in the electroretinogram and the subjective dark-adaptation curve. (G. Karpe & K. Tansley) 272-279  
 The mechanism of haemostasis in peripheral vessels. (T. I. Chen & C. Tsai) 280-288  
 The action of acetylcholine and adrenaline on flexor and extensor movements evoked by stimulation of the descending motor tracts. (E. Bülbring, J. H. Burn & C. R. Skoglund) 289-299  
 The effects of small amounts of carboxyhaemoglobin on the determination of oxygen in the blood by the Haldane and Van Slyke methods. (F. C. Courtice & W. J. Simmonds) 300-305  
 Some effects of nicotine-like substances and their relation to sensory nerve endings. (G. L. Brown & J. A. B. Gray) 306-317  
 Some properties of amarin, with special reference to its use in conjunction with adrenaline for the production of idio-ventricular rhythms. (F. N. Fastier & F. H. Smirk) 318-331  
 The oxidation of haemoglobin to methaemoglobin by oxygen. (J. Brooks) 332-335  
 Observations on the urine, blood and arterial pressure of dogs before and after the production of renal ischaemia. (H. Konzett & E. B. Verney) 336-345  
 The effect of disopropyl fluorophosphate on neuromuscular transmission in cats. (G. L. Brown, B. D. Burns & W. Feldberg) 346-354  
 An integration of the total oxygen consumption of the sheep foetus from that of the tissues. (A. Carlyle) 355-364  
 The presence of a peptic synergist in gastric juice: its importance in the estimation of the proteolytic activity of gastric juice. (J. N. Hunt) 365-371  
 Acetylcholine synthesis in different regions of the central nervous system. (W. Feldberg & M. Vogt) 372-381

## 107 : September 1948

- The assay of the nutritive value of a protein by its effect on liver cytoplasm. (R. M. Campbell & H. W. Kosterlitz) 383-398  
 The relative humidity of the skin. (R. H. Mole) 399-411  
 Stimulation of the supraopticohypophyseal tract in the conscious rabbit with currents of different wave form. (G. W. Harris) 412-417  
 Electrical stimulation of the hypothalamus and the mechanism of neural control of the adenylohypophysis. (G. W. Harris) 418-429  
 The excretion of an antidiuretic substance by the kidney, after electrical stimulation of the neurohypophysis in the unanaesthetized rabbit. (G. W. Harris) 430-435  
 Further evidence regarding the endocrine status of the neurohypophysis. (G. W. Harris) 436-448  
 The standardization of secretin and pancreozymin. (J. H. Burn & P. Holton) 449-455  
 The sounds from single motor units in a contracting muscle. (G. Gordon & A. H. S. Holbourn) 456-464  
 The measurement of chloride losses in the sweat. (W. S. S. Ladell) 465-471  
 The activity of the duodenum. (D. M. Douglas) 472-478  
 Oxygen tension and the respiration of resting frog's muscle. (D. K. Hill) 479-495  
 Afferent nerve fibres from the heart and lungs in the cervical vagus. (D. Whitteridge) 496-512  
 Osteogenesis around multiple fragments of chick embryo bone grafted to developing chick embryo chorioallantois. (N. M. Hancox) 513-517  
 The pressure developed in muscle during contraction. (A. V. Hill) 518-526

## 108 : March 1949

- The effect of adrenobromine on sympathetic nerve stimulation. (G. Deraux & J. Roskam) 1-8  
 New method for measuring the arterio-venous oxygen difference by means of photoelectrical colorimeter. (B. Issekutz, G. Heleányi & I. Feuer) 9-11  
 A simplified method for the determination of circulating red-cell volume with radioactive phosphorus. (E. B. Reeve & N. Veall) 12-23  
 The effects of glucose on the action of the rat diaphragm. (R. J. S. McDowall, W. Miechowski & A. Z. Shafiei) 24-32  
 The measurement of the temperature at the eardrum during the caloric test of the labyrinth. (J. J. Groen & L. B. W. Jongkees) 33-36  
 The effect of sodium ions on the electrical activity of the giant axon of the squid. (A. L. Hodgkin & B. Katz) 37-77  
 Intensity discrimination of the central fovea measured with small fields. (L. C. Thompson) 78-91  
 The effects of avitaminosis and hypervitaminosis A upon the incisor teeth and incisal alveolar bone of rats. (J. T. Irving) 92-101  
 An apparatus for recording the output and coronary flow in the heart-lung preparation. (R. P. Stephenson) 102-103  
 The relation between the motor and inhibitor actions of acetylcholine. (J. H. Burn & J. R. Vane) 104-115

## 108 : March 1949

- Fructose in the sheep foetus. (M. W. S. Hitchcock) 117-126  
 The peripheral action of *Cl. batulinum* toxin. (N. Ambache) 127-141  
 The determination of the blood volume in man by the carbon monoxide and dye methods. (F. C. Courtice & R. W. Guntton) 142-156  
 A foetal plethysmograph. (A. D. M. Greenfield) 157-159  
 The umbilical blood flow in the foetal sheep. (K. E. Cooper, A. D. M. Greenfield & A. St. G. Huggert) 160-166

- A method for measuring the blood flow in the umbilical vessels. (K. E. Cooper & A. D. M. Greenfield) 167-176
- The passage into the embryonic yolk-sac cavity of maternal plasma proteins in rabbits. With an addendum on electrophoretic and ultracentrifugal examination of rabbit blastocyst fluid. (F. W. R. Brambell, W. A. Hemmings, E. F. McCarthy & R. A. Kekwick) 177-185
- Bradycardia of central origin produced by injections of tetanus toxin into the vagus nerve. (N. Ambache & O. C. J. Lippold) 186-196
- Effect of the protein content of the diet on the glomerular filtration rate of young and adult rats. (S. E. Dickcr) 197-202
- The penetration of some electrolytes and non electrolytes into the aqueous humour and vitreous body of the cat. (H. Dawson, W. S. Duke-Elder, D. M. Maurice, E. J. Ross & A. M. Woodin) 203-217
- Action of adrenaline-like substances on the serum potassium. (J. L. D'Silva) 218-225
- The excitation and contraction of the flight muscles of insects. (J. W. S. Pringle) 226-232
- The effect of protein hydrolysates (leukotaxine) on skin-histamine in cats. (J. Dekanski) 233-245

### Journal of the Royal Army Medical Corps

90 : June 1948

- Fifty years of hygiene in the British Army. (A. E. Richmond) 233-246
- Landmarks in fifty years of medicine in the Army. (J. Bennett) 247-256
- Advances in military pathology during the past fifty years. (H. T. Findlay) 257-270
- Fifty years of surgery in the Royal Army Medical Corps. (D. Fettes) 271-281
- The treatment of venereal diseases in the British Army—1898-1948. (J. W. Eames) 282-305
- Anaesthesia. (W. Scriven) 306-312
- Military ophthalmology 1898-1948. (G. C. Dansey-Browning) 313-320
- Oto-laryngology. (W. A. D. Drummond) 321-326
- Psychiatry. (A. Torric & R. H. Ahrensfield) 327-333
- Radiology (In arduis fidelis) 1898-1948. (D. B. McGrigor) 334-338

91 : July 1948

- Echoes from the past. Surgeon General W. G. N. Manley, V.C., C.B. A few facts and incidents in the life of the late Surgeon General, W. G. N. Manley, V.C., C.B., as told by him at various times, to his son. (J. C. M. Manley) 1-6
- Malaria and the Army. (T. M. W. D'Arcy) 7-22
- Sickness and mortality rates of the English Army in the sixteenth century. (D. Stewart) 23-35
- The periodic dyspepsia syndrome. (J. Mackay-Dick) 36-42
- Air evacuation. An opinion expressed at the Southern Command Medical Study Period, November 1947. 43-45
- Evacuation of wounded during operations involving the use of armoured personnel carriers. Being a note taken from Southern Command Medical Study Period, November 1947. 46-48

91 : August 1948

- Work and problems of a medical officer prisoner of war in the Far East. (J. E. C. Robinson) 51-65
- Group therapy and its application in the British Army to-day. (J. T. Robinson) 66-79
- The early diagnosis of infective hepatitis in syphilitic patients undergoing arsenical therapy. (W. Fowler) 80-81
- The Pioneer Health Centre, Peckham. (C. R. Farrar) 81-87
- A case of meningococcal septicaemia. (J. Mackay-Dick) 87-89

91 : September 1948

- Forward psychiatry. (N. Cantlie) 93-95
- The effects of mapharsin on the white cell count of early syphilis. (R. R. Willcox) 96-100
- The Burma campaigns—1942-45. A history of casualty evacuation. (R. Wigglesworth) 101-124
- A survey of the history of the medical services of the Army prior to and since the formation of the R.A.M.C. (A. L. Pennefather) 125-128
- Two cases of acute peritonitis of appendical origin. (J. Huston) 129-130
- Intensive penicillin therapy in free perforation of carcinoma of sigmoid colon. (J. Huston) 131-132
- An unusual case of osteitis deformans (Paget's disease). (W. F. L. Fava & J. D. Hallissy) 132-134

91 : October 1948

- Backache and sciatica in the Army. (D. C. M. C. Ettles) 137-151
- The pathogenesis of the clinical picture in sciatica. (I. Macnab) 152-155
- Review of 93 laminectomies for low backache and cranial pain. (H. Hall) 156-157
- What every medical officer should know about the atomic bomb. 158-179

91 : November 1948

- Paratyphoid "B" fever. An epidemic remarkable for its mildness. (A. B. Shaw & R. P. C. Handfield-Jones) 189-202
- Competitive health preservation in the Army. (F. M. Richardson & J. Wishart) 203-218
- What every medical officer should know about the atomic bomb. [Continued.] 219-238
- A note on malignant disease, its disposal and treatment in the Army. (W. A. D. Drummond) 239-241

91 : December 1948

- Some observations on amoebic dysentery. (R. V. Coxon) 243-256
- Indian airborne reminiscences. (F. G. Neilo) 257-274
- What every medical officer should know about the atomic bomb. [Concluded.] 275-293
- A case of infantile kala-azar. (M. G. Philpott) 294

92 : January 1949

- The eosinophilic respiratory syndrome. A review of 100 cases. (E. Soysa) 1-23
- Narrative of the medical evacuation of Palestine Command from January 1 to June 30, 1948. (A. J. Beveridge) 24-30

- The Middle East Chest Unit. (R. D. W. Schofield) 31-34
- The causes of disease in the sixteenth century Army. (D. Stewart) 35-41
- International Committee on Military Medicine and Pharmacy. (M. H. P. Sayers) 42-44
- Notes on a small epidemic of paratyphoid "A" fever. (S. Cope & R. A. Bennett) 44-47

92 : February 1949

- Penetrating wounds of the knee. (N. G. C. Hendry) 55-76
- "Looking at health." (D. H. D. Burbridge) 77-85
- The acute abdomen in the East African Askari. (H. B. Young) 97-100

### Journal of the Royal Institute of Public Health and Hygiene

11 : August 1948

- A century of public health. (A. S. MacNalty) 257-265
- Alcohol and alcoholism. (H. G. McGregor) 266-283

11 : September 1948

- Children at play. 293-299
- The health of the nation in 1946. 302-309

11 : October 1948

- Crudity to children. 329-336
- Health in Europe. 337-346

11 : November 1948

- Modern trends in the weaning and mixed feeding of the infant. (W. G. Wyllie) 363-368
- Epilepsy in children. (P. Henderson) 369-377

11 : December 1948

- Speech therapy. Stammering treatment—supply and demand. (H. St. J. Rumsey) 399-402
- The Bengue Memorial Award Lecture, 1948. "The surgical treatment of gastric ulcers." (P. Banzet) 411-421

12 : January 1949

- Problem families. (C. F. Brockington) 9-18
- Haemopoiesis. *The Harben Lectures*, 1948. Lecture No. 1. (L. E. H. Whitby) 19-34

12 : February 1949

- Placing the impaired worker in industry. (N. L. Lloyd) 44-53
- Haemopoiesis. *The Harben Lectures*, 1948. Lecture No. 2. (L. E. H. Whitby) 54-69

12 : March 1949

- The care and correction of dental defects in children. (L. M. Clinch) 80-87
- Haemopoiesis. *The Harben Lectures*, 1948. Lecture No. 3. (L. E. H. Whitby) 88-105

12 : April 1949

- Food and resistance to disease. (P. G. H. Gell) 118-125

### Journal of the Royal Naval Medical Service

33 : October 1947

- An account of a smallpox epidemic. (L. G. P. Shiers) 281-285
- A simple method of bronchography. (G. L. Hardman) 285-288
- Résumé of causes for non-acceptance of, and for operative treatment considered necessary on new entries (N.S.) already passed as fit by civilian medical boards. (C. V. Harries) 288-290
- Some recent aspects of medical treatment. (H. J. Bennett) 290-294
- Recent advances in naval hygiene and preventive medicine. (G. H. G. Southwell-Sander) 294-305
- Notes on recent advances in the treatment of psychiatric cases. (W. Cullen) 305-312

34 : January 1948

- Observations on amoebiasis in Ceylon. (G. T. Stewart, P. J. O'Meara & W. E. Kershaw) 2-12
- The medicine of history. (J. W. L. Crossfill) 13-22
- Plague in Shakespeare and Pepys. (J. W. L. Crossfill) 22-28
- Hospital ships in the second Dutch war. (D. Stewart) 29-35
- A case of "dope" poisoning. (K. J. R. O'Connor) 35-38
- A case of pulmonary tuberculosis presenting as a toxic confusional state. (B. S. Lewis & H. Osmond) 39-41
- A case of delirium tremens: an account by a patient. With an introduction by C. G. Hunter. 41-45
- Persistent right aortic arch. (B. R. Alderson) 45-48

34 : April-July 1948

- The Royal Naval Hospital at Haslar near Gosport. (J. Howard) 76-78
- The Antarctic expedition from a medical angle. (E. W. Bingham) 78-84
- X-ray treatment of tuberculous cervical adenitis. (D. R. F. Bertram) 84-86
- The story of the St. John Ambulance Brigade and the British Red Cross Society. (The Director, V. A. D. Department) 86-91

34 : October 1948

- A medico-legal appointment. (J. L. S. Coulter) 131-145
- Advances in the treatment of venereal diseases during the war 1939-1945. (J. G. Maguire) 145-151
- Zoster lymphadenitis. (H. R. Mallows) 152-153
- A case of pulmonary embolism treated with anticoagulants. (C. D. Coode) 154-162
- Epidermulysis bullosa. (B. Lewis) 162-165
- Carcinoma of prostate with secondaries in bones. (T. L. Cleave) 165-167
- A slow pulse. (C. J. Stevenson) 167-169
- Replantation of teeth. (P. S. Turner) 169-171

## 35 : January 1949

- James Lind, M.D.: eighteenth century naval medical hygienist. Part I. Biographical notes with an appreciation of the naval background. (J. Glass) 1-20  
Radiotherapy in the Royal Navy. (D. R. F. Berram) 20-26  
Physiological problems in short-fitted submarines. (W. M. Davidson) 26-29  
Medical aspects of atomic warfare. (G. D. Wedd) 29-36

## 35 : April 1949

- The Armed Forces Committee of the British Medical Association. (W. H. Edgar) 62-64  
The inflatable exposure suit. (P. M. Vasey) 65-67  
James Lind, M.D.: eighteenth century naval medical hygienist. Part II. Biographical notes with an appreciation of the naval background. (J. Glass) 68-86  
The medical officers. (S. Jenkinson) 87-90  
The investigation of photo-radiographic pick-up cases. (A. O'Connor) 90-94  
Venereal disease in the West Indies. (B. Geoghegan) 94-96  
Addison's disease. (H. J. Bennett) 96-103  
A case of post-operative tetanus. (M. A. R. Gunn & W. Wilson) 103-107  
Haematuria as a symptom of acute appendicitis. (F. B. B. Weston) 107-110  
A case of chronic myelogenous leukaemia. (C. V. Harries) 110-111  
Two cases of Bornholm's disease. (C. H. Birt) 111  
A case of hallucinosis due to cocaine. (G. G. Wallis) 112-113  
Tannic acid. (W. M. Hamilton) 113

## Journal of Tropical Medicine and Hygiene

## 51 : August 1948

- Malaria in Kigezi, Uganda. (P. C. C. Garnham, D. B. Wilson & M. E. Wilson) 156-159  
Millet beer and peanuts as remedial foods in polyhypovitaminosis. (N. L. Corkhill, H. Creditor & G. E. S. Stewart) 160-168

## 51 : September 1948

- Is it possible to provoke an attack of malaria? (C. W. F. Winckel) 178-183  
Criteria of the cure of "bilharziasis." (F. G. Cawston) 184

## 51 : October 1948

- Diodoquin compared with E.B.I. and chiniofon in the early treatment of amoebic dysentery in Burma. (R. W. Parnell) 200-202  
The basic rules for building cool houses in hot climates. (F. Vick) 203-208

## 51 : November 1948

- Is the gametocyte production of *Plasmodium vivax* influenced by elimination of the mosquito passage? (J. Bijlmer & H. Kraan) 222-225  
Rhodesian sleeping sickness in Kenya Colony. (R. B. Heisch) 225-227  
A comparison of haematological results in Europeans and Africans suffering from active malaria. (J. I. Roberts) 228-234

## 51 : December 1948

- Some remarks on the common ulcers of the leg in the tropics and subtropics with a description of tropical ulcer (mycetoid desert sore). (A. Castellani) 245-254  
Normal haematological standards for Nairobi, Kenya. (J. I. Roberts) 254-259  
Experiments on the standardization and keeping properties of tetanus antitoxin in the tropics. (R. K. Goyal) 259-263

## 52 : January 1949

- On the incidence of protozoal and bacillary intestinal infections in men of the Royal Air Force returning from service in tropical and subtropical lands. (A. G. Rickards) 2-11  
The diagnosis of schistosomiasis by rectal and vesical snips based on 150 autopsies. (M. Gelfand & W. F. Ross) 12-15

## 52 : February 1949

- Strongyloides stercoralis* infection. Part I. (L. E. Napier) 25-30  
A parasitological survey of African school children in Nairobi schools with haematological results of malarial infections. (J. I. Roberts) 31-33  
The treatment of amoebiasis with "diodoquin." (A. G. Rickards) 33-38

## 52 : March 1949

- Strongyloides stercoralis* infection. Part II. Strongyloidiasis among ex-prisoners-of-war. (L. E. Napier) 46-48  
A protozoological and helminthological survey of three races in Nairobi, Kenya. (J. I. Roberts) 49-59  
The tribal distribution of bilharzia in East Africa. (K. E. Dewhurst) 60-61

## 52 : April 1949

- Tropical ulcer in British Somaliland. (P. B. Adamson) 68-76  
Dysentery associated with malaria. (J. I. Roberts) 76-78  
The development of Western medicine in India. (B. Hance) 79-82

## Lancet

## 1 : 3/4/48

- Measured radical gastrectomy. Review of 505 operations for peptic ulcer. (A. H. Visick) 505-510  
Penicillin and sulphonamides in typhoid fever. Experience of physicians in military hospitals in the Middle East. (C. G. Parsons) 510-513  
Physiological jaundice of the newborn. Some new measurements of the factors concerned. (P. L. Mollison) 513-515  
Combined chaulmoogra and sulphone treatment of leprosy and tuberculosis. (L. Rogers) 515-517  
Normal temperatures in old age. (T. H. Howell) 517-518  
Treatment of angina of effort with androgens. (V. K. Summers) 519  
Tetra-ethylpyrophosphate in myasthenia gravis. (A. S. V. Burgen, C. A. Keele & D. McAlpine) 519-521  
Genesis of the Association of Clinical Pathologists. (S. C. Dyke) 528-530

## 1 : 10/4/48

- Penicillin and sulphathiazole in typhoid fever: clinical trial. (G. Bevan, M. V. N. Sudds, R. Evans, M. T. Parker, I. Pugh & A. F. S. Sladden) 545-550  
Weight changes in pregnancy. (J. A. Scott & B. Benjamin) 550-551  
Measured radical gastrectomy. Review of 505 operations for peptic ulcer. (A. H. Visick) 551-555  
Sterile splenic abscess after relapsing fever. (L. A. Nasr) 555-558  
Reducing substances in the urine in pregnancy and the early puerperium. (H. E. Archer & B. J. Haram) 558-559  
Primary atypical pneumonia. A small highly infective outbreak. (B. G. Alton & M. D. Hickey) 559-560  
Anæmias. (S. K. Sundaram) 568-569

## 1 : 17/4/48

- Carcinoma of the stomach. (H. Taylor) 581-582  
Streptomycin treatment of tuberculous meningitis. Streptomycin in Tuberculosis Trials Committee, Medical Research Council. 582-596  
Blood-sugar levels in slow starvation. (M. L. Chakrabarty) 596-597  
Intensified electrical convulsion therapy in the treatment of mental disorders. (L. G. M. Page & R. J. Russell) 597-598  
Local fascial repair of femoral hernia. (D. F. E. Nash) 598-599

## 1 : 24/4/48

- Some aspects of old age. (J. H. Sheldon) 621-624  
Pneumonic plague in Rangoon. (G. Wynne-Griffith) 625-627  
Treatment of tuberculous meningitis with streptomycin. A report to the Medical Research Council. (H. V. Smith, R. L. Vollum & H. Cairns) 627-636  
Reiter's syndrome. Report on nine cases. (R. J. G. Morrison & M. Thompson) 636-637  
Diabetes insipidus due to sphenoidal sinusitis. Report of a case. (K. P. Ball & A. C. Thackray) 637-639

## 1 : 1/5/48

- Some reflections on genius. (W. R. Brain) 661-665  
Function of the cruciate ligaments of the knee-joint. (A. J. Helfet) 665-667  
Aledrine and anthesin in bronchial spasm. (H. Herxheimer) 667-671  
Penicillin therapy in scarlet fever and complicating otitis. (T. Jersild) 671-673  
Quantitative sensitisation of a penicillin-resistant staphylococcus. (H. I. Winner) 674  
Anaesthesia in cardiac surgery: with special reference to operations for patent ductus arteriosus. (B. Rait-Smith & G. Osilere) 674-676  
Unusual cause of spasm of psoas muscle. (C. Poniedel) 676

## 1 : 8/5/48

- Is rheumatism a virus disease? (M. Gordon) 697-701  
Acute haematogenous osteomyelitis. A method of treatment. (F. R. Tucker & C. Hollenberg) 701-703  
Primary atypical pneumonia. A clinical study. (J. W. Stephens) 703-707  
Mastoid surgery—old and new. (A. Tumarkin) 708-711  
New antibacterial diamidines. (R. Wien, J. Harrison & W. A. Freeman) 711-712  
The treatment of bilharziasis with miraeil D. (M. A. Azim, A. Halawani & J. M. Watson) 712-713  
Beds for tuberculosis. (F. J. Bentley) 722-723

## 1 : 15/5/48

- Psychiatry as applied to occupational health. (D. Stewart) 737-740  
Is rheumatism a virus disease? (Concluded.) (M. Gordon) 740-744  
Rubella in pregnancy as an aetiological factor in stillbirth. (C. Swan) 744-746  
Maternal measles, mumps, and chickenpox as a cause of congenital anomalies. (M. J. Fox, E. R. Krumbiegel & J. L. Teresi) 746-749  
Avulsion fracture of lesser tuberosity of humerus. Report of a case. (A. T. Andreasen) 750-751  
Exophthalmic ophthalmoplegia treated with prostigmin. (C. F. Critchley & A. J. Cameron) 751  
A growth-retarding factor in maize bran. (A. Borrow, L. Fowden, M. M. Stedman, J. C. Waterlow & R. A. Webb) 752-753

## 1 : 22/5/48

- Infections of the fingers and hand. A report from the Hand Clinic of University College Hospital. (R. S. Pilcher, R. L. G. Dawson, B. B. Milstein & A. G. Riddell) 777-783  
Tissue forms of a malaria parasite: *Plasmodium cynomolgi*. (F. Hawking, W. L. M. Perry & J. P. Thurston) 783-789  
Clearing of X-ray shadows in welders' siderosis. (A. T. Doig & A. I. G. McLaughlin) 789-791  
Pulmonary tuberculosis treated with *p*-aminosalicylic acid. Early results in 6 cases. (A. Erdei & W. E. Snell) 791-793  
Pyloric spasm simulating congenital hypertrophic stenosis. Report of a case. (E. de C. Falle) 794-795  
Intracerebral calcification in a microcephalic. (D. Cappon) 795  
Treatment of cancer. The problem of organisation. (E. Finch) 803-806

## 1 : 29/5/48

- Post-hepatitis cirrhosis. (S. Sherlock) 817-822  
Bronchiectasis simulating chronic bronchitis. A study of 46 cases. (J. D. H. Wearing) 822-824  
Protein katabolism in uraemia. Effects of protein-free diet, infections, and blood-transfusions. (J. G. G. Borst, J. T. Dasia & W. van der Wal) 824-828  
Mercury in the urine of children with acrodynia. (J. Warkany & D. M. Hubbard) 829-830  
A photo-electric drop recorder for investigating cardiovascular effects of drugs in man. (R. H. Goetz) 830-831  
The unstable semilunar bone. (H. Davies) 831  
The medical curriculum: B.M.A. Committee's report. 839-842

## 1 : 5/6/48

- Vitamin-C requirement of human adults. Experimental study of vitamin-C deprivation in man. A preliminary report by the Vitamin-C Subcommittee of the Accessory Food Factors Committee, Medical Research Council. 853-858  
Residual symptoms in Graves's disease after thyroidectomy. (L. Martin) 858-860

Floss-silk lattice repair for inguinal hernia. (R. Maingot) 861-863  
 Anthrax in the treatment of allergic rhinitis. (A. G. S. Calder) 863-864  
 Non-suppurative hepatitis. Report of a case. (W. E. King, P. J. Parsons, J. W. Perry & M. Freeman) 864-867  
 Incidence of chronic hepatitis in women in Copenhagen 1944-45. (M. Bjørnhoj, M. Jersild, K. Lundbaek, E. H. Thaysen & E. Ryssing) 867-868  
 Thrombocytopenic purpura due to sensitivity to sedormid. (S. Instone) 869

## 1 : 12/6/48

The control of infection in burns. (L. Colebrook, J. M. Duncan & W. P. D. Ross) 893-899  
 Supernumerary nipples and neurosis. (R. Harper) 899-903  
 Susceptibility to cholera. (S. Abdou) 903-904  
 Closing the pneumonectomy gap. (G. S. Eedy) 905-907  
 Elliptical human erythrocytes in an Egyptian family. (S. E. Kholy) 908  
 Partial coarctation of the aorta: with bacterial endocarditis and bicuspid aortic valve. (J. Bates & R. J. W. Rees) 908-909  
 The physic garden at Chelsea. (W. S. C. Copeman) 919-920

## 1 : 19/6/48

The geographical origin of nurses. (B. Woolf) 933-936  
 Repair of large herniae with tantalum gauze. An experimental and clinical study. (D. M. Douglas) 936-939  
 Leukaemia presenting with neurological manifestations. (W. R. Gauld) 939-941  
 Homologous serum hepatitis. Review of 216 cases. (D. Borenstein) 941-944  
 Chorionepithelioma treated with stilboestrol. (S. Kullander) 944-945  
 Poliomyelitis and associated minor illness in a residential school. (J. C. Ryle) 945-947  
 Gangrene following intra-arterial injection of myanesin: with a study of blood and myanesin mixtures. (T. A. Ogilvie, J. B. Penfold & D. R. T. Clendon) 947-949  
 Multiple streptococcal abscesses of liver. Recovery with penicillin. (H. S. Morley) 949  
 The recording of psychotherapeutic sessions: its value in teaching, research, and treatment. (J. Brier & R. Ström-Olsen) 957-958

## 1 : 26/6/48

Neuralgic amyotrophy. The shoulder-girdle syndrome. (M. J. Parsonage & J. W. A. Turner) 973-978  
 Vaccination against influenza A. (H. Mellanby, C. H. Andrewes, J. A. Dudgeon & D. G. Mackay) 978-982  
 Primary pulmonary coccidioidomycosis. Case of laboratory infection in England. (J. D. N. Nabarro) 982-984  
 Postcricoid pharyngo-oesophageal perforation due to endoscopy treated by immediate suture. (J. C. Goligher) 985-987  
 Surgery of pulmonary stenosis. A case in which the pulmonary valve was successfully divided. (T. H. Sellors) 988-989  
 Monopolies of medical and dental supplies. (H. Levy) 998-999

## 2 : 3/7/48

A surgeon's life. (H. Ogilvie) 1-6  
 The pain chart. (K. D. Keele) 6-8  
 Leptospirosis canicularis. (J. E. Minkenhof) 8-10  
 Malarial diabetes. Report of a case. (L. Rau) 11-12  
 Strangulated traumatic diaphragmatic hernia. (J. Borrie & H. M. Foreman) 12-13  
 Pilonidal sinus in a barber's hand: with observations on postnatal pilonidal sinus. (D. H. Patey & R. W. Scarff) 13-14

## 2 : 10/7/48

Gamma-globulin in the prevention and attenuation of measles. Report of a subcommittee to the Blood Transfusion Research Committee of the Medical Research Council. 41-44  
 Operations for hernia: technique of nylon dam. (G. E. Moloney, W. G. Gill & R. C. Barclay) 45-48  
 Four cases of *Leptospira canicola* infection in England. A symposium. (L. J. M. Laurent, T. St. M. Norris, J. M. Starks, J. C. Broom & J. M. Alston) 48-51  
 Isotopes and radiation hazards. (F. Howarth) 51-53  
 Neonatal gastrocolic fistula: report of a case. (N. K. Pein) 53-54  
 Apparent acute glomerulonephritis without albuminuria. (J. Crofton & L. True-love) 54-55  
 Epidemic of bullous erythema on legs due to bed-bugs. (J. Kinnear) 55

## 2 : 17/7/48

Movement of the diaphragm after operation. (J. Howkins) 85-88  
 Rapid determination of urinary pregnanediol: method suitable for routine clinical use. (I. F. Somerville, G. F. Marrian & R. J. Kellar) 89-90  
 Treatment of thoracogenic brain abscess. (J. B. Pennybacker & T. H. Sellors) 90-95  
 Weil's disease. Analysis of 195 cases in England. (J. C. Broom & J. M. Alston) 96-97  
 Acute intestinal obstruction in typhoid fever. (F. F. Kane) 97-98  
 Syringomyelia temporarily relieved after scalenotomy. (J. M. Potter) 98-99

## 2 : 24/7/48

The American teaching hospital. (E. Davis) 129-130  
 Sulphathiazole: therapeutics and toxicology. (G. Brownlee) 131-134  
 Chemotherapy of pulmonary tuberculosis with sulphathiazole. (T. Anderson & S. J. Strachan) 135-139  
 Obstetrical evaluation of the pubic arch: a clinical method. (W. I. C. Morris) 139-141  
 The laryngeal swab in early and convalescent cases of pulmonary tuberculosis. (G. B. Forbes, J. V. Hurford, B. J. D. Smith & V. H. Springett) 141-143  
 Cysticercosis cerebri mistaken for cerebral syphilis. Report of a case. (A. A. Williams) 144  
 Phlyctenular kerato-conjunctivitis treated with penicillin. (R. W. Stephenson) 144-145

## 2 : 31/7/48

Latent tetany caused by BAL, 2 : 3 dimercaptopropanol. (B. Russell, B. Green & L. G. R. Wand) 169-174  
 Treatment of tuberculosis with sulphathiazole. (D. G. Madigan) 174-179  
 Chemotherapy of tuberculosis with sulphathiazole. (M. G. Clay & A. C. Clay) 180-182  
 Radical cure of inguinal hernia with a plastic insert. (W. Thompson) 182-183  
 Handkerchiefs in the transfer of respiratory infection. (K. R. Dumbell, J. E. Lovelock & E. J. Lowbury) 183-185

## 2 : 7/8/48

Cirrhosis of the liver in Ceylon and its relation to diet. A review of 102 cases. (P. B. Fernando, O. R. Medonza & P. K. Rajasuriya) 205-211  
 Acute atropine poisoning. Review of eight cases. (R. B. Welbourn & J. D. Buxton) 211-213  
 Experiments with occlusive dressings of a new plastic. (J. P. Bull, J. R. Squire & E. Topley) 213-215  
 Vitamin E (tocopherols) in the collagenoses. (J. F. Burgess) 215-217  
 Occupational aneurysm of the palmar arch. Report of a case. (D. W. Short) 217-218  
 Associated ectopic anus and uterus didelphys. Report of a case. (A. J. Underwood-Whitney) 218  
 Pyloric obstruction with tetany and coma. Report of a case. (H. G. Ungley) 218-220

## 2 : 14/8/48

Aftercare of the aged sick. (E. N. Thomson & M. Curran) 241-244  
 Some medical uses of polythene, with special reference to venoclysis in infants. (J. W. Farquhar & I. C. Lewis) 244-246  
 Pulmonary tuberculosis in the old. (F. J. Hebbert) 247-249  
 Refrigerated autogenous skin grafting. A review of 50 cases. (A. E. Flatt) 249-251  
 A student health service. (R. E. Verney & R. F. Robertson) 251-254  
 Acute benign dry pleurisy: six cases in a hospital staff. (J. D. Gray & F. S. Carter) 254-255  
 Preparation of streptococcal extracts for Lancefield grouping. (W. R. Maxted) 255-256  
 Renal tumour and persistent fever. Report of a case. (L. Zádor) 256  
 First World Health Assembly. (N. M. Goodman) 265  
 Enteric fever (paratyphoid B) apparently spread by pasteurised milk. (W. E. Thomas, T. H. Stephens, G. J. G. King & S. Thomson) 270-271

## 2 : 21/8/48

The agricultural worker. (G. F. Keatinge & R. Littlewood) 281-286  
 Menocephalomyelitis. A hitherto unknown virus affecting man. (G. W. A. Dick, A. M. Best, A. J. Haddow & K. C. Smithburn) 286-289  
 Perforated peptic ulcer. Review of 105 cases. (A. H. Sangster) 289-291  
 Polyarteritis nodosa. Report of a case. (R. D. Tonkin & R. J. V. Pulvertaft) 291-293  
 Minimal requirements for mass radiography. (F. C. S. Bradbury) 293

## 2 : 28/8/48

The selection of medical students. (A. D. Harris) 317-320  
 Psychiatric screening of medical students. (R. Orton & D. R. Martin) 321-323  
 Intelligence tests and university careers of medical students. (Q. H. Gibson) 323-324  
 The selection of medical students. (A. Petrie) 325-327  
 Personality studies of medical students. (W. M. Millar) 327-331  
 Student selection: practice and precept. 337-340

## 2 : 4/9/48

Accidental intra-arterial injection of drugs. (S. M. Cohen) 361-371  
 Transorbital leucotomy. (W. Freeman) 371-373  
 Incontinence of urine in the aged. (T. S. Wilson) 374-377  
 Spontaneous rupture of the rectum. Report of a case. (C. P. Allen) 378  
 Congenital torticollis in identical twins. (A. E. Stevens) 378  
 Exsanguino-transfusion in acute leukaemia. (A. Piney) 379  
 Intramedullary nailing of fractures. The practice at Kiel. (G. J. Fraenkel) 387-388

## 2 : 11/9/48

Modern phonocardiography. (G. E. Donovan) 401-404  
 Experimental macrocytic anaemia in the rat. (G. M. Watson, D. G. Cameron & L. J. Wits) 404-408  
 Primary tuberculosis with meningism and bacilli in the spinal fluid: significance in streptomycin treatment of tuberculous meningitis. (K. Choremis & G. Vrachnos) 408-409  
 Accidental intra-arterial injection of drugs (Concluded). (S. M. Cohen) 409-416  
 Acute transverse myelitis complicating pneumonia. Report of a case. (A. I. Suchett-Kaye) 417  
 Compensation for injury. (H. C. W. Nuttall) 425-428

## 2 : 18/9/48

Clinical research in the education of the specialist. (W. M. Arnott) 441-445  
 Streptomycin in non-tuberculous infections. Summary of a report to the Medical Research Council. (C. Wilson) 445-446  
 Streptomycin treatment of meningitis due to gram-negative saprophytes. (W. Lewin & R. L. Vollum) 446-449  
 Streptomycin in pulmonary tuberculosis. Report on ten cases. (R. Y. Keers) 449-451  
 The eosinophil cell. Studies in horse and camel. (F. Duran-Jorda) 451-452  
 Meningo-encephalitis in man due to the loupiog-ill virus. (G. Davison, C. Neubauer & E. W. Hurst) 453-457  
 Leontiasis ossium. (C. B. Way) 457

## 2 : 25/9/48

Subacute bacterial endocarditis. (C. Bramwell) 481-484  
*Haemophilus influenzae* meningitis treated with streptomycin. (P. M. Smythe) 485-491  
 An artificial heart or cardio-pulmonary machine. Performance in animals. (V. O. Björk) 491-493  
 Absorption and excretion studies with radioactive penicillin. (S. Rowlands, D. Rowley & H. C. Stewart) 493-495  
 Intestinal obstruction due to ascariasis. Report of a case. (K. Naji) 495

## 2 : 2/10/48

- Penicillin in diphtheria. Report of a subcommittee of the Public Health Laboratory Service. 517-519  
 Thymine, folic acid, and vitamin B<sub>12</sub> in nutritional macrocytic anaemia, tropical sprue and pernicious anaemia. (T. D. Spies, R. E. Stone, G. G. Lopez, F. Milanes, R. L. Toca & T. Aramburo) 519-522  
 Exchange transfusion in haemolytic disease of the newborn. (P. L. Mollison & M. Cutbush) 522-526  
 Influence of restraint on automatic movements. Value in diagnosis. (V. Vujic & K. Kurtes) 527-528  
 Primary carcinoma of the liver in a boy aged 15. (A. E. Beynon) 528-530  
 Delayed pneumonitis in a beryllium worker. Report of a case. (J. N. Agate) 530-533  
 Organisation of an arthritis clinic. (A. A. M. Nicol, W. G. Waugh, I. C. Cowan & J. Harkness) 541

## 2 : 9/10/48

- Infantile gastro-enteritis treated with streptomycin by mouth. (U. James, I. R. H. Kramer & P. Armitage) 555-561  
 Survival period of patients with cerebral haemorrhage dying in hospital. (W. M. Rose) 561-563  
 Determination of haemoglobin. V. Precision of colorimetric methods. (E. J. King, M. Gilchrist, I. D. P. Wootton, R. Donaldson, R. B. Sisson, R. G. Macfarlane, H. M. Jope, J. R. P. O'Brien, J. M. Peterson & D. H. Strangeways) 563-566  
 Unexplained thrombosis of the internal carotid artery. (H. R. I. Wolfe) 567-569  
 Intestinal obstruction from fibrous stricture, following strangulated hernia. (P. Konstam) 569-570  
 Tetraethylammonium bromide in renal cortical ischaemia. (F. E. Stock) 570-571  
 Medical education in the Ukraine. (W. P. Forrest) 579-582

## 2 : 16/10/48

- Streptomycin therapy of tuberculous meningitis in children. (K. Cboerem, N. Zervos, V. Constantinides & S. Pantazis) 595-599  
 Recurrent dislocation of the shoulder. The surgical treatment. (J. E. Richardson) 599-601  
 Effect of caronamide on blood-penicillin concentrations in man. (R. B. Hunter, W. M. Wilson & J. Dick) 601-604  
 Mass deaths of infants. Role of cross-infection. (T. Brehme) 604-607  
 Para-aminobenzoic acid in leukaemia. Effect on the leucocyte-count. (H. B. May & J. Vallance-Owen) 607-609  
 Despericated bovine serum. (D. Annis) 609-610  
 p-Aminosalicylic acid. Determination in blood and cerebrospinal fluid. (W. Klyne & J. P. Newhouse) 611  
 Condition of children in Western Germany. (A. P. Meiklejohn) 619-623

## 2 : 23/10/48

- Meningococcosis. A protean disease. (H. S. Banks) 635-640  
 Infection by penicillin-resistant staphylococci. (M. Barber & M. Rozwadowska-Dowzenko) 641-644  
 Carotid-sinus syndrome. A case treated by bilateral denervation. (R. Turner & J. R. Learmonth) 644-646  
 Fatal staphylococcal enteritis developing during streptomycin therapy by mouth. (I. R. H. Kramer) 646-647  
 Treatment of local infection with diamidines. (F. Kohn & C. D. Cross) 647-651  
 Alginates in endaural wound dressing. (E. R. G. Passe & G. Blaine) 651

## 2 : 30/10/48

- Treatment of thyrotoxicosis. Review of 350 cases. (C. Roberson) 675-676  
 Meningococcosis. A protean disease. (Concluded.) (H. S. Banks) 677-681  
 Infection through soaked dressings. (L. Colebrook & A. M. Hood) 682-683  
 A method of testing analgesics in man. (A. J. H. Hewer & C. A. Keele) 683-688  
 Nebulised penicillin and postoperative pulmonary complications. (E. J. Holborow & E. A. Spriggs) 688-689  
 Tuberculous mastoiditis treated with streptomycin. Report of a case. (O. D. Fisher & E. A. Malkin) 689  
 Trigeminal neuralgia treated with cuprelone. (A. M. G. Campbell) 690-691  
 Rehabilitation in industry. (L. W. Plewes, J. N. Barron, A. R. Thompson & H. H. Newell) 699-703  
 Home nursing of premature babies in Newcastle-on-Tyne. (F. J. W. Miller) 703-705

## 2 : 6/11/48

- The vocation of medicine. (Horder) 715-717  
 Thrombo-angiitis obliterans. Results of sympathectomy and prognosis. (J. B. Kinmonth) 717-719  
 Ovulation and the menstrual cycle. (F. Davies) 720-721  
 Thyroidectomy with block dissection of the neck for carcinoma of the thyroid gland. (M. Dargent) 721-723  
 Penetration of cervical mucus by spermatozoa. A method of investigation. (C. Harvey & M. H. Jackson) 723-724  
 Parkinsonism treated with parpanit. (W. F. Dunham & C. H. Edwards) 724-727  
 Familial outbreak of staphylococcal infection of bone and joint. (M. H. M. Harrison) 727  
 Cysticercosis resembling myopathy. (R. J. McGill) 728-730  
 Recurrence of duodenal ulcer six months after adequate vagotomy. (C. G. Rob) 730  
 Mode of action of hetrazan in filariasis. (F. Hawking, P. Sewell & J. P. Thurston) 730-731

## 2 : 13/11/48

- The period of transmission in certain epidemic diseases. An observational method for its discovery. (R. E. H. Simpson) 755-760  
 Rapid disinfection of clean unwashed skin: further experiments. (A. D. Gardner) 760-763  
 Potency and "toxicity" of some synthetic oestrogens: clinical assessment. (P. M. F. Bishop, G. C. Kennedy & G. Wynn-Williams) 764-766  
 Activity of some synthetic oestrogens determined by experiments on rats. (G. L. M. Harmer & W. A. Broom) 766-767  
 Rate of flow of venous blood in the legs measured with radioactive sodium. (H. P. Wright, S. B. Oshorn & D. G. Edmonds) 767-769  
 Further observations on the results of sympathectomy of the upper limb. (H. Barcroft & G. T. C. Hamilton) 770-771  
 A method of testing analgesics. (R. Asher) 771-773  
 Simple statistics of cancer. (M. Greenwood) 781-782

## 2 : 20/11/48

- Parenthood and social change. (R. M. Titmuss) 797-801  
 Clinical assessment of peripheral nerve injuries. Tinel's test. (W. R. Henderson) 801-805  
 Safety of intraperitoneal and intratubal penicillin. (A. Westman) 805-806  
 Anthias in perennial vasomotor rhinorrhoea. (T. J. Reid & R. B. Hunter) 806-807  
 Myanesis in tetanus. (J. A. Torrens, P. M. Edwards & M. W. W. Wood) 807-809  
 Acute toxic encephalopathy of unknown aetiology in two brothers. (E. S. Frazer) 809-810  
 Thrombosis of the abdominal aorta apparently caused by pressure from a vertebral osteophyte. (G. E. Pinkerton) 811

## 2 : 27/11/48

- Carcinogenic and anticarcinogenic substances. (E. C. Dodds) 837-842  
 Surgery in haemophilia. A case of spinal subdural haematoma producing paraplegia. (F. Schiller, G. Neligan & O. Budtz-Olsen) 842-845  
 Air infection with dust liberated from clothing. (J. P. Duguid & A. T. Wallace) 845-849  
 Resistance to proguanil (paludrine) in a mammalian malaria parasite. (*Plasmodium cynomolgi*). (F. Hawking & W. L. M. Perry) 850  
 Simplified flocculation tests for differential diagnosis of jaundice. (E. B. Love & C. A. Mawson) 850-851  
 Multiple abdominal catastrophes. (S. Glaser) 851-852  
 Reducing substances in cervical mucus. (R. Milton & B. P. Wiesner) 852-853  
 The universities and the Health Service. (J. H. Dible) 861  
 Specific laboratory tests in streptomycin therapy of tuberculosis. Report by the Pathological Sub-committee of the Streptomycin in Tuberculosis Trials Committee, Medical Research Council. 862-865

## 2 : 4/12/48

- Scientific construction of the normal child's diet. (A. Brown) 877-881  
 Surgery of portal hypertension: an account of 16 cases. (J. R. Learmonth & A. I. S. Macpherson) 882-885  
 Haemophilus influenzae meningitis: four cases treated with streptomycin. (J. D. Roscoe & M. H. Gleeson-White) 885-888  
 Folic acid in the treatment of agranulocytosis. (J. H. Waelisch) 888-891  
 Paracetamol in pyopericardium. (W. E. Gibby) 891-892  
 The welfare of the housewife. (S. Instone) 899-901

## 2 : 11/12/48

- The pathogenesis of the acute exanthems. (F. Fenner) 915-920  
 Splenectomy in kala-azar. (T. C. Morton & J. N. C. Cooke) 902-923  
 The male-toad test for pregnancy. (M. Haines) 923-926  
 Human toxoplasmosis in England: report of a case. (N. M. Jacoby & L. Sagorin) 926-928  
 Relapse of pernicious anaemia during maintenance therapy with folic acid. (D. L. Mollin) 928-930  
 Hyperdure premedication. (E. Asquith & E. Thomas) 930-931  
 The pathological service of a district hospital. (J. D. A. Gray) 939-942  
 Primary multiple-pressure vaccination of infants: comparison with scarification. (R. J. W. Rees) 943-944

## 2 : 18/12/48

- Metabolism in experimental diabetes mellitus. (F. G. Young) 955-961  
 Early ambulation in obstetric and gynaecological cases. (R. de Soldenhoff) 961-964  
 Some aspects of the action of histamine antagonists. (W. A. Bain, F. F. Hellier & R. P. Warin) 964-969  
 Dimethylsulphaphenylamido-isoxazole (NU-445) in urinary infections. (J. D. Fergusson, D. G. Reinold & F. Wrigley) 969-971  
 Determination of haemoglobin. VI. Test of the M.R.C. grey-wedge photometer. (E. J. King, I. D. P. Wootton, R. Donaldson, R. B. Sisson & R. G. Macfarlane) 971-974  
 Diagnostic fluoroscopy at a chest clinic. (W. H. Tattersall) 974-975  
 A teaching museum in miniature: slices mounted in portfolios. (T. H. C. Benians) 983-984

## 2 : 25/12/48

- The aims of medicine. (E. D. Adrian) 997-1001  
 A drug sensitising the organism to ethyl alcohol. (J. Hald & E. Jacobsen) 1001-1004  
 Treatment of alcoholism with a sensitising drug. (O. Martensen-Larsen) 1004-1005  
 Peritoneal effusion as a complication of artificial pneumoperitoneum. (R. C. Cohen) 1006-1007  
 Hypertrophy of the pylorus in an adult: with massive eosinophil infiltration and giant-cell reaction. (H. J. Barrie & J. C. Anderson) 1007-1009  
 Calciferol by intramuscular injection. (T. Lightbound) 1010-1012  
 Pethidine in obstetrics: review of 153 cases. (P. J. O'Reilly) 1012-1013  
 Osteopathy: a visit to the London College. (J. S. Batcbelor & S. M. Cohen) 1021-1022

## 1 : 1/1/49

- Consciousness and its disturbances considered from the neurological aspect. (J. P. Martin) 1-6  
 Hirschsprung's disease and idiopathic megacolon. (M. Bodian, F. D. Stephens & B. C. H. Ward) 6-11  
 Intravenous treatment of anaemia with an iron-sucrose preparation. (H. G. B. Slack & J. F. Wilkinson) 11-14  
 Intravenous iron in the treatment of anaemia of pregnancy. (A. D. T. Govan & J. M. Scott) 14-16  
 Response of infants to diphtheria immunisation. (B. Vahlquist) 16-18  
 Gastric biopsy. Report on fifty-five biopsies using a new flexible gastric biopsy tube. (I. J. Wood, R. K. Doig, R. Mottram & A. Hughes) 18-21  
 Preliminary trials of bistrimethylammonium decane and pentane diiodide (C10 and C5) in man. (G. Organe, W. D. M. Paton & E. J. Zaimis) 21-23

## 1 : 8/1/49

- Dangers of criminal instrumental abortion. (K. Simpson) 47-48  
 Consciousness and its disturbances considered from the neurological aspect. (Concluded.) (J. Purdon-Martin) 48-53  
 Torulosis of the central nervous system. Report of two cases. (P. M. Daniel, F. Schiller & R. L. Vollum) 53-56

Diabetic ketosis. A comparison of results of orthodox and intensive methods of treatment based on 170 consecutive cases. (A. B. Black & J. M. Malins) 56-59  
Toxic effects of tridione. (J. N. Briggs & J. L. Emery) 59-62  
Hypertension following renal infarction. (J. Wainwright) 62-63  
The natural history of the common cold. (C. H. Andrews) 71-75

## 1 : 15/1/49

Late social results of prefrontal leucotomy. (R. Ström-Olsen & P. M. Tow) 87-90  
Macrocytic anaemia in central Africans in relation to ancylostomiasis and other diseases. (H. Lehmann) 90-95  
Streptomycin in human plague compared with other treatments. (P. V. Karamchandani & K. S. Rao) 96-97  
Experimental pancreatico-osteostomy. (C. A. Wells & D. Annis) 97-99  
Penicillin and caronamide in resistant subacute bacterial endocarditis. (C. H. Stuart-Harris, J. Colquhoun & J. W. Brown) 99-101  
Resistance to tumour growth in rats fed on vitamin-B complex. (G. M. Scott) 102-104  
Rapid determination of urinary pregnanediol: a comparison of two methods. (G. I. M. Swyer) 104-105  
Medical technology in Britain and America. (R. Whitehead) 113-115

## 1 : 22/1/49

Medicine in the new social order. (F. Fraser) 131-132  
Dextran as a plasma substitute. (G. Thorsén) 132-134  
Dextran as a plasma substitute. (J. P. Bull, C. Ricketts, J. R. Squire, W. d'A. Maycock, S. J. L. Spooner, P. L. Mollison & J. C. S. Paterson) 134-143  
Effects of faginated flour on man. (A. Elithorn, D. M. Johnson & M. A. Crosskey) 143-146  
Morbidity and feeding in infancy. (F. C. Naish) 146  
Clinical estimation of basal metabolic rate: the RP index. (E. Bene) 147  
Action of noradrenaline and adrenaline on human heart-rate. (H. Barcroft & H. Konzett) 147-148  
Prevalence of tuberculosis in Western Germany. (M. Daniels & P. D'A. Hart) 157-158

## 1 : 29/1/49

Objects of research: reorientation towards commoner diseases. (S. Alstead) 171-172  
Blood changes in peritonitis. (P. H. Theron & W. C. Wilson) 172-178  
Serological evidence of Q fever in Great Britain. (M. G. P. Stoker) 178-179  
Streptomycin in whooping-cough. (H. Schwabacher, R. H. Wilkinson & C. W. Carran) 180-183  
Fatal anuria after use of myasine in anaesthesia. (T. E. W. Goodier & C. E. D. H. Goodhart) 183-184  
Restriction of thoracic respiration as an aid to abdominal palpation. (N. J. Nicholson) 184-185  
Postpartum haemorrhage following eclampsia treated by blood transfusion. (E. M. Sawdon) 185

## 1 : 5/2/49

he rhesus factor: a summary based on 200 cases. (E. N. Allott & C. A. Holman) 209-214  
testinal lipodystrophy (Whipple's disease). (F. A. Jones & J. W. Paulley) 214-216  
Acute phenobarbitone poisoning: treatment with picrotoxin. (E. G. Sita-Lumsden) 217-220  
Outbreak of *Shigella schmitzi* infection in men and apes. (R. E. Rewell) 220-221  
Plasma-protein level and disappearance of Evans blue from the blood-stream. (R. J. Rossiter) 222-223  
Suction applied to appendectomy. (J. Devine) 223-225  
Lymphocytes and intravascular haemolysis. (R. H. Trinick) 225  
Setting up the disabled. (C. B. Heald) 234-235

## 1 : 12/2/49

Megalneytic anaemias. (J. F. Wilkinson) 249-255  
Palliative surgery in facial palsy. (C. R. McLaughlin) 255-258  
Benadryl in the treatment of parkinsonism: results in forty cases. (G. M. S. Ryan & J. S. Wood) 258-259  
Acute osteomyelitis due to a penicillinase-producing *Staphylococcus aureus*. (C. C. Jeffrey, S. Sevvit & E. Topley) 259-261  
Radical surgery in advanced squamous carcinoma. (R. W. Raven) 261-263  
Influence of previous diet on the effect of glucose in periodic paralysis. (K. Lundback) 263-264  
Cerebral abscess in an infant followed by recovery. (D. L. B. Farley) 264-266  
Nutrition and health of children in five countries of South America. 1. Paraguay. (R. Passmore) 277-278

## 1 : 19/2/49

Megalocytic anaemias. (J. F. Wilkinson) 291-296  
The treatment of typhoid carriers with penicillin and sulphathiazole. (J. W. Bigger & R. A. Daly) 296-299  
Maternal rubella and congenital defects: data from National Health Insurance records. (A. B. Hill & T. M. Galloway) 299-301  
Congenital absence of the gall-bladder. (M. J. Smyth) 301-303  
Multiple pregnancies and erythroblastosis foetalis. (A. Sadowsky & A. Brzezinski) 303-305  
Lymphosarcoma presenting as oedema of the eyelids. (M. T. F. Carpendale) 305-306  
Nutrition and health of children in five countries of South America. 2. Chile. (R. Passmore) 315-317

## 1 : 26/2/49

Physiology, science, and medicine. (W. H. Newton) 333-336  
Megalocytic anaemias. (J. F. Wilkinson) 336-340  
Effect of analgesics on respiratory response to carbon dioxide in man. (F. Prescott, S. G. Ransom, R. H. Thorp & A. Wilson) 340-344  
Urinary schistosomiasis treated with miracid. (D. M. Blair, F. G. Loveridge, C. V. Measer & W. F. Ross) 344-346  
An in-vitro test of the toxin-producing capacity of *Corynebacterium diphtheriae*. (O. Ouchterlony) 346-348  
Estimation of *p*-aminosalicylic acid in blood and urine. (H. G. Dickenson & W. Kelly) 349  
Nutrition and health of children in five countries of South America. 3. Bolivia. (R. Passmore) 362-363

## 1 : 5/3/49

Retropubic prostatectomy: experiences based on 757 cases. (T. Millin, C. L. O. Macalister & P. M. Kelly) 381-385  
Growth of the pre-school child in London. (A. T. Gore & W. T. Palmer) 385-387  
Paroxysmal cold haemoglobinuria of non-syphilitic type. (L. K. Malley & M. D. Hickey) 387-390  
Survival of transfused erythrocytes from a donor with nocturnal haemoglobinuria. (J. V. Dacie & P. L. Mollison) 390-392  
Oesophageal lesions in sclerodactyly. (W. A. Bourne) 392-394  
Acquired resistance to proguanil (paludrine) in plasmodium vivax. (D. R. Seaton & E. M. Lourie) 394-395  
Streptomycin in non-gonococcal urethritis. (R. R. Willcox) 395-396  
Somatotypes and medicine. (J. M. Tanner) 405-407  
Nutrition and health of children in five countries of South America. 4. Peru. (R. Passmore) 408-409

## 1 : 12/3/49

Value of systemic penicillin in finger-pulp infections. A controlled trial of 169 cases. (S. H. Harrison, E. Topley & J. Lennard-Jones) 425-430  
A clinical method of assessing analgesics. (A. J. H. Hewer, C. A. Keele, K. D. Keele & P. W. Nathan) 431-435  
March haemoglobinuria. (M. Lubran & J. Sakula) 435-438  
Inhalation of stomach contents. (A. Willcox) 438-439  
A tuberculin-neutralising factor in the serum of patients with sarcoidosis. (A. Q. Weiss & I. A. H. Wylie) 439-441  
Streptomycin-streptokinase treatment of tuberculous meningitis. (I. A. B. Cathie) 441-442  
Nutrition and health of children in five countries of South America. 5. Colombia. (Concluded.) (R. Passmore) 450-451

## 1 : 19/3/49

The syndrome of diabetes mellitus and its causes. (H. P. Himsforth) 465-472  
Injuries and death from lightning. (M. J. G. Lynch & P. H. Shorthouse) 473-478  
Tuberculous abscess at the site of penicillin injections. (G. B. Forbes & F. G. S. C. Strange) 478-479  
Long-acting preparation of testosterone. (E. Carlinfant, F. D'Alò & L. Cutolo) 479-480  
A wheel-chair. (A. G. B. Poole) 480-482

## 1 : 26/3/49

At the cross-roads: the development of our health services. (A. L. Banks) 509-510  
The action of dihydroergocornine on the circulation with special reference to hypertension. (R. H. Goetz) 510-514  
Immediate results of partial gastrectomy for peptic ulcer. (B. B. Milstein) 514-517  
Agranulocytosis and thrombocytopenia following the use of tridione. (T. W. Forster, J. W. Watson & E. Neumark) 517-518  
Necrotic jejunitis. (K. A. Fick & A. P. Wolkstein) 519-521  
Effect of intra-uterine radium therapy on ovarian function. (G. Goldscheider) 521-523  
Use of thrombin in liver puncture. (L. Friedrich & M. Policzer) 523-524  
The reflecting microscope. (R. Barer) 533-534  
Propagation of mouse tumours by means of dried tissue. Successful experiments reported. 535

## 1 : 2/4/49

The rôle and value of the anamnesis. (A. Abrahams) 553-555  
Retinal and vascular damage in long-standing diabetes. (J. H. Croom & G. I. Scott) 555-558  
Deaths from vagal inhibition. (K. Simpson) 558-560  
The adrenolytic action of dihydroergocornine in man. (R. H. Goetz & A. Katz) 560-563  
Reablement of tuberculous patients. (R. Grenville-Mathers) 563-565  
Cretinism with goitre in infancy: two cases treated with thyroid. (V. Smallpeice) 565-568  
Convalescent homes. The need for modernisation. (H. Tidy) 577-578

## 1 : 9/4/49

Treatment of congestive heart-failure. (H. A. Reid & W. Hughes) 593-598  
Subcutaneous implantation of insulin in diabetes mellitus. (L. Vargas) 598-601  
Complete rupture of the membranous urethra: follow-up note. (A. H. Hunt & C. N. Morgan) 601-602  
Filamentous forms associated with newly isolated influenza virus. (C. M. Cbu, I. M. Dawson & W. J. Elford) 602-603  
Rôle of di-isopropyl fluorophosphonate in surgery. (J. P. Quilliam & T. A. Quilliam) 603-606  
Operation for severe varicose veins during pregnancy. (H. Dodd) 606-607  
Mortality from pink disease in 1923-47. (W. P. D. Logan) 608-609  
Intravenous procaine. A review. (W. W. Mushin & L. Rendell-Baker) 619-620

## 1 : 16/4/49

Wertheim's operation in retrospect. (V. Bonney) 637-639  
Excretion of chloride and sodium after surgical operations. (A. W. Wilkinson, B. H. Billing, G. Nagy & C. P. Stewart) 640-644  
Treatment of a stammerer in the secondary stage of stammering. (M. C. Crickmay) 644-646  
Factors influencing the maintenance of antitoxic immunity. (M. Barr & A. T. Glenn) 646-649  
Intestinal rupture following non-penetrating injury. (G. Flavell) 649  
Gynaecomastia during treatment with amphetamine. (P. H. Tooley & C. Lack) 650-651  
Fibrocystic disease of the pancreas in an infant. (G. G. Jones) 651-652  
Estimation of ergothioneine in urine by paper partition chromatography. (E. Work) 652-654  
Studies of child growth in the United States. (J. M. Tanner) 663-665

## 1 : 23/4/49

Reorientations in neurology. (C. Symonds) 677-680  
Effect of diethylstilboestrol on urinary excretion of pregnanediol and endogenous oestrogen during pregnancy. (I. F. Sommerville, G. F. Marrian & B. E. Clayton) 680-682  
Idiopathic renal acidosis in an infant with excessive loss of bicarbonate in the urine. (T. Siapleton) 683-685

Preparation and standardisation of saccharated iron oxide for intravenous administration. (J. A. Nixson & J. M. Robson) 686-689  
 Another case of louping-ill in man: isolation of the virus. (E. G. Brewis, C. Neubauer & E. W. Hurst) 689-691  
 Water-soluble vitamin K in the newborn. (R. R. Gordon) 692-693  
 The scope of the medical illustrator. (S. Treadgold) 701-704  
 The Hebrew University Hadassah medical school. (E. Davis) 704-705

1 : 30/4/49

Chronic bronchitis: never a complete diagnosis. (W. A. Lister) 719-721  
 Observations on a series of labours, with special reference to physiological delivery. (G. D. Read) 721-726  
 Curare-like actions of tri-(diethylaminoethoxy)-benzene triethyldide. (W. W. Mushin, R. Wien, D. F. J. Mason & G. T. Langston) 726-728  
 Streptomycin in non-tuberculosis infections. (P. H. Buxton, R. D. Simoo & F. R. Selbie) 729-733  
 Experimental observations on renal blood-flow. (D. A. K. Black & M. G. Saunders) 733-734  
 Fatal air embolism during blood-transfusion. (G. B. Doyle & P. Frodsham) 735-736  
 Haemochromatosis in three families and in a woman. (R. D. Lawreoe) 736  
 A plan for the acid. (C. A. Boucher) 745-746  
 Cardiac catheterisation. A historical note. (A. J. Benatt) 746-747  
 Fever without rash after contact with smallpox. (I. R. Gray) 749-751

### Medical Officer

79 : 3/4/48

The infectivity of tuberculosis. (R. Grenville-Mathers) 143  
 Planning for the chronically ill. 143-145  
 Ministry of Health return of infectious diseases. 147

79 : 10/4/48

The sex ratio. (W. J. Martin) 153-156  
 Ministry of Health return of infectious diseases. 160

79 : 17/4/48

Health education in Scotland. (W. L. Burgess) 165-167  
 Ministry of Health return of infectious diseases. 171

79 : 24/4/48

The statistical assessment of public health. (B. Benjamin) 177-179  
 Ministry of Health return of infectious diseases. 182

79 : 1/5/48

Sulohathiazole ointment in the treatment of impetigo contagiosa. (R. S. Davidson) 187-188  
 Ministry of Health return of infectious diseases. 192

79 : 8/5/48

The statistical assessment of results in preventive medicine. (B. Benjamin) 197-198  
 Plantar warts in school children. (M. Watkins) 198-199  
 Ministry of Health return of infectious diseases. 201

79 : 15/5/48

The pioneers of public health. (A. Bevan) 207-208  
 New York City's restaurant clean-up programme. (I. Weinstein) 208-212  
 Ministry of Health return of infectious diseases. 214

79 : 22/5/48

Administrative structure of a county health department: the West Riding scheme. (C. F. Brockington) 219-221  
 Superannuation rights under the National Health Service (Superannuation) Regulations, 1947. (H. Keast) 222-223  
 Ministry of Health return of infectious diseases. 224

79 : 29/5/48

Administrative structure of a county health department: the West Riding scheme. (Concluded.) (C. F. Brockington) 230-232  
 Ministry of Health return of infectious diseases. 233

79 : 5/6/48

The road ahead in public health. (L. A. Scheele) 239-240  
 Diphtheria immunisation in Lancashire. (F. Hall) 240-242  
 Heights and weights of London school children. (A. Daley) 242-244  
 Ministry of Health return of infectious diseases. 245

79 : 12/6/48

The R.S.I. Health Congress. 251-253  
 Ministry of Health return of infectious diseases. 255

79 : 19/6/48

The bacteriological grading of ice-cream. (G. S. Wilson) 261-264  
 Ministry of Health return of infectious diseases. 268

79 : 26/6/48

Acute anterior poliomyelitis in a rural holiday area. (E. C. Downer) 273-274  
 The spread of acute anterior poliomyelitis—a theory and a plea. (B. Broadbent) 274  
 Trading in diseased meat. (W. A. Lethem) 274-275  
 Ministry of Health return of infectious diseases. 280

80 : 3/7/48

The utilisation of orange juice and cod liver oil. (J. Berkeley) 5  
 The progress of cremation. (Horder) 6-7  
 Ministry of Health return of infectious diseases. 9

80 : 10/7/48

Care of the chronic sick and the aged. (C. O. Stallybrass) 15-16  
 Food poisoning: bacillus aertrycke infection. (A. G. G. Thompson) 17  
 Ministry of Health return of infectious diseases. 20

80 : 17/7/48

Children, and the risk of tuberculosis infection by adults. [Report of the Children's Committee of the Joint Tuberculosis Council.] 25-27  
 Ministry of Health return of infectious diseases. 29

80 : 24/7/48

The National Health Service Act as it affects young children. (J. A. Scott) 35-36  
 Ministry of Health return of infectious diseases. 40

80 : 31/7/48

Study leave in the United States. (F. Grundy) 45-46  
 Ministry of Health return of infectious diseases. 50

80 : 7/8/48

Study leave in the United States. (Concluded.) (F. Grundy) 55-57  
 Fatal septicaemia due to Salmonella Dublin. (G. A. Lindeboom) 57-58  
 Ministry of Health return of infectious diseases. 61

80 : 14/8/48

The dispensary side of a county tuberculosis service. (F. C. S. Bradbury) 67-69  
 A proposed health centre. (D. A. Goldfinch) 69-70  
 Ministry of Health return of infectious diseases. 74

80 : 21/8/48

Enuresis. 79-81  
 Ministry of Health return of infectious diseases. 83

80 : 28/8/48

Chronic cough and the School Health Service. (K. McAlpine) 89-90  
 Dismissal of a suspected typhoid carrier. 91-92  
 Ministry of Health return of infectious diseases. 94

80 : 4/9/48

Some observations relating to low haemoglobin levels. (M. J. Pleydell & F. S. Leben) 99-100  
 Ministry of Health return of infectious diseases. 105

80 : 11/9/48

A national service for health. (S. Hastings) 111-113  
 Ministry of Health return of infectious diseases. 117

80 : 18/9/48

School health statistics. (A. T. Gore) 123-126  
 Ministry of Health return of infectious diseases. 129

80 : 25/9/48

The public health service as a career. (R. H. Parry) 135-136  
 The role of the medical officer of health within the new National Health Service (including reference to the relationship of the general practitioner to the nursing services). (E. D. Irvine) 138-140  
 Ministry of Health return of infectious diseases. 140

80 : 2/10/48

Holt's diphtheria toxoid (P.T.A.P.): an investigation as to reproducibility of antigenic properties in successive batches. (G. Bousfield & H. L. Duke) 145-146  
 Foot health. (C. O. S. B. Brooke) 146-147  
 Investigation into the foot health of school children. (A. H. Carter) 147  
 Ministry of Health return of infectious diseases. 152

80 : 9/10/48

How Sir John Simon entered the public health service. (I. E. McCracken) 157-158  
 Home helps—their part in the social services. (C. G. Cartwright) 158-162  
 Ministry of Health return of infectious diseases. 165

80 : 16/10/48

An epidemiological note on the outbreak of poliomyelitis in London in 1947. (A. Daley & B. Benjamin) 171-176  
 The importance of clean food. (F. A. Belam) 176-177  
 Ministry of Health return of infectious diseases. 179

80 : 23/10/48

The fragments that remain. (E. K. Macdonald) 185-187  
 Ministry of Health return of infectious diseases. 190

80 : 30/10/48

An account of an experiment in two day nurseries. (J. Z. Garson) 195-197  
 An example of the carrier state with *Bacillus aertrycke* as the pathogen. (F. M. Day) 197  
 The development of school dental services. (A. J. Sutherland) 197-198  
 Ministry of Health return of infectious diseases. 201

80 : 6/11/48

Maternal mortality and the ante-natal clinic. (H. Menzies) 207-208  
 Ministry of Health return of infectious diseases. 212

80 : 13/11/48

The regional hospital board and the medical officer of health. (W. G. Patterson) 217-219  
 Ministry of Health return of infectious diseases. 223

80 : 20/11/48

"Nutrition" and "general condition." (K. McAlpine) 229-230  
Multiple cases of acute poliomyelitis. (A. W. Johns) 230-231  
Ministry of Health return of infectious diseases. 233

80 : 27/11/48

The development of health services. (A. D. Symons) 239-240  
A portable Wood's light for ringworm diagnosis. (J. Curry) 240-241  
Accidental plumbism in a temporary dwelling. (V. O. B. Gartside) 241  
Ministry of Health return of infectious diseases. 246

80 : 4/12/48

The uses of D.D.T. in bug extermination in slum properties. (W. C. Gunn) 251-252  
An attempt at rapid testing of physical fitness in schoolchildren. (J. Cahill) 252-253  
Ministry of Health return of infectious diseases. 256

80 : 11/12/48

The after-history of juvenile rheumatism patients. (C. W. Anderson) 261-264  
Ministry of Health return of infectious diseases. 268

80 : 18/12/48

The after-history of juvenile rheumatism patients. (C. W. Anderson) 273-276  
Ministry of Health return of infectious diseases. 279

80 : 25/12/48

The after-history of juvenile rheumatism patients. (C. W. Anderson) 285-287  
"Meals on wheels." (E. Hughes) 287  
Ministry of Health return of infectious diseases. 289

81 : 1/1/49

Mortality from heart disease. (J. H. C. Clarke) 5-6  
Ministry of Health return of infectious diseases. 8

81 : 8/1/49

Home nursing of premature infants. (F. J. W. Miller) 13-14  
Ministry of Health return of infectious diseases. 18

81 : 15/1/49

Conditions of service and recruitment to the public health service. 23-28  
Ministry of Health return of infectious diseases. 30

81 : 22/1/49

Gastro-enteritis in infants from the physiological aspect. (B. A. Peters, G. R. Scarff, E. L. Seymour & J. Stanton) 35-37  
Ministry of Health return of infectious diseases. 41

81 : 29/1/49

Gastro-enteritis in infants from the physiological aspect. (Concluded.) (B. A. Peters, G. R. Scarff, E. L. Seymour & J. Stanton) 47-49  
Ministry of Health return of infectious diseases. 53

81 : 5/2/49

Twenty years' progress at a municipal chest clinic. (P. Ellman) 59-61  
Ministry of Health return of infectious diseases. 66

81 : 12/2/49

The psychology of "delicacy." (R. P. Garrow) 71  
Ministry of Health return of infectious diseases. 78

81 : 19/2/49

Public health care of the healthy aged. (F. A. Belam) 83-84  
Ministry of Health return of infectious diseases. 87

81 : 26/2/49

An outbreak of poliomyelitis. (J. E. Spence) 93-96  
Ministry of Health return of infectious diseases. 99

81 : 5/3/49

A health services bureau. (M. E. Hocken) 105  
Ministry of Health return of infectious diseases. 109

81 : 12/3/49

Infant mortality in Essex. (W. A. Bullough) 115-116  
Mass radiography—what should be our policy for the future? 116-117  
Ministry of Health return of infectious diseases. 120

81 : 19/3/49

Food and drink infections. (C. Porter) 125-127  
Ministry of Health return of infectious diseases. 130

81 : 26/3/49

Aspects of poliomyelitis in childhood. (A. P. Norman) 135-136  
Ministry of Health return of infectious diseases. 138

81 : 2/4/49

Illness in early childhood in Luton. (F. Grundy) 144-147  
Ministry of Health return of infectious diseases. 148

81 : 9/4/49

Health centres for the City of Portsmouth. (T. E. Roberts & T. L. Marshall) 153-155  
Ministry of Health return of infectious diseases. 157

81 : 16/4/49

The strategy and tactics of health education. (W. Hartston) 163-164  
Some of the aspects of the present policy of the Central Midwives Board. (R. J. Fenny) 164-165  
Ministry of Health return of infectious diseases. 168

81 : 23/4/49

Occupational health: its place within the framework of a public health department. (S. I. A. Laidlaw) 173-174  
Ministry of Health return of infectious diseases. 176

81 : 30/4/49

Informing the public: II. "The spoken word." (C. Hill) 181-182. III. "On approaching the public." (A. A. McLoughlin) 182-184. IV. "Telling the world." (R. W. King) 184-185  
Ministry of Health return of infectious diseases. 188

## Medical Press

219 : 7/4/48

The treatment of mastoiditis and its complications. (J. C. Hogg) 301-305  
Breast feeding and some of its problems. (R. C. Jewsbury) 306-307  
Physiological principles and clinical application of the basal metabolic rate test. (A. E. B. Harding) 307-311  
Action of antacids in gastric hyperacidity. (A. H. Walters) 311-317

219 : 14/4/48

Detachment of the retina. (W. J. B. Riddell) 323-325  
Some suggestions for the prevention of mental illness. (J. Hammond) 326-329  
Open-air schools. (P. L. T. Bennett) 330-334  
Lesions of the cervix in relation to pregnancy. (G. Hill) 335-337

219 : 21/4/48

Modern treatment of fracture of the os calcis. (A. Miller) 346-350  
The heart in thyrotoxicosis. (A. A. F. Peck) 351-354  
The management of patients with a contracted pelvis in pregnancy and labour. (P. Malpas) 354-358  
The cell fluid circulation basis of the body. (C. P. Lapage) 358-361

219 : 28/4/48

Prevention and treatment of sterile mating. (V. B. Green-Armytage) 367-373  
Bronchoscopy in diagnosis. (C. Hamblin-Thomas) 373-376  
The value of exercises before and following an abdominal operation. (N. I. Lanckenau) 376-378  
Treatment of arsenical reaction with BAL. (E. W. Prosser-Thomas) 379-380

219 : 5/5/48

Geriatrics—the new approach. (T. H. Howell) 387-389  
Mental disorders in old age. (D. S. Fairweather) 389-393  
The problem of the ageing population. (C. C. Morrell) 393-396  
Care of the hemiplegic patient. (M. Warren) 396-398  
The care of old age in the home. (J. H. Sheldon) 398-400  
The place of the out-patient department in caring for old people. (E. B. Brooke) 400-402  
Future plans on the care of old people. (E. L. Sturdee) 403-406

219 : 12/5/48

The aetiology and treatment of paroxysmal tachycardia. (C. Evans) 415-418  
Diseases of the nails. (H. Gordon) 418-422  
Gastric and duodenal ulceration viewed as preventable diseases. (J. D. Craig) 422-426  
Differential diagnosis of haematuria in women. (E. C. Lewis) 426-428

219 : 19/5/48

Modern treatment of carcinoma of the breast. (S. Cade) 435-438  
Tuberculosis: some psychological observations—psychiatric aspects. (P. A. Galpin) 438-444  
The use and abuse of forceps deliveries in general practice. (S. J. Paterson) 444-446  
The isomers of aspirin. (A. T. Todd & E. Lloyd) 447-448

219 : 26/5/48

The aetiology, prevention and treatment of retained placenta. (K. M. D. Harding) 457-458  
Notes on amnesia in crime for the general practitioner. (A. Leitch) 459-463  
Time, soil, population, food, health. (T. H. Sanderson-Wells) 463-469  
Trichomonas vaginalis: incidence, signs, symptomatology and special cases. (W. M. H. McCullagh) 469-471

219 : 2/6/48

The aetiology and modern treatment of achlorhydria. (J. Ronald) 479-481  
The concentration camps of Terezin. (K. Raska) 481-484  
The necrobiotic nodules of the rheumatoid arthritis type, with remarks on rheumatoid arthritis. (F. P. Weber) 484-486  
The diagnosis and treatment of hay fever. (D. Harley) 486-488  
The ordeal of chronic illness. ("Peter Quince") 488-491

219 : 9/6/48

The third molar. (G. Jack) 501-504  
The value of drugs in the treatment of heart disease. (T. J. Hoskin) 504-507  
Adolescence and psychological disorders. (W. Doherty) 508-512  
Proteins and pregnancy. (J. H. Hannan) 512-514

219 : 16/6/48

The aetiology and modern treatment of amenorrhoea. (H. R. MacLennan) 525-529  
The choice of the anaesthetic for cerebral surgery. (Z. Mennell) 529-531  
The propaganda of venereal disease in a hospital ship. (A. R. H. Oakley) 532-534  
Hospital architect and administrator: the opportunity to further their mutual understanding. (A. E. Whitworth) 534-537

## 219 : 23/6/48

- An approach to the investigation and treatment of the subfertile couple. (C. S. Lane-Roberts) 547-550  
Concerning the dropping of "bricks." (P. H. Mitchiner) 551-552  
The role of chemical pathology in general practice. (C. H. Gray) 553-557  
The choice of anaesthesia in ear, nose and throat operations. (H. H. Pinkertoo) 558-561

## 219 : 30/6/48

- First aid in road accidents. (St. J. D. Buxton) 563-571  
Head injuries due to road accidents. (L. Rogers) 571-575  
Some common fractures due to accidents. (C. J. D. Langton) 575-579  
Common accidents to the ears and their treatment. (R. S. Lewis) 579-582  
Injuries of the eyes in road accidents. (T. K. Lyle) 583-589  
Anaesthetic accidents and their prevention. (A. D. Marston) 589-592  
Injuries to the genito-urinary system due to road accidents. (R. A. Mogg) 593-598

## 220 : 7/7/48

- Various forms of conjunctivitis and their treatment. (R. Lindsay-Rea) 7-9  
A medical officer in the Antarctic. (A. Bond) 9-10  
New growths of the bladder. (C. H. Mills) 10-17

## 220 : 14/7/48

- Modern trends in treatment of pulmonary tuberculosis. (W. C. Fowler) 27-30  
Family spacing. (R. Boyd) 30-32  
Modern trends in the treatment of intermittent claudication. (M. Newman) 33-37

## 220 : 21/7/48

- The modern treatment of the retracted lumbar intervertebral disc. (J. R. Armstrong) 47-52  
The pneumoconioses. (E. L. Middleton) 52-55  
Early signs of anti-social behaviour in children. (K. Friedlander) 56-58

## 220 : 28/7/48

- Chronic otitis media. (W. H. B. Magauran) 69-71  
Psychiatry in relation to general practice. (R. A. Noble) 72-75  
The prevention of fore-foot injuries in heavy industry. (D. Engel) 75-77

## 220 : 4/8/48

- The modern treatment of burns. (J. A. Ross) 89-92  
Diseases of the lacrimal sac. (A. M. W. Thomson) 93-95  
The new anticonvulsant mesantoin, and its place in the treatment of epilepsy. (H. Pullar-Strecker) 95-97

## 220 : 11/8/48

- Sycosis barbae. (W. J. O'Donovan) 105-106  
Conditions simulating pulmonary tuberculosis. (J. Maxwell) 106-108  
A case of sub-acute bacterial endocarditis in an infant aged three months. (J. M. Harrison) 109-115

## 220 : 18/8/48

- The modern treatment of hysteria in children. (D. Odium) 121-124  
Modern treatment of pyelitis. (A. A. Osman) 124-127  
Post-partum haemorrhage: some remarks intended as a guide to the general practitioner. (A. C. Palmer) 127-130

## 220 : 25/8/48

- Radical excision of the rectum without colostomy. (R. W. Raven) 139-142  
Radiotherapy in the treatment of gynaecological disorders. (M. Lederman) 142-145  
Typhoid outbreak in immunised personnel due to a carrier. (D. Lewes) 145-149

## 220 : 1/9/48

- The diagnosis and modern treatment of injuries of the semilunar cartilages. (J. A. McLaughlan) 157-161  
Eye cases in general practice. (F. W. G. Smith) 161-166  
A new one-stage method of cranioplasty with acrylic plastic. (L. C. Oliver & G. Blaine) 167-169

## 220 : 8/9/48

- Aetiology and treatment of iridocyclitis. (J. G. Milner) 175-178  
The role of the endocrine glands in clinical psychiatry. (H. Palmer) 178-182  
Analgesia for domiciliary midwifery. (K. Lloyd-Williams) 182-187

## 220 : 15/9/48

- The early diagnosis and treatment of carcinoma of the rectum. (W. H. C. Romanis) 197-200  
The obstetric responsibility for stillbirth. (J. H. Peel) 201-204  
Modern treatment and prognosis of pleurisy. (R. W. Parnell) 204-207  
The diagnosis and treatment of psychological disorders in childhood. (P. Davis & J. Bowlby) 208-211

## 220 : 22/9/48

- Diagnosis and modern treatment of hypertrophic pyloric stenosis of infancy. (C. Pinckney) 219-221  
Note on haemangioma, its causes and results. (F. P. Weber) 222-223  
Radiotherapy in cancer of uterus. (L. Martindale) 223-227  
Some aspects of meatal deficiency. (J. Thomson) 227-232

## 220 : 29/9/48

- Modern trends in radiology. (A. M. Rackow) 240-245  
The London medical schools: their origin and evolution. (C. Wall) 246-249  
Dental education: I. (H. F. Humphreys) 250-253  
Dental education: II. (R. Cocker) 253-255  
Dental research: its achievements and its future. (J. D. King) 255-259  
The Faculty of Anaesthetists of the Royal College of Surgeons of England. (A. D. Marston) 260-261  
The Faculty of Dental Surgery: Royal College of Surgeons of England. (G. H. Leatherman) 261-263  
Standardisation. (L. G. Watkins) 264-268

## 220 : 6/10/48

- Chronic mastitis. (A. A. Fleming) 275-278  
Indications for, and prognosis in, radical mastoidectomy. (V. T. Smith) 278-280  
The day nurseries. (G. D. Pirrie) 281-284  
Vulvovaginitis in children. (M. O'Donnell) 284-288

## 220 : 13/10/48

- Pyorrhoea. (J. F. Webster) 295-298  
Increased frequency of micturition. (A. E. Roche) 298-300  
The psychological problems of the repatriated prisoner of war. (H. R. Rollin) 301-304  
The scope of the almoner under the National Health Service Act. (A. C. T. Perkins) 304-307

## 220 : 20/10/48

- Contemporary skin hazards in industry: their recognition, prevention and treatment. (H. C. Semon) 315-318  
Post-maturity. (F. N. Reynolds) 318-321  
Swallowed foreign bodies. (A. H. M. Siddons) 321-324  
The prevention and treatment of post-operative vomiting. (E. H. Rink) 325-327

## 220 : 27/10/48

- Proptosis: its differential diagnosis and treatment. (L. H. Savin) 335-338  
Low backache and sciatica. (E. L. Robert) 338-341  
Diseases of the ear, nose and throat in childhood. (B. Silbiger) 342-350  
Visual education—6. The scientific film. (P. Hansell) 352

## 220 : 3/11/48

- Cystitis. (I. M. Orr) 359-362  
The sedimentation rate in diseases of children. (G. Newns) 363-365  
The aetiology and treatment of trigonitis (basal cystitis) in the female. (G. M. Saodes) 365-366  
Malignant disease: observation and suggested line of experiment. (D. A. James) 367-369  
Topical massive infiltration of penicillin in surgical infections. (S. Ciancarelli) 370-372

## 220 : 10/11/48

- The modern treatment of chronic gastric and duodenal ulceration. (J. D. Craig) 381-386  
The value of vitamins in ophthalmology. (O. G. Morgan) 386-389  
Ante-natal clinics in relation to general practice. (M. Salmond) 389-391  
A practical note on rheumatic fibrositis. (G. L. Scott) 391-392

## 220 : 17/11/48

- The modern treatment of pneumonia. (R. J. Twort) 407-409  
Carcinoma of the lung. (T. H. Sellers) 409-413  
Pleurisy and its treatment. (J. B. Alexander) 414-416  
Empyema. (R. C. Brock) 417-419  
The value of bronchoscopy in the diagnosis of lung conditions. (R. S. Lewis) 419-422  
Treatment of pulmonary tuberculosis to-day. (W. E. Lloyd) 422-425  
The value of sanatorium treatment in pulmonary tuberculosis. (G. S. Todd) 425-426  
The pathology and treatment of bronchiectasis. (C. Shaw) 427-436

## 220 : 24/11/48

- The treatment of Sydenham's chorea. (E. R. C. Walker) 445-448  
The rôle of the general practitioner in the investigation of sterility. (A. Macquarrie) 448-451  
The diagnosis and treatment of acute intussusception in infants. (M. White) 452-455  
Speculations and suggestions on general endoscopic surgery. (W. Hilton-Parry) 455-457

## 220 : 1/12/48

- Differential diagnosis and treatment of tumours of the breast. (F. D. Saner) 467-470  
Responsibilities during anaesthesia. (E. V. Slaughter) 470-474  
Pain in the left chest: some considerations in general practice. (A. Schott) 474-479  
The after-treatment of peptic ulcers. (G. D. Laing) 479

## 220 : 8/12/48

- The use of contact lenses. (F. Ridley) 489-490  
Disorders of the personality. (B. B. Sharp) 490-494  
Exercises and obstetric analgesia. (H. E. Rodway) 494-498  
Diagnosis and treatment of low backache. (M. G. Good) 498-501

## 220 : 15/12/48

- Prevention and modern treatment of eclampsia. (A. McAllister) 511-514  
Modern trends in the care of the premature infant. (S. B. Dimson) 514-519  
The early diagnosis of alimentary malignancy. (W. Houston) 519-523  
The eradication of bovine tuberculosis would be a definite step towards the prevention of tuberculosis. (S. G. Tippet) 523-524

## 220 : 22/12/48

- The causative lesion in sciatica: its diagnosis and modern treatment. (J. E. A. O'Connell) 531-534  
The diagnosis of acute intussusception. (W. D. Park) 534-536  
Army medical service under the Tudors. (C. Wall) 536-541  
The changing aetiology of fame. (H. Creditor) 541-543  
Cervical erosion. (J. H. Hannan) 543

## 220 : 29/12/48

- Modern treatment of sterility in the female. (A. Sharma) 553-557  
Chronic gastric ulcer. (E. G. Slesinger) 557-560  
Outline of the psychosomatic structure of stammering. (L. Stein) 560-563  
Acid injections in the treatment of painful osteoarthritis. (F. V. A. Bosc) 563-566

## 221 : 5/1/49

- The modern treatment of thyrotoxicosis. (S. L. Simpson) 5-8  
 Haematemesis and melaena: an investigation of the place of surgery in its treatment. (N. C. Tanner) 9-17  
 The use of skin tension and abrasion in the relief of facial pockmarks. (P. Clarkson) 17-18  
 The relation of dentistry to general medicine. (F. R. Smyth) 19-22

## 221 : 12/1/49

- The surgical treatment of unilateral atrophic rhinitis (ozena) by a plastic sub-mucous resection of the septum. (A. Miller) 31-32  
 The study of homosexuality. (D. Stanley-Jones) 32-38  
 Spontaneous pneumothorax and its treatment. (J. Smart) 38-41  
 The value of radiological investigation of the appendix. (A. R. Thomas) 41-43  
 Successful treatment of hirsuties by heavy dosage with oestrogens. (N. Leyton) 44

## 221 : 19/1/49

- The treatment of enuresis. (R. J. Batty) 53-55  
 Combined osseous and dermal dysplasias—developmental osteodermopathies. (F. P. Weber) 55-56  
 Indications for the removal of teeth. (R. S. Taylor) 57-59  
 The value of the electroencephalogram in diagnosis. (D. Williams) 60-62  
 Some pointers in the diagnosis of the difficult abdomen. (W. Houston) 63-66

## 221 : 26/1/49

- Aetiology and modern treatment of influenza. (C. H. Stuart-Harris) 75-78  
 Carcinoma of the pancreatic head and ampulla of Vater. (R. Smith) 78-82  
 Anaesthesia for short operations on children. (H. L. Thornton) 83-88  
 The aetiology of sterility. (M. M. White) 88-91

## 221 : 2/2/49

- The treatment of angina of effort. (D. Robertson) 102-107  
 Cardiac invalidism. (B. Parsons-Smith) 108-112  
 Advantages and limitations of the electrocardiograph in general practice. (S. Oram) 113-116  
 Rheumatic carditis in children. (C. E. Thornton) 117-121  
 Congenital heart disease. (E. Graham-Elwell) 122-127  
 Modern views of hypertension. (R. Hartley) 127-130  
 Modern trends in the treatment of heart disease. (J. H. Wright) 131-133  
 Surgical aspects of thrombosis. (R. S. Murley) 134-140  
 Surgery of the heart. (W. P. Clelland) 140-146

## 221 : 9/2/49

- Modern trends in the treatment of prostatic enlargement. (J. G. Y. Bell) 157-160  
 The management of the patient with an artificial pneumothorax. (J. E. Stokes) 161-164  
 Psychiatry in a general hospital. (J. F. Wilde) 165-169  
 The new anticonvulsant mesantoin and the blood picture. (H. Pullar-Strecker) 170

## 221 : 16/2/49

- Modern treatment of sinusitis. (G. Young) 177-179  
 What is marriage guidance? (D. R. Mace) 180-182  
 The diagnosis of ectopic gestation. (V. H. Barnett) 182-187  
 Dying of cancer. (N. A. Sprott) 187-191

## 221 : 23/2/49

- Keratitis and corneal ulcers and their treatment in general practice. (T. H. Whittington) 199-202  
 Physical factors in mental disorders. (I. Atkin) 202-205  
 T bronchial carcinoma. (M. Telling) 205-211  
 T against colds: a new approach to the solution.

## 221 : 2/3/49

- Some recollections of Iraq, 1918-1946. (H. C. Sinderson) 221-224  
 Heart disease in general practice. (A. Wingfield) 225-228  
 Pre- and post-operative care of the patient with a peptic ulcer. (W. Houston) 229-232  
 Whither tuberculosis? (S. G. Tippet) 233-234

## 221 : 9/3/49

- Brachial neuritis. (T. T. Stamm) 243-245  
 Penetrating injuries of the eye. (T. M. Tyrrell) 245-248  
 "Cans and can'ts" in psychotherapy. (W. L. Neustatter) 248-251  
 Non-specific urethritis—a modern treatment? (R. R. Willcox) 251-254

## 221 : 16/3/49

- The modern treatment of iridocyclitis. (A. H. Briggs) 265-267  
 The past and future of physical medicine. (R. S. Woods & A. H. A. Gem) 267-271  
 Some common psychiatric sequelae of head injury. (E. W. Anderson) 272-275  
 Tumours of the bladder. (H. K. Vernon) 275-278

## 221 : 23/3/49

- The place and scope of the health centre in the health services of the future. (R. H. Parry) 287-291  
 Functional pain. (H. Wilson) 291-294  
 The abdominal emergencies and use of the direct radiograph. (J. E. Bannen) 294-300  
 Ectopic gestation: ruptured right tubal pregnancy: unusual features. (C. A. H. Franklyn) 301-302

## 221 : 30/3/49

- The modern treatment of subacute bacterial endocarditis. (S. Almond) 309-312  
 Diseases of the sacro-iliac joint. (G. O. Tippet) 312-315  
 Sympathetic ophthalmitis. (C. Yow) 316-319  
 Obsessional neurosis. (H. Weber) 319-322

## 221 : 6/4/49

- Modern trends in the treatment of obesity. (C. N. Armstrong) 331-335  
 Peptic ulcer: partial gastrectomy and an alternative. (A. W. Adams) 335-340  
 "What is the value of routine medical examinations of school children?" (G. Barber) 340-343  
 Synthetic detergents. (J. Lawrie) 343-345

## 221 : 13/4/49

- The modern treatment of corneal ulcers. (T. R. Aynsley) 353-357  
 Epidermophytosis. (D. Erskine) 357-361  
 Uterine fibroids. (F. C. Alton) 361-364  
 The C.N.S. is a living electrical system. (K. Hazell) 364-366

## 221 : 20/4/49

- Congenital clubfoot. (F. G. Allan) 375-378  
 Pulmonary tuberculosis—a survey of treatment. (A. J. P. Alexander) 378-382  
 Aural vertigo. (G. E. Archer) 382-386  
 Contact lenses. (M. Sarwar) 386-388

## 221 : 27/4/49

- Common skin affections in childhood. (J. T. Ingram) 397-400  
 Common forms of gastro-enteritis in infancy. (M. J. Wilmers) 401-404  
 Pneumonia in infancy and childhood. (R. H. Dobbs) 405-411  
 Speech defects and deafness in childhood. (M. D. Sheridan) 411-414  
 Pertussis and measles. (J. C. McEntee) 415-418  
 Tuberculosis in childhood. (W. E. Snell) 418-421

## Monthly Bulletin of the Ministry of Health and the Public Health Laboratory Service

## 7 : April 1948

- Encephalomyelitis after vaccination. (E. T. Conybeare) 72-79  
 Survey of sickness prevalence, September quarter, 1947. 79-83  
 Notification of infectious disease in England and Wales, February, 1948. 83

## 7 : May 1948

- Smallpox in 1947. (L. H. Murray & W. H. Bradley) 96-103  
 The 1946-1947 measles epidemic. (W. Butler) 103-109  
 Para-aminosalicylic acid. (H. Davis) 109-112  
 Notification of infectious disease in England and Wales, March, 1948. 113  
 Technique of the complement-fixation test in influenza. (L. Hoyle) 114-116  
 A new *Salmonella* type—*Salmonella manchester*. (J. Taylor & H. Douglas) 117-118

## 7 : June 1948

- Evolution of disease, with particular reference to variations in age-incidence and mortality. (C. O. Stallybrass) 120-127  
 Poliomyelitis in England and Wales in 1947. (A. H. Gale) 127-132  
 An outbreak of staphylococcal food poisoning. (K. J. Grant & J. McMurray) 133-135  
 Notification of infectious disease in England and Wales, April, 1948. 135  
 A food-poisoning outbreak apparently caused by *a*-haemolytic streptococci. (B. Moore) 136-145

## 7 : July 1948

- The social medicine of old age. (J. M. Mackintosh) 148-150  
 Poliomyelitis and tonsillectomy. (J. A. Glover) 150-153  
 The nutritional state during the war and after. VI. (E. W. Adcock, H. E. Magee, E. H. M. Milligan & H. S. Townsend) 153-155  
 Notification of infectious disease in England and Wales, May, 1948. 155  
 A comparison of the results obtained with pernasal and postnasal swabs in the diagnosis of pertussis. (W. C. Cockburn & H. D. Holt) 156-158  
 A new type of *Salmonella* isolated from shell-fish: *Salmonella brancaster*. (A. MacDonald, C. W. Sivell, W. R. Emms & S. H. Douglas) 158-159

## 7 : August 1948

- The history of a group of *Anopheles maculipennis* Var. *Atryparvus* (3,600 in number) infected with *P. vivax* malaria. (P. G. Shute) 162-165  
 Haemoglobin levels in expectant mothers attending ante-natal clinics. (E. W. Adcock, H. E. Magee & E. H. M. Milligan) 165-169  
 Survey of sickness prevalence: December quarter, 1947. 169-173  
 Immunisation of travellers. (L. H. Murray) 173-177  
 Notification of infectious disease in England and Wales, June, 1948. 177  
 An outbreak of staphylococcal food poisoning probably due to tinned sausage. (A. A. Miller) 178-180  
 A risk associated with "xylol vapour" immersion oil containers. (D. B. Cruickshank) 180-181

## 7 : September 1948

- Post Office Medical Services and morbidity statistics. (C. Roberts) 184-201  
 Notification of infectious disease in England and Wales, July, 1948. 201  
 An outbreak of food poisoning due to *Salmonella dublin* conveyed by sausages and sausage meat. (A. C. Jones & A. D. Symons) 202-206  
 A severe case of gastro-enteritis caused by *Salmonella thompson* (J. A. Shrigley) 207-208

## 7 : October 1948

- The Rh factor and the public health. (A. E. Mourant) 210-213  
 Survey of sickness prevalence: March quarter, 1948. (P. Stocks) 213-219  
 Notification of infectious disease in England and Wales, August 1948. 219

## 7 : November 1948

- The recent trend of diphtheria in England and Wales. (W. J. Martin) 232-236  
 An alternative method of computing serial fatality rates. (W. P. D. Logan) 236-240  
 Notification of infectious disease in England and Wales, September, 1948. 240  
 The detection of paratyphoid carriers in towns by means of sewage examination. (B. Moore) 241-248  
 Selective media for *Pseudomonas pyocyanea*. (A. M. Hood) 248-251

## 7 : December 1948

- Measles 1946-47. (I. Taylor) 254-259  
 Notification of infectious disease in England and Wales, October, 1948. 260  
 Staphylococcal food poisoning from infected lambs' tongues. (B. C. Hobbs & M. E. M. Thomas) 261-266  
 A new *Salmonella* type (*Salm. taboradi*) isolated from a python. (R. E. Rewell, J. Taylor & S. H. Douglas) 266-267

## 8 : January 1949

- A review of indigenous malaria in Great Britain after the war of 1939-1945 compared with the corresponding period after the 1914-1918 war. (With some observations of the aetiology.) (P. G. Shute) 2-9  
 Survey of sickness prevalence: June quarter 1948. 9-13  
 Notification of infectious disease in England and Wales, November, 1948. 14  
 A selective medium for the isolation of *Staph. aureus* from heavily contaminated material. (G. B. Ludlam) 15-20  
 Streptococcal and staphylococcal skin lesions following chicken-pox. (R. Knox) 20-22  
 A difficulty experienced in the bacteriological diagnosis of paratyphoid fever in cases treated with sulphonamides. (L. Hoyle) 22-23

## 8 : February 1949

- The incidence of head lice in 1947 compared with 1933-40. (E. C. G. Maddock) 26-31  
 Comparison of the rates of sick absence of Metropolitan policemen before and after the war. (E. R. Bransby) 31-36  
 Inoculation and vaccination of travellers. 36-37  
 Notification of infectious disease in England and Wales, December, 1948. 37  
 A widespread outbreak of staphylococcal food poisoning. (V. D. Allison, B. C. Hobbs & P. H. Martin) 38-47

## 8 : March 1949

- The National Formulary, 1949. (H. Davis) 50-52  
 The public dental services in Norway. (E. M. Knowles) 52-59  
 Nutritional state during the war and after: VII. (E. W. Adcock, W. T. C. Berry, P. J. Cowin & E. H. N. Milligan) 59-60  
 Notification of infectious disease in England and Wales, January, 1949. 60

## 8 : April 1949

- Treatment of flour by the agency process. (H. E. Magge) 72-74  
 Ice-cream (heat treatment etc.) regulations, 1947. (J. Cauchil) 75-77  
 Survey of sickness prevalence: September quarter, 1948. 77-82  
 Notification of infectious disease in England and Wales, February, 1949. 83  
 An outbreak of food poisoning due to *Salmonella typhi-murium*. (J. A. P. Evans & B. Suggitt) 84-88

## Nutrition Abstracts and Reviews \*

## 17 : April 1948

- Methods of estimating plasma and total red cell volume. (E. B. Reeve) 811-834

## 18 : July 1948

- The nutritive value of silage and dried grass. (S. J. Watson) 1-14

## 18 : October 1948

- The mineral requirements and metabolism of poultry. Calcium and phosphorus. Part I. (C. Tyler) 261-274

## 18 : January 1949

- The mineral requirements and metabolism of poultry. Calcium and phosphorus. Part II. (C. Tyler) 473-483

## Overseas Post Graduate Medical Journal

## 3 : April 1949

- Thyrotoxicosis. (C. Robertson) 265-272  
 Intracranial tumours. A clinical review. (C. Worster-Drought) 273-282  
 Diagnosis of infective hepatitis and its sequelae. (G. A. Elliott) 283-292  
 Treatment of uraemia with special reference to acute renal failure. (A. M. Joekes) 293-302  
 Drainage of the bladder with special reference to urethrostomy. (J. Sandrey) 303-309  
 The ischaemic limb. (P. Martin) 309-314  
 The complications of osteitis deformans. (B. Lennox) 315-325  
 The phantom limb. (J. D. Craig) 327-332  
 Malnutritional amblyopia. (T. K. Lyle) 333-339  
 Cryotherapy for rosacea. (E. L. Cohen) 340-343  
 A new approach to acute otitis in infancy. (H. Lewenfish) 344-346

## Parasitology

## 39 : July 1948

- The 'head' and 'body' races of *Pediculus humanus* L. (J. R. Busvine) 1-16  
 The ecology of immature phases of trichostrongyle nematodes. I. The vertical distribution of infective larvae of *Trichostrongylus retortaeformis* in relation to their habitat. (H. D. Crofton) 17-25  
 The ecology of immature phases of trichostrongyle nematodes. II. The effect of climatic factors on the availability of the infective larvae of *Trichostrongylus retortaeformis* to the host. (H. D. Crofton) 26-38  
 Some new piliculous mites from South African mammals. (R. F. Lawrence) 39-42  
 The respiratory horns of *Psychoda* pupae (Diptera: Psychodidae). (G. H. Satchell) 43-52  
 On the egg of the tick, *Ixodes ricinus* L. (D. R. Arthur) 53-60  
 The distribution and dynamics of ked populations, *Melophagus ovinus* Linn. (J. Macleod) 61-63

\* Journals marked with an asterisk in this Guide consist mainly of abstracts and are listed only when they include original articles.—Ed.]

- An essentially synthetic liquid medium for *Entamoeba histolytica*. (E. L. Hansen & H. H. Anderson) 69-72  
 On the genus *Dinobothrium* van Beneden (Cestoda), with a description of two new species from sharks, and a note on *Monorygia* sp. from the electric ray. (N. G. Sproston) 73-90  
 Cultivation of *Trypanosoma cruzi* in tissue cultures: a four-year study. (H. Meyer & M. X. de Oliveira) 91-94  
 A note of the genus *Hyalomma* Koch in Palestine. (S. Adler & B. Feldman-Muehsam) 95-101  
 The technique for breeding pure-line cultures of the blow-fly (*Calliphora erythrocephala*). 102-104  
 The respiratory metabolism of parasitic nematodes. (W. P. Rogers) 105-109  
 Some new myxosporidia from Plymouth with a proposed new classification of the order. (Y. R. Tripathi) 110-118  
 Experiments with mice and fleas. I. The baby mouse. (P. A. Borton) 119-124  
 Drug-resistance in *Plasmodium gallinaceum*, and the persistence of paludine-resistance after mosquito transmission. (A. Bishop & B. Birkett) 125-137  
 On larvae and nymphs of some species of Palestinian *Hyalomma*. (B. Feldman-Muehsam) 138-147  
 The water relations of the larva of *Xenopsylla cheopis* (Siphonaptera). (M. Sharif) 148-155

## Practitioner

## 161 : September 1948

- The problem of rheumatism. (A. H. Douthwaite) 153-157  
 The present status of gold therapy in rheumatoid arthritis. (G. D. Kerley) 158-162  
 The surgical treatment of rheumatoid arthritis. (W. A. Law) 163-169  
 Some industrial aspects of rheumatism. (T. Ferguson) 170-175  
 Heberden's nodes. The importance of osteoarthritis of the fingers to the practising physician. (R. M. Stecher) 176-179  
 Laboratory aids in the diagnosis of rheumatism. (D. H. Collins) 180-185  
 A critical survey of the present position in the treatment of the more common specific fevers. (J. L. Fluker) 186-198  
 Pharyngeal abscesses in young children. (F. B. Korkis) 199-202  
 The rôle of bismuth orychloride in the treatment of syphilis. (R. R. Willcox) 203-204  
 African medicine. (W. A. R. Thomson) 205-210  
 Current therapeutics. IX. Oestrogens. (P. M. F. Bishop) 211-218  
 Revision corner: The choice of sulphonamides. (F. Hawking) 219-221. The treatment of headache. (A. G. W. Whitfield) 221-223

## 161 : October 1948

- Advances in medicine. (H. Cohen) 233-246  
 Advances in surgery. (I. Aird) 247-255  
 Advances in obstetrics and gynaecology. (J. Wyatt) 256-260  
 Advances in paediatrics. (A. V. Neale) 261-273  
 Advances in cardiology. (C. Bramwell) 274-279  
 Advances in the treatment of nervous diseases. (M. Critchley) 280-283  
 Advances in the treatment of diseases of the liver. (J. W. McNee) 284-290  
 Advances in dermatology. (F. F. Hellier) 291-297  
 Advances in endocrinology. (A. C. Crooke) 298-304  
 Advances in the treatment of allergy. (D. Harley) 305-310  
 Advances in otology. (G. Bateman) 311-316  
 Advances in ophthalmology. (I. Mann) 317-320  
 Advances in the treatment of oral and dental diseases. (M. A. Rushton) 321-324  
 Advances in tropical medicine. A report on the Fourth International Congress on Tropical Medicine and Malaria. (B. Macgregor) 325-332  
 Current therapeutics. X. The clinical use of gamma globulin. (C. A. Janeway) 333-338  
 Revision corner: The treatment of coryza. (E. D. D. Davis) 339-340. Conjunctivitis. (A. G. Cross) 341. Stammering. (A. S. Paterson) 341-343

## 161 : November 1948

- Intravenous anaesthesia. (W. W. Mushin) 353-360  
 The newer inhalational anaesthetics. (C. S. Hellilias & R. M. Tovell) 361-371  
 Anaesthesia in minor surgery. (T. M. Millar) 372-378  
 Pre-anaesthetic medication. (W. D. Wylie) 379-384  
 Analgesia and anaesthesia in obstetrics. (G. C. Steel) 385-389  
 The choice of anaesthetic in elderly patients. (E. H. Rink) 390-395  
 Facial injuries in road accidents. (P. Clarksoo) 396-405  
 Drugs in country practice. (W. N. Leak) 406-408  
 Pruritus in industry. (A. V. Magge) 409-410  
 Tobias and the doctors. (W. K. Connell) 411-416  
 Current therapeutics. XI. The modern treatment of epilepsy. (A. J. M. Butter) 417-422  
 Revision corner: The use and abuse of aspirin. (K. O. Rawlings) 423-425. The anaesthetist's bag. (F. Evans) 425-427

## 161 : December 1948

- The treatment of acute infections of the respiratory tract. (N. L. Rusby) 437-443  
 The care of the elderly bronchitic patient. (H. Goadby) 446-448  
 Cough mixtures. (R. B. Hunter) 449-453  
 The child's diet in winter. (S. Graham) 454-460  
 Care of the skin in winter. (R. M. Bolam) 461-464  
 Chilblains and their treatment. (G. B. Dowling) 465-468  
 The management of deafness. (M. R. Dix & M. S. Harrison) 469-478  
 Arterial transfusion. (I. H. Page) 479-482  
 The treatment of undescended testicles. (S. L. Simpson) 483-486  
 An instructive case of dermatitis artefacta. (C. Poniedel) 487-489  
 Current therapeutics. XII. The newer barbiturates. (J. W. Chambers & S. Alstead) 490-502  
 Idiopathic steatorrhea. (D. A. K. Black) 503-504  
 Nocturnal enuresis. (M. MacGregor) 504-508

## 162 : January 1949

- The etiology of peptic ulcer. (W. I. Card) 3-9  
 The medical treatment of peptic ulcer. (D. T. Davies) 10-18  
 Diet in peptic ulcer. (E. Meulengracht) 19-24  
 The surgical treatment of peptic ulcer. (A. H. Visick) 25-32

- Vagotomy in the treatment of peptic ulcer. (W. Walters) 33-35  
 Radiology in the diagnosis of peptic ulcer. (G. R. M. Cordiner) 36-43  
 Environmental factors in the etiology of peptic ulcer. (R. Doll & F. A. Jones) 44-50  
 Instructions for the patient with dyspepsia. (C. M. Fletcher) 51-60  
 The dietetic treatment of obesity. (I. A. Anderson) 61-66  
 Current therapeutics. XIII. Antibiotics. (H. Florey) 67-75  
 Revision corner: Hoarseness. (N. G. Hulbert) 76-78. The differential diagnosis of glycosuria. (H. Whittaker) 78-80

## 162 : February 1949

- The treatment of angina pectoris: with special reference to drug therapy. (P. T. O'Farrell) 89-95  
 Cardiac oedema: causation and treatment. (C. J. Gavey) 96-100  
 Digitalis and its derivatives. (T. N. Morgan) 101-109  
 The use and abuse of the electrocardiograph. (W. Evans) 110-114  
 Traumatic lesions of the heart and great vessels. (P. H. Wood) 115-121  
 The surgery of the heart. (R. C. Brock) 122-126  
 The riddle of rheumatoid arthritis. (R. M. Stecher) 127-131  
 The time factor in the treatment of congenital abnormalities. (D. Browne) 132-138  
 Endocrine disorders and the mind. (V. C. Medvei) 139-147  
 The treatment of hay fever. (N. Southwell) 148-151  
 Current therapeutics. XIV. The use of synthetic plastic materials in surgery. (F. D. Ingham, F. A. Jones & D. D. Matson) 152-159  
 Revision corner: The use of vasoconstrictors in the nose. (W. A. Mill) 160-161. The significance of haematuria. (C. S. D. Don) 162-163

## 162 : March 1949

- The modern concept of cirrhosis of the liver. (L. J. Davis) 173-181  
 The treatment of hepatitis and cirrhosis. (R. E. Tunbridge) 182-187  
 Surgery of the pancreas. (R. B. Cattell & K. W. Warren) 188-199  
 Tests of liver and pancreatic function. (N. F. MacLagan) 200-210  
 Portal hypertension. (R. M. Walker) 211-216  
 Cholecystography. (R. K. Harper) 217-223  
 Pre-frontal leucotomy. A short account of a surgical surprise. (M. Partridge) 224-231  
 The results of vagotomy: follow-up of 29 patients. (W. Walters) 232-234  
 Current therapeutics. XV. The vitamin B complex. (H. M. Sinclair) 235-246  
 Revision Corner: The treatment of barbiturate poisoning. (W. G. Sears) 247-249.  
 The treatment of eclampsia. (A. W. Purdie) 249-251

## 162 : April 1949

- The problem of adolescence. (F. Ogilvie) 261-262  
 The adolescent boy. (W. Moodie) 263-268  
 The adolescent girl. (W. Rushforth) 269-274  
 The "delicate" adolescent. (T. A. A. Hunter) 275-279  
 The endocrines in adolescence. (J. S. Richardson) 280-286  
 The adolescent at work. (R. E. Lane & R. F. L. Logan) 287-298  
 The adolescent delinquent boy. (B. L. Q. Henriques) 299-304  
 Meatal disorders in adolescence. (H. Wilson) 305-312  
 Intracranial aneurysms. A general survey. (W. B. Hamby) 313-320  
 The National Formulary, 1949. (W. A. R. Thomson) 321-326  
 Current therapeutics. XVI. Antimalarial drugs. (B. G. Macgrath) 327-335  
 Revision corner: Diaphoretics. (K. D. Wilkinson) 336-337. Hammer-toe. (W. D. Coltart) 338-339. Asphyxia neonatorum. (W. A. B. Campbell) 339-340

Proceedings of the Nutrition Society<sup>1</sup>

## 5 : 1947

- 35th Scientific Meeting: European Conference of the Nutrition Society.  
 Activities in nutrition of the Ministry of Health in England during the war. (H. E. Magee) 211-213  
 Investigations of human nutrition in the United Kingdom during the war. (J. R. Marrack) 213-241  
 Research work in animal nutrition in Great Britain during 1939-46. (D. P. Cuthbertson) 241-255  
 Nutritional investigations in Denmark during the war, 1939-45. (L. S. Fridricia) 255-259  
 Conditions and research into human nutrition in Finland during the war years. (J. Tikka) 260-263  
 Food conditions in Norway during the war, 1939-45. (O. G. Hansen) 263-270  
 Nutrition and nutritional research in Sweden in the years of war, 1939-45. (E. Abramson) 271-276  
 Nutrition in Poland under the German occupation. (A. Szczygiel) 276-280  
 Malnutrition in Java during the Japanese occupation. (A. G. van Veen) 280-282  
 Recent nutritional research in the United States. (C. G. Kiog) 282-289  
 Nutrition problems and research in Belgium during and since the war. (E. J. Bigwood) 290-294  
 Observations on nutrition in France from 1940 to 1945. (J. Trémolières) 294-304  
 Nutritional research in Holland during the war. (B. C. P. Jansen) 305-311  
 Switzerland's contribution to war-time food research. (F. Verzar) 311-316  
 A survey of vitamin research in Switzerland during the war, 1939-45. (V. Demole) 317-322  
 Danish experiments on the nutrition of domestic animals during the years of war. (V. Steensberg) 322-326  
 Animal nutrition during the war years in Finland. (U. Vartiomaara) 326-330  
 Experiences and research work in animal nutrition in Norway during the war, 1939-45. (K. Breirem) 330-338  
 A survey of Swedish research work in animal nutrition, 1940-45. (F. Jarf) 339-345  
 The effects of malnutrition on domestic animals during the German occupation of Belgium. (L. M. G. Geurden) 345-347

<sup>1</sup>[The Proceedings of the Nutrition Society has, since the completion of vol 5, been merged in the British Journal of Nutrition—Ed.]

- Research work on animal nutrition in France during the years, 1940-45. (H. Simmonet & R. Jacquot) 347-350  
 Nutritional conditions and research in animal nutrition during the years, 1939-45, in the Netherlands. (E. Brouwer) 350-355  
 Problems of food supply and food utilization in Switzerland. (A. Schürch) 355-358  
 Some aspects of work on animal nutrition in Poland during the war. (E. Pijanowski) 358-361  
 Recent research in animal nutrition in the United States. (F. B. Morrison) 361-368

## Proceedings of the Royal Society, B

## 135 : October 1948

- The Wellcome Research Institution. (C. H. Kellaway) 259-270  
 Antiplasmodial action and chemical constitution. IX. Carbinolamines derived from 6:7-dimethylquinolone. (H. King & J. Wright) 271-292  
 Fertilization, including chemotactic phenomena in the Fucaceae. (A. H. Cook, J. A. Elvidge & I. Heilbron) 293-301  
 Adjustments in bacterial reaction systems. I. The reducing power of *Bact. lactis aerogenes* under various conditions. (P. R. Lewis & C. N. Hinshelwood) 301-316  
 Adjustments in bacterial reaction systems. II. Adaptive mechanisms. (C. N. Hinshelwood & P. R. Lewis) 316-322  
 The thickness of the myelin sheaths of normal and regenerating peripheral nerve fibres. (F. K. Sanders) 323-357  
 The histophysiology of the alimentary canal of the earthworm *Lumbricus terrestris* Linnaeus. I. The process of extrusion from the intestinal glands, and other features of the intestinal epithelium. (N. Millott) 358-381  
 The buoyancy of plankton diatoms: a problem of cell physiology. (F. Gross & E. Zeuthen) 382-389  
 The passage of antibodies from the maternal circulation into the embryo in rabbits. (F. W. R. Brambell, W. A. Hemmings & W. T. Rowlands) 390-403

## 135 : December 1948

- The Lister Institute of Preventive Medicine. (A. N. Drury) 405-418  
 The Royal Botanic Gardens, Kew. (E. Salisbury) 419-429  
 The insect as a medium for the study of physiology. (V. B. Wigglesworth) 430-446  
 On the time required for diffusion and its relation to processes in muscle. (A. V. Hill) 446-453  
 The changes induced in *Bact. lactis aerogenes* by irradiation with ultra-violet light. (A. R. Peacocke & C. N. Hinshelwood) 454-461  
 Hearing. I. The cochlea as a frequency analyzer. (T. Gold & R. J. Pumphrey) 462-491  
 Hearing. II. The physical basis of the action of the cochlea. (T. Gold) 492-498  
 Studies on the genetic and antigenic basis of tumour transplantation. Links between a and 'fused' in mice. (P. A. Gorer, S. Lyman & J. H. D. Brown) 499-506  
 The electrical properties of the muscle fibre membrane. (B. Katz) 506-534

## Proceedings of the Royal Society of Medicine

## 41 : July 1948

- Discussion on advances in the treatment of uraemia. 409-412  
 Transperitoneal dialysis. (R. W. Reid) 413-418  
 Dialysis of blood for the treatment of uraemia. [Précis] (E. M. Darmady) 418-419  
 The artificial kidney: its clinical application in the treatment of traumatic anuria. (E. G. L. Bywaters & A. M. Jockes) 420-426  
 Discussion on staphylococcal infections. 427-430  
 Discussion on chronic diseases of the pericardium. 431-442  
 Discussion on malignant disease of the pharynx, excluding the nasopharynx. 443-448  
 Acute infantile hemiplegia. (W. G. Wyllie) 459-466  
 Thiersch's operation for anal incontinence. (W. B. Gabriel) 467-468  
 Recto-epididymal fistulae: complete prolapse of rectum. (M. J. Smyth) 468-469  
 . . . . . in associated with idiopathic ulcerative colitis. (R. W. Raven) 469-474  
 Anorectal gonorrhoea. (A. H. Harkness) 476-478  
 Anaesthesia in babies and children. (R. W. Cope) 479-484

## 41 : August 1948

- Unilateral bony swelling of the maxilla. (R. W. Scarff & D. G. Walker) 485-489  
 A dental abnormality of size and rate. (M. A. Rushton) 490-496  
 Smallpox 1947. [Abridged] (W. H. Bradley) 497-500  
 Clinical epidemiology. (W. S. C. Copeman) 502-508  
 Discussion on rupture of the intervertebral disc in the cervical region. 509-516  
 Observations upon . . . . . phenomenon, with especial reference to the differential . . . . . of the internal ear and VIII nerve. (M. R. Dix, C. S. . . . .) 516-526  
 Experimental investigations in the endocrinology of schizophrenia. (R. E. Hemphill & M. Reiss) 533-540  
 . . . . . (M. Sinclair) 541-544  
 . . . . . (M. Hynes) 545-550  
 . . . . . ology of trypanosomiasis in man and animals. 551-558 (T. C. Gray) 559-568

## 41 : September 1948

- The technique and application of electronarcosis. (A. S. Paterson & W. L. Milligan) 575-586  
 Infra-orbital neuralgia. (G. C. Knight) 587-592  
 The present position of myanesis in anaesthesia. Clinical aspects. (F. B. Mallinson) 593-606  
 Amyloid disease and rheumatoid arthritis. [Abridged] (L. C. Hill) 607-608  
 Effect of blood transfusion on rheumatoid arthritis. (N. R. W. Simpson & D. H. Brooks) 609-615  
 Indications for joint manipulation. (J. Bastow) 615-616  
 Lempert fenestra nov-ovalis for the restoration of practical unaided hearing in clinical otosclerosis: its present status. (J. Lempert) 617-630  
 Discussion on primary treatment of varicose veins. 631-639  
 Discussion on vagal resection for peptic ulcer. 639-652

## 41 : October 1948

- The hypothalamus and water metabolism. (G. W. Harris) 661-666  
 The hypothalamus and urine secretion. (W. J. O'Connor) 666-670  
 Discussion on streptomycin. 671-674  
 Experimental investigation into factors concerning the growth of the jaws. (P. A. Toller) 681-688  
 The million-volt X-ray plant—its development and application. (G. S. Innes) 691-703  
 Clinical reactions and injuries in supravoltage therapy. (A. Jones) 703-709  
 Million-volt X-ray therapy. (I. G. Williams) 709-718  
 Million-volt X-ray research at St. Bartholomew's Hospital. (N. S. Finzi) 719-720  
 Discussion on the effect of sympathectomy on hypertensive retinal changes. 728-734

## 41 : November 1948

- Discussion on generalized diseases of bone in the adult. 735-744  
 Anterior synechiae following perforating injuries. (P. M. Moffatt) 745-750  
 Modern conceptions concerning the compulsory isolation of lepers. Contagious malignant Morbus Hansen versus non-contagious benign Hansenide. (R. D. G. P. Simons) 751-754  
 The management and treatment of psychopaths in a special institution in Denmark. (G. K. Stürup) 765-768  
 Discussion on cerebral vascular disease in the young. [Summary] 769-771  
 Discussion on intracranial hypotension. [Abstract] 771-776  
 Urethrostomy drainage of the bladder? (J. G. Sandrey) 777-780  
 Pharmacology and biochemical lesions. (R. A. Peters) 781-792  
 Recent progress in nasal physiology. (A. W. Proetz) 793-798  
 The nasal mucous membrane in relation to the lymph stream and cerebrospinal fluid. (J. M. Yoffey) 798-803  
 Ménière's disease. (A. J. Wright) 801-805  
 Purulent pachymeningitis. (H. Cairns & F. Schiller) 805-812

## 41 : December 1948

- Discussion on radical excision of carcinoma of the rectum with conservation of the sphincters. 813-827  
 Discussion on the surgery of urethral stricture. 837-844  
 Variations of the teeth of the green monkey of St. Kitts. (F. Colyer) 845-848  
 Tomography in surgical tuberculosis. (V. Snell) 853-856  
 Tomography of bones and joints. (F. G. Wood) 856-857  
 The late results of tuberculosis of the spine in children, with special reference to spinal grafting. (D. M. Dunn) 858-860  
 Sudden death in infancy (a preliminary communication). (L. L. R. White) 866-868  
 Charles Creighton, M.A., M.D. (1847-1927): scholar, historian and epidemiologist. (E. A. Underwood) 869-876  
 The evolution of the auditory conducting apparatus. A new synthesis based on functional considerations. (A. Tumarkin) 877-888

## 42 : January 1949

- Discussion on emergency obstetrical service (the Flying Squad)—its use and abuse. 1-10  
 Host and tissue specificity in infective disease. (W. Smith) 11-18  
 The morbid anatomist and cancer research. (R. W. Scarff) 19-24  
 The present diagnosis and therapy of cystic fibrosis of the pancreas. (D. H. Andersen) 25-32  
 Orthodontic diagnosis. (S. Friel) 33-36  
 The ureter, the gynaecologist and the urologist. (T. Millin) 37-46  
 Discussion on poliomyelitis—England and Wales. 47-54  
 The otologist and rehabilitation of the deaf. (R. S. Stevenson) 55-58

## 42 : February 1949

- The last ten years—some experiences and reflections. [Abridged] (E. C. Tamplin) 71-76  
 Recent impressions of anaesthesia in the United States of America and in Canada. (R. Jarman) 99-102  
 Sir William Knighton, Bart. 1776-1836. (H. Williams) 107-114

## 42 : March 1949

- Anaesthesia for thyroid surgery. (S. Rowbotham) 115-122  
 Therapeutic and diagnostic applications of anaesthesia. (R. Woolmer) 122-134  
 Discussion: colour vision in industry. 145-150  
 Dental sepsis and chronic rheumatism. (G. D. Kersley) 151-153  
 Fibrositis in the muscles of mastication (with reference to the Masseter muscle). (J. W. E. Snawdon) 153-154  
 A review of the treatment of tuberculous meningitis with streptomycin. (H. Cairns & M. Taylor) 155-168  
 Gross morbid anatomy of the central nervous system of cases of tuberculous meningitis treated with streptomycin. (P. M. Daniel) 169-174  
 Team surgery in cancer. (H. Gillies) 176-183

## Public Health

## 61 : July 1948

- The handicapped child as a social and educational problem. (J. D. Kershaw) 186-187  
 Some common skin affections in the school child. (B. Russell) 187-190  
 Child guidance. (W. L. Neustatter) 191-193  
 The quest for standards of physical proportion and performance in school children. (J. E. Cheesman) 193-195

## 61 : August 1948

- Our medical officers of health. A study of the medical officer of health of the larger towns in the 'seventies. (By students of the History Seminar at the London School of Hygiene and Tropical Medicine, 1947-48.) 210-213  
 The place of fever hospitals in the National Health Service. (E. H. R. Harries) 214-215  
 The medical officer of health and V.D. control. (F. R. Curtis) 216-218  
 The evolution of speech therapy and stammering. (E. J. Boome) 218-219  
 Speech disorders and relaxation. (H. Boome) 219-221  
 The adolescent in industry. (G. C. Pether) 221

## 61 : September 1948

- The widening scope of preventive medicine. (A. V. Neale) 235-238  
 A study of the epidemiological aspects of undulant fever in this country, based upon nearly 900 cases. (W. Dalrymple-Champneys) 239-243  
 Juvenile rheumatism and the school doctor. (C. E. Thornton) 243-245  
 The partially sighted child. (P. M. Moffatt) 245-246

## 62 : October 1948

- Further observations on the medico-social aspect of venereal diseases. (W. V. Macfarlane) 4-8  
 Vital statistics in public health. (W. T. Russell) 9-13

## 62 : November 1948

- The task ahead. (R. H. Parry) 27-28  
 Whooping cough vaccine, its preparation and use. (R. T. Mummery) 28-29

## 62 : December 1948

- Some aspects of the mental welfare of children and infants. (C. W. Anderson) 47-51  
 Report of the Boundary Commission: a critical examination. (A. Elliott) 51-54  
 Economics in nurse-owever. A statement by the Society of Medical Officers of Health for the Nursing Committee of the British Medical Association. 54-55

## 62 : January 1949

- Social and preventive medicine in civil and military life. (A. T. Elder) 73-79  
 Organisation of a mass miniature radiography survey. (L. R. Benham) 79-80  
 A local investigation of enteric fever. (H. Tabbush) 81-82  
 Opportunities in school medicine. (G. H. Hoghen) 83-85

## 62 : February 1949

- The "progress" of public health administration. (N. E. Chadwick) 95-97  
 Observations on infantile diarrhoea and vomiting, its management and treatment. (M. B. Alexander) 97-99  
 Venereal disease case-finding—the American way. (R. R. Willcox) 99-101  
 The bacteriology of food poisoning. (A. B. Porteous) 101-105

## 62 : March 1949

- Can the M.O.H. help to prevent home accidents? (C. A. Boucher) 116-118  
 Breast-feeding and social circumstances. (R. M. Dykes) 118-120  
 Some public health problems of seaside resorts. (W. S. Parker) 120-121  
 Early ascertainment of and prevention of deformity from cerebral palsy. (J. Macnamara) 121-122

## 62 : April 1949

- Surveying the housewife. (D. C. Wilson) 139-142  
 Superchlorination of London water supplies. A report to the Metropolitan Water Board. 142-144  
 The need for a revision in the training of health visitors. (I. G. Davies & F. Brockington) 144-146  
 Mental health social work. A report to the London County Council. 148-150

## Quarterly Journal of Experimental Physiology

## 34 : 1948

- Pulmonary vasoconstriction in response to inhalation of CO<sub>2</sub> in the isolated perfused lungs of *Macacus rhesus*. (C. O. Hehh & R. H. Nimmo-Smith) 159-163  
 The effects of skin contamination with liquid mustard-gas on water balance in animals. (G. R. Cameron & F. C. Courtice) 165-180  
 A gas-analysis apparatus for 200 c.mm. samples. (M. N. J. Dirken & H. Heemstra) 181-192  
 Alveolar oxygen tension and lung circulation. (M. N. J. Dirken & H. Heemstra) 193-211  
 The adaptation of the lung circulation to the ventilation. (M. N. J. Dirken & H. Heemstra) 213-226  
 Agents acting on the lung circulation. (M. N. J. Dirken & H. Heemstra) 227-241  
 Spontaneous intracorporeal inactivation and reactivation of haemoglobin. (G. Fegler) 243-261  
 Intracorporeal methaemoglobin formation and its relation to the rate of oxygen release. (G. Fegler) 263-278  
 Some effects of an acute toxic substance formed by solution of methyl-bis (B-chloroethyl) amine in water after injection in animals. (G. L. Foss) 279-284  
 Pulmonary vasomotor fibres in the sympathetic chain and its associated ganglia in the dog. (I. de Burgh Daly, H. Duke, C. O. Hehh & J. Weatherall) 285-313

## Quarterly Journal of Medicine

## 17 : July 1948

- The kidney in periarthritis nodosa. (J. Davson, J. Ball & R. Platt) 175-202  
 The toxic effects of calciferol. (S. T. Anning, J. Dawson, D. E. Dolby & J. T. Ingram) 203-228  
 Factors influencing plasma concentrations of salicylate. (W. A. Parker) 229-246  
 Haemochromatosis. Observations on the incidence and on the value of liver biopsy in diagnosis. (W. E. King and E. Downie) 247-256

## 17 : October 1948

- Pulmonary eosinophilosis. (R. Viswanathan) 257-270  
 A review of antihistamine drugs. (R. B. Hunter & D. M. Dunlop) 271-290  
 The aetiology of constrictive pericarditis, with special reference to tuberculous pericarditis, together with a note on polyserositis. (G. W. S. Andrews, G. W. Pickering & T. H. Sellors) 291-321

## 18 : January 1949

- Honeycomb lungs. (N. Oswald & T. Parkinson) 1-20  
 Bronchoscopic studies in primary tuberculosis in childhood. (J. H. Hutchison) 21-49  
 The effect of smoking on water diuresis in man. (J. M. Walker) 51-55  
 On the nature and significance of stippling in lead poisoning, with reference to the effect of splenectomy. (A. J. S. McFadyrean & L. J. Davis) 57-72  
 Reduction in coronary flow by pituitary (posterior lobe) extract in relation to the action of nicotine and to smoking. (E. Bülbring, J. H. Burn & J. M. Walker) 73-80

Quarterly Journal of Pharmacy and Pharmacology<sup>2</sup>

## 21 : April-June 1948

- Local anaesthetics and ester-hydrolysing enzymes. Part I. The inhibitory action of certain local anaesthetics on liver esterase. (K. Bullock) 97-107  
 Local anaesthetics and ester-hydrolysing enzymes. Part II. The actions of certain local anaesthetics on pancreatic lipase. (K. Bullock) 107-120  
 The importance of optical configuration in biologically active substances. (W. H. Linnell & M. J. H. Smith) 121-126  
 The partition chromatography of alkaloids. Part I. Solanaceous alkaloids. (W. C. Evans & M. W. Partridge) 126-137  
 A note on *Datura ferox*. (M. E. Bolton) 137-140  
 Polymethylene diamines and their sulphaniyl derivatives. Part I. (W. H. Linnell & D. V. K. Raju) 140-146  
 The influence of the magnesium concentration in the Ringer's solution used for the assay of oxytocin in pituitary (posterior lobe) extract. (Y.-C. Hsu) 146-151  
 A micro method for the determination of thallium and its application in medico-legal cases. (L. Milad & H. A. El-Mangour) 151-154  
 The alkaloidal content and pharmacological action of aconite root in relation to altitude. (G. Dordi) 154-158  
 On the setting property of agar-agar. (D. Chakraborty) 159-161

## 21 : July-September 1948

- The importance of physical chemistry in pharmacy. (N. Evers) 201-210  
 The stability of ergometrine preparations. Chemical and biological studies. (G. E. Foster & G. A. Stewart) 211-218  
 The manufacture of dry extracts of cascara and krameria. (H. Deane & W. Mitchell) 218-225  
 The stability of adrenaline solutions. Part V. Further observations on the storage of solutions containing hydrochloric acid, tartaric acid and ascorbic acid. (G. B. West & T. D. Whittet) 225-228  
 A note on the stability of penicillin in lozenges. (N. H. Barnard & F. Hartley) 228-231  
 The sterilisation of sodium bicarbonate solutions. (I. Michaels) 231-239  
 An examination of the sources and the quantitative methods of testing pyrogen. (D. W. Wylic & J. P. Todd) 243-252  
 A biological evaluation of the purgative activity of senna extracts. (H. O. J. Collier, E. C. Fieller & S. K. Pars) 252-259  
 The effect of diet on the sensitivity of mice to insulin. (H. R. Rowlinson & J. M. Lesford) 259-266  
 Local anaesthetics and ester-hydrolysing enzymes. Part III. The inhibitory action of certain local anaesthetics on cholinesterase. (K. Bullock) 266-283  
 The pharmacology of the diethylamine salt of 3 : 5-diiodo-4-pyridone-N-acetic acid. (J. E. Page, G. F. Somers & M. E. Fielding) 283-291  
 Para-aminosalicylic acid. Part I. Analytical and pharmaceutical studies. (K. H. Oberweger, D. E. Seymour & D. Simmonite) 292-301  
 Para-aminosalicylic acid. Part II. The *in vitro* tuberculostatic behaviour of para-aminosalicylic acid and related compounds. (C. L. Goodacre, B. W. Muchall & D. E. Seymour) 301-305  
 The instability of picrotoxin in alkaline solution. (G. Bryan & P. B. Marshall) 305-312  
 The determination of olive tones in powdered vegetable products. (T. E. Wallis & D. K. Santra) 312-320  
 Some further observations on Indian santonica. (N. A. Qazilbash) 320-333  
 Indian valerian—its structural characters. (T. E. Wallis and P. K. Sanyal) 333-343  
 The spectroscopy of riboflavin. (C. Daglish, N. Baxter & F. Wokes) 344-355  
 Notes on microbiological analysis. (G. E. Shaw) 355-361  
 The vitamin B complex content of commercial liver extracts. (G. E. Shaw) 362-364  
 The effect of dimercaprol (B.A.L.) in acute iron poisoning. (N. D. Edge & G. F. Somers) 364-369  
 The chemical determination of aneurine in tablets and ampoule solutions. (D. C. M. Adamson & F. P. Handiside) 370-376  
 The determination of aromatic di-amidines in pharmaceutical preparations. Part I. The colorimetric determination of propamidine. (C. W. Ballard) 376-387  
 Some analytical characters of iodinated proteins and of dried thyroid. (R. K. Lewis & W. Smith) 387-390

## 21 : October-December 1948

- British Pharmaceutical Conference, Brighton, 1948:  
 Report of a symposium on modern methods of preservation of medicinal substances and pharmaceutical preparations. 451-469  
 The determination of alkaloid in solanaceous drugs and preparations. (F. Reimers) 470-475  
 Some observations on Indian ephedra. (N. A. Qazilbash) 475-487  
 The determination of amino-compounds occurring as impurities in pharmaceutical chemicals. Part I. Arsanilic acid in tryparsamide. (C. W. Ballard & E. J. Ballard) 487-498  
 The isolation and properties of ammoxidin, ammidin and majudin, and their effect in the treatment of leukoderma. (I. R. Fahmy & H. Abu-Shady) 499-503  
 The evaluation of the bactericidal activity of ethylene glycol and some of its monoalkylethers against *Bacterium coli*. Part V. (H. Berry & I. Michaels) 503-518

<sup>2</sup> [In January 1949 the *Quarterly Journal of Pharmacy and Pharmacology* was succeeded by the *Journal of Pharmacy and Pharmacology*.—Ed.]

## Rheumatism

## 4 : July 1948

- Chronic rheumatism. (A. Daley) 199-203  
 The problem of psychogenesis in non-articular rheumatism. (A. F. Kennedy) 204-210  
 The treatment of lumbar disc lesions by immobilization in a plaster jacket. (E. J. Crisp) 211-213  
 Treatment with bacterial filtrates. (L. J. Barford) 214-215

## 4 : October 1948

- The backache-sciatica syndrome and the intervertebral disc. (H. Platt) 218-223, 237  
 Sex-hormone implantation in the treatment of rheumatic conditions. (M.-P. Weil & R. M. Sichere) 224-228, 240  
 Rehabilitation in rheumatoid arthritis. (S. L. Osborne) 229-233  
 Use of intracaine in oil for the relief of pain involving the musculo-skeletal system. (P. Levey) 234-237  
 Sleep posture: costo-vertebral manipulations. (J. McDonnell) 239-240, 238

## 5 : January 1949

- Chronic rheumatism—public health aspects. (H. N. Bundesen) 3-6  
 The position of rest of the spine in the treatment of sciatica, malum coxae, frozen shoulder. (A. Farkas) 7-20  
 Treatment of arthritis. (O. Meyer) 21-24  
 Sulphonamide therapy in rheumatoid arthritis. (L. J. A. Parr & E. Sipton) 25-29

## 5 : April 1949

- Scheuermann's disease. (J. E. W. Brocher) 33-37  
 Interview therapy of . . . 37  
 X-ray treatment in . . . 47  
 Occupational therat . . .  
 The clinical response to vaccine in 125 cases of rheumatic disease. (K. Phillips) 53-57

## Thorax

## 3 : September 1948

- Pneumopericardium complicating pneumothorax therapy. (P. Ellman & K. K. Hussain) 129-139  
 The absorption of pneumoperitoneum: a study of 33 cases. (W. Fox) 141-147, 140  
 Arterio-venous aneurysm of the lung. (C. G. Barnes, L. Fatti & D. M. Pryce) 148-160  
 Posture in thoracic surgery. (A. I. P. Brown) 161-165  
 Extrapleural pneumothorax: a review of 128 cases. (A. T. M. Roberts) 166-173  
 Lung alveolar tumours: a report of two cases. (G. H. Jennings) 174-184

## 3 : December 1948

- A provocative talk on pulmonary tuberculosis. (H. M. Davies) 189-213  
 Pneumonia in North-West London, 1942-44. II. Pneumonias not attributable to specific bacterial infection. (R. E. Glover, J. H. Humphrey, H. Joules & E. D. Van Der Walt) 214-232  
 The control of haemorrhage in extrapleural pneumothorax. (K. S. Mullard) 233-236  
 The anaesthetic problems associated with giant tension cysts of the lung. (T. C. Gray & F. R. Edwards) 237-240  
 Pulmonary fibrosis in generalized scleroderma. Review of the literature and report of four further cases. (W. E. Lloyd & R. D. Tonkin) 241-246  
 Extrapleural pneumothorax. (M. Konstam) 247-248

## 4 : March 1949

- Subphrenic abscess. (H. R. S. Harley) 1-30  
 Pneumoconiosis due to graphite dust. (S. R. Gloyne, G. Marshall & C. Hoyle) 31-38  
 Cardiac myxoma. (S. J. R. Macoun) 39-43  
 The pulmonary complications of dysphagia. (J. R. Belcher) 44-56  
 Ciliary action. (V. E. Negus) 57-64  
 Some observations on the co-ordination of diaphragmatic and rib movement in respiration. (H. Herxheimer) 65-72

## Transactions of the Royal Society of Tropical Medicine and Hygiene

## 42 : July 1948

- Diseases of tropical origin in captive wild animals. (R. E. Rewell) 17-36  
 Investigations on the antibilharzial action of miracid D (nilodin). (J. M. Watson, M. A. Azim & A. Halawani) 37-54  
 A clinical and serological follow-up of yaws cases treated by acetylarsan and bismuth sodium potassium tartrate. (I. Apted, R. D. Harding & M. Gosden) 55-64  
 Anaemia and marasmus in Indian troops on active service. (R. H. Girdwood) 65-82  
 Dengue in the East African Command. Incidence in relation to Aedes prevalence and some clinical features. (D. D. McCarthy & D. B. Wilson) 83-88  
 The tolerance of the metacyclic and flagellate forms of *Leptomonas ctenocephali* Fantham to variations of humidity and salinity. (A. J. Gibbs) 89-93  
 Capillaria hepatica. A case report. (O. T. Brosius, E. E. Thomas & B. Brosius) 95-97  
 Non-pigmented malaria parasites in the bone marrow from a mixed infection of *Leishmania* and *Plasmodium vivax*. (M. Yoeli) 99-100  
 Injuries produced by tropical "water-beetles." (K. V. Earle) 101-104

## 42 : September 1948

- Pulmonary schistosomiasis. (M. Erfan) 109-116  
 Observations on the development of resistance to vivax malaria. (C. R. B. Blackburn) 117-162  
 Treatment of epidemic typhus with chloromycetin. (E. H. Payne, E. A. Sharp & J. A. Knaudi) 163-170

# GUIDE TO THE JOURNALS

1413

Mite typhus fever in Assam and Burma, 1944-1946. (P. H. A. Wilcox) 171-189  
A fatal case of generalized amoebiasis due to a protozoan closely resembling, if not identical with, *Iodamoeba bütschlii*. (E. H. Derrick, with comment by C. M. Wenyon) 191-198  
A note on the value of folic acid in the treatment of macrocytic anaemia in Assam tea garden labourers. (P. H. Birks) 203-205  
Hatching speed of schistosome miracidia. (F. A. Goodliffe & D. M. Blair) 205

## 42 : November 1948

The epidemiology of fungus diseases. (J. T. Duncan) 207-216  
The life cycle of *Plasmodium cynomolgi* in its insect and mammalian hosts. (H. E. Shortt) 227-230  
A preliminary report on the value of palm-leaf traps in the survey and treatment of streams infested with snails. (M. A. Azim and N. Ayyad) 231-246  
An attempt to control house rats in Rangoon. (J. L. Harrison & H. C. Wood-Stuczynski) 247-258  
Serological examination of human and cattle sera from Palestine for the presence of antibodies against a bovine strain of *Leptospira*. (H. Bernkopf, L. A. Therapeutic extraradial block in tropical ulcer. (O. N. Ransford) 267-275  
A note on vitamin B complex deficiency states among Africans in the Gold Coast. (J. Dawson, G. M. Findlay & R. D. Ward) 277-282  
The diagnosis of schistosomiasis in Southern Rhodesia by the rectal biopsy technique. (M. Gelfand) 283-286  
Lymphostatic verrucosis in the Fort Hall district of Kenya. (M. Clark) 287-290  
*Balanitidum* infection associated with diarrhoea in primates. (T. A. Cockburn) 291-293  
Notes on certain aspects of the action of DDT residual sprays, and on the partial treatment of dwellings as a means of anti-anopheline protection. (S. Gebert) 294-297  
Effect of climate on the blood pressure in acclimatized subjects. (L. P. R. Fourman) 299-301

## 42 : January 1949

A survey of physiological studies of mental and physical work in hot and humid environments. (G. P. Crowder) 325-340  
Studies on a West African strain of *Plasmodium falciparum*. The efficacy of paludrine (proguanil) as a prophylactic agent. (G. Covell, W. D. Nicol, P. G. Shute & M. Maryon) 341-346  
A yaws campaign in Sierra Leone. (R. D. Hardings) 347-366  
Severe anaemia in Indian sepoy (refractory tropical macrocytic anaemia) (R. Staalardization of daboia and cobra antivenines. (R. K. Goyal) 381-392  
The extermination of *Anopheles gambiae* in the Wadi Halfa area. (D. J. Lewis) 393-402  
Notes on endemic and acute malaria in Central African natives. (J. Schwetz) 403-409

## 42 : March 1949

Malignant malnutrition (kwashiorkor). (H. C. Trowell) 417-442  
Some observations on the action of quinine, atabrine, and plasmoquine on *Plasmodium vivax*. (M. J. Mackerras & Q. N. Ercole) 443-454  
Observations on the action of quinine, atabrine and plasmoquine on the gametocytes of *Plasmodium falciparum*. (M. J. Mackerras & Q. N. Ercole) 455-463  
Studies on a West African strain of *Plasmodium falciparum*. II. The efficacy of paludrine (proguanil) as a therapeutic agent. (G. Covell, W. D. Nicol, P. G. Shute & M. Maryon) 465-476  
Chronic pulmonary senitosomiasis: a clinical and radiological study. (M. Erfan, H. Erfan, A. M. Mousa & A. A. Deeb) 477-485  
Dietary deficiencies in children in the island of Viti Levu, Fiji. (F. A. Thomson) 487-492  
The treatment of polyethaemia vera. A record of one case treated with *Ancylostoma* infection. (H. F. Nagaty & A. F. Zanaty) 493-499  
Studies in leishmaniasis in the Anglo-Egyptian Sudan. X. An interesting strain of *Leishmania*. (R. Kirk) 501-502  
Observations on the epidemiology of infections with *Clonorchis sinensis*. (R. P. Koenigstein) 503-509

## Mental Health Services

The preceding number of *British Medical Bulletin*, under the general title of Mental Health, endeavoured to cover that field from the psychological and psychiatric points of view. It ranged from the psychiatry of the child, with a discussion on some aspects of juvenile delinquency, to the problems of the mental health of the aged, and included articles on assessment of personality and measurement of intelligence, and surveys of modern trends in psychotherapy in Britain.

This more academic treatment of the subject left no room for any account of those ancillary services which, since about 1930, have been developing and increasing in importance and to which the mental health practitioner has turned more and more as auxiliary aids in rehabilitating and re-integrating the disordered personality of his patient. It is with these services that the present number, under the title of MENTAL HEALTH SERVICES, mainly deals. In addition, in view of the increasing realization of the importance of mental health as opposed to mental disease, the *mens sana in corpore sano*, it was felt that something must be said about the teaching of this subject to medical students and also about the opportunities for postgraduate study now available.

This number, then, opens with an article by Professor Aubrey Lewis on postgraduate study in mental health, in which he traces the history of this subject and shows the considerable advances now in progress, particularly since the radical reorganization of postgraduate instruction in 1944. This is followed by an article from Professor MacCalman on the place of mental health

in the medical curriculum—until quite recently, a very meagre place—in which he illustrates the fact that “a slow revolution has taken place since psychiatric teaching was confined to a few lectures and demonstrations of psychotic disorders”. This revolution is still, one hopes, not yet terminated.

The introduction in 1948 of the new National Health Service which, by the terms of the Act of 1946, is “to secure improvement in the physical and mental health of the people”, has meant integration of the existing mental health services with the new comprehensive Health Service. The administrative and other changes following on this are explained in the article by Dr. Maclay of the Board of Control.

In order to evaluate the services described in the articles which follow, it is necessary to know something of the size of the problem. The latest official figures available, those of the Report of the Ministry of Health for the year ended 31 March 1948, show that the number of persons in England and Wales at the end of 1947 suffering from mental disorder notified as under care was 145,772, of whom 42.8 per cent were male and 57.2 female. A very large proportion, 126,751 or 87 per cent, were certified patients, and 18,585 (12.7 per cent) were voluntary patients. For the single year 1947 the number of direct admissions was 44,356; of these 57.6 per cent were voluntary and 39.0 per cent certified patients.

On the other hand, when we turn to the credit side of the account, we find for the same year that, of direct admissions, the percentage of patients discharged as recovered or relieved was 67.0, while for recoveries alone the percentage was 34.4. It is interesting to note that in 1947 the percentage of total discharges from all causes (including the small number discharged on admission as “not now insane”) was 76.5, compared with an average of only 48.3 per cent for the five years preceding the operation of the Mental Treatment Act, 1930.

These figures would seem to show that there has been considerable improvement in the situation in the last two decades, most of which must be attributed to improved methods of treatment. In that improvement the various ancillary services described in this number have undoubtedly played a not insignificant part. Perhaps the most immediately important service is that of mental nursing. In common with all branches of nursing in the last decade this service has suffered in both the quantity and quality of the recruits offering themselves. It is reassuring to learn from the Chief Medical Officer's Report quoted above that so far this shortage has not been allowed to affect adversely the patients under care. The present position of mental nursing and some indications for future recruitment and training are outlined in the article by Miss Olive Griffith.

Next to nursing come the rehabilitatory services—psychiatric social work, community care and, perhaps most important, occupational therapy. This last has of course been employed for some considerable time, but only in recent years has it become a properly organized and recognized service, and now most mental hospitals employ one or more trained occupational therapists. A very full account of this important form of therapy is given by Miss Macdonald, Principal of the Dorset House School of Occupational Therapy, Oxford, in which she indicates the forms of occupational therapy which have been found most beneficial for different types of patients. It might be remarked that, apart from its therapeutic value, some of the work produced by these patients is of high artistic standard and often of admirable craftsmanship.

The extension of mental health care beyond the confines of the hospital is also a service which has grown only in the last years, but it received a particular impetus in the closing years of the war. Dr. Soddy, in his article on community care, describes the formation of the Ex-Services After-Care Scheme for psychiatric casualties discharged from the Armed Forces and shows how it was gradually extended to the civilian population, while Miss Ruth Darwin gives a short résumé of the development of the psychiatric social workers' service, which had its modest beginnings in 1928, but is now a firmly established and essential part of mental health therapy.

The remaining subject is that of mental defect. It is regretted that it has not been possible to include in this, or in the preceding number of the Bulletin, a paper on the genetical aspect of mental disease. It was the expert view that not enough new research had been done on these lines since previously published work. The education and training, however, of the mentally defective child, though long neglected, are now receiving considerable attention, and Miss Isabel M. Laird contributes an article in which she describes what can be done and is being done to improve the lot of these unfortunate children; although in a sense this must remain only palliative much has been accomplished to help them to optimum development within the limits of their capacity.

Finally, it has been thought useful to include a list of organizations concerned with mental health. Most of these are directly related to the field but others lie on the fringe of sociology—indeed, it is difficult to draw the line. The symposium is concluded by a bibliography of British journals, and of British books published since 1939, devoted to the wide subject of mental health. Short biographical notes on the authors contributing to this symposium will be found immediately following the bibliography.

## POSTGRADUATE STUDY IN MENTAL HEALTH IN BRITAIN

AUBREY LEWIS M.D. F.R.C.P.

*Professor of Psychiatry, University of London*

*Director of Professorial Unit, Bethlem Royal Hospital and Maudsley Hospital, London*

- 1 Training in psychological medicine before 1914
- 2 Standards set after First World War
- 3 Reorganization of postgraduate training since 1944

It was not until the latter part of the 19th century that psychiatry came to be regarded in Great Britain as a branch of medicine requiring special training; before then it had been assumed that a competent physician could deal with the mentally ill without needing any instruction beyond what he might have received as a medical student. The mentally ill at that time meant the insane; the study and treatment of neurotic illness was not regarded as the concern of the psychiatrist.

### 1. Training in Psychological Medicine before 1914

In 1885 the Medico-Psychological Association instituted a certificate in psychological medicine, open to doctors who had had at least three months' clinical experience in mental disorders or who had attended a course of lectures on insanity and followed the practice of a mental hospital where there was clinical teaching; the examination was in three parts, oral, practical and written. Between 1892 and 1920 this certificate was taken by 370 candidates, who had had no systematic instruction or preparation for it. Gradually, however, it was recognized more and more clearly that this served little purpose, and in 1908 Dr. David Thomson, a prominent member of the Association, pointed out that systematic postgraduate teaching in psychiatry and an examination by the universities and medical colleges were needed. Charles Mercier, then President of the Association, wrote a formal request to the universities and other medical examining bodies, pointing out that:

young medical men, in their appointment as medical officers to asylums, find themselves face to face with work and problems of which they have had no previous knowledge and in preparation for which they can obtain no systematic or scientific training or teaching. As is well known, lectures on psychological medicine and pathological laboratories have been established here and there, and in one or two universities Chairs in Experimental Psychology have been founded; but there is no systematic course of instruction and no recognised diploma at the end of such a course. It is submitted that the time has now arrived when such a course and diploma should be established in the principal medical schools in this country, and a diploma in the subject should be instituted by the examining bodies.

It was also suggested that the minimum period of study should

be one year. By 1912, five universities—Manchester, Leeds, Edinburgh, Cambridge and Durham—had instituted diplomas in psychological medicine, and the Royal College of Physicians, London, had created a special examination in psychiatry. The universities mentioned required candidates to attend a course of instruction. Several universities, including London, permitted the M.D. examination to be taken in psychological medicine, but did not provide special instruction.

The leading psychiatrists of that time agreed, in numerous discussions on the subject, that the unsatisfactory qualities and attainments of a large number of those engaged in mental hospital practice could be bettered, and more-promising recruits attracted to this branch of medicine, if universities would provide thorough postgraduate training, preferably at special clinics similar to those on the Continent, and if the standard of the diploma were kept high. A few of the older psychiatrists maintained, on the contrary, that any such demands upon the intelligence and energy of psychiatrists-to-be would diminish the flow of recruits and make it difficult to staff the "asylums".

### 2. Standards Set after First World War

The First World War altered the situation, and in 1920 Hubert Bond, who had become a Commissioner of the Board of Control, addressed the Association with a plea for schools of psychiatry which would be closely affiliated with general medicine. Less than a score of candidates had taken the diploma, the qualifying courses of instruction had been interrupted and insufficient aid had been afforded by employing authorities in allowing their staff to be seconded for the necessary period of study. Hubert Bond emphasized that any university conducting an examination for the diploma should insist on the student's attendance at a course of instruction given by that university, to ensure that "some important share of the diplomate's knowledge is the fruit of a school of thought with traditions of its own". The lessons taught by the war also led him to insist that clinical experience of the psychoneuroses should be recognized in the curriculum and examination.

Some of the five universities mentioned gradually allowed their courses of instruction, and consequently their diplomas, to lapse. Eventually, although the number of examining bodies remained fairly large, the bulk of candidates in the United Kingdom obtained their diploma from the Conjoint Board for England and Wales or from the University of London, neither of which required candidates to attend a particular course of instruction, though they had to show evidence of clinical work for a specified period in a mental hospital or equivalent institution, as well as in neurology. The diploma in psychiatry of the University of Edinburgh was available only to those who attended a special course of postgraduate instruction at that university. In all the examinations for the diploma, neurology was given a large place in the requirements, and candidates were also required to show an adequate knowledge of psychology and of the normal anatomy and physiology of the nervous system.

Although the majority of psychiatrists who obtained the diploma in psychological medicine during the inter-war period had not been obliged to attend a course of instruction, 600 availed themselves of the systematic instruction, lasting six months, provided at the Maudsley Hospital from 1920 to

1938. The connexion between the Maudsley and the trend of events related above is fairly close. Dr. Thomson's proposals in 1908 were prompted by the announcement of Henry Maudsley's offer to the London County Council of £30,000 for the establishment in London of a hospital which should provide early treatment of mental disease, promote exact scientific research, and serve as an educational institution providing good clinical instruction. The hospital thus created became in 1923 a School of the University of London, providing not only the regular courses of systematic instruction already referred to, but also clinical appointments which served as a training ground comparable to that afforded by the European clinics, particularly the one directed by Kraepelin at Munich. The Royal Hospital in Edinburgh similarly provided postgraduate instruction, in a university atmosphere, for those holding clinical appointments. Bethlem Royal Hospital was admitted as a School of the University of London in 1924, and provided courses of instruction for the Diploma in Psychological Medicine.

The recognition of psychiatry by the universities as an important branch of postgraduate instruction was attested by the creation of Chairs at Edinburgh and at Leeds, and in London where Chairs of Psychiatry and of the Pathology of Mental Disease were created at the Maudsley Hospital. Among the holders of these Chairs have been T. S. Clouston (Edinburgh), Shaw Bolton (Leeds), Edward Mapother and F. L. Golla (London).

Besides the instruction provided at the postgraduate schools in Edinburgh and London, there were two main kinds of psychiatric appointment available: in the psychiatric departments of the voluntary teaching hospitals, and in mental hospitals. The former were on the whole the training ground of psychiatric consultants and teachers, who commonly possessed higher qualifications in medicine, such as the Membership or Fellowship of the Royal College of Physicians, and had had specialized training in neurology and possibly had worked in a university psychiatric clinic abroad. The mental hospital appointments provided training for the bulk of psychiatrists in the various institutions throughout the country; the standards and practice prevailing in these varied so widely that, in some, young men obtained excellent instruction in modern psychiatry, while in others the example and conditions were adverse to good training.

There was also, after the 1914-18 war, a growth of interest in psychopathology and psychotherapy, especially of the neuroses. The Tavistock Clinic was founded by Dr. Crichton Miller and provided opportunities for many doctors and other workers in related fields to gain experience in these branches. The London Clinic of Psycho-Analysis was formed and an Institute developed in association with it which provided a thorough and highly organized training in psychoanalysis. The Institute for the Scientific Treatment of Delinquency was also brought into being. With the help of the Commonwealth Foundation, the London Child Guidance Clinic was set up and afforded training in the psychiatry of childhood to a steady flow of psychiatrists; during this period child psychiatry was commonly regarded as an additional training, to be built on to a solid foundation of adult psychiatry.

For mental deficiency the provision was much the same as for mental disorder; the bulk of those working in institutions for the defective had no other specialized instruction than short courses of lectures and demonstrations given to prepare candidates for the Diploma in Psychological Medicine. The

Diploma of the University of London allowed candidates to profess a "higher knowledge of Mental Deficiency".

### 3. Reorganization of Postgraduate Training since 1944

In 1944 the Interdepartmental Committee on Medical Education put forward its proposals for the radical reorganization of postgraduate instruction. It urged that the award of postgraduate medical diplomas, such as that in psychiatry, should be undertaken by the Royal Medical Colleges and not by the universities. The Interdepartmental Committee held that the postgraduate training and experience of intending psychiatrists should be comparable with the requirements for specialists in other branches of medicine, and that the generally low standard of the diplomas in psychological medicine and the inadequate clinical requirements and experience demanded must be raised appreciably. The training should be of four or five years' duration and should be obtained in approved institutions which, on account of their high standard in staffing and other facilities, were capable of providing the requisite supervision and teaching. The Committee emphasized the special position of Edinburgh and London in this regard.

Detailed proposals regarding the desirable range of clinical training and instruction were put forward by a Royal College of Physicians Committee on Psychological Medicine, of which Sir David Henderson, the Professor of Psychiatry in Edinburgh, was the chairman.

In London the comprehensive scheme for organizing postgraduate schools within a federation led to some radical changes. The Maudsley Hospital Medical School became the Institute of Psychiatry within the University of London, and the post-war years saw a large influx of postgraduate students, the majority of them recently demobilized from the fighting services, who received training by appointment to the established staff or as supernumerary registrars and who attended the systematic courses of instruction planned to cover a minimum period of two years. These courses followed, so far as lectures and demonstrations were concerned, the customary pattern of university teaching, while the clinical instruction was given at the Maudsley Hospital and at associated hospitals. Bethlem Royal Hospital ceased to be a School of the University in 1946, but since July 1948 the Maudsley Hospital and Bethlem Royal Hospital have formed one teaching hospital, in close association with the Institute of Psychiatry.

In Edinburgh, training is centred on the Royal Edinburgh Hospital for Mental and Nervous Disorders and the associated University Department of Psychiatry. Candidates seeking the diploma in psychiatry of the University are required to have spent a year in general hospitals, including six months as a house physician; to have had three years' training in approved psychiatric institutions, including 18 months in a mental hospital, 6 months in neurology, 6 months in child psychiatry and mental deficiency, 3 months in psychology and 3 months in special study; and finally to have attended a 5 weeks' whole-time course at the University during the autumn term immediately prior to the examination.

A number of other universities have either revived or created diplomas in psychological medicine, and have set up corresponding courses of instruction. Among these are Leeds, Bristol and Manchester. Chairs of Psychiatry have been created at Leeds, Durham, Aberdeen, Glasgow and Manchester, and facilities for postgraduate instruction are being actively developed at those universities.

In 1946 the Conjoint Board for England and Wales revised the clinical requirements for candidates taking its diploma in psychological medicine. All candidates must have completed not less than 2½ years' special study of psychological medicine at recognized hospitals or institutions, devoting 6 months to nervous diseases, 18 months to mental diseases, and 6 months to child psychiatry and mental deficiency.

The University of London, which had instituted more exacting clinical requirements in 1936, found it necessary to suspend these and has not yet settled the future requirements which will be demanded from candidates who sit the final examination of the diploma. It has hitherto been an "extension diploma", i.e., a diploma for which candidates do not need to attend any specified course of systematic instruction in the University.

The pattern of postgraduate teaching in psychiatry afforded by the universities varies somewhat. The following list shows the courses given in the Institute of Psychiatry at the Maudsley Hospital :

### FIRST YEAR

#### *First Term*

- Anatomy and physiology, including electrophysiology, in relation to mental disease

#### *Second Term*

- Methods of psychiatric examination
- Elementary statistics
- Mental testing
- Introduction to social investigation and treatment
- Introduction to administration of psychiatric services

#### *Third Term*

- Historical development of modern psychiatry
- Principles of dynamic psychology
- Systematic general psychiatry, including treatment
- General and social psychology, including personality

### SECOND YEAR

#### *First Term*

- Child development
- Child psychiatry (including mental deficiency)
- Administrative procedure and legal relationships
- Social medicine and legislation

#### *Second Term*

- Psychophysical relationships
- Genetics of mental disorder
- Psychiatric aspects of cerebral disease
- Character structure
- Psychotherapy, including occupational therapy
- Analytical psychology (Jung)
- Psychopathology
- Social psychotherapy

#### *Third Term*

- Pathology of the central nervous system, anatomical, biochemical and electrophysiological
- Forensic psychiatry
- Psychiatry and the community
- Criminology

These lectures and demonstrations occupy, in all, some 312 hours in a university session. Specialists in training at the Institute who obtain junior appointments as house physicians or registrars at the Bethlem Royal Hospital and the Maudsley

Hospital are provided with clinical instruction not only in the in-patient and out-patient departments, where the neuroses and psychoses of adults and children can be studied, but also at prisons, remand homes<sup>1</sup> and general hospitals; instruction in neurology is also a necessary part of full clinical training.

The principle followed in the general plan of postgraduate education in this country is that the future psychiatrist should spend five years after he qualifies in gaining adequate knowledge and experience in the various branches of the subject. If he wishes to specialize in any particular division, for instance psychotherapy or neuropathology, he can, in a large centre like the Institute of Psychiatry in London, do so during the latter part of his training. Thus, during the first two years he would in any case attend classes and demonstrations in neuro-anatomy and neuropathology and would probably take part also in fortnightly clinicopathological discussions; in his third year of training, or later, he might concentrate on the study of a neuropathological problem, giving half or even the whole of his time to it for six months or more, according to the nature of the problem and his personal aims in psychiatry. The candidate who wishes to become a psychotherapist might begin a personal analysis at a comparatively early stage of his training and would gradually be given more and more opportunity of treating patients by special psychological methods. The same applies to many other divisions of clinical and scientific psychiatry and related fields such as psychology. Apart from the provision organized by the universities, there are facilities at various hospitals and clinics, such as, in London, the Institute of Psycho-Analysis, the Tavistock Clinic and Institute of Human Relations, the Society of Analytical Psychology, the Cassel Hospital, the Institute of Child Psychology, the Therapeutic Social Club Centre, etc.; at other university centres similar facilities exist, though not on the same scale as in London.

Psychiatric departments at the undergraduate teaching hospitals and at postgraduate hospitals such as the National Hospital for Nervous Diseases, Queen Square, and the Hospital for Sick Children, Great Ormond Street, both in London, further enlarge the field wherein postgraduate training may be obtained. In London the arrangements are centralized through the British Postgraduate Medical Federation, of which the Director is Professor Sir Francis Fraser. Similar but smaller postgraduate organizations exist at each of the other university centres in Great Britain. Overseas physicians who wish to obtain psychiatric experience in Great Britain do so either through the university organization or, in the case of certain scholarship holders, through the British Council and the Nuffield Foundation. The Empire Medical Advisory Bureau also provides facilities for practitioners from overseas.

It will thus be seen that the range of training provided for psychiatrists is wide, and differs according to the branch in which the postgraduate is specially interested. There is much flexibility and experiment in the various centres, which may lead to interesting educational developments.

<sup>1</sup> The primary purpose of remand homes is the custody of children remanded by courts of law or committed for trial.—Ed.

# THE PLACE OF MENTAL HEALTH IN THE MEDICAL CURRICULUM

D. R. MacCALMAN M.D. M.R.C.P.E.

*Nuffield Professor of Psychiatry  
University of Leeds*

- 1 Recent rapid growth of psychological medicine
  - 2 Requisites of a good medical curriculum
  - 3 Methods of teaching
  - 4 Study of the patient as a person
- References

Had this symposium on mental health been written a quarter of a century ago little could have been said about the teaching of psychiatry to medical students. In some medical schools there was no organized course, and, when instruction was given, the student had to be content with a few lectures, supplemented by what was correctly described as a "variety show" at a mental hospital. If the subject was ever mentioned by other clinical teachers, a tone of such criticism and disparagement was used that the student was little encouraged to take an active interest in it. Nor would much have been found in the literature published in this country.

There were, of course, notable exceptions. In 1823 the first systematic instruction in psychiatry was given in Edinburgh by Sir Alexander Morison, and in 1915 the Managers of the Royal Edinburgh Hospital endowed a chair at the University. In the same year, in the USA, we find Adolf Meyer outlining a course for medical students which met with obstruction and indifference at that time but which proved to be strangely prophetic of the best teaching today. The demand for better instruction came not only from inspired teachers like Adolf Meyer but from students themselves. In 1941 the Medical Students' Committee of the National Union of Students submitted a strongly-worded memorandum to the British Medical Association, in which they stated:

In the course of his studies the student is constantly meeting with psychological problems of which he has no understanding and even less knowledge how to treat. It is the opinion of nearly all students that the present arrangements for the teaching of psychology are totally inadequate. In those cases where practical instruction is given there is insufficient use made of the material to be found in the wards and out-patient departments.

This echoed the findings of the American National Committee for Mental Hygiene Conference in 1936 which set as its goal "the stimulating of the student's sense for the personal reaction and problems of the patient in any medical, surgical or obstetrical case, not only in the obviously psychiatric or psychoneurotic patient" (Lief, 1948).

In the last twenty years increasing attention has been paid to the teaching of psychiatry. This is reflected in various important papers and reports. Much prominence, for example, is given to the subject in the British Medical Association's *Report of Committee on Mental Health* (1941) and in the same body's *The training of a doctor* (1948). The same applies to

the more official *Report of the Inter-departmental Committee on Medical Schools* (Ministry of Health & Department of Health for Scotland, 1944)—often referred to as the Good-enough Report—and the General Medical Council's *Recommendations as to the medical curriculum* (1947). Here it is not possible to discuss in detail the interesting recommendations which these reports make but they should be read by anyone who wishes to assess the position which mental health holds today in the medical curriculum in Great Britain. Rather, an attempt will be made to discuss some of the issues and difficulties which these reports raise, and to comment upon possible future developments.

## 1. Recent Rapid Growth of Psychological Medicine

The acceptance of the need to give mental health a more important place in the medical curriculum could not have taken place had there not been a correspondingly great demand for psychiatry on clinical grounds and an increase in psychiatric knowledge. There is abundant evidence of the former, for the need for practical therapy far exceeds the supply of trained personnel. The recent development of psychological medicine has been so rapid that its history reads like the story of Cinderella. From a position of relative isolation from the general body of medicine it has emerged into glittering if uncertain prominence. A mere quarter of a century ago its scope was limited to the study and treatment of the graver forms of mental disease within the geographical remoteness of "lunatic asylums". Now it embraces the psychoneuroses and the so-called psychosomatic disorders; its preventive aspects cover child guidance and delinquency and range over a vast field of social, cultural, industrial, eugenic, educational, military, and even political factors. Even the man in the street has taken it home on approval though he has not yet "bought it".

This rapidly increased demand for psychiatric service has made teaching at the undergraduate stage very difficult, for scarcely enough time is allowed in the course to teach any one aspect adequately. It has had other effects too. Despite the fact that the older psychiatrists have struggled to retain the mental hospital as the main focus and location of therapy and teaching, an increasing number of psychiatrists are therapists in the community based upon the general hospital. Hence the teacher must attempt to bridge the gap between institutional and extramural interests, and orientate himself to a variety of new methods in child guidance and psychoanalysis, social medicine and modern methods of physical treatment. Some teachers obviously have found difficulty in doing so; others, because of the new alliance between medicine and psychiatry, have orientated themselves to the requirements and standards of internal medicine and know more about the patient's nervous system and the various techniques and tests by which it can be measured than they do about the patient as a person. Still others, pointing to the small contribution which neurophysiology makes to the understanding of human behaviour, concentrate upon teaching a psycho-analytic view of life. There are thus few teachers whose background of experience has been sufficiently wide, whose knowledge is sufficiently erudite, who retain an active personal experience in all types of psychiatric practice, and who enjoy and are skilled in teaching. All the reports mentioned above indicate that there is a great shortage of those whose development and abilities have been along these lines, and

give an appropriate warning that considerable time must pass before teachers can be selected who have the requisite experience and skill.

## 2. Requisites of a Department of Psychiatry

The first requirement for the proper provision of training for medical students is that every medical school should have an active department of psychiatry, centred in the teaching hospital and co-ordinated with the work and teaching of the other clinical and non-clinical departments. It is only when the student comes to know the psychiatrist as a familiar figure in the wards, out-patients departments and clinical conferences that he recognizes and accepts the part which psychological medicine has to play in the prevention and treatment of ill-health. The time has passed when psychiatrists had to fight for recognition and position, and so has the need to demand autonomy. Rather, the student should see the bilateral osmosis of knowledge which takes place when the psychiatric department is truly integrated with all other disciplines and therapeutic procedures, and note the enormous gain in the general body of medical skill which results. At the same time the university department of psychiatry must have a close association with the mental health services of the community. Ideally this means a sharing of staff between the mental hospitals, mental deficiency colonies, child guidance clinics, and the statutory activities of the local health authorities. Administratively the provisions of the National Health Service Act make this co-ordination much easier, for in most areas the head of the department plays a prominent part in the work of the Regional Hospital Board. Here, in parenthesis, should be mentioned the burden of administrative duties and activities which the head of the department is expected to carry. Much of his time is taken up by university, teaching hospital and Regional Hospital Board committees, but this complaint can equally well be made by clinicians and teachers in other subjects.

The Goodenough Report (Ministry of Health & Department of Health for Scotland, 1944) gives a broad and helpful outline of other prerequisites of a department of psychiatry, and we can pass on to consider briefly the seldom-mentioned fact that students find psychology and psychiatry difficult to learn. The majority are obviously fascinated by these subjects, but there is ample evidence that they are emotionally disturbed by facing the facts of life which patients so frequently demonstrate. As Whitehorn (1946) says:

There is uneasy laughter, tense silences, fixity of facial expression, often even a flushed and belligerent defense of the polite evasions against the "base insinuations" of the more objectively oriented observer.

It is not surprising that this should be so, for students are generally brought up in "respectable" circles and it is not easy for them to take the risk of disillusionment in the search for truth about themselves and their fellows. Further, they have been trained from an early age in the study of subjects where reliance can be put upon reason and intelligence as instruments in learning, but the facts of psychology demand other qualities for their understanding. The student must therefore face the hard and unpalatable fact that human beings are far from being wholly rational in their behaviour but are very much at the mercy of their emotions in all their actions and attitudes, and that the thoughts they have are determined more by their wishes than by their reason. Partly to overcome this difficulty, and partly in the belief that knowledge of others should be based upon a knowledge of oneself,

Adolf Meyer (1928) introduced his students to the analysis of personality by getting them to chart their own personal history in the making.

In my psychobiology course I begin with the request, "Give the steps of evolution of your own personal attitude with regard to the nature of mind from childhood up and your understanding as to the nature of the facts dealt with under the heading of psychology".

Such a high-sounding demand might, it could be alleged, produce just those culturally-determined and polite evasions of reality which dynamic psychobiology attempts to eradicate. My own experience of students' autobiographical life-charts is that they show an astounding lack of appreciation of the "biographic determinants" which Meyer considered so important. Some method which goes deeper than self-analysis is obviously desirable but I would hesitate to agree with Rado (1946) that "Under ideal conditions, every medical student would be psychoanalyzed, preferably during his (pre-medical) college years". Opportunities should, however, be taken, particularly during clinical demonstrations and seminars with small groups of students, to relate to their own lives and experience the dynamic factors uncovered. Time should also be given to group discussion, which ought to be as far as possible leaderless, and which turns naturally for illustration to autobiographical experiences. Some critics of this type of teaching allege that it is so emotionally disturbing that students may themselves fall mentally ill. It must be obvious, however, that there is already a significant breakdown-rate among medical students and qualified practitioners, and that any method of uncovering, at an early stage, a latent vulnerability is to be welcomed rather than deplored. No method has yet been adopted of eliminating by selection those who would find the brutal and unpalatable facts of medical practice too much for them.

Another difficulty concerns the personality of the teacher himself. An instructor is appointed generally because he has a good knowledge of the subject and a flair for research. It is assumed that he has a liking for teaching, is interested in his subject, and gets on well with students. In actual practice it must be admitted that there are other less worthy motives which divert psychiatrists into the academic field. It is, as Greenacre (1946) points out, quite as true of professors as of the practitioners of psychiatry that their wish to understand and help maladjusted patients has some nuclear need to understand themselves and those near them, and that they have an obligation to face their own neurotic problems. There may be, too, a hidden or even overt wish in the case of the full-time teacher to lead a cloistered life, withdrawn from individual responsibility to patients and from the keen competition with colleagues that he would experience in practice. In the extreme case the teacher, to whom his profession has become too strong a neurotic defence, becomes dogmatic and then disappointed.

Greenacre (1946) also indicates that the relationship between the teacher and the student is of great importance:

That this quasi-fraternal relationship of teacher and student, that benevolence should at least slightly outweigh the tacit competitiveness, basically a sibling rivalry, seems to be imperative for good teaching. For in all teaching relationships, whether the formal ones of school or the informal ones of the family, a good feeling towards the teacher furnishes the necessary emotional background for *assimilation* of knowledge and genuine understanding. This is comparable to the positive relationship between patient and doctor which is the necessary general framework of the complicated and difficult transference reactions in the course of psychoanalysis.

We must admit that this is true in the teaching of psychiatry, where the personality of the teacher tends to become inextricably intermingled with his subject-matter. But what Meyers called "the adoration of personalities" is much in evidence in other fields of medicine, though the negative transference shown by students is clearly not suspected by a number of leading figures in our medical schools. One cannot expect many surgeons, for instance, to show much insight in their relationships with students, but every psychiatric teacher should have in mind the effect which his personality has upon his students. Aubrey Lewis (1947) gives a witty account of a questionnaire designed to assess student opinion. He concludes that "it seems safe to infer from the replies of the 75 students that psychiatry is not now a laughing-stock or a closed book to the bulk of medical students but a serious and on the whole respected branch of medicine". Carefully fostered leaderless group discussions should extend the teacher's self-knowledge and lead to a reformulation of his attitude and methods. Only thus can he learn from his students (who may presently succeed him) and go on to a world of wider experience and knowledge.

### 3. Methods of Teaching

In conclusion something must be said of the methods of teaching which are best adapted to the teaching of undergraduates. Perhaps the first lesson which the teacher must learn is that the student is immature, not only in experience of men and affairs but also in his own emotional development. To give only one simple example: the fact that he is generally unmarried and therefore inexperienced in parenthood makes it hard for him to appreciate the difficulties and diversities of family life. This is particularly true of the student in his pre-clinical period when he may not even realize that there are individual differences in intelligence, personality and character. In many instances the nature of his previous education may have been so materialistic that he unwittingly subscribes to the doctrine of psycho-physical parallelism. Mind and body are to him sharply divisible entities, and he probably considers it somewhat dangerous and certainly not very "good form" to think too deeply about himself or his fellow beings. Added to his ignorance of human nature is probably a surprising lack of acquaintance with literature. One student, when asked what he had read lately, at first looked blank, then, brightening visibly, said with eager pride: "The last book I read was one by Peter Cheyney<sup>1</sup>".

To this immaturity the teacher must adapt himself, conscious that he must use his opportunity to stimulate a curiosity about human nature, a broad and humane attitude to all aspects of ill-health, an understanding and a toleration of human frailty. Following the reiterated precepts of Adolf Meyer, he will avoid abstruse interpretations and theories and direct the student's attention upon facts which are clearly established and connected with his own experience. Particularly in clinical teaching he will demand from the student concentration upon the behaviour, mood, stream of thought, ideas, etc. shown by the patient in his presence. Such training in observation will do much to counteract the student's pre-conception that there is something vague and mysterious, something indeed almost akin to crystal-gazing, about a psychiatric examination.

As far as possible, therefore, the student should learn by

doing. For this reason formal lectures should be kept to a minimum, and should be used mainly to arouse interest, to stimulate curiosity and to foster a thirst for practical knowledge. As the curve of forgetting related to the spoken word falls steeply within a few hours, and as the notes taken by the student are generally confused and illegible even to himself, a crisp résumé should be given in mimeographed form.

Much more use should be made of the tutorial system although it is time-consuming and presupposes that the psychiatric department has a large and experienced staff. But tutorials should not be allowed to take the form of a monologue, even though this may be preferred by the student and easiest for the teacher. One of the great difficulties is that the student has been expected, from his earlier schooldays, to produce accurate knowledge for his teachers and has been made timid of his powers of observation and deduction by the sanctions imposed upon inaccurate answers. Most students are what has been aptly termed "boss-eyed", that is, they constantly try to estimate the mood and wishes of the person in authority and will give textbook information even when they privately disagree with it. Advantage may be taken of the fact that they are also pathetically eager to find a good father-figure, one who will allow them to talk without severe restrictions, who will tolerate their ignorance, and correct their mistakes without sarcasm or malice. Liberal use should be made of what Rickman called the psychiatric silence, the teacher being sufficiently secure in his handling of the group situation not to fill the inevitable pauses in discussion with his words and his ideas. In this way the student learns something of what, after all, is going to be his main clinical skill in the practice of medicine—the interpersonal relationships between himself and his patients, between his patients and the others who make up their occupational, family and community backgrounds. Students show interesting individual differences in their method of handling interpersonal relationships. As may be expected, those who score most in theoretical examinations do not always rate so high in the ease with which they deal with their fellows. This type of discussion-group teaching is therefore also of value in assessing potential clinical skill, and may in the future be used in advising the student as to the branch of medicine in which he is most likely to succeed.

### 4. Study of the Patient as a Person

Ample opportunity should be given to the student for appreciating the importance of environmental, cultural and occupational factors in all types of ill-health. A high proportion of students on qualifying become family physicians. It is strange, therefore, that so little opportunity is given them, in their undergraduate training, of seeing and studying the homes of the patients whom they encounter in hospital. Some indication of the importance of parental and sibling influence on personality development should therefore be given in the pre-clinical course of lectures in normal psychology. This should be amplified and illustrated during the transitional period of study, when the psychiatrist should co-operate with the other clinical teachers by helping the student to study the person who is ill, rather than the disease process from which he suffers. This can best be done when a small group of students co-operates with the teacher in examining the patient's life history in an attempt to answer such questions as: what kind of person is this who has fallen

## OCCUPATIONAL THERAPY AND MENTAL HEALTH

E. MARY MACDONALD T.M.A.O.T.

*Principal, Dorset House School of Occupational Therapy  
Oxford*

### A Aims and principles of occupational therapy

### B Methods of fulfilling these aims and principles

- 1 Selection and training of personnel
  - 2 Co-operation with the physician
  - 3 Duties of the occupational therapist
  - 4 Occupational therapy in relation to physical treatment in psychiatry
- References

It is important, in discussing occupational therapy, to emphasize that therapy means treatment, and that treatment presupposes diagnosis, prescription and application by selected and trained personnel. Note the two qualifications mentioned. Though undoubtedly important for all ancillary medical workers, selection and training are particularly important for the occupational therapist. An occupational therapist has to help the patient to help himself, a task far less easy than doing something for him. The success of the treatment is, in the first instance, particularly dependent on the person applying the treatment.

To clarify the subject-matter of this article it is essential to find a definition for "mental health". This, unhappily, is

more difficult than discussing conditions of ill-health. A broad charter for conditions of mental health may be taken from the following, by Nicole (1946):

Perhaps happiness and adaptability are the keynotes to the diagnosis of mental health—it has to be "diagnosed", for it is so uncommon—or else liberty in the broad sense may become the hall-mark of the healthy man. Not liberty that comes from the refusal to recognize obligations, but an internal moral freedom that allows of full use being made of intelligent discrimination. . . . Crichton-Miller would measure man's liberty in terms of his detachment from fear of consequences; that is, fear of frustration (self), fear of retribution (society) and fear of extinction (future).

These fears undermine health: they can be overlaid by, or converted into, physical or psychological symptoms and syndromes, or they can accompany certain conditions of physical or psychological illness. But "the development of . . . positive qualities inevitably eliminates their opposites" (Read, 1944); so occupational therapy is designed to provide these positive qualities and to help to dispel the symptoms of the disabilities for which it is prescribed. "One of the requirements for Mental Health is a task" (Carrington, 1946)—occupational therapy provides that task.

### A. AIMS AND PRINCIPLES OF OCCUPATIONAL THERAPY

The occupations used in this form of treatment cover all forms of work or recreational activity, mental or physical, "medically prescribed and professionally guided to aid a patient in recovery from disease or injury" (Willard & Spackman, 1947). Occupational therapy is not just any work or recreation given to entertain the patient.

In spite of the necessary attention to the disability of the patient, no occupational therapy can hope to succeed unless the patient is treated as a whole individual with proper consideration for his economic, social, psychological and physical needs. Treatment must be part of a well-organized and co-operative scheme of rehabilitation, the occupational therapist having close connexion with other medical workers, such as almoners, nurses and physiotherapists, and with the aim of:

### MENTAL HEALTH: UNDERGRADUATE TEACHING

*Continued from page 190*

ill? how does the illness affect the patient and the patient the illness? what effect have his home and occupational conditions had upon his health and what can usefully be done to ameliorate these conditions? did his early upbringing and circumstances have any bearing upon his present condition? This type of enquiry appeals strongly to the student, who is at last realizing his ambition to deal with real people who are in need of medical care, and becomes more vividly alive to him if he is permitted to visit the patient's home, particularly when he can discuss his findings with the psychiatric social worker. Later in his course the student should have the experience of seeing the co-operation between the departments of social medicine, child health and psychiatry.

There are many new techniques and methods of teaching psychiatry and many opportunities throughout the medical curriculum

of presenting the patient as a person to the student. Enough has been said, perhaps, to illustrate the fact that a slow revolution has taken place since psychiatric teaching was confined to a few lectures and demonstrations of psychotic disorders. That revolution reflects the changing interests and developing knowledge of psychological medicine, and we may look forward to the time when such knowledge will infiltrate and enlighten all medical teaching. But before that desired end can be reached, much time and patience and determination must be spent by psychiatrists themselves in building up a body of proven knowledge. The defects and failures of present-day teachers and their training must be honestly faced, so that medical students in the future can have the mature, wise and understanding teachers they deserve.

re-establishment of the patient in former employment, or assessment and vocational training for new employment in normal, sheltered or "home-bound" conditions. Employment under "sheltered" conditions indicates the possibility of working and earning under special care and with special provision made for disability. Employment of the "home-bound" means taking work to the disabled in their own homes. These two latter services are being catered for by the Disabled Persons Employment Corporation.

Over-emphasis on the economic factors of the patient's treatment can be as detrimental as neglect of this aspect. It is true that at times the primary need of the patient may be economic re-adjustment. Proper choice of occupation as treatment can, undoubtedly, contribute to this. At other times, distraction from excessive economic anxiety may be the aim.

The maintenance or improvement of social adjustment in illness can lessen the period of sickness, and occupational treatment devised to this end can influence considerably the re-establishment and sense of security of a patient in convalescence and on discharge. A continued link, maintained with patients after discharge, through social clubs or by visits to sheltered workshop or home-bound cases, can sometimes prevent a return of symptoms or the necessity for re-hospitalization.

The main psychological benefits of occupational therapy are its normalizing effects and the contribution it makes towards the prevention of invalidism. It relieves emotional tension, arouses interest and helps to focus attention; it offers an outlet for creative and experimental needs, and can, by its practical demonstration of actual achievement, contribute towards the re-establishment of confidence.

Physically, occupational therapy can be useful in the maintenance of good general physical condition, for the restoration of function of joints and muscles, for contributing towards resistance to fatigue and for the assessment of work tolerance. Some further principles are given by Kidner (1930):

(1) In applying Occupational Therapy, system and precision are as important as in other forms of treatment. (2) The occu-

pation selected should be within the patient's estimated interests and capability. (3) The only reliable measure of treatment is the effect on the patient. Employment in an occupation which would be trivial for the healthy may be attended with benefit to the sick or injured, but standards worthy of entirely normal persons must be maintained for proper mental stimulation. (4) As the patient's strength and capability increase, the type and extent of the occupation should be regulated and graded accordingly.

## **B. METHODS OF FULFILLING THESE AIMS AND PRINCIPLES**

### **1. Selection and Training of Personnel**

Occupational therapy, in its initial stages, and in its introduction to the patient, is a very personal matter. So much depends upon the occupational therapist making an acceptable and somewhat social approach, with a view to discovering the occupation which will be interesting to the patient, as well as progressive and therapeutic. The occupational therapist must be trained in the therapeutic possibilities of a large variety of occupations, and have sufficient accurate and scientific medical knowledge and administrative ability to carry out the prescriptions with intelligence and enterprise, coupled with a capacity for observation and skill in acceptable presentation.

Selection of the right candidate for this work is of paramount importance. It need not be limited to a particular type only: there is room for the pioneer, the plodder, the administrator and the executive; but, fundamentally, the applicants must have the following qualities in common: tact, good judgement, an optimistic outlook, emotional maturity, satisfactory personal integration, a sincere and friendly interest in others, a capacity for enjoyment, a wide background of interests, enterprise, imagination and tolerance, and a reasonable amount of assurance and determination in carrying out treatment.

In most training centres students have lectures and demonstrations in the following theoretical subjects: anatomy and physiology, general medicine and surgery, physical medicine

**FIG. 2. METAL TURNING**

and orthopaedics, psychopathology, psychiatry, department management, book-keeping, etc., and, of course, occupational therapy as applied to physical and psychological conditions. They further learn of the therapeutic possibilities of social activities, art, music, drama, literature, domestic and secretarial subjects, gardening and industrial occupations, and of correspondence courses. Certain crafts are taught with the intention of training the students in versatility, in the use of tools and in constructive methods. Emphasis is also put on ingenuity and capacity to help the patient to "make do and mend". The manual arts are among the occupations most adaptable and readily acceptable to the patients, and give opportunity for objective observation of the patient as an aid to diagnosis and further prescription. Among these manual arts are woodwork, metalwork, textile design and construction, pottery, leatherwork, basket-work, and stool- and chair-seating. (See figs. 1-6.)

During training, students work in hospital rehabilitation departments under trained occupational therapists. There they learn the practical problems of application of treatment by occupation, and of departmental management, and how best to co-operate with other treatment departments.

In the early days the courses were of one year's duration. It has been found, however, that a longer course is necessary to give sufficient basic knowledge from which to work. The course now covers 2½-3 years, for those without previous experience; some students, offering previous training and qualification, may in less time gain the Diploma of the Association of Occupational Therapists; students from all schools in England enter the examination for this Diploma.

## 2. Co-operation with the Physician

The occupational therapist needs from the doctor in charge of the case the fullest co-operation, and a willingness on his part to understand the aims and methods of occupational treatment. The role of the physician, then, falls mainly under five heads, viz.: diagnosis, and the supply of facts relevant to

FIG. 3. WEAVING ON SMALL LOOMS

FIG. 4. SPINNING

the history of the case; prescription of treatment; prognosis; precautions to be observed; and supervision of treatment, up-grading and progression. It is recognized that all medical men are busy. If, therefore, specific information is given when treatment is prescribed, and special times for observations, reports and revision of treatment are arranged, the occupational therapist need not lose valuable time trying to make contact with the doctor, nor need she work without his expressed wishes. It cannot be too strongly emphasized that occupational therapy carried out with the really active supervision and co-operation of the doctor is successful, and can at times even be termed spectacular. Without this co-operation the treatment is, on the whole, wasteful of time, energy and money.

Apart from the actual prescription and the clinical meetings for assessment of the case, which may be given or conducted by the patient's particular doctor, all ancillary medical services should, ideally, work under a co-ordinating and supervising medical officer, who will interpret to his colleagues the possibilities of the various treatments or the difficulties of the team of workers. This medical officer should correlate all treatments for the benefit of the patient and should distinguish between their usefulness. Not every patient needs every form of treatment.

## 3. Duties of the Occupational Therapist

These fall under two main heads, namely, administration and the actual carrying out of treatments.

*Administration*

Before opening his or her department in the hospital or rehabilitation centre, the occupational therapist must make assessments of the following: (i) area to be served by the rehabilitation facilities; (ii) local interests and industries; (iii) types of patients to be treated; (iv) whether the service is for hospital in-patients, out-patients or for home-bound cases, etc.; (v) the number of patients for whom treatment may be required. In addition there should be consideration of social facilities, ancillary services, transport for out-patients, home conditions, and the possibilities for light, productive and remunerative work for suitable cases.

In considering the question of assistance, what would appear a paradox is true: an occupational therapist with an assistant can more than double her usefulness. In addition to the assistance of further experts in treatment, good voluntary or paid help with stores or book-keeping can be a very great asset.

With regard to details of equipment for the department these vary with the needs and possibilities in different hospitals and centres. Their consideration, though important to each individual hospital, is not one on which generalization can be made, and is too detailed for the scope of this article.

*Prescriptive Considerations and Particular Treatments*

Occupational therapy is useful for physical as well as for psychological disabilities. The science of prescribed work can, however, in all cases be termed to some degree psychological. A happy, contented patient is a better patient for the doctor to treat.

All treatment falls into two categories: (i) general treatment, which aims at maintenance of normal work habits, prevention of invalidism, and maintenance of good physical and mental tone; (ii) special treatment, which carries with it the aforementioned obligations, but has, in addition, a particular aim in giving treatment for a particular disability or for restoration of a particular function.

General and special treatment should be carried out in as normal an atmosphere as possible. The lines of general treatment should be laid down in the light of an analysis of the occupations available; certain patients can be assigned to occupations which are at once useful and of therapeutic value. Naturally, the greatest benefit will accrue if these patients are under expert supervision and if regular reports are made on their progress. These patients should be re-assigned to other occupations whenever their progress allows. It is necessary also to cater for their recreational needs.

Special occupational therapy makes a far more direct attack on the pathological reactions of the patient. In any given case, a full description of the patient and of his individual traits is necessary; but it may be feasible to indicate some of the general principles upon which the choice of methods of treatment is based. A distinction may be made between stimulative and sedative treatment, though this distinction is by no means always rigid. Stimulative occupations give large movements, variety, quick results and encouragement; they avoid monotony and hold attention. Sedative occupations may be repetitive; they should give continuous, rhythmic movements, at the same time holding interest and avoiding monotony.

The prescription of occupational therapy is as individualized a matter as is the diagnosis of the patient's illness. However, mental patients requiring occupational therapy do

fall into certain broad groups, and a discussion of these with the appropriate type of therapy may be of value.

The therapy of psychotic and disorientated patients should have as its goals re-socialization, the maintenance of contact with reality, and arrest of deterioration. Occupational therapy should be part of a carefully organized programme for each day; it is more effective when given in groups in pleasant surroundings. The capacity of the patient and the need for precautions must be considered when the programme is arranged. Community singing, exercises to music, relaxation, and work with large movements are all useful in stimulating interest and initiative, penetrating self-absorption and maintaining work habits. Deluded and refractory patients may in some cases take part in these activities with value. With regressed patients, habit training must be a primary aim.

For many depressed patients, work with an element of challenge in it is a help towards overcoming apathy, a sense of guilt and feelings of inadequacy. Exercises are vital, as are social events and group work; some attention, also, to personal appearance may be stimulated by the making of clothes. Gardening, basketry and flat rug weaving may be beneficial.

For excited patients rhythm is essential, and an attempt must be made to hold and improve concentration. Fatigue, already being induced by the state of the patient, should be avoided; the spells of work should be regulated carefully. Gardening, weaving, wool winding and basketry are useful and safe occupations requiring few tools.

For the psychoneurotic patient, certain principles of the aforementioned methods are applicable. This type of patient should be encouraged to start treatment even in bed, and urged to persist in completing one task before proceeding to another. Occupational therapy can take almost any form in the practical or intellectual field that appeals to the patient and that meets his prescriptive needs and maintains a good balance of work and recreation (see figs. 1, 4). When possible, men should do work of a masculine nature, promoting self-esteem (see fig. 2); in other cases, combined work with women (fig. 3) has a socializing value. Art, modelling and pottery have also very valuable therapeutic possibilities. Reports from the occupational therapists to the medical officer in charge of the case may be helpful in the psychiatric treatment of these cases, and all occupational therapy should be planned in the closest co-operation with other medical treatments. Relaxation should be taught, and occupations which induce this are invaluable. They need not be without stimulative content but should bring relief from tension (see figs. 5, 6).

For the mentally deficient case, occupational therapy can make an important contribution, by helping to develop, to the fullest extent, the existent capacities of the patient; and by helping the disturbed and distressed patient to find his level of ability and achievement—this needs a very particular and individual approach. Occupations already mentioned can be used in varying degrees, and the greatest success is achieved by close co-operation with the nursing, maintenance and educational services of the colony, hospital or home.

**4. Occupational Therapy in Relation to Physical Treatment in Psychiatry**

In discussing occupational treatment given to patients during or after physical treatments, it should not be necessary

FIG. 5. MEN'S WORKSHOP IN A MENTAL HOSPITAL

FIG. 6. WOMEN'S WORKSHOP IN A MENTAL HOSPITAL

to enlarge upon or explain the effects of these physical treatments in detail. These will be known to the readers of this article and are discussed in the preceding issue of *British Medical Bulletin* (Hill, 1949). As yet experience of occupational therapy in this field is limited, but a few observations may be of interest.

If the occupational therapist makes contact with the patient before he receives the physical treatment, and if she is able to observe him in at least one of his treatments, she can develop a far more successful programme for him than if he comes only after treatment, as an isolated case of which she has had no previous knowledge; for, according to Sargent & Slater (1948), the make-up of the personality is not in any way changed by physical treatments, except in prefrontal leucotomy. In this latter case it is equally imperative that she have worked with the patient before operation.

Cases receiving *modified* or *deep insulin treatment* will usually receive their occupational treatment in the afternoon. A programme carried out at one hospital arranges the insulin treatment in the morning; after lunch, there is garden occupation for an hour, followed by indoor occupations for 1½ hours. These latter may be of a socializing nature, often in mixed groups, but limited by the physical condition of the patient as well as his psychological state.

Cases receiving *electro-convulsion therapy* should have visited the occupational therapy department on several occasions and become familiar with it before the convulsion treatment is started. Outdoor occupations are good for these patients. The occupational therapists must watch for the first signs of change and improvement in the patient after any one treatment. Advantage of the improvement must be taken immediately and, while the patient is more open to suggestion, further progress can be made towards achieving the highest level of occupation of which the patient is capable.

After *prolonged narcosis*, cases arrive for occupational treatment with visionary disturbances and transitory depression. They have to be given simple, re-assuring occupations within their capacities, though the challenge and quality should be increased with improvement.

Patients receiving treatment by *abreactive techniques* need, above all, to be re-assured and re-socialized in the occu-

pational therapy department; they may be disturbed for days, worrying about what they have divulged to their doctor. It is important that they should meet the occupational therapist as a friend, without suspicion that she may be informed of the facts they have, for therapeutic purposes, been encouraged to reveal to the psychiatrist.

Opinions vary as to when occupational therapy should be started. After *prefrontal leucotomy* it is begun in some cases after 48 hours, in others not till a week later. The patients may now lack some ability and drive, but tension may be lessened, and a form of re-socialization and general occupational therapy is needed. In reporting the results of occupational therapy for the leucotomized patient, Hyde & Wood (1949) state:

There was evidence of increased acceptance of the occupational activities proffered after the operation. Fifteen patients showed increased participation in occupational therapy, 5 were unchanged and 7 showed decreased participation. Ten showed increased socialization, 14 were unchanged and 3 showed decreased socialization. On the other hand, spontaneity was increased in 6, unchanged in 11 and decreased in 10 post lobotomy.

There was a decrease in number of cases displaying self-preoccupation, hostility and compulsiveness and an increase in the number of patients displaying lethargia and malaise. Five patients showed a peculiar defect in their appreciation of the passage of time postoperatively. There was no defect noted in the ability of patients to learn occupational tasks postoperatively.

More could be said of detailed organization and treatment, of the possibilities of the more intellectual occupations, of "psychodrama", of occupational therapy through art, music or industry, but the foregoing information has been directed at giving as complete a general picture of occupational therapy in relation to mental health as is possible within the scope of a single article.

#### ACKNOWLEDGEMENTS

I should like to acknowledge and pay particular tribute to the work and inspiring example of Dr. Elizabeth Casson, psychiatrist and pioneer in the institution of training in occupational therapy in Great Britain.

I am indebted to the following for illustrative material and photographs: Professor Aubrey Lewis, Dr. A. Harris, Miss Olwen Owen, Mr. P. Chappel and Mr. E. Parish of the Maudsley Hospital, London and to Dr. Ström-Olsen of Runwell Hospital, Essex.

## MENTAL HEALTH AND THE NATIONAL HEALTH SERVICE

W. S. MACLAY *O.B.E. M.D. M.R.C.S. M.R.C.P.*

*Medical Senior Commissioner  
Board of Control*

- 1 Provisions of the National Health Service Act, 1946
- 2 History and development of the central authority
- 3 Responsibilities of the hospital and specialist services
  - a Accommodation for the mentally ill
  - b Care of mental defectives
- 4 Responsibilities of the local health authority

Under the National Health Service Act, 1946,<sup>1</sup> it is recognized clearly that mental health and physical health cannot be separated, and that psychiatry is an integral part of medicine and medicine of psychiatry. The planning of the mental health service is designed to encourage and develop this point of view.

### 1. Provisions of the National Health Service Act, 1946

Under the Act, it is the duty of the Minister of Health

to promote the establishment in England and Wales of a comprehensive health service designed to secure improvement in the physical and mental health of the people of England and Wales and the prevention, diagnosis and treatment of illness . . .

The Act places the responsibility for providing the mental health services on the same authorities as those who are required to establish and maintain comparable services in other fields of health. There are two main divisions of responsibility.

i. *Hospital and specialist service.* The hospital and specialist services are provided by the Minister through the agency of a Regional Hospital Board in each of the fourteen Regional Areas into which England and Wales have been divided for this purpose. The Regional Hospital Board administers the individual hospitals or institutions within its Area by means of a Hospital Management Committee for each hospital or group of hospitals. Each region is based on a university, but the teaching hospitals, though working in close co-operation with the Regional Hospital Boards, are not administered by them but by their own Boards of Governors, directly responsible to the Minister. This is intended to allow the teaching hospital more freedom of action and scope for individuality. This arrangement has been criticized, especially outside London, as leading to needless administrative complications, because Regional Hospital Boards and Boards of Governors have to co-operate in so many projects.

Each Region has a senior administrative Medical Officer and he should have on his staff a Regional Psychiatrist. The

latter post is an important one, as it is to the Regional Psychiatrist that the Mental Health Committee of the Regional Hospital Board turns for help. His job is to act as a liaison officer between the various bodies concerned and to play an important part in the planning of a satisfactory mental health service for the region. The value of such officers, with status second only to that of the senior administrative Medical Officer, is already apparent.

ii. *Local health authority.* The newly constituted local health authorities are responsible, in addition to their other health duties, for certain mental health duties, particularly for the community care of patients suffering from mental defect or mental illness and for the initial care and conveyance to hospitals of patients dealt with under the Lunacy and Mental Treatment Acts. The local health authorities perform their duties through a Mental Health Sub-Committee in accordance with proposals submitted to the Minister and approved by him.

This division of the service between Regional Boards and Boards of Governors on the one hand and local authorities on the other has caused many administrative problems and difficulties, particularly in the field of mental health. It is too early as yet to say whether the advantages of leaving certain duties in the hands of local authorities will outweigh the obvious advantages of having a single service. To give but two examples of the complexities involved: (i) in the field of child guidance the Regional Hospital Board, the school medical service of the local authority, and the local education authority are all interested and must work in harmony; (ii) in the field of mental defect, the local authority is responsible for ascertainment, statutory supervision and guardianship, whereas the Regional Hospital Board is responsible for institutional care and care of patients on licence. It is difficult to get continuity of care unless there is close co-operation between these various bodies.

### 2. History and Development of the Central Authority

The central authority for mental health is the Minister of Health, since he either provides or in some degree controls all forms of mental health service. One of the main problems of legislation and administration in this field is to hold the balance between the treatment of the illness, on the one hand, and the necessity, on the other hand, of infringing the liberty of the patient in cases where detention is necessary for the safety of the patient or of others.

From the earliest times the Lord Chancellor has been concerned with the safeguards for the liberty of the subject, and his participation in the administration of the service is preserved today. Apart from this, the present arrangements can be traced to an Act of 1845, which established a Board of eleven Commissioners in Lunacy as a permanent central authority with supervisory powers. At that date, licences for public asylums were granted under the authority of the Justices of the Peace, assembled in Quarter Sessions. In 1890, the Lunacy Act laid the foundation on which all recent developments have been based. County and county borough councils were charged with the duty of providing asylums, and the Lunacy Commission was established as the central supervisory authority, the Commissioners, both medical and legal, being appointed by the Lord Chancellor. The position was further modified in 1913, when the Mental Deficiency Act

<sup>1</sup> *National Health Service Act, 1946. 9 & 10 Geo. 6, Ch. 81. [1947] His Majesty's Stationery Office, London*

was passed. This created the Board of Control, consisting of Commissioners who took over the functions of the Lunacy Commissioners and who, in addition, were charged with the responsibility for directing the mental deficiency service established by that Act. The Board of Control consisted of Commissioners appointed by Royal Warrant, the legal Commissioners on the recommendation of the Lord Chancellor, the medical Commissioners on the recommendation of the Home Secretary.

It was not until 1920 that the concern of the Minister of Health in this field was recognized. In that year, an Order under the Ministry of Health Act, 1919, transferred to the Minister of Health most of the administrative functions of the Home Secretary relating to lunacy and mental deficiency. The Mental Treatment Act of 1930 marked a further stage in development. The Board of Control was reconstituted to consist of five senior Commissioners appointed by Royal Warrant; of these the chairman, the two medical senior Commissioners, and the woman senior Commissioner are appointed on the recommendation of the Minister of Health, and the legal senior Commissioner on the recommendation of the Lord Chancellor. In addition to the senior Commissioners there are normally eight medical and four legal visiting Commissioners and six inspectors. There are thus some twenty-two individuals to carry out the statutory duties of inspection and visitation throughout the country.

The final changes which established the position and the responsibility of the Minister of Health were made by the National Health Service Act, 1946. There were transferred to the Minister the administrative and medical functions of the Board of Control which, however, retained its responsibilities for dealing with matters affecting the liberty of the subject, e.g. the operation of the safeguards relating to the admission, detention and discharge of patients; and the handling of complaints in regard to conditions and treatment.

While, however, it is possible, on paper, to make this distinction between the administrative functions and functions relating to the liberty of the subject, it is not feasible strictly to maintain it in practice, because frequently both aspects have to be considered in regard to the same patient. In order, therefore, to prevent duplication, and to preserve the accumulated knowledge and experience of those who have been responsible for supervising the service, it has been decided to use the personnel and the staff of the Board of Control for the discharge of the duties transferred to the Minister. These officers were accordingly assigned to the Mental Health Division of the Ministry of Health. They discharge the Ministry of Health functions as officers of the Minister and, at the same time, they discharge the functions retained by the Board of Control in its semi-independent capacity. One of the functions of the Board is to administer directly and without the intervention of the Regional Hospital Boards the State Hospital, for the criminally insane, with accommodation for 800 patients, and the two State Hospitals, for violent and dangerous mental defectives, with accommodation for 1,518 patients.

In addition to the officials of the Ministry of Health and Board of Control, the Minister can call for advice from a Central Health Services Council, which will normally deal with general questions relating to all types of health services, and a standing mental health advisory committee which will advise both the Central Health Services Council and the Minister himself. Of the forty-one members of the Central

Council, two are doctors selected for their knowledge of mental illness and mental defectiveness and two are laymen with experience in mental health services. The standing mental health committee may itself appoint sub-committees so that expert help is available from the widest possible field.

#### *Payment*

All the mental health services are, with unimportant exceptions, to be free of charge to the patient or his relatives, however wealthy they may be. It will be open to Hospital Management Committees of mental hospitals or institutions for defectives to allow patients who do not for medical reasons strictly require a single room, or a bed in a small ward, to have one upon payment of the additional cost thus involved in their maintenance. Such patients will continue to receive medical and nursing attention free of charge. Single rooms or small wards may also be set aside for the patient whose relatives are willing to pay the whole cost, both of his accommodation and of the necessary medical attention and nursing. The charges are to be prescribed by regulation. But neither part-paying nor full-paying patients may occupy rooms or beds which are urgently needed upon medical grounds for non-paying patients. Subject to the foregoing, it will be possible for any member of the medical staff to arrange for his own private patients to be treated in a private room or small ward, either at his own or any other hospital. If he takes advantage of this arrangement, his charges to his patient for his own services must not exceed a maximum which is to be fixed by regulation, and the sum payable by the patient to the hospital for accommodation will not include, as it otherwise would, the cost of those services.

### **3. Responsibilities of the Hospital and Specialist Services**

The two main divisions already referred to, i.e., the hospital and specialist services, and the local authority health service, will now be discussed in more detail.

The Minister is responsible for providing, to such extent as he considers necessary to meet all reasonable requirements:

- i. Hospital accommodation for mentally ill and mentally defective persons;
- ii. Medical, nursing, and other services required at, or for the purposes of, hospitals for mentally ill or mentally defective persons;
- iii. The services of specialists for mentally ill and mentally defective persons whether at a hospital, a health centre, or a clinic, or, if necessary on medical grounds, at the home of the patient.

#### *a. Accommodation for the Mentally Ill*

In the past there have been four main types of accommodation for the mentally ill. The figures for 1947 show their relative importance as regards the number of patients accommodated:

In mental hospitals provided by local authorities . . . . .	128,579 patients
In registered hospitals . . . . .	2,447 "
In licensed houses . . . . .	2,529 "
In public assistance institutions . . . . .	9,507 "

The 101 mental hospitals which were owned and administered by the local authorities have all been taken over by the National Health Service; the 13 registered hospitals, which were non-profit-making hospitals comparable to voluntary

general hospitals, have also been taken over with the exception of four; the 35 licensed houses which are profit-making establishments under private ownership remain outside the National Health Service; the public assistance institutions require rather fuller explanation. These institutions were intended, under the Poor Law, for all types of destitute persons; however, owing to lack of accommodation elsewhere, they have had to look after some 10,000 persons of unsound mind, together with a similar number of mental defectives and a considerable number of mentally-enfeebled old persons requiring hospital care. As a result of the National Health Service Act, public assistance institutions as such no longer exist legally and they have been shared between the health service and the local authorities. If they belong to the health service they are now hospitals and some may be designated as mental hospitals or mental deficiency institutions, or as premises ancillary to existing hospitals and institutions. Such accommodation may prove to be very suitable for the care of the quiet type of senile patient who needs psychiatric supervision, but not necessarily in a mental hospital.

Special mention must be made of what are known as "observation wards", though they have not been included under the types of accommodation mentioned and the term is not to be found in the Lunacy and Mental Treatment Acts. Broadly speaking, the usual procedure for certification prescribed by the Lunacy Act, 1890, is that a person of unsound mind who is not under proper care and control shall be seen by a Justice who has at his disposal the petition and appropriate medical documents. This Justice will make the order authorizing detention. The Acts, however, do authorize, in certain circumstances, detention of persons alleged to be of unsound mind, as a temporary measure pending such further proceedings as are required. The maximum period for which a patient can be detained without the intervention of a Justice is 17 days. In some places, e.g. London, it has been the custom for practically all persons requiring care under the Lunacy Act to be removed in the first instance to a ward for observation and detained there until proceedings under the Act are completed. These observation wards may be situated either in a general hospital or in a mental hospital. They deal with a wide variety of acute cases, and large numbers are able to go home within 17 days and thus avoid the stigma of having been certified as persons of unsound mind. The number of hospitals in England and Wales which have observation wards and are able to admit patients under this section of the Act is 128.

The new service is based largely on the mental hospitals—not the old type of isolated unit interested only in its intramural activities, but on hospitals which may have old buildings but which will have a new outlook about their function and will recognize that their extramural duties among the community are just as important as, or even more important than, the intramural.

The following summarizes some aspects of the work to be done by the hospital and specialist service.

#### *Domiciliary*

Persons suffering from mental illness normally receive domiciliary treatment in the first instance from the general practitioner. The services of psychiatric specialists are usually obtained through attendance at in-patient and out-patient departments of the hospital services. If the patient

is unable to visit a hospital or clinic the general practitioner in attendance is now able to ask for expert psychiatric advice to be given in the home of the patient. Arrangements for this purpose are usually made directly with the local hospitals which provide psychiatric services, so that if the patient later attends an out-patient department, or is admitted to hospital, continuity of contact and treatment is possible.

#### *Out-Patient Work*

An adequate out-patient service is essential for securing the early treatment of mental disorders. It is hoped that, in time, the out-patient departments of all general hospitals will, as a matter of course, include psychiatric clinics, as many already do. Only exceptionally need they be sited in separate buildings or in mental hospitals. In a large centre the clinic should be an all-purpose unit, able to deal efficiently with all aspects of out-patient work. Smaller clinics, which may be affiliated to the central clinic, will also be required, but their field of work should be limited, so that they can do better work within these limits instead of trying to contend with every type of problem. Owing to the rapid development of out-patient departments since 1930 there are many which operate only once a week or once a month, and which may be attended by one senior medical officer without any help. The usefulness of such clinics is very limited, as the medical officer is quite unable to deal with the numbers of new and old patients that he has to see and with the variety of problems that may arise. With increased medical personnel at the mental hospitals it is expected that there will be many more doctors available to help in out-patient work and that all those joining the service will within a short time take part, under supervision, in extramural work. The functions of an out-patient clinic are to diagnose the psychiatric disorder, to arrange proper in-patient or out-patient treatment, and to interpret the disorder to persons or agencies who must co-operate in treatment. To achieve this are required adequate premises and an adequate staff of psychiatrists, psychologists, social workers, nurses, technicians and clerks. Although there are now about 250 psychiatric clinics for adults, it can be said that both premises and staff are inadequate in most; in particular there is a lack of psychiatric social workers. If a clinic is to be an all-purpose one there should be specialization within it, to deal efficiently with the various aspects of the work, such as child psychiatry, court work, industrial problems, vocational guidance, teaching, information and research. To take but two of these aspects: (i) The new Criminal Justice Act widens the possibilities of arranging psychiatric examination and treatment of offenders. The courts now have the power to place offenders under a probation order, making it a condition of probation that the offender will agree to go for treatment to a mental hospital, out-patient clinic or anywhere suitable for the purpose of treatment; this will lead to a greater demand on the clinics. (ii) The Ministry of Labour is planning with the Ministry of Health to get from the clinics more psychiatric advice for the employment exchanges when these have to deal with problems of persons with psychiatric symptoms. The main reason for this is that the Disabled Persons Act of 1944 imposes on the Ministry of Labour a duty to help to find or even provide employment for those who are "substantially handicapped for employment by reason of injury, disease, or congenital deformity". This definition includes mental illness and mental defectiveness, and the special officers of the Ministry of Labour, called Disablement

Rehabilitation Officers, are more and more seeking from the clinics the psychiatric advice they need.

#### *In-Patients' Accommodation*

This will be provided in a variety of places.

i. *General hospitals.* For patients without behaviour difficulties beds may be provided in general or in special wards in a general hospital. These beds are intended to serve the patients who require only a short term of treatment away from their homes or for whom investigation is necessary for diagnostic purposes.

ii. *Neurosis centres.* These centres have emerged as the result of war-time developments under the Emergency Medical Service. They are as yet few in number and no general policy in regard to size, administration, etc., has been laid down. In some regions there are independent neurosis hospitals, in others they are under the curtilage of the mental hospitals, while in still others they are linked with general hospitals. They are intended for patients who can be received as voluntary patients under the Mental Treatment Act or without any formality at all. They provide facilities for rehabilitation and psychotherapy fuller than would normally be available in a general hospital, but avoid the necessity—still feared by so many—of entering a mental hospital.

iii. *Teaching psychiatric units.* These are being set up in university centres and are primarily for undergraduate and postgraduate teaching and for research in psychiatry. It is considered that a unit of 60 beds or more is required to provide a sufficient variety of patients. Such units may admit three classes of patients: those admitted without any formality, those who have signed an undertaking agreeing to admission as "voluntary patients" and those who are detained as "temporary patients". At present certified patients cannot be admitted to these units. This may not be such a drawback as it seems, as it has always been hoped that professors of psychiatry would take an active interest in the mental hospitals in their region and be given facilities for teaching in them. Inability to admit certified patients to their own units may help to bring this about.

iv. *Mental hospitals.*<sup>2</sup> Voluntary, temporary and certified patients may all be admitted. The average number of beds required is 3.5 to 4 per 1,000 of the population. Most mental hospitals are of such a size as to require their own Management Committee, but in some Regions the desire to integrate psychiatry with medicine has led to the grouping of mental hospitals with other types of hospital, giving to each of the constituent hospitals a Sub-Committee (called a House Committee) of the Management Committee. The danger lies in the possible development of a three-tier system (Regional Hospital Board, Hospital Management Committee, House Committee), with subordination of the needs of the mental hospital to the demands of the others, as has happened so often in the past. Experience suggests that, although integration is desirable, the integration and interchange of medical and nursing staff is to be preferred to that of the administrative committees.

The question of how far the function of particular mental hospitals should be specialized remains debatable, but there

are obvious advantages in concentrating in hospitals with specially equipped units patients requiring neurosurgical operations such as prefrontal leucotomy, patients with active tuberculosis, and typhoid carriers. To some extent this has already been done in hospitals under large authorities such as the London County Council, but it will now be possible to develop the principle further on a regional basis.

In regard to the voluntary treatment which has been mentioned, it may be of interest to note that, until the passage of the Mental Treatment Act in 1930, patients could be admitted to public mental hospitals only after certification as persons of unsound mind. The Act empowered authorities to admit patients on a voluntary basis, i.e., patients enter the hospital of their own free will and they are free to leave the hospital if they give 72 hours' notice to the medical superintendent. The number admitted in this way has increased steadily each year until the present time, when over 50 per cent of all admissions throughout the country are on a voluntary basis. This and the establishment of out-patient clinics has given a great impetus to the development of early treatment and has led to a greater awareness by the public that a mental hospital is a place where effective treatment can be given and where conditions in a great many instances are fully acceptable to those seeking treatment.

v. *Former public assistance institutions.* Reference has already been made to this accommodation and to its possible use for elderly chronic harmless certified patients or for mentally-enfeebled, aged people who are not certified.

#### *b. Care of Mental Defectives*

There are two principal ways in which certifiable mental defectives can be given the protection they need: by treatment in an institution; by provision of community care through statutory supervision or by guardianship.

The first is the responsibility of the hospital and specialist service, the second is that of the local health authority. The relative numbers in 1947 were:

In institutions provided under the Mental Deficiency Act	53,361
Under guardianship	5,172
Under statutory supervision	43,272

(Guardianship is a method by which the local health authority can put a defective in a private family and pay for maintenance, clothing, etc., if he is unable to earn anything towards these expenses. Statutory supervision is used when there is no need to remove a defective from his home. It provides regular visitation to ensure that conditions are as satisfactory as possible.)

Most of the in-patient accommodation has passed under the control of the Minister of Health, with the exception of some 22 institutions (holding, approximately, 2,000 patients), which were not taken over, mainly because they belonged to Roman Catholic or other religious bodies. Throughout the country there is overcrowding in the institutions and large numbers are awaiting admission. The hardship caused by inability to remove even low-grade defectives from their homes is great, and provision of adequate accommodation for defectives at the earliest possible moment is one of the important tasks of the hospital and specialist services. Many building schemes are ready and only await withdrawal of present post-war restrictions.

<sup>2</sup> The law relating to temporary treatment in mental hospitals is discussed by Mr. Cyril F. Penton in the previous number of *British Medical Bulletin* (Vol. 6, No. 1-2, p. 59, *BMJ* 1305).—Ed.

#### 4. Responsibilities of the Local Health Authority

The local health authority, according to the *Provisions relating to the Mental Health Services*,<sup>3</sup> "is the body responsible for providing the local government health services, as distinct from the general practitioner services and the hospital and specialist services". These provisions define the responsibilities of the local health authority in relation to mental health as follows:

(a) The initial care and removal to hospital of persons who are dealt with under the Lunacy and Mental Treatment Acts.

(b) The ascertainment and (where necessary) removal to institutions of mental defectives and the supervision, guardianship, training and occupation of those in the community.

(c) The preventive care and after care of all types of patient so far as this is not otherwise provided for.

Each local health authority must appoint a statutory Health Committee and normally it is a Mental Health Subcommittee of this Committee which has responsibility for the services outlined above. It is clear that the local health authority has a big responsibility in regard to the prevention and early treatment of mental illness.

Mental health is a positive condition and the task has been placed on the local authority to try to maintain and enhance mental health in the community. It will be necessary to disseminate information regarding mental health services to enable the public to know the resources available and to encourage the early seeking of advice. The schemes prepared by the local health authorities as required by the National Health Service Act show, as one might expect, varying degrees of awareness of their responsibility and a wide variety of methods; comparison of these will, in time, give guidance as to which are the best. Some authorities have asked the Regional Hospital Boards to provide psychiatric specialists to help with, and advise on, their mental health work. This method is obviously a useful one for bringing about a close liaison between the two fields of work. Others propose to appoint their own psychiatrists. Clearly, joint use of the same officer has many advantages, particularly in the complicated field of child guidance.

For some years attempts have been made to clarify the

administrative relationship between the psychiatrist and the educational psychologist or, in other words, the relationship of the health department to the education department. Much of the child guidance work undertaken by local education authorities is an educational service closely linked with the school and the home. Thus the needs of many children who are maladjusted, whether to a degree which calls for their ascertainment as handicapped pupils or to a lesser degree, can be met by social and educational adjustments. Much of the work is carried out at the schools by educational psychologists and specially qualified social workers, in co-operation with parents and teachers. The educational, physical and psychiatric aspects of the work are, however, inseparable, and at the child guidance centres established by the local authorities the team of workers includes a psychiatrist and also, as a rule, a paediatrician. Some of the children will be found to need psychiatric treatment, and the Minister of Health, in agreement with the Minister of Education, considers that these children are the responsibility of the National Health Service and should be dealt with in the child guidance clinics provided by the Regional Hospital Boards. In order to avoid splitting the service it is hoped that there will be joint use of both staff and premises as often as possible. Such arrangements have already been made in many places, so that the child guidance centre under the local education authority and the child guidance clinic under the Regional Hospital Board act as one, with the same premises and staff but with financial adjustments.

In this article an attempt has been made to describe the administrative structure of the mental health services and to indicate to some extent how they may develop. The 1946 Act opens up new prospects, but it will not be easy to translate its provisions from paper to reality. There is too much to do and there are too few to do it. The mental health of the community must be maintained and improved, early treatment must be encouraged in out-patient departments and hospitals, and the care of the chronic patient and of the aged must be improved. Vision in planning, as well as more buildings and trained personnel, will be needed if there is to be an adequate, organized service integrated with other branches of medicine, yet remaining aware of its own particular problems.

<sup>3</sup> Ministry of Health (1948) *National Health Service Act, 1946. Provisions relating to the Mental Health Services*. His Majesty's Stationery Office, London.

## SOCIAL WORK AND SOCIAL WORKERS IN THE MENTAL HEALTH SERVICES

RUTH DARWIN C.B.E.

*Formerly Senior Commissioner, Board of Control*

- 1 Social care of the mentally disordered
- 2 Care of the mentally defective
- 3 Administration under the National Health Service Act, 1946
- 4 Training and qualifications of social workers
- 5 Future trends

The field of social work in mental health is a wide one and difficult to define; in effect, all social workers are to some degree concerned with mental health problems, and all need knowledge of human beings and human relationships as well as of social and economic conditions. In this article, however, discussion will be confined to the functions and training of those social workers employed under medical direction in the field of psychological medicine. Today this field is vigorously growing, and is certain of progress as a branch of social medicine, but in some respects the lines of future development are uncertain.

The immediate concern of this type of social worker is the care of those children and adults whose behaviour in the community is symptomatic of neurosis, psychological disturbance or disorder, or of mental defect. At the outset, it will clear the ground to classify the cases into two groups: those suffering from mental disorder, and those who are mentally defective.

### 1. Social Care of the Mentally Disordered

This group is a diverse one, ranging from the mentally unbalanced child, whose behaviour may be due to environmental causes, to the patient from a mental hospital still "under certificate" but living in the community. Many persons, not under psychiatric care, come to the notice of the psychiatric social worker because their behaviour gives rise to anxiety. Mothers attending maternity and child welfare centres whose babies show some difficulty in behaviour or development may be referred by the physician in charge to a social worker for home investigation. This may include observation of the mother's emotional attitude to the child, which may lie at the root of the trouble and need modification before the child's own difficulties can be resolved. In the case of children of school age suffering from educational or behaviour defects, home investigation and contact with parents may also be required. The family and social background of juvenile delinquents must also be studied, as well as their inherent mental abilities and abnormalities. Patients suffering

from neurotic and psychopathic disabilities may be referred to the psychiatric social worker by other social workers or agencies; ex-Service men and women often require help in meeting the problems of re-adjustment to civil life; employment agencies, welfare officers in factories, and general practitioners bring forward other cases. The role of the psychiatric social worker is to supply background information so that the position may be clarified and specialist medical advice secured if necessary. Finally, an increasing number of parents, relatives, and friends, as well as patients themselves, are now calling directly upon the mental health worker for help and advice. Preventive work of this kind is recognized as part of the health service of the country; it can be carried out only by social workers who are in close contact with the home and who are aware of the psychological issues involved.

In the psychiatric care of patients at out-patient clinics, the psychiatric social worker is one of a team consisting usually of psychiatrist, psychologist and social worker. She is required to form contacts with the patients and their homes, and acts as a liaison officer between the community and the clinic. In child guidance clinics her role is similar. The psychiatric social worker frequently persuades new patients to come to the clinic for help and advice; she is better able to do this if she herself is in attendance and can effect the introduction.

The services of the psychiatric social worker are called for when a patient is discharged or sent on leave from a mental hospital and, in the opinion of the medical superintendent, requires after-care. Her work here may consist of general rehabilitation in the community as well as adjustment of the patient's relationship with his family, his surroundings, and his employment. Preparing the way for the return to family life before a patient is discharged or sent out on trial is a further function needing skill and judgement; so also is the after-care given during the difficult stage of convalescence. Both these functions and the choice of guardians for homeless patients fit to live in sheltered conditions in the community are undertaken at the request of and in co-operation with a psychiatrist whose work is centred on a mental hospital or clinic.

The statutory duties in relation to the certification of patients under the Lunacy and Mental Treatment Acts, hitherto carried out by Poor Law officials, are now undertaken by officers authorized under the National Health Service Act, 1946; the great majority of these will be social workers. It is still too early to judge the results of this new provision, but there are obvious arguments in its favour.

### 2. Care of the Mentally Defective

The local health authorities are required to ascertain what persons living in the area are mentally defective and to provide care for them; social workers are mainly concerned with this ascertainment and with community care. Ascertainment consists of obtaining a medical opinion on the patient's mental condition and deciding whether he is "subject to be dealt with" under the Mental Deficiency Acts. The medical officer and the Mental Health Committee must depend largely on the social worker's knowledge of the defective's environment and behaviour in assessing need for care, training, or control. Local education authorities report the majority of mental defectives to the local health authorities. Others are referred by the courts, by the police, or by other agents, or

are brought by parents and friends because of behaviour difficulties. Ascertainment is the first step in forming a relationship between the social worker and the defective and his family; this may be continued over very long periods.

Defectives not requiring institutional care are usually referred to the social worker by the medical officer of health for supervision. They may be placed under guardianship if financial help or statutory control is needed. Relevant changes in the behaviour and circumstances of the defective are reported by the social worker. Effective supervision depends upon the social worker's relationship with the family; parents usually have to shoulder the full responsibility for their defective children and need the help which an experienced social worker can give. The social worker helps in finding suitable work, in the operation of recreational clubs, in protecting the defectives from their own weaknesses and from unfair treatment, and in securing training for children who have been rejected by the ordinary schools. Home training may be combined with supervision, and where attendance at an occupational centre is not practicable, the worker should be able to undertake the training of children singly or in groups, and to advise parents how to carry out instruction at home.

Mental defectives sent out on licence at the instance of the medical superintendent and the hospital management committee are referred to a social worker for supervision; they may be high- or low-grade patients, sometimes under care in their own homes but often living with an employer or a foster parent. Many are able to earn their own living and are looking forward to discharge; the period of re-adjustment to ordinary life is a critical one, and it is only by constant watchfulness on the part of the social worker that the inevitable ups and downs of rehabilitation are tided over. The duties of a petitioning officer in obtaining an order when a defective is sent to an institution or placed under guardianship under the Mental Deficiency Acts are often combined with those of a social worker.

### 3. Administration under the National Health Service Act, 1946

Following the pattern of this Act, an administrative division must now be made between those social services supplied by local health and local education authorities, and social work in connexion with the medical specialist services in hospitals, out-patient clinics, and neurosis centres. It must be emphasized that clinically the work is, of course, the same. The same qualifications are needed by workers in both services, and in most areas the local health authorities and Regional Hospital Boards are trying to co-ordinate the work by making joint use of the meagre supply of trained social workers at present available.<sup>1</sup>

The care of mental defectives, and the preventive supervision and the after-care of all types of mental patients, are responsibilities of the local health authority. These duties are usually delegated to a mental health sub-committee of the health committee and the work is carried out by a team of mental health workers under the direction of the medical officer of health. Hospitals, institutions and clinics are provided by the new Regional Hospital Boards and administered

by hospital management committees. Social workers are employed on the staff of mental hospitals and mental deficiency institutions; they also form part of the team employed in adult out-patient clinics and child guidance clinics and centres. There is considerable overlapping between the local health authorities and the hospital management committees, and this can be adjusted only by agreement between the two bodies; these can also delegate social work to voluntary bodies, such as the National Association for Mental Health, employing trained social workers.

### 4. Training and Qualifications of Social Workers

A committee appointed by the Minister of Health is at present considering the question of recruitment, training and qualifications of psychiatric social workers.<sup>2</sup> At the moment the only professional training for psychiatric social workers consists of a university course of one year in mental health, taken by those holding a social study diploma or other suitable educational qualification. The profession dates from 1928; at the beginning of 1948 there were some 300 trained psychiatric social workers. Of these, 93 were known to be working in mental hospitals and out-patient clinics, 94 in child guidance clinics or centres, 35 in other branches of mental health work and 33 in general social work, including administrative and university teaching posts.

Apart from the mental health course there is no standardized training for work with mental defectives, and employees of local health authorities and of mental welfare associations are therefore not equally equipped for their work. Many have reached a high professional standard of efficiency through practical experience and their own efforts, supplemented by short courses organized by the National Association for Mental Health; others, however, have remained in isolated positions without being given any opportunity for training.

The mental health courses at the Universities of London, Edinburgh and Manchester are planned to meet the needs of trained social workers wishing to specialize in mental health work and are supervised throughout by experienced psychiatrists and psychiatric social workers.

### 5. Future Trends

Increasing emphasis on prevention is a feature of the present-day development of the mental health services. Twenty years ago psychiatric social workers were employed in taking social histories in clinics and hospitals, and in boarding out patients: the work has now grown to a wider service of care in the community and is actively concerned with prevention as well as after-care. As a specialist, the mental health worker still takes her place in the team of psychiatrist, psychologist, and social worker. But in the capacity of an educationalist, and as a consultant to other social workers needing specialist advice, her services are extending in ever widening circles. At the same time other branches of social and educational work are feeling the need for increased psychological knowledge; it may be hoped that this will lead to the common basis of understanding needed by all social workers in attempting to relate human beings and their behaviour to their social and economic background.

## THE EDUCATION OF MENTALLY DEFECTIVE CHILDREN

ISABEL M. LAIRD M.A. B.Ed.

*Chairman, Association of Mental Health Workers*

*Formerly Inspector, Board of Control, England and Wales*

- 1 Education of higher grade defectives
  - 2 Training of low-grade defectives
  - 3 Function of the occupation centre
  - 4 Institutional care
  - 5 Value of special measures
- Select bibliography

The term "mentally defective children" will here be used descriptively to include girls and boys up to sixteen years of age whose capacity for benefiting by ordinary education is deficient by at least one-quarter, but by not more than two-thirds. At four years of age the defective child is mentally not yet three, at eight years of age mentally not six, at sixteen and thereafter mentally not over twelve years. This represents the upper limit: at the lower limit of the group will be children whose all-round mental capacity at four will be only one year and four months, at eight only two years and eight months, at sixteen and afterwards only five years and four months. However, no experienced worker would claim that available psychological tests allow such a rigid classification of feeble-minded and imbecile children. Further, practically all defective children, like most people, live at well below capacity level.

It should be noted, too, that the educational handicap must be primarily due to fundamental defect of intelligence, though it may be accompanied in some cases by physical illness, grossly impaired sight or hearing, personality disturbance, or sheer lack of normal opportunity for social development. The defect will persist throughout life, though in favourable circumstances the adult may, for many years after adolescence, show improvement in the use he can make of the skills and information acquired in youth and childhood. The group under discussion, in short, excludes at one end those who are merely backward or dull, and at the other those who are idiots or who border upon idiocy.

There are two points which should be made clear. First, there is still widespread confusion between the terms "mental deficiency" and "mental disease". The defective is not insane, though an occasional defective may become mentally ill in addition to his defect. Second, though the level of general intelligence is an important criterion in the educational placing of very backward children, in the case of certain high-grade defectives it may well take second place to social maturity rating or stability of temperament. High-grade unstable defectives usually require institutional care; whatever other therapy is given, educational facilities suitably adapted to the interests and intellectual level must be provided.

By education is meant any process of "educing" the skills, interests, and capacities each child may have, and assisting him to find a niche in the community life he shares. This education includes actual teaching of much that is taught normal children of similar mental age; much, especially in manners and behaviour, that belongs to children of similar physical age; and much, notably in the first five or six years of life, that average children absorb from the spontaneous interplay of environment and ripening interest.

### 1. Education of Higher Grade Defectives

In schoolwork, reading and writing will have a place, but not a compulsory place: these subjects should be pursued only where there is interest on the pupil's part and where the teacher believes that reading will be a likely hobby after schooldays, or where success will ensure later freedom from illiteracy ratings. Similarly, arithmetic should be restricted to the most practical types of counting, dealing with everyday weights and measures, handling money, and keeping score at games. Instruction in physical education and personal hygiene, lessons in general knowledge and music, the telling of stories, and activities such as gardening and craftwork can be adapted to the ages and abilities of the mentally handicapped. Teachers in charge of such classes should have special initial training, in addition to basic training in teaching, and benefit greatly by having refresher courses from time to time.

Older high-grade defectives should have pre-trade help, both in advice about employment and in practical classes for teaching the necessary skills. Some former pupils of "special schools"<sup>1</sup> will qualify for registration as disabled persons needing special training, or for sheltered conditions of employment. In less densely populated areas the pupils may have to travel to centralized classes; but in rural districts many are adequately catered for by the versatility of the local schoolteacher, and by the willingness of village folk to supervise and encourage the less able ones in their midst.

### 2. Training of Low-Grade Defectives

Mentally defective children are frequently thought of as ineducable. This is a negative description, and incorrect, unless education is thought of as only a matter of book-learning. But education includes more than this, and though deeply handicapped children may not be able to benefit from books, they are trainable and can master many things, including themselves, with surprising success in the right circumstances. Among happy imbecile children the range of individual differences is hardly less marked, to the casual view, than among normal children.

Training may be accomplished in three ways: at home, in centres and in institutions. Where the family, and especially the mother, can accept the defectiveness, the child can often be well cared for at home. Simple household tasks can provide a great variety of occupations which offer interest, exercise, opportunity for the increase of vocabulary, and a sense of usefulness and "belonging" which helps towards more mature behaviour. Such co-operation between mother and child slows down the work of the household of course,

<sup>1</sup> "Special schools" as defined by the Education Act, 1944, are "schools which are specially organised for the purpose of providing special educational treatment for pupils requiring such treatment and are approved by the Minister [of Education] . . ."—*Ed.*

but the time invested is worth-while. The defective child needs the company of his own kind, even at home; a family with a similar child should be sought for exchange visits, and in time, perhaps, exchange holidays. Attendance at a centre may be better still.

Wherever possible home care should be supplemented by home teaching; this provides for visits by the teacher fortnightly, weekly or oftener, and usually a parent, grandparent or sibling will help the pupil between visits. Home teaching may be a substitute for attendance at a centre; organized home teaching often leads to the meeting of similarly situated families, and this may lead to a willingness among parents to have joint classes in rotation at their homes.

The occupation centre should be an extension of good family life, rather than a refuge for outcasts from the orthodox schools. A centre should provide simpler environmental demands, and a slower pace of development and learning, though both these should be expected to continue to at least the age of fourteen, and to sixteen or even eighteen in some cases. Centres have been successfully run in a wide variety of premises; where the authorities have been genuinely enthusiastic, premises have usually been found or improvised.

The problem of staff is more difficult. Trainees should not, as a rule, be accepted before the age of twenty, and the first six months should be a probationary period. Previous experience with children is essential, though training for teaching is not required. It is important that the trainee have real expectation of enjoying the work, and of being acceptable to the children.

Training, of course, dates back to the days of Séguin and Montessori, but today courses of an intensive type are now available: the Royal Medico-Psychological Association conducts regular examinations upon the courses for mental deficiency nurses who wish to specialize in institutional care. For many years before the recent war the former Central Association for Mental Welfare ran holiday- and other short training-courses for the encouragement and initiation of staff. A one-year course is now given annually by the National Association for Mental Health for students from Britain, Eire and overseas. A similar course is being planned for a Scottish training college, under the Scottish Education Department. Refresher courses have long been popular, and have included visits from Britain to classes in Belgium, the Netherlands, and Denmark; there is in Britain an Association of Mental Health Workers, about half of whose members are engaged in training-work with the more severely mentally handicapped. Finally, there is the work of the fully-trained occupational therapists among high-grade unstable patients, where activity and teaching are primarily therapeutic and secondarily educational; Rampton State Institution is an example of this type of effort.

### 3. *Function of the Occupation Centre*

For senior pupils, activities should be fashioned after the routine of family life. The midday meal should, as far as possible, be planned, prepared, cooked and served with the help of the pupils; the use of meals delivered in containers, while convenient, involves a serious loss of training. The foundation of training consists of physical education, hygiene, handwork, speech training (including singing), and the recreation of stories and games, with some time for religious instruction and simple worship. The pupils may well share in

seasonal festivities, local shows, and such local and national efforts as savings campaigns and salvage collections. A successful centre will, in fact, take each child from his own starting point as far as possible in any direction of training.

Where numbers allow, a small nursery class will repay the additional effort. Very young defectives, especially of the mongolian type, often react to daily attendance at classes in a most encouraging way. However, the staff must be able and willing to give nursery attention, such as the superintendence of habit training, midday rest or sleep, and additional out-door activity. Some of the more stable and older girls at the centre can be very helpful working in the nursery under constant supervision. The day is past when a child had to be proved a failure in ordinary school over a period of years before he could get the type of training far better suited to him; the nursery section of an occupational centre should lay the foundations for the success of all the rest of the centre training. Children attending the centres will often not be able to travel alone; special buses, cars, or guides to escort pupils on public transport vehicles, are usually provided.

In an area in which both special schools and centres are provided pupils can transfer easily from one to the other. In Scotland the centres are by law included in the special school system, and recently procedure in England and Wales has been simplified to allow easy transfer, when needed, between ordinary and special schools. In some cases it is better for a more mature pupil of only centre standards in intelligence to attend the special school, while a timid, young, feeble-minded child could best start as one of the brightest pupils in a centre.

There have been isolated instances in Britain of a child being boarded out in a family, to be near a centre for training. The idea might be further explored, especially, perhaps, in the case of foster homes with a similar type of defective child. In one town a hostel was opened a few years ago for a group of suitable boys from the county institution, in order that they might attend the local occupation centre. As staffing and premises allow, this plan might be useful elsewhere. Needless to say, many children in institutions would benefit socially by living in a cottage, rather than in a villa in a colony.

The best arrangements for training the young will lose much of their value if some provision is not made for supervision to be continued into adolescence. Visits by a home teacher will encourage the pursuit of varied interests. Occasional reunions, merging into small clubs where feasible, have proved successful. Ensuring that ex-pupils of special schools and centres are not unnecessarily excluded from local youth activities will preserve for some of these boys and girls their hard-won social poise. Organized clubs, meeting only once or twice weekly in the winter months, make a genuine though unobtrusive contribution to mental health work. Full-time classes for youths and girls should be held wherever a centre exists. Home visits by qualified social workers, and sometimes by unqualified workers acting under skilled guidance, should be an integral part of the care of mentally handicapped persons not fit to be completely independent. To assess the eventual worth of centres and institutions it is necessary to keep and maintain records of progress.

Full-time employment is possible for some ex-pupils. There are good records of work in less skilled occupations, for example, in a biscuit factory; of steady domestic work in the maternity wards of a big hospital; and of good daily domestic work in private houses in a large number of cities where hostels exist for the girls. The value of some of the

more stable medium-grade defectives in the maintenance and utility services of large institutions and colonies can hardly be exaggerated. But, in all cases of employment, vigilance is needed to protect the mentally handicapped from exploitation, and to secure the full benefits allowed by legislation for insurances, or the partial rights individually assessed for his circumstances.

#### 4. Institutional Care

On the whole, children in institutions gain in physical care—they sleep better, have a better balanced diet, better nursing and medical attention. They also gain in having, as a rule, a playing field and a large hall, and sometimes a swimming-bath and gymnasium. When older, they have access to workshops and a great variety of activities within a colony. Larger institutions can provide more equipment as the cost, shared by so many, is proportionately less, and a greater variety of specialists can be employed.

Children in institutions, however, are the losers in those aids to development and stability which come from being loved and cherished as an individual by a small but permanent group of one's own kin. They also lose by lack of the everyday variety of any kind of family life, and by constant association with the same people of their own age-group and sex. They are weaker on general vocabulary, so that progress in reading and writing is slower. They tend to follow the behaviour pattern set by the institution; also, there is almost always too much of the "nursing" attitude to these young people who, though immature and slow, are not ill.

Institutions will always be needed, and more in every country than now exist. It is to be hoped that, some day, institutional workers of all types will have time for research and for keeping records of the work done and its results, so that the value of the widely differing routines may be compared.

#### 5. Value of Special Measures

Few would question that appropriately planned education and training will do much, perhaps all that can be done, towards the optimum development of the mentally defective individual. To those who doubt, however, whether such work is either necessary or helpful in a society planning for its own development, the following arguments are offered in support of the value of such work. When high-grade mentally handicapped children are taught in ordinary school classes they can seldom excel socially and never educationally; there is a steady and increasing sense of failure and uselessness; sustained effort is difficult for the growing pupil; he may become increasingly irritable in school, and turn to social misconduct or even crime. Such reactions are then regarded as signs and symptoms of inherent mental defect, instead of the results of inadequate provision for mental handicap. Where

suitable care and training have been provided, however, they can produce many useful and contented citizens, of one-half to three-quarters normal intellectual development but nevertheless able to carry out steady jobs and even become self-supporting within the resident colony or community.

High-grade defectives who do not make good are expensive failures; yet some of the instability of these children and adolescents is amenable to treatment. It is perhaps understandable that child guidance clinics have usually not been prepared to do more than diagnose the mentally deficient; stress has chiefly been laid on intensive analytical work with a fully co-operating patient. But play-therapy techniques of less rigid pattern have aided numbers of children, both of normal and impaired intelligence, and these techniques undoubtedly provide a means of therapy for worried or restless children with mental defect.

Only careful training can save low-grade children from steady deterioration towards levels of idiocy; they will require casual or, better, organized supervision throughout their lives. This will usually involve institutional care at some time. The task of nursing mentally defective persons can be needlessly boring, distressing, or even repulsive; it can never be easy, but it can be rewarding where training is fully encouraged.

In most countries the defective child is excluded from school, and the unemployable adolescent and adult remain at home. Aids to mental health are here imperative. Parents, especially mothers, are heavily burdened by the care of a defective child; the long, rather hopeless, extra years of feeding, dressing and undressing, supervision and teaching, and the constant effort to induce more tolerance among brighter siblings, all make life unusually hard. Help is needed in meeting the questions of growing brothers and sisters as to whether the condition of the defective is a punishment, "catching", or hereditary. Even those who know intimately a family with one defective child do not always fully realize the anxiety endured by the other children if their worries are not discussed with them.

The continuity of training of the mental defective is dependent upon community interest, and education of the general public will do much to assist this. Far too many half-finished projects have marked research work in mental deficiency. Teaching and training are only one aspect of the field; the causes of mental deficiency, and in some cases its prevention, should call for at least equal interest and research. Finally, many who work among defectives have come to find new criteria for happiness and contentment, and to realize that high intelligence, specific abilities, and knowledge and appreciation of world affairs are not fundamental but only relative criteria. The example of contented, useful defectives shows the importance of balancing the calls of environment against the capabilities of individuals, and the even greater importance of developing personal rather than intellectual factors.

The care of men and women suffering from nervous and mental disorders, but living free from restraint in their own homes, had its origin as a charitable and religious service. The individuals who undertook this care necessarily lacked a clear conception of the nature of these disorders or sufficient knowledge to see beyond the immediate need of the patients. After the foundation of the big mental hospitals in the 19th century, the difficult transition between the patient's life in hospital and his return home was to some extent eased by small voluntary homes—such as those established by the Mental After-Care Association, which began work in 1876—where recovering psychotics could live for a while, relatively free from the restrictions of the hospital but without the responsibilities of normal life.

The Central Association for Mental Welfare, formed in 1913, was a pioneer of the care by trained social workers of mental defectives in their own homes or in foster homes. Twenty years later the emergence of the new profession of psychiatric social worker made possible the extension of this idea to other classes of patients suffering from mental ill-health. The emphasis in this psychiatric social work was at first mainly on history taking and manipulation of the environment, but has gradually shifted, via interpretation of the social situation, to the role of the social therapist.

At the outbreak of war in 1939, after-care of patients by psychiatric social workers was undertaken in a few mental hospitals. Such after-care included the preparation of the patient's family for his return to normal life and visiting him at intervals after his discharge to help with the problems then arising. This work had so proved its value when undertaken by trained people that, when later large numbers of men and women were being discharged from the fighting Services for psychiatric reasons, often after less complete treatment than would have been possible in civil life, the Ministry of Health in January 1944 commissioned the National Association

for Mental Health to establish the Ex-Services After-Care Scheme for psychiatric casualties, under the general guidance of the Board of Control.

### 1. Ex-Services After-Care Scheme

This scheme, now known as the Mental Health Community Care Service, was a natural development of the concept of after-care and also, in several respects, a bold innovation. It deserves attention, as it is the only large-scale experience of modern community care yet available in Great Britain.

The Community Care Service has many novel features: for example, it has accepted all classes of psychiatric disorder; the patient's participation is entirely voluntary; it is nation-wide, but organized regionally, without close identification either with local authorities or with mental hospitals; it has been developed and operated by psychiatric social workers with a minimum of direction; circumstances have dictated the employment of teams of general trained social workers under the direction of a psychiatric social worker; and the Service has obtained in most districts the closest possible co-operation with other case-work agencies and with the Ministries of Health, Pensions and Labour.

There are approximately 15 psychiatric social workers and 37 assistants working from 20 offices, organized in regions corresponding to the Civil Defence regions. Provision has nowhere been adequate but the greatest demand has been found in those areas where it is most nearly so. Generous establishments of secretarial help and of transport are important requirements for successful operation.

### 2. Sources from which Patients are Referred

At first, patients about to be discharged from Service psychiatric hospitals, and later also those discharged under a psychiatric diagnosis from Service general hospitals, were asked if they wished to enter the scheme, the purpose of which was explained to them. On the average about one-quarter agreed, and these were visited by a worker from the scheme just before they left hospital, again at home about a month later, and thereafter as necessary. The success of after-care depends to some extent on the manner in which the first explanation in hospital is given and on the skill with which the first contact is made by the social worker.

As the reputation of the scheme grew, ex-Service patients discharged before the scheme was introduced started applying for help; but whereas the earlier patients had had a recent psychiatric investigation, the last-named had either no medical report or else an out-of-date one. This marked a significant change in the orientation of the scheme. After the end of the war, civilians came forward in increasing numbers and their right to receive help was conceded 2½ years after the start of the scheme. An important factor influencing their application for help seems to have been the reputation enjoyed locally by the social workers, for these patients usually had had neither medical nor psychiatric examination. Hence in 2½ years the scheme had progressed far beyond its original main purpose of after-care for ex-Service personnel.

The routes by which patients come for help (Table I) may indicate to some extent the value set on such a social service by the community. Coincident with the increased civilian entry and with greater local knowledge of the scheme, the proportion of "spontaneous" cases in the case-load is increasing rapidly. Less than half the patients are sent by doctors and hospitals and this proportion tends to decrease.

\* Since this article was written, administrative changes following on the introduction of the National Health Service have affected the position of this voluntary Association, so that the scheme here described is no longer functioning as an organized whole. It is hoped, however, that the useful work done by such voluntary organizations will be maintained.—Ed.

The Ministry of Labour and the voluntary agencies make up the remainder. These figures might reflect lack of knowledge of, or of confidence in, community care among doctors. Alternatively, it may be that many of the problems occurring are not regarded by the public as being within the sphere of the doctor; if proved, this would be a fact of medico-social importance.

**TABLE I. SOURCES FROM WHICH PATIENTS WERE REFERRED**

(September 1947—March 1948)

Sources	(a) Percentage of patients not referred directly from Service hospitals (3,780 patients)	(b) Percentage of the total case-load (6,639 patients)
Service hospitals under the Scheme ...		46.1
Private doctors and local authority medical services ...	32.9	20.6
Service and Emergency Medical Service hospitals ...	5.3	
Ministry of Pensions ...	4.9	
<i>From medical sources ...</i>	43.1	66.7
Patients, relatives or friends ...	20.7	11.8
"Spontaneous" ...	20.7	
Ministry of Labour ...	15.9	10.9
Official Services' Welfare ...	0.3	
Probation officers ...	2.6	
<i>Official social services ...</i>	18.8	
Voluntary social service organizations	12.7	9.9
Voluntary Service welfare organizations ...	4.6	
<i>Voluntary social services ...</i>	17.3	

Column (a) shows the percentage of patients who entered the Scheme from predominantly civilian sources (3,780 patients), i.e., excluding all patients sent direct by Service hospitals under the Scheme.

Column (b) shows, for comparison, the proportions of the main sources to the total case-load for the same period (6,639 patients).

The scheme accepted 14,500 patients in its first four years and on 25 March 1948 there were 4,277 patients in receipt of active care. Sex distribution was normal, i.e., women formed less than 10 % of Service cases and about 48 % of the civilian entry. In the four successive six-month periods from their first admission the proportion of civilians was 3, 8, 17 and 27 %, respectively, of the total case-load. Social classes among the civilian entry were normally distributed, except that there were fewer than might have been expected from among the lowest-income group. This suggests that there is a threshold in cultural standards below which a voluntary service of this type has less appeal, and so is less useful.

With no available standards for comparison, the optimum intensity of service is unknown. Active cases have, on the average, some form of consultation nearly four times in six months. Each social worker gives about 80 items of service

per month, taking about 130 cases in a six-month period (including closure of cases). It is thought that a current case-load of 80 is the maximum desirable for one worker in a well-populated district, with fewer in rural areas.

### 3. Classification, Types of Problems, and Disposal of Patients

*Classification.* In spite of the many sources from which cases are referred and the varied types of problem found, about 90 % of patients are susceptible to medical classification, and the remaining 10 % includes recent arrivals not yet sent for consultation. The relative proportions of neurotics and psychotics have remained practically unchanged for two years, and have not significantly altered with the larger civilian entry. The figures for the older-established general case-work of the National Association for Mental Health, which are given for comparison (Table II) show the differences in distribution of problems experienced by an agency well known for its work among mental defectives, for educational and foster-home placement of children and for general advisory services. The proportion of mental defectives dealt with by the Mental Health Community Care Scheme is no doubt reduced by the prior provision of facilities by the voluntary associations for mental welfare.

**TABLE II. MEDICAL CLASSIFICATION OF PATIENTS IN THE SCHEME**

A comparison with the figures of the National Association for Mental Health (N.A.M.H.)

Classification	(a) Percentage of total case-load of the Scheme (6,639 cases)	(b) Percentage of general case-work of the N.A.M.H. (2,484 cases)
Neuroses (including many types) ...	39.8	32.3
Psychoses ...	29.9	12.3
Mental deficiency ...	5.3	16.9
Psychopathic personality ...	7.3	—
Organic diseases (including epilepsy and post-traumatic cases) ...	7.3	3.3
Maladjusted children ...	—	5.6 (epilepsy)
Educationally subnormal children ...	—	2.0
Unspecified ...	10.8	21.9

Column (a) refers to the total case-load from September 1947 to March 1948 (6,639 cases).

Column (b) refers to the total number of new cases received by the National Association for Mental Health during the same period (2,484).

The method of classification in the two columns differs somewhat: in particular, children are not shown separately in column (a). "Unspecified" includes recent entrants not yet diagnosed and also a proportion of those who seek help for a vaguely felt need rather than for a defined reason.

*Types of Problems Encountered.* The assessment by the social worker of what is really the main problem in each case (Table III) may be little better than arbitrary but, with caution in interpretation, an indication of the main causes of difficulty may be obtained. In nearly 40 % of cases there are two or more co-existent difficulties, and in 27.5 % the problem cannot be specified, most of the latter being referred because of a general inability to get on without supervision and help.

**TABLE III. TYPES OF PROBLEMS ENCOUNTERED**  
(September 1947—March 1948)

Main problems or combinations of problems	Percentage of total case-load (6,639 cases)
Mainly medical problems ... ..	25.3
Medical and employment problems ... ..	13.2
Medical and domestic problems ... ..	5.2
<i>Medical problems an important factor</i> ...	43.7
Mainly domestic problems ... ..	2.8
Domestic and medical problems ... ..	5.2
Domestic and employment problems ... ..	1.5
<i>Domestic problems an important factor</i> ...	9.5
Mainly employment problems ... ..	7.9
Employment and medical problems ... ..	13.2
Employment and domestic problems ... ..	1.5
<i>Employment problems an important factor</i> ...	22.6
Medical, domestic and employment problems ...	55.9
Mainly housing problems ... ..	1.6
Other combinations of problems ... ..	14.7
For general supervision (including those with no specific problem) ... ..	27.5

"Medical problems" are those arising directly out of the patients' psychiatric condition; "domestic problems" include marital and family difficulties, and "employment problems" difficulties in finding and keeping suitable employment. It will be noted that in each main group the percentages of combined problems include problems in other groups. The table serves to show the main problems and where they overlap.

As might be expected, the most important factor is medical (43.7%), with employment difficulties second (22.6%), and domestic troubles third, with only 9.5%. The last figure does not fit in with the emphasis now laid on marriage problems as both a cause of, and a sequel to, emotional maladjustment. Again, the insignificance of housing as a problem (1.6%) may

**TABLE IV. DISPOSAL OF PATIENTS**

Action taken	Percentage of total case-load (6,639 cases)
Referred to out-patient psychiatric clinics ...	18.9
Admitted to Emergency Medical Service Neurosis Centre ... ..	2.5
Referred to Ministry of Pensions for consultation	0.6
Admitted to mental hospital:	
voluntary patients ... ..	6.4
certified patients ... ..	2.9
for observation ... ..	0.6
Refusal by patient or relatives to co-operate in seeking consultations ... ..	6.0
General supervision by social worker ... ..	62.1
New cases admitted during period under review	35.1
Cases closed during period under review ...	35.5

The figures refer to the total case-load for the period September 1947 to March 1948 (6,639 cases). The number of cases being actively dealt with at the beginning of the period was 4,521.

cause surprise, though it may be that cases in trouble over housing go elsewhere for help.

It should be noted that no patient is, or should be, referred to the scheme solely because he is in need of financial relief, and this aspect of social work has been small in the scheme: only 4.4% have had financial assistance procured for them in the period under review.

*Disposal of Patients.* A bird's-eye view of activities under the scheme can be obtained from Table IV, but its exact significance is to some extent a matter of speculation.

The amount of out-patient psychiatric treatment is less than might be expected. In almost every district the social workers report that clinics are inadequate in number and relatively inaccessible to the more distantly placed patients, and are frequently so pressed that they provide little more than a diagnostic service. This combination of circumstances must tend to depress treatment figures.

The proportion of patients in the scheme admitted to mental hospitals (10%), compared with that of known psychotics under care (30%), suggests that the scheme is gaining valuable experience in the social supervision of chronic and recovering psychotics. It is evident that the scheme's main contribution is social care and help, but every case is now subject to review periodically by a psychiatrist.

*Co-operation with General Practitioners.* In the year under review there has been more contact with the patients' own doctors than previously: from September 1947 to March 1948 local doctors were consulted in respect of 33.6% of the case-load (new admissions for the period being 35.1%).

*Employment of Patients.* About 54% of patients are gainfully employed (Table V), mainly through their own efforts. They are far from being helpless or a dead loss to the community. The current return of 3,655 patients in employment gives 76 occupations, including two doctors, many other professional people, skilled and unskilled tradesmen, labourers, and even one neurotic man employed as a lion-tamer!

**TABLE V. PROPORTION OF PATIENTS EMPLOYED**  
(September 1947—March 1948)

Diagnosis	Employed (%)	Unemployed (%)	Not known (%)	Total (%)
Neurosis ... ..	25.1	9.3	5.0	39.4
Psychosis ... ..	15.3	12.4	2.1	29.8
Psychopathic personality ... ..	4.2	2.1	1.0	7.3
Mental deficiency ... ..	2.1	2.7	0.5	5.3
Organic disease ... ..	3.0	3.3	0.7	7.0
Unspecified ... ..	4.0	5.0	2.2	11.2
Total ... ..	53.7	34.8	11.5	100.0

These figures refer to the total case-load for the period September 1947 to March 1948 (6,639 cases). 187 patients changed their jobs during the period and are recorded twice, thus causing minor variations from Table II. The group of organic diseases includes a high proportion of elderly people, and that of the unspecified a high proportion of children and of members of the "social problem" group.

As might be expected, neurotics have a higher employment rate than psychotics. Medical unfitness for work accounts for 52% of the unemployment, and lack of suitable work for only 10%. Among those classified as unemployed are housewives (12%), children (8.7%) and students on training courses (8%).

#### 4. Duration and Results of Community Care

It is impossible to apply reliable criteria of improvement or deterioration, or to interpret with any confidence the alterations due to environmental chance. Usually patients are retained on the active list until they no longer need help and if they break away in dissatisfaction their case is not closed until it is certain they will not return. A few cases are closed because it is found impossible for the social workers to give help—as in the un-co-operative group described below.

The training of psychiatric social workers does not normally envisage responsibility for closing cases, and recently the employment of consulting psychiatrists has eased difficulties in this matter to some extent. As a result of this and of increasing experience all round, the proportion of cases closed during the last two six-month periods has risen from the previous level of 21.5 % of the case-load, to 29 % and then to 35.5 %.

Patients showing deterioration remain with the scheme as long as a useful purpose is served or until their condition necessitates hospitalization. Apart from those who remove or die, the remaining cases are closed as improved, i.e., able to get on in life without social help. There have been 3 or 4 cases of suicide and one of murder per year; in every case, except one living remote from a social worker and therefore inadequately supervised, the patients were under direct medical care at the time of the tragedy.

It appears that two years is a reasonable time for a patient usefully to remain with the scheme, except for a small group of mildly incompetent permanent cases who can be kept socially stable with a minimum of supervision.

From the outset about 8 % of patients, although entering the scheme voluntarily, have persistently refused to accept advice, or in some other way have defeated the efforts of the social worker. They do not, however, disappear, but return again and again for the advice and help they will not accept. This constant phenomenon deserves more exact study.

#### 5. Role and Qualifications of Social Workers

The Mental Health Community Care Scheme has developed rapidly in many directions from its origin in the After-Care Scheme. Its success lies in its several distinctive contributions to social casework, the clinical aspects of which have been fully described elsewhere (Goldberg, 1947).

When cases come from other than medical sources, the community care social worker cannot avoid having some diagnostic function. As a first step, there is an Advice Bureau—telling enquirers how and where to get help; but after this, and more profoundly, there is assessment of the urgency of a case and application of “psychiatric first-aid”, that is, overcoming doubts and hostile attitudes, and preparing the patient and his relatives for psychiatric investigation, all of which tasks require skill and confidence.

After psychiatric consultation the social worker may merely have to follow medical instructions, though even this may call for great ingenuity and patience. Usually much more is required of her; at the least she must receive and keep the patient's confidence; more probably she will become a general guide, philosopher and friend, and in some cases a parent figure. Without encroaching on the doctor's position she must fulfil her function of social therapist.

The psychiatric social worker's most important function is to consider the case as a whole. She must be competent to

deal with medical, psychiatric, sociological and economic aspects alike; whereas nearly all other agencies (including doctors) have a marked tendency to view the case in the light of their own special interest. In exchange for specialist advice, the worker brings the significance of the social situation to the psychiatrist's attention, acting, if required, as an intermediary between him and other social agencies. She attempts to interpret the patient's own state to himself and to explain his special problems to his family, his employer and his friends, while helping the patient to meet the demands made on him by the community. Such activities will involve the co-ordination of other social agencies which otherwise tend to deal in piecemeal fashion with only those symptoms which concern them.

In attempting to execute a planned withdrawal of support from a recovering patient—a lesson learnt from psychoanalysis—community care is perhaps unique among social agencies. The management of the patient's slow and difficult return to independence is the social worker's most difficult task.

An attempt to conduct such a service with untrained or partially trained personnel might lead to disaster. Ideally, only psychiatric social workers holding a Mental Health Certificate would be employed, but there is probably a useful function for teams of experienced assistants with social science diplomas, each working under the personal supervision of a psychiatric social worker. Social work demands a broad general education and wide sympathies, without which it is apt to become merely technical and sterile.

There is general agreement that social workers should possess a “suitable personality”, but there is great dispute as to what this is and how it can be selected. A proved ability to handle the patient's attachments wisely is a *sine qua non*, and this cannot be implanted merely by training. The work calls for male as well as female social workers of good education, and the present standard of salaries is a great obstacle, particularly to the recruitment of men.

#### 6. Other Aspects of Community Care

In addition to general psychiatric case-work, as described above, and to the “follow-up” of ex-hospital patients, Mental Health Community Care should include other provisions: e.g., boarding out of mental patients in private homes, as in New York State, or in villages as in Belgium; working hostels for mental defectives, chronic mild psychotics, severe neurotics, epileptics, etc.; sheltered workshops for mentally disabled persons, combined with social supervision of living conditions; home occupations; and vigorous preventive measures, educational, medical and social, through advice bureaux and guidance clinics.

In the opinion of most social workers engaged in mental health community care, the inclusion in their duties of the ascertainment of mental illness and defect—which may often result in certification—is likely to embarrass their relations with the public to such an extent as to be a serious handicap.

#### 7. Factors Influencing Success

To epitomize the experience of the Ex-Services Scheme: it appears to be important that a Mental Health Community Care Service should be so accessible to the public that every potential patient, or relative, knows (or can easily find out) where to go for help, without having far to go or long to wait.

# THE PRESENT POSITION OF MENTAL NURSING IN ENGLAND

OLIVE F. GRIFFITH S.R.N.

*General Nursing Council for England and Wales*

- 1 The work of the mental nurse
  - 2 Recruitment and training
  - 3 Indications for future training
- Reference  
Select bibliography

Mental patients form a mixed group, ranging from the frankly psychotic, the psychopathic and the mentally defective to those suffering from neuroses and psychosomatic disorders. It is obvious, then, that what a patient needs from a mental nurse will vary. The psychotic and mentally defective may require full-time care in an institution; the neurotic may well be able to care for his own bodily needs but requires intelligent appraisal and guidance in dealing with his emotional requirements. The psychopath requires what is for him the most unpleasant medicine of all, discipline.

## 1. The Work of the Mental Nurse

The work of the mental nurse will thus vary according to the type of patient cared for. In a private hospital there will be a demand for better amenities—hot water to be fetched to private rooms, clothes to be marked, more time to be spent on serving meals, and so forth. A public hospital, because of the large numbers of patients to be served, requires concentration on seeing a large number of patients through the toilet room, and on getting them dressed, sitting at table, and served promptly with a meal which has to be cleared quickly so that the day's work can be continued. Twelve new patients in an admission ward will require more detailed observation

and care than 120 patients of long standing who are able to be at work about the hospital most of the day. In a neurosis unit a nurse may gain enough experience to participate actively in the psychiatric treatment directed by the doctor, but not enough experience of acute illness to be able to deal with a sudden outburst of psychotic behaviour.

Specialization in the mental hospital has been necessitated, even encouraged, by the shortage of nurses and reduction in their working hours; occupational therapists, physical training instructors, domestics, porters and others now share the load previously carried by the nurses alone. While in some ways this has relieved the weight of work, it has to a certain extent narrowed its range and interest. Occupational therapy, for instance, could well be considered a form of nursing treatment, but it is not usually left to the nurse to carry out.

## 2. Recruitment and Training

Should a mental nurse be trained to deal with all types of patient and carry out all types of treatment, or should specialization in dealing with one or two types be encouraged? That is, should training be professional and based on principles which can be applied in any circumstances, or should it be empirical, learned by daily experience, and accordingly limited in scope? The type of training it is possible to give will depend to a large extent on the quality of the recruits available to take up the work; the training must, to some extent, be fitted to the available students. Nurses who are to hold higher posts, supervising and directing the work of others, and participating in the management of the hospital, need a type of training wider in its scope than is available today.

In the past there was a steady flow of stable people of average intelligence to work as mental hospital nurses. Recruitment was mainly from the locality around the hospital; there were villages where most of the inhabitants worked at the hospital in one capacity or another, and brought up their families to do likewise. During the economic depression of the 1920's, mental nursing offered a steady, comparatively well-paid job, with a pension. The hospital authorities were able to choose the best from a number of applicants, and these recruits were willing to work hard to qualify; old lecture registers show good attendances and good examination results. These figures fall off after the early 1930's when other employment became more attractive and more readily available.

## COMMUNITY CARE

*Continued from page 210*

Ideally there should be an "over the counter" service on demand, as well as interviews or visits by appointment. Letters of introduction should never be insisted on, though they may be useful for conveying a case-history to the worker. There must be no irritating delays while questions of settlement or entitlement are argued.

Applying for advice or help should be to the patient a step even simpler than going to see his own doctor; it must commit him or his relations to nothing. Advice is later taken and help accepted only with the free consent of the patient. It would seem wise that the service be not conducted by the local mental hospital as part of its avowed activities; and, more emphatically, that certification be not undertaken either on the same premises or by the same personnel as community care.

Any leakage of confidential information, especially in small country towns, is disastrous and all staff, including clerical, must realize the necessity of absolute discretion. The fewer staff changes in all grades, the better for the service.

The service should be highly skilled; only trained, experienced social workers of known stability of personality should be employed. Each case should ultimately come under the personal responsibility of a psychiatric social worker who is herself in regular consultation with a psychiatrist.

The best demonstration of the effectiveness of a Mental Health Community Care Service is the extent to which it is freely used by the community it is designed to serve.

## REFERENCE

Goldberg, E. M. (1947) *J. ment. Sci.* 93, 374

During and since the war the attractions of factory work have made it difficult for mental hospitals to secure recruits. Mental hospitals are often situated in remote villages, with no labour-saving devices and infrequent transport, and the work required is inherently difficult and sometimes distasteful. Certain trends in the structure of the population have also tended to reduce the number of recruits available for nursing; the school-leaving age has been raised from 14 to 15 years (and will eventually be 16), the average age of marriage for women has fallen from 26 in the 1920's to 24 today, and with the general improvement in wages and employment throughout the country, fewer married women have had to go to work (Hubback, 1947).

In line with the development of the nursing profession as a whole the highest ranks on the female side were, before the war, filled by experienced women with both general and mental training. The men did not become doubly qualified in the same numbers, because there were fewer general hospitals willing to take male student nurses; also if a man took general nursing training he earned a much lower salary during this period and lost those years of contribution towards a pension. There was little incentive for men to make the sacrifice, since promotion was by seniority and not by qualification.

Since the war, men who had had good nursing experience in the armed forces and elsewhere have been given the opportunity of completing their general training in one year instead of the three normally required, and many more general hospitals have taken male nurses as students. Promotion of male mental nurses now depends on their holding the double qualification, and as competition for promotion is keen the younger men are making every effort to qualify. On the other hand, owing to the shortage of staff in the general hospitals, female nurses who went to them from mental hospitals for general training are staying on; there is great anxiety over the dearth of suitable doubly-qualified female nurses for the higher posts in mental hospitals. There is also a shortage of female staff nurses, and whereas the teaching of mental nurses used to be carried on by female tutors, it is now increasingly difficult to find suitably trained women, and male tutors are increasing in numbers.

At the same time there is a universal complaint that the quality of recruits has fallen, as well as their number. New nurses are less stable and less well educated than they were 20 or even 10 years ago. As a result they cannot or will not study, and show great reluctance to train and take an examination. When the time comes, many leave rather than take even the preliminary examination.

The employment of part-time workers has temporarily enabled hospitals to continue their work, but the seriousness of the situation is shown by the fact that in some cases the number of part-time workers is double the permanent staff.

At present, some of the part-time workers are trained mental nurses who have married and settled down near the hospital; but it is clear that this source of trained staff will shortly be exhausted.

### 3. Indications for Future Training

To meet this situation it follows that more attention must be paid to the ability and interests which recruits to mental nursing show. They can no longer be compelled to study, so the classroom work will have to be presented in a more stimulating way, and be more closely related to the work they are doing day by day, so as to maintain their interest. If the prevailing phobia about examinations persists, there will have to be some other way of assessing the practical abilities which the nurses show in their work. In short, as things are at present, an empirical rather than a professional training is required for the great majority of our recruits. Further, as so many of the female staff now work only part-time, experience should be assessed, not so much in terms of length of service, but in terms of capability, so that whatever recognition is given to practical experience is available to part-time as well as full-time workers.

Nurses who are to hold the higher posts, supervising and directing the work of others and the management of the hospital, will need a type of training wider in its scope than that available to nurses today. At present we have only one level of training for mental nurses, and that was designed to suit the average. Most of our recruits are failing to reach even this standard, while the few really able ones are bored by it, and we are losing some of these potential leaders by failing to provide sufficient scope and interest for them.

The training of the mental nurse should not be planned in isolation from the psychiatrists and other grades of worker; all should work together. Too often the psychiatrist takes a good nursing service for granted and does not feel it a part of his work to help in stimulating and maintaining the nurses' interest and co-operation. In these circumstances, the nurses often fail to understand what is required of them, with the result that the nursing is often less efficient than it could be.

In future, it may be necessary to give appointments previously held by women to male nurses; if this is not done, it would seem that in a very few years the female patients in our mental hospitals will be cared for by partially trained nurses or untrained domestic workers.

At present there is still a lingering stigma attached to anything connected with the mentally ill. Until this is removed and mental nursing is considered a profession of which anyone might be proud, the shortage of staff will continue, the work of the psychiatrists will be hampered, and lastly and most important, the patients will not get the care they need.

## BRITISH ORGANIZATIONS CONCERNED WITH MENTAL HEALTH

DEREK RICHTER M.A. Ph.D. M.R.C.S.  
L.R.C.P.

*Director of the Neuropsychiatric Research Centre  
Whitchurch Hospital, Cardiff*

*Hon. Lecturer in Neuropsychiatry in the Welsh National School of  
Medicine*

Voluntary bodies have played an important part in the development of the existing mental health services. In promoting the study of mental health and providing for the training of mental health workers, as well as in encouraging research and fostering new experimental methods of treatment, they continue to fulfil an essential role in the mental health activities of this country.

The main burden of caring for the mentally sick is borne by the mental hospitals and by the psychiatric out-patient departments attached to the general hospitals, which are now included under the National Health Service. A few of the general hospitals run clinics for child guidance, speech therapy and similar work; but many of the clinics providing special forms of treatment, as well as the maternity and child welfare centres, are still in the hands of voluntary bodies.

The following list of organizations includes most of the main bodies in Great Britain primarily concerned with mental health; but the list is not exhaustive, for it would be possible to name many other organizations, such as those under the auspices of the various religious denominations, which take an active interest in mental health. Individual mental hospitals and institutions primarily for treatment are not included, nor has it been possible to include more than a few of the educational and social organizations which are engaged in activities related to mental health.

**Association for Education in Citizenship, 51 Tothill Street, London, S.W. 1**

The object of the Association is "to advance training in citizenship, by which is meant training in the moral qualities necessary for the citizens of a democracy, the encouragement of clear thinking in everyday affairs and the acquisition of a knowledge of the modern world." The methods used include the publication of books and pamphlets. Conferences are arranged and speakers are available. An information service is maintained and research is carried out.

**Association of Mental Health Workers, 39 Queen Anne Street, London, W. 1**

This Association promotes the work and status of those engaged in mental health activities.

**Association of Occupational Therapists, 251 Brompton Road, London, S.W. 3**

**Association for Promoting Employment of the Mentally and Physically Defective, 39 Lillie Road, London, S.W. 6**

The Association is concerned with obtaining employment for the mentally and physically defective in London.

**Association of Psychiatric Social Workers, 1 Park Crescent, London, W. 1**

The Association seeks to promote the study of psychiatric social work and to maintain the status of workers engaged in this field. It publishes the *British Journal of Psychiatric Social Work*.

**Aylesbury After-Care Association**

Now the Women's and Girls' After-Care Division of the Central After-Care Association, *q.v.*

**Biochemical and Endocrinological Research Department, Bristol Mental Hospitals, Fishponds, Bristol**

Research is carried out, mainly by biochemical and endocrinological methods, on scientific and clinical problems related to the nervous system.

**Board of Control, 32 Rutland Gate, London, S.W. 7**

The Board of Control was established by the Mental Deficiency Act, 1913, and reorganized by the Mental Treatment Act, 1930. It consists of a Chairman and not more than five Senior Commissioners. The Board's functions comprise the powers and duties conferred on them by the Lunacy and Mental Treatment Acts, 1913-1938, as amended by the National Health Service Act, 1946. The Minister of Health is responsible to Parliament for the work of the Board of Control.

**Borstal Association**

Now the Borstal After-Care Division of the Central After-Care Association, *q.v.*

**British Council for Rehabilitation, 32 Shaftesbury Avenue, London, W. 1**

The Council is a co-operating and co-ordinating body concerned with the treatment, training and resettlement of all disabled persons. The Council set up two specific activities in 1948—the Preparatory Training Department to provide training for long-stay hospital and sanatorium patients, and the National Association for the Paralysed to deal with the welfare of the paralysed.

**British Institute of Management, 17 Hill Street, London, W. 1**

The Institute seeks to encourage the study and application of scientific methods of management, particularly in industry; it is concerned with factors affecting conditions of work and the relationship between employers and employees.

**British Psychological Society, Tavistock House South, Tavistock Square, London, W.C. 1**

The Society "exists to promote the advancement of the study of psychology and its applications, and to maintain high standards of professional education and conduct." The journals published include: *British Journal of Psychology* (General Section), *British Journal of Psychology* (Statistical Section), *British Journal of Medical Psychology*, and *British Journal of Educational Psychology*. A selection of current journals on psychology and related subjects is available in the library, which is situated in the Senate House, University of London, W.C. 1.

**British Rorschach Forum, c/o Tavistock Clinic, 2 Beaumont Street, London, W. 1**

The Forum is an independent body designed to safeguard professional standards in the use of the Rorschach test, to provide interchange of ideas among members, and to encourage research. Its constitution provides for Fellowship and Membership. Fellowship is confined to those of senior status among psychologists and psychiatrists, and implies ability to teach the method.

**British Social Hygiene Council, Tavistock House North, Tavistock Square, London, W.C. 1**

The Council promotes the application of biological knowledge to social problems, e.g., population trends, sexual promiscuity and prostitution.

**British Society for Research on Ageing, c/o Department of Physiology, The University, Oxford**

Meetings are held at which scientific papers are read and research on ageing is promoted.

**Burden Neurological Institute, Stoke Lane, Stapleton, Bristol**

The Institute is mainly concerned with research on scientific and clinical problems related to the nervous system. There are laboratories for work on electrophysiology, endocrinology, biochemistry and physiological psychology. Electroencephalographic research is carried out and a course is arranged for the training of electroencephalograph operators.

**Central After-Care Association, England & Wales**

This Association was appointed by the Secretary of State for the Home Department under the relevant provisions of the Criminal Justice Act, 1948, to undertake the supervision of persons conditionally released from Borstal training, corrective training and preventive detention and of young prisoners released on licence from sentences of imprisonment. It is also the society approved by the Secretary of State to receive information of the addresses of persons discharged from prison under the provisions of section 22 of the Criminal Justice Act. The governing body of the Association is a Council of twenty members representative of after-care organizations, Prison Commissioners, Government Departments and persons interested in the problems of this branch of social service.

The duties of supervision, which include such help, financial or otherwise as is required, are undertaken by three Divisions of the Association each under its Director:

- Women and Girls . . . . . *Women's and Girls' After-Care,*  
66 Eccleston Square Mews,  
London, S.W. 1
- Borstal and young  
adult prisoners (under  
21 when sentenced) . . . . . *Borstal After-Care,*  
19 Chester Square,  
London, S.W. 1
- Men . . . . . *Men's After-Care,*  
66 Eccleston Square,  
London, S.W. 1

**Central Association for the Aid of Discharged Convicts**

This is the After-Care Division of the Central After-Care Association.

**Central Association for Mental Welfare**

This Association was amalgamated with the National Association for Mental Health in 1946, *q.v.*

**Central Council for Health Education, Tavistock House North, Tavistock Square, London, W.C. 1** (Division for London, Middlesex and Hertfordshire); **7 Victoria Street, London, S.W. 1** (Division for Surrey, Sussex, Kent and Essex)

The Central Council is recognized by the Ministry of Health as the organization primarily responsible for supplying local authorities with services and material in connexion with their work in health education. The Council's services are also used by other organizations and individuals concerned with public health, hygiene, nutrition, etc.

**Child Guidance Council**

This Council was incorporated into the National Association for Mental Health in 1946, *q.v.*

**Child Guidance Training Centre, 6 Osnaburgh Street, London, N.W. 1**

The Centre was founded in 1929 as the London Child Guidance Clinic by the Commonwealth Fund of America and is now part of the National Health Service. Its main objects include the psychological investigation and treatment of maladjusted children and the training of child psychiatrists, educational psychologists and psychiatric social workers. Courses for students of all these branches of the work are conducted continuously and there is also a programme of active research, mainly into the educational treatment of handicapped children.

**Child Study Society, Westover, West Malvern, Worcestershire**

The Society promotes the study of the educational methods and environment best suited to ensure the mental and physical development of normal and feeble-minded children.

**Electroencephalographic Society, 68 Compton Road, Winchmore Hill, London, N. 21**

The Society was founded to promote the study of electroencephalography and allied subjects and to maintain the status of assistants engaged in electroencephalographic recording. Meetings are held at which scientific papers are read.

**Eugenics Society, 69 Eccleston Square, London, S.W. 1**

The Society exists "to study the influences, social and genetical, that may modify inborn human qualities; to formulate and support policies for developing these qualities to the utmost advantage; to promote research upon eugenic problems; and to foster a responsible attitude to parenthood." The Society organizes meetings at which scientific papers are read and it publishes the *Eugenics Review*.

**Ex-Services Welfare Society, Temple Chambers, Temple Avenue, London, E.C. 4****Family Planning Association, 69 Eccleston Square, London, S.W. 1**

The Association has organized a large number of women's welfare centres and clinics throughout the country. Advice is given on matters relating to family planning, sterility and difficulties connected with the marriage relationship. An international congress on "Population and World Resources in Relation to the Family" was organized by the Association in 1948.

**Federation of Committees for the Moral Welfare of Children, 170 Sheen Court, Richmond, Surrey**

The Federation is concerned with the education and care of children in moral difficulties.

**Guild of Health, 8 Kensington Park Road, London, W. 11**

The Guild aims at bringing together doctors, nurses, psychologists and ministers of religion, in the study of mental, physical and spiritual factors in healing. The Guild arranges lectures and conferences; it publishes the *Guild of Health Magazine*.

**Home and School Council of Great Britain, 109 Fulham Palace Road, London, W. 6**

By means of publications (books, pamphlets and a magazine, *Home and School*), written by acknowledged educators and psychologists, the Council aims at spreading in simple form the understanding of how children and adolescents develop. It does this largely through parent-teacher associations which it helps to form and federate into a national body and to which it supplies lectures.

**Howard League for Penal Reform, Parliament Mansions, Abbey Orchard Street, Victoria Street, London, S.W. 1**

The League seeks to promote efficient methods for the treatment and prevention of juvenile delinquency and of crime. The League publishes *The Howard Journal*.

**Industrial Health Research Board, 38 Old Queen Street, London, S.W. 1**

The Board is a standing advisory committee of the Medical Research Council, with the following terms of reference:

"To advise and assist the Medical Research Council in promoting scientific investigations into problems of health among workers, including occupational and environmental factors in the causation of ill-health and disease, and the relation of methods and conditions of work to the functions and efficiency of body and mind; and in making known such results of these researches as are capable of useful applications to practical needs."

The detailed consideration of research work is in the hands of scientific committees dealing with such subjects as occupational medicine, occupational physiology, occupational psychology, industrial pulmonary diseases, toxicology and statistics.

**Industrial Neurosis Unit, Belmont Hospital, Brighton Road, Sutton, Surrey**

The Unit is for the psychiatric treatment of patients in whom occupational problems play a prominent part. It is the largest neurosis centre of the kind in England and original work has been carried out here on "psychodrama" and other special

forms of treatment. Special facilities are available for post-graduate teaching and a six-months' course for candidates for the Diploma in Psychological Medicine (D.P.M.) is arranged.

**Institute of Child Health (University of London), Hospital for Sick Children, Great Ormond Street, London, W.C. 1**

Among the general activities of the Institute are included courses of lectures on psychological medicine in children.

**Institute of Child Psychology, 6 Peinbridge Villas, London, W.11**

The activities of the Institute include an out-patient clinic for the treatment of psychological disorders of children of all ages up to 18 years. Training courses are organized.

**Institute of Education (University of London), Malet Street, London, W.C. 1**

The activities of the Institute include research in education and in educational psychology. Courses for the training of teachers are arranged.

**Institute of Psychiatry, Maudsley Hospital, Denmark Hill, London, S.E. 5**

This Institute is one of the institutes of the British Postgraduate Medical Federation and is concerned with research and the postgraduate teaching of psychiatry and allied subjects. There are biochemical, electrophysiological, neuropathological and psychological laboratories. Clinical instruction and systematic lectures and demonstrations are provided; these cover the requirements of the Diploma in Psychological Medicine (D.P.M.), and appropriate instruction and facilities are available for those working for higher degrees such as the M.D. or Ph.D.

**Institute of Psycho-Analysis, 96 Gloucester Place, London, W. 1**

Full training is given in the theory and practice of psycho-analysis. The course is part-time, lasts four years and consists of a personal analysis, the analysis of patients under supervision, lectures and seminars.

**Institute for the Scientific Treatment of Delinquency, 8 Bourdon Street, Davies Street, London, W. 1**

The Institute promotes scientific research into the causes and prevention of crime.

**Institute of Social Medicine, 10 Parks Road, Oxford**

The purposes of the Institute include: (i) the investigation of the influence of social, genetic, environmental and domestic factors on the incidence of human disease and disability, and (ii) the promotion of measures, other than those usually employed in the practice of remedial medicine, for the protection of the individual and of the community against such forces as interfere with the full development and maintenance of man's mental and physical capacity.

**Institute of Social Psychiatry Limited, 7 Fellows Road, London, N.W. 3**

The Institute is concerned with the study of the social causation and cure of those suffering from nervous and mental disorders, with special emphasis on the social implications. With this object, it has established a number of rehabilitation and occupational centres, day hospitals, therapeutic social clubs and other self-governing associations of patients. Six clubs are under direct control of the Institute and a number of others have been started in collaboration with various teaching hospitals. Research is being carried out on the use of social psychotherapy as an alternative to out-patient treatment. Lectures and demonstrations are organized and a Bulletin is to be published by the Institute.

**Institute of Sociology, Le Play House, Ledbury, Herefordshire**

The Institute promotes: (i) the study of human communities; (ii) the use of sociological studies in education, and (iii) the application of sociological studies to urban and rural development. The Institute publishes the *Sociological Review* and various bulletins. Discussion meetings are held regularly in London.

**London Police Court Mission, 152 Clarence Gate Gardens, Baker Street, London, N.W. 1**

The Mission gives assistance in personal matters to those who have offended against the law.

**The Magistrates' Association, Tavistock House South, Tavistock Square, London, W.C. 1**

This Association arranges conferences of magistrates throughout Great Britain, and every two months publishes a bulletin, *The Magistrate*, for its members.

**Medical Research Council Unit for Applied Psychology, The Department of Psychology, Downing Street, Cambridge**

The unit is engaged in laboratory and field research on environmental factors affecting human performance. Problems under investigation include: (i) the optimum tempo in industrial tasks; (ii) the causation of accidents; (iii) the selection of medical students, and (iv) sources of error affecting mental tests.

**Mental After-Care Association, 108 Jermyn Street, London, S.W. 1**

The Association facilitates the re-admission into normal social life of persons recovering from nervous and mental disorders. Persons discharged from mental hospitals are assisted to obtain suitable employment and consideration is given to their personal needs. Arrangements are made for convalescent treatment.

**Mental Health Research Fund, c/o The Director, Neuropsychiatric Research Centre, Whitchurch Hospital, Cardiff**

The purpose of the Fund is to promote, finance and encourage research on mental health and disease. The aims include: (1) The study of the factors conducive to the fullest development and maintenance of man's mental capacity. (2) Research on the causation, prevention and cure of nervous and mental disease. (3) Research on fundamental problems related to mental health. (4) Research on the forms of social structure most likely to lead to the improvement of the mental quality and stamina of the community, and most likely to reduce the incidence of addiction, delinquency and crime. The methods used include the provision of suitable grants and fellowships for research.

**Mental Nurses and Mental Deficiency Nurses Guild of the Confederation of Health Service, 1 Rushford Avenue, Leverhulme, Manchester, 19**

The Guild seeks to promote the co-operation of all who are engaged in the National Health Service and to maintain the status of the nursing profession.

**Moor House School, Hurst Green, Oxted, Surrey**

The School provides treatment and specialized education for children of 5 to 11 suffering from speech defects.

**National Association of Boys' Clubs, 17 Bedford Square, London, W.C. 1**

The Association aims at promoting the mental, physical and social well-being of boys, especially those in poor circumstances.

**National Association of Discharged Prisoners' Aid Societies, St. Leonard's House, 66 Eccleston Square, London, S.W. 1**

The Association co-ordinates and furthers the work of Discharged Prisoners' Aid Societies throughout the country.

**National Association for the Feeble-Minded, 296 Vauxhall Bridge Road, London, S.W. 1**

The organization is concerned with the care and control of the mentally defective. A farm colony and a group of homes are maintained for this purpose.

**National Association of Girls' Clubs and Mixed Clubs, Hamilton House, Bidborough Street, London, W.C. 1**

The Association co-ordinates the activities of National Societies and Unions of Girls' Clubs and Mixed Clubs; it aims at promoting the mental, physical and social welfare of working girls and boys. It maintains an employment bureau and publishes a monthly magazine, *Club News*.

**National Association for Maternity and Child Welfare, 5 Tavistock Place, London, W.C. 1**

The Association exists for the furtherance of education in matters connected with maternity and child welfare, for the study and prevention of mortality and of ill-health among mothers and young children. It publishes and distributes

books, journals and pamphlets promoting a sound knowledge of maternity and child welfare. It undertakes the collection and publication of statistics and reports; it organizes conferences and meetings, local, national and international, and acts as a consultative body in connexion with maternity and child welfare.

**National Association for Mental Health, Maurice Craig House, 39 Queen Anne Street, London, W. 1**

The National Association for Mental Health serves as a co-ordinating body for the activities of other national and international organizations concerned with different aspects of mental health. It was formed by the amalgamation of three voluntary bodies: the Central Association for Mental Welfare, the National Council for Mental Hygiene and the Child Guidance Council. Among the many activities of this Association has been the provision of training facilities for social workers at various centres throughout the country. The Association runs advisory services on schools, homes and clinics for persons suffering from mental disorders and it provides courses, lectures and conferences for the general public and for professional groups. The Association organized the International Congress on Mental Health held in London in 1948. A lending library service is conducted and the Association publishes a quarterly journal, *Mental Health*.

**National Association of Prison Visitors, 6 Old Bailey, London, E.C. 4**

The Association brings together those engaged in the work of visiting prisoners and in making representations, when necessary, to the Prison Commissioners.

**National Association of Probation Officers, 2 Hobart Place, Eaton Square, London, S.W. 1**

The Association seeks to promote the health, education and social welfare of the community through the practice of probation; investigations are carried out by medical, psychological and other methods on the causes and treatment of delinquency.

**National Council for Mental Hygiene**

This Council was incorporated in 1946 in the National Association for Mental Health, *q.v.*

**National Council of Social Service, 26 Bedford Square, London, W.C. 1**

The Council promotes the co-operation of voluntary agencies and public authorities concerned with social service. It provides a headquarters for the Citizens Advice Bureaux Service, which is established throughout the country. It acts as an advisory body for occupational clubs and community associations in urban neighbourhoods. The Council maintains a library and a books advice service.

**National Council for the Unmarried Mother and her Child, 21 Coram Street, London, W.C. 1**

The Council promotes legislative reform and co-ordinates the activities of voluntary and statutory organizations.

**National Hospital, Queen Square, London, W.C. 1**

In addition to the treatment of patients suffering from neurological conditions, research is carried out on fundamental and clinical problems related to the nervous system. There are facilities for electroencephalographic investigations and for the training of electroencephalograph operators.

**National Institute of Industrial Psychology, Aldwych House, London, W.C. 2**

The Institute promotes the study of people in their capacity as workers and their behaviour at work, in order to obtain the maximum of achievement and the minimum of stress. Lectures, discussion groups, conferences and instructional courses are organized in London and the provincial cities. A library and a consultative service is maintained. Membership is open to individuals and to corporate bodies. The Institute publishes two journals: one, *Occupational Psychology*, is a scientific quarterly; the other, *Psychology at Work*, is published every two months and is designed to appeal to those who are interested in the application of industrial psychology, but who are not specialists in the subject.

**National Marriage Guidance Council, 78 Duke Street, Grosvenor Square, London, W. 1**

The Marriage Guidance Council has established throughout the country about a hundred local Councils, which give advice to engaged couples and provide help in marriage troubles of all kinds. Educational work is undertaken through lectures and conferences. The Council supplies selected literature and issues the monthly journal, *Marriage Guidance*.

**National Society for Epileptics, Chalfont Colony, Chalfont St. Peter, Buckinghamshire**

The objects of this Society are to establish and maintain Homes on the Colony system for persons suffering from epilepsy and to promote the welfare of epileptics generally.

**Neuropsychiatric Research Centre, Whitchurch Hospital, Cardiff**

The Research Centre has liaison with the University of Wales and the Welsh National School of Medicine. Research is carried out on fundamental and on clinical problems related to the nervous system and there are laboratories for biochemical, electrophysiological and psychological work. There is a department for electroencephalographic investigation and research. Appropriate facilities are available for those working for the Ph.D. and other higher degrees.

**New Education Fellowship, 1 Park Crescent, London, W. 1**

The Fellowship is a world movement organized in self-governing national sections. Its aim is to promote the exchange and practice of ideas that strengthen the educational foundations of peace. Activities include international conferences, study courses, the publication of an international educational magazine, *The New Era*, and publication of books by the New Education Book Club.

**Nursery School Association of Great Britain and Ireland, 1 Park Crescent, London, W. 1**

The Association is concerned with all aspects of the work of nursery schools. It supplies literature and films; it organizes conferences, meetings and summer schools, on subjects connected with the education and care of children up to 7 years of age.

**Provisional National Council for Mental Health**

The Council was formed in 1943 by the following three bodies, as a first step towards their amalgamation: (i) the Central Association for Mental Welfare; (ii) the Child Guidance Council, and (iii) the National Council for Mental Hygiene. This was completed in 1946 and the Council is now known as the National Association for Mental Health, *q.v.*

**Rationalist Press Association, 5 & 6 Johnson's Court, Fleet Street, London, E.C. 4**

The Association is concerned with maintaining a healthy mental outlook in the community, by promoting the publication of books and periodicals of educational value. Publications include the Thinker's Library series. Public meetings and conferences are organized.

**Roffey Park Rehabilitation Centre, Horsham, Surrey**

The Centre provides psychiatric treatment and resettlement facilities for patients who are referred by psychiatric out-patient departments and by industrial medical officers. All forms of modern psychiatric treatment are available and special attention is paid to placement on discharge. The Centre is supported by the National Council for the Rehabilitation of Industrial Workers.

**Royal Medico-Psychological Association, 11 Chandos Street, Cavendish Square, London, W. 1**

The Association is the chief medical organization concerned with psychiatry in Great Britain. Activities include the arrangement of scientific and clinical meetings in London and the provinces, as well as study tours abroad. Separate meetings are held in the South-Eastern, South-Western, Northern and Midland, Scottish and Irish divisions. Papers are read at meetings of the Research and Clinical, Mental Deficiency, Psychotherapy and Social Psychiatry, and Child Psychiatry

Sections. The work of the Association is carried out by a number of committees and subcommittees. Examinations for the Diploma in Psychological Medicine and the Mental Nursing Certificates are conducted. The Association publishes the *Journal of Mental Science*, the *Handbook for mental nurses*, *Recent progress in psychiatry* and other publications.

**Royal Society of Medicine : Section of Psychiatry, 1 Wimpole Street, London, W. 1**

Meetings are held at which papers are read and matters of scientific and clinical interest are discussed. Papers are published in the *Proceedings of the Royal Society of Medicine*. The library contains a very full collection of psychiatric journals and books. Visitors can be admitted to meetings only on the introduction of a member of the Section. The library is private to Fellows, but visitors can be admitted if sponsored by a Fellow.

**Scottish Association for Mental Health, 41 Charlotte Square, Edinburgh, 2**

**Scottish Council for Health Education, 3 Castle Street, Edinburgh, 2**

The objects of the Scottish Council are to promote and encourage education in the science and art of healthy living and in the principles of hygiene, by the dissemination of knowledge about health among the general public of all ages. The Council acts in close co-operation with the major local authorities in the promotion of health lectures, with films, in cities and towns throughout Scotland, and in the organization of "health weeks" and exhibitions and annual summer schools in health education. The Council also produces a wide range of literature on many aspects of health.

**Society of Analytical Psychology, Limited, 32 Carlton Hill, St. John's Wood, London, N.W. 8**

This Society undertakes the training of medical and non-medical analysts according to the principles of Jungian psychology. Acceptance for training depends on personal suitability and academic qualifications. Duration of training varies with individual need, but a minimum of three years' personal analysis is required.

**Society for the Study of Inebriety, Alcoholism and Drug Addiction, c/o Westminster Hospital, London, S.W. 1**

The Society holds quarterly discussions and issues the *British Journal of Addiction*. Research on relevant problems is promoted.

**Tavistock Clinic, 2 Beaumont Street, London, W. 1**

Provision is made for out-patient psychotherapy for adults and children. Individual and group methods are used, and research and training in this field are carried out.

**Tavistock Institute of Human Relations, 2 Beaumont Street, London, W. 1**

The aim of the Institute is to advance scientific knowledge of human affairs and to facilitate the application of such knowledge to the solution of practical problems. Its activities comprise therapeutic services to the community and research in family, educational, industrial and other fields. The basis of its work is medical, but it attempts to integrate all branches of social science.

**Usher Institute, Warrender Park Road, Edinburgh, 9**

The Institute is concerned with the study of social problems, including those related to mental health.

**Village Centres Council (Enham-Alamein Village Centre, Andover, Hants.), 16 Grosvenor Place, London, S.W. 1**

The object of the Council is to aid the restoration in mind and body of those disabled by war or sickness, accident, etc. This work of rehabilitation comprises the following activities: (i) the provision of medical treatment; (ii) where necessary, the provision of training in a suitable occupation; (iii) the offer of permanent medically-protected employment in the industries established at Enham, and (iv) where financially possible, the provision of homes in healthy surroundings for the disabled and their families.

**West of Scotland Neuro-Psychiatric Research Institute, 10 Shelley Road, Glasgow, W. 2**

The Institute is engaged in research on the pathology and treatment of mental disease. Work is in progress on the serodiagnosis of syphilis, on immunology and on blood changes in mental disorders.

**World Federation for Mental Health : British Branch, 19 Manchester Street, London, W. 1**

The purposes of the Federation include the co-ordination of the activities of governmental and professional organizations concerned with the promotion of mental health. The Federation publishes the *Bulletin of the World Federation for Mental Health*.

# MENTAL HEALTH

## A Bibliography of British Books and Periodicals

T. F. HOWARTH

Sub-Librarian, British Medical Association

The study of the mind and its disorders was for many years considered to be within the sphere of the psychiatrist and specialist only, but today a knowledge of psychological medicine has become an essential part of general practice and social welfare.

In compiling this bibliography an attempt has been made to include literature which will be of value not only to the specialist, but to the general practitioner and all others having an interest in mental health.

As will be seen from the list, the number of British periodicals relating to mental health is comparatively small, but articles on this specialty appear from time to time in most of the leading medical journals published in Great Britain.

## A. PERIODICALS

Information given includes name of publication, frequency of appearance, place of publication, name of publisher and amount of subscription, which is annual unless otherwise indicated.

*Archives of Neurology and Psychiatry from the Central Pathological Laboratory and the Maudsley Hospital, Denmark Hill, London and the London County Hospitals for Nervous and Mental Diseases.* Irregular. London: London County Council. Price variable.

Reprints of articles by members of the staff of the various London County Council mental hospitals and laboratories.

*Brain. A Journal of Neurology.* Quarterly. London: Macmillan. 34s. [£1.7]

Original neurological research: notices of recent publications.

*British Journal of Educational Psychology.* Three times a year. London: Methuen. 20s. [£1.0]

Issued by the British Psychological Society and the Association of Teachers in Colleges and Departments of Education. Original articles, book reviews.

*British Journal of Medical Psychology.* Quarterly. London: Cambridge University Press. 40s. [£2.0]

Medical section of the *British Journal of Psychology*. Original articles.

*British Journal of Psychiatric Social Work.* Irregular. London: Association of Psychiatric Social Workers. Price variable.

New journal for social workers.

*British Journal of Psychology (General Section).* Quarterly. London: Cambridge University Press. 40s. [£2.0]

Issued by the British Psychological Society.

*British Journal of Psychology (Statistical Section).* Irregular. London: University of London Press. 30s. [£1.5]

*Bulletin of the World Federation for Mental Health.* Every two months. London: World Federation for Mental Health. 5s. [£0.25]

New publication.

*Howard Journal. A Review of Modern Methods for the Prevention and Treatment of Crime and Juvenile Delinquency.* Irregular. London: Howard League for Penal Reform. 1s. per copy. [£0.05]

*Human Relations.* Quarterly. London: Tavistock Institute of Human Relations. 35s. [£1.75]

Studies towards the integration of social sciences. Contributions on social psychology.

*International Journal of Psycho-Analysis.* Quarterly. London: Baillière. 40s. [£2.0]

Official organ of the International Psycho-Analytical Association. Original papers, abstracts of international psychoanalytical literature, and book reviews.

*Journal of Mental Science.* Quarterly. London: Churchill. 50s. [£2.5]

Official publication of the Royal Medico-Psychological Association, devoted to psychiatry. Contains bibliography and epitome of international literature and book reviews.

*Journal of Neurology, Neurosurgery and Psychiatry.* Quarterly. London: British Medical Association. 25s. [£1.25]

Original contributions. Book reviews.

*Mental Health.* Quarterly. London: National Association for Mental Health. 5s. [£0.25]

Articles on the various aspects of mental health. News and notes. Book reviews. Lists of recent publications.

*Occupational Psychology.* Quarterly. London: National Institute of Industrial Psychology. 20s. [£1.0]

Articles on application of psychology to educational and industrial problems. Book reviews. Abstracts of articles, and reports.

*Quarterly Journal of Experimental Psychology.* Quarterly. Cambridge: Hefter. 30s. [£1.5]

New journal. Organ of the Experimental Psychology Group. Book reviews. Group proceedings.

## B. BOOKS

This list comprises books published in Great Britain in 1947 or later years. Owing to restrictions on space, the list is limited, and the data given include author's name, title of the book, edition, date and place of publication, publisher, price, whether illustrated or containing a bibliography.

### 1. General Works

Blacker, C. P. *Neurosis and the mental health services.* 1946, London: Oxford University Press. 21s. [£1.05]

Proposals, made before the provisions of the National Health Act came into force, for the organization of a mental health service in England and Wales.

Brown, J. A. C. *The distressed mind.* 2nd ed., 1949, London: Watts. 2s. 6d. [£0.125]

Presents in simple language the difficulties which are a handicap to mental health.

Culpin, M. *Mental abnormality. Facts and theories.* 1948, London: Hutchinson. 7s. 6d. [£0.375] Bibliography.

Intended mainly for the intelligent layman.

Ewen, J. H. *Mental health. A practical guide to disorders of the mind.* (With a chapter on special treatments and their practical technique, by C. Friedman.) 1947, London: Arnold. 12s. 6d. [£0.625] Bibliography.

A concise account of the salient features of mental illness.

Feversham Committee. *The voluntary mental health services. The report of the Feversham Committee.* 1939, London: Feversham Committee. 2s. 6d. [£0.125]

Guttmann, E. & Thomas, E. L. *On the re-adjustment in civil life of soldiers discharged from the Army on account of neurosis.* (Ministry of Health Report No. 93.) 1946, London: His Majesty's Stationery Office. 1s. 3d. [£0.0625]

Halliday, J. L. *Psychosocial medicine. A study of the sick society.* 1949, London: Heinemann. 17s. 6d. [£0.875]

*International Congress on Mental Health, London 1948.* 1949: London, Lewis.

Vol. I. History, development and organisation. 10s. [£0.5]

„ II. Proceedings of the International Conference on Child Psychiatry, 11th-14th August. 10s. [£0.5]

- Vol. III. Proceedings of the International Conference on Medical Psychotherapy, 11th-14th August. 10s. [£0.5]
- „ IV. Proceedings of the International Conference on Mental Hygiene, 16th-21st August. 20s. [£1.0]
- London County Council. *Handbook on mental health social work*. 1947, London: London County Council. 2s. 6d. [£0.125]
- Mackintosh, J. M. *The war and mental health in England*. 1944, London: Oxford University Press. 5s. 6d. [£0.275]  
Deals in non-technical language with mental health in England during the Second World War.
- Matthews, F. B. *Mental health services. A handbook on lunacy, mental treatment and mental deficiency*. 1948, London: Shaw. 35s. [£1.75]  
Written as a handbook for those engaged in the administration of the Lunacy and Mental Treatment Acts and the Mental Deficiency Acts under the National Health Service.
- Moore, D. T. V. *Personal mental hygiene*. 1947, London: Heinemann. 21s. [£1.05]  
Intended primarily for the individual confronted with the difficulties of life.
- Neill, A. S. *The problem family*. 1949, London: Jenkins. 7s. 6d. [£0.375]  
Psychological problems of family life.
- Preston, G. H. *The substance of mental health*. 1944, London: Jarrold. 3s. 6d. [£0.175]  
For parents and teachers.
- White, H. D. J. *Guide to mental health*. 1939, London: Daniel. 15s. [£0.75]
- ## 2. Child Psychology
- Allen, F. H. *Psychotherapy with children*. 1947, London: Kegan Paul. 10s. 6d. [£0.525]  
Author's experience of a child guidance clinic.
- Aris, N. *Parents and children*. 1940, London: Stanley Paul. 5s. [£0.25] Illustrated.  
For parents and social workers.
- Bowley, A. H. *Everyday problems of the school child*. 1948, Edinburgh: Livingstone. 7s. 6d. [£0.375] Illustrated.  
For doctors, parents and teachers.
- Bowley, A. H. *Modern child psychology*. 1949, London: Hutchinson. 7s. 6d. [£0.375]  
A non-technical account of child psychology suitable especially for students and teachers.
- Bowley, A. H. *The problems of family life. An environmental study*. 2nd ed., 1947, Edinburgh: Livingstone. 6s. [£0.3] Illustrated.  
Useful little volume on child psychology. Of value to parents.
- Braithwaite, E. W. *Parent and child*. 1939, London: Nelson. 2s. 6d. [£0.125]
- Bühler, C. et al. *The child and his family*. (Translated by Beaumont, H.) 1940, London: Kegan Paul. 10s. 6d. [£0.525]
- Burbury, W. M., Balint, E. M. & Yapp, B. J. *An introduction to child guidance*. 1946, London: Macmillan. 7s. 6d. [£0.375]
- Cameron, H. C. *The nervous child*. 5th ed., 1946, London: Geoffrey Cumberlege. 10s. 6d. [£0.525] Plates.  
Nervous disorders of infancy and childhood and their management.
- Child Guidance Council. *Bibliography of child psychology, 1928-1938*. 1939, London: Child Guidance Council. 1s. [£0.05]
- Fordham, M. *The life of childhood. A contribution to analytical psychology*. 1944, London: Kegan Paul. 15s. [£0.75] Illustrated.
- Gordon, R. G., ed. *Survey of child psychiatry. A contribution by contemporary British authorities*. (Edited on behalf of the Child Guidance Council.) 1939, London: Oxford University Press. 10s. 6d. [£0.525]
- Hall, M. B. *Psychiatric examination of the school child*. 1947, London: Arnold. 15s. [£0.75] Bibliography.  
Written primarily for the medical practitioner, but also useful to social workers.
- Hicklin, M. *War-damaged children. Some aspects of recovery*. 1947, London: Association of Psychiatric Social Workers. 1s. 6d. [£0.075]
- Isaacs, S. *Childhood and after. Some essays and clinical studies*. 1948, London: Routledge & Kegan Paul. 15s. [£0.75]
- Isaacs, S. *Troubles of children and parents*. 1948, London: Methuen. 8s. 6d. [£0.425]  
Child guidance for parents and nurses.
- Ladell, R. M. *The first five years from birth to school. How to help your child to develop its personality*. 1939, London: Psychologist. 1s. [£0.05]  
Small book on child psychology for all who deal with children.
- Moodie, W. *Child guidance*. 1947, London: Cassell. 4s. 6d. [£0.225]  
Essentially for the doctor, but of interest and value to the layman.
- Moodie, W. *The doctor and the difficult child*. 2nd ed., 1947, London: Geoffrey Cumberlege. 11s. 6d. [£0.525]
- Reiss, S. *Mental readjustment*. 1949, London: Allen & Unwin. 10s. 6d. [£0.525]  
Child psychology and psychotherapy of special interest to parents and teachers of young children.
- Valentine, C. W. *The psychology of early childhood. A study of mental development in the first years of life*. 3rd ed., 1946, London: Methuen. 22s. 6d. [£1.125]
- Williams, J. G. *The psychology of childhood to maturity*. 1946, London: Heinemann. 8s. 6d. [£0.425]  
Mainly for parents, teachers and social workers.
- ## 3. Neurology
- Biggart, J. H. *Pathology of the nervous system. A student's introduction*. 2nd ed., 1949, Edinburgh: Livingstone. 21s. [£1.05] Illustrated.
- Blackwood, W., Dodds, T. C. & Somerville, J. C. *Atlas of neuropathology*. 1949, Edinburgh: Livingstone. 35s. [£1.75] Illustrated.
- Brain, W. R. *Diseases of the nervous system*. 3rd ed., 1947, London: Geoffrey Cumberlege. 37s. 6d. [£1.875] Illustrated.  
A standard textbook on nervous diseases.
- Brain, W. R. & Strauss, E. B. *Recent advances in neurology and neuropsychiatry*. 5th ed., 1945, London: Churchill. 18s. [£0.9] Illustrated. Bibliography.
- Hern, K. M. *Physical treatment of injuries of the brain and allied nervous disorders*. 1947, London: Baillière. 10s. 6d. [£0.525] Illustrated.
- Holmes, G. *Introduction to clinical neurology*. 1946, Edinburgh: Livingstone. 12s. 6d. [£0.625] Illustrated.  
An introduction to the study of disorders of the nervous system.
- Monrad-Krohn, G. H. *The clinical examination of the nervous system*. 9th ed., 1948, London: Lewis. 16s. [£0.8]  
A standard work on examination of the nervous system.
- Purves-Stewart, J. *The diagnosis of nervous diseases*. 9th ed., 1945, London: Arnold. 40s. [£2.0] Illustrated.  
A standard textbook by a leading authority on nervous diseases.
- Sherrington, C. *The integrative action of the nervous system. With a new foreword by the author and a bibliography of his writings*. 1947, Cambridge: University Press. 25s. [£1.25] Illustrated. Bibliography.  
A standard work on the physiology of the nervous system.
- Spillane, J. D. *Nutritional disorders of the nervous system*. 1947, Edinburgh: Livingstone. 20s. [£1.0] Illustrated. Bibliography.

Walshe, F. M. R. *Critical studies in neurology*. 1948, Edinburgh: Livingstone. 15s. [£0.75] Illustrated.

Walshe, F. M. R. *Diseases of the nervous system. Described for practitioners and students*. 6th ed., 1949, Edinburgh: Livingstone. 17s. 6d. [£0.875] Illustrated.

A recognized textbook on diseases of the nervous system.

Wilson, S. A. K. *Neurology*. Edited by A. Ninian Bruce. Vols. 1, 2, 1940, London: Arnold. 84s. [£4.2] Illustrated.

A detailed treatise on neurology.

#### 4. Psychiatry

Beccle, H. C. *Psychiatry, theory and practice. For students and nurses*. 2nd ed., 1948, London: Faber & Faber. 10s. 6d. [£0.525] Illustrated.

Board of Control (England and Wales). *Pre-frontal leucotomy in a thousand cases*. 1947, London: His Majesty's Stationery Office. 6d. [£0.025]

Report on the results of prefrontal leucotomy in the treatment of mental disorder.

Bowlby, J. *Personality and mental illness. An essay in psychiatric diagnosis*. 1940, London: Kegan Paul. 10s. 6d. [£0.525] Bibliography.

Curran, D. & Guttmann, E. *Psychological medicine. A short introduction to psychiatry with an appendix on psychiatry associated with war conditions*. 3rd ed., 1949, Edinburgh: Livingstone. 12s. 6d. [£0.625] Illustrated. Bibliography.

Dawson, W. S. *Aids to psychiatry*. 5th ed., 1944, London: Baillière. 6s. [£0.3]

Students' Aids Series.

Eager, R. *The treatment of mental disorders (ancient and modern)*. 1945, Exeter: W. V. Cole & Sons. 7s. 6d. [£0.375] Illustrated.

A short history of the treatment of mental disorders.

Harris, N. G., ed. *Modern trends in psychological medicine*. 1948, London: Butterworth. 50s. [£2.5] Illustrated. Bibliography.

Collection of papers by leading authorities on psychological medicine.

Henderson, D. K. & Gillespie, R. D. *A textbook of psychiatry for students and practitioners*. 6th ed., 1944, London: Oxford University Press. 25s. [£1.25] Bibliography.

A standard textbook.

Hill, H. *The histamine and insulin treatment of schizophrenia and other mental diseases*. 1940, London: Baillière. 6s. [£0.3]

Home Office. *Report of the psychological treatment of crime*. By W. Norwood East & W. H. de B. Hubert. 1939, London: His Majesty's Stationery Office. 2s. 6d. [£0.125]

Report on the investigation carried out at Wormwood Scrubs Prison to ascertain the value of psychological treatment in the prevention and cure of crime.

Ironside, R. N. & Batchelor, I. R. C. *Aviation neuro-psychiatry*. 1945, Edinburgh: Livingstone. 8s. 6d. [£0.425]

Of interest and value to medical officers of the RAF and others concerned with flying personnel.

Jessner, L. & Ryan, V. G. *Shock treatment in psychiatry. A manual*. 1942, London: Heinemann. 17s. 6d. [£0.875] Bibliography.

Brief, practical review of the various shock treatments.

Kalinowsky, L. B. & Hoch, P. H. *Shock treatments and other somatic procedures in psychiatry*. 1946, London: Heinemann. 21s. [£1.05] Bibliography.

Miller, E., ed. *The neuroses in war*. 1940, London: Macmillan. 10s. 6d. [£0.525] Bibliography.

Contains papers by several authors on mental problems associated with war.

Minski, L. *A practical handbook of psychiatry for students and nurses*. 1946, London: Heinemann. 6s. [£0.3]

Moncrieff, A., ed. *Psychology in general practice*. 1945, London: Eyre & Spottiswoode. 12s. 6d. [£0.625]

Papers by various authors.

Moodie, W. *The doctor and the difficult adult*. 1947, London: Cassell. 15s. [£0.75]

Written for the practitioner who wishes more fully to understand the many peculiar persons he meets in everyday practice.

Murray, J. B. *Some common psychosomatic manifestations*. 1949, London: Geoffrey Cumberlege. 7s. 6d. [£0.375] Illustrated. Bibliography.

Neustatter, W. L. *The early treatment of nervous and mental diseases*. 1940, London: Churchill. 15s. [£0.75] Bibliography.

Neustatter, W. L. *Modern psychiatry in practice*. 2nd ed., 1948, London: Churchill. 12s. 6d. [£0.625]

Psychiatric problems as presented in the consulting room, ward and out-patient department.

Nicole, J. E. *Normal and abnormal psychology. A précis for junior students, nurses, occupational therapists, welfare workers and others*. 1948, London: Allen & Unwin. 8s. 6d. [£0.425]

Nicole, J. E. *Psychopathology. A survey of modern approaches*. 4th ed., 1946, London: Baillière. 15s. [£0.75] Bibliography.

Designed to provide a general survey of the views of the different schools of psychiatry of today.

O'Connor, W. A. *Psychiatry. A short treatise*. 1948, Bristol: Wright, 35s. [£1.75]

Rees, J. R. *The shaping of psychiatry by war*. 1945, London: Chapman & Hall. 10s. 6d. [£0.525]

Ross, T. A. *Lectures on war neuroses*. 1941, London: Arnold. 6s. [£0.3]

A small volume on the effects of war on mental health.

Rudolf, G. de M., ed. *The psychological aspects of delinquency. A series of lectures*. 1939, London: Baillière. 2s. 6d. [£0.125]

Sargant, W. & Slater, E. *An introduction to physical methods of treatment in psychiatry*. With a chapter on treatment of the epilepsies, by Denis Hill. 2nd ed., 1948, Edinburgh: Livingstone. 10s. 6d. [£0.525] Bibliography.

Skinner, E. F. *An outline of medical psychology*. 1939, London: Lewis. 6s. [£0.3]

Useful to medical students studying psychological medicine.

Soddy, K. *Some lessons of war-time psychiatry*. 1948, London: National Association for Mental Health. 1s. [£0.05]

Tredgold, A. F. *Manual of psychological medicine. For practitioners and students*. 2nd ed. (reprint), 1946, London: Baillière. 18s. [£0.9] Bibliography.

Tredgold, A. F. *A text-book of mental deficiency (amentia)*. 7th ed., 1947, London: Baillière. 30s. [£1.5] Illustrated.

A standard work on mental deficiency.

Wall, C. W. *The value of neurosis*. 1948, London: Rylee. 8s. 6d. [£0.425] Illustrated.

Wexberg, L. E. *Introduction to medical psychology*. 1948, London: Heinemann. 17s. 6d. [£0.875]

For the physician and student.

#### 5. Psychoanalysis

Berg, C. *Clinical psychology. A case book of the neuroses and their treatment*. 1948, London: Allen & Unwin. 25s. [£1.25]

Berg, C. *Deep analysis. The clinical study of an individual case*. 1946, London: Allen & Unwin. 12s. 6d. [£0.625]

Berg, C. *War in the mind. The case book of a medical psychologist. An introduction to the practical application of modern psychology*. 2nd ed., 1944 (reprinted 1946), London: Macaulay Press. 10s. 6d. [£0.525]

Faithfull, T. *A handbook of self-analysis*. 1948, London: Rylee. 8s. 6d. [£0.425] Illustrated.

Flugel, J. C. *Man, morals and society. A psycho-analytical study*. 1945, London: Duckworth. 21s. [£1.05]

Freud, S. *An outline of psycho-analysis*. Authorized translation by James Strachey. 1949, London: Hogarth Press. 8s. 6d. [£0.425]

Freud's last major work.

Glover, E. *Psycho-analysis. A handbook for medical practitioners and students of comparative psychology*. 2nd ed., 1949, London: Staples Press. 15s. [£0.75]

Glover, E. & Brierley, M. F. E. *An investigation of the technique of psycho-analysis*. 1940, London: Baillière. 10s. 6d. [£0.525]

Horney, K. *New ways in psychoanalysis*. 1949, London: Kegan Paul. 18s. [£0.9]

Horney, K. *Our inner conflicts. A constructive theory of neurosis*. 1946, London: Kegan Paul. 10s. 6d. [£0.525]

Jones, E. *Papers on psycho-analysis*. 5th ed., 1948, London: Baillière. 31s. 6d. [£1.575]

A classical work on psychoanalysis.

## 6. Psychology

Adler, A. *Guiding human misfits. A practical application of individual psychology*. 2nd ed., 1948, London: Faber & Faber. 7s. 6d. [£0.375]

Adler, G. *Studies in analytical psychology*. 1948, London: Routledge & Kegan Paul. 21s. [£1.05] Illustrated.

Bartlett, F. C., Ginsberg, M., Lindgren, E. J. & Thouless, R. H., ed. *The study of society. Methods and problems*. 1939, London: Kegan Paul. 10s. 6d. [£0.525]

A study of social psychology.

Brend, W. A. *Foundations of human conflicts. A study in group psychology*. 1944, London: Chapman & Hall. 15s. [£0.75]

Brown, W. *Oxford essays on psychology*. 1948, London: Heinemann. 10s. 6d. [£0.525]

Primarily intended for the intelligent layman.

Ewen, J. H. *Aids to psychology*. 3rd ed., 1948, London: Baillière. 5s. [£0.25]

Students' Aids Series.

Jung, C. G. *The integration of the personality*. Translated by Stanley M. Dell. 1940, London: Kegan Paul. 15s. [£0.75] Illustrated.

Leahy, M. P. *Fear*. 1948, London: Research Books Ltd. 10s. 6d. [£0.525]

Explains in everyday language what fear is and how this condition of the mind can be successfully treated.

Lowy, S. *Man and his fellowman. Modern chapters on social psychology*. 1944, London: Kegan Paul. 15s. [£0.75]

MacCurdy, J. T. *The structure of morale*. 1943, Cambridge: University Press. 8s. 6d. [£0.425]

McDowall, R. J. S. *Sane psychology. A biological introduction to psychology*. 2nd ed., 1943, London: Murray. 9s. [£0.45] Bibliography.

Mackenzie, M. *The human mind. The organ of thought in function and dysfunction*. 1941, London: Churchill. 7s. 6d. [£0.375]

Valentine, C. W. *Psychology and mental health*. 1948, London: Methuen. 4s. [£0.2] Bibliography.

West, R. *Conscience and society. A study of the psychological prerequisites of law and order*. 1942, London: Methuen. 15s. [£0.75]

Woodworth, R. S. *Psychology*. 19th ed., 1948, London: Methuen. 12s. 6d. [£0.625] Illustrated. Bibliography.

A standard work of value to students.

Young, K. *Handbook of social psychology*. 1946, London: Kegan Paul. 21s. [£1.05]

## 7. Psychotherapy

Allison, D. R. & Gordon, R. G. *Psychotherapy. Its uses and limitations*. 1948, London: Geoffrey Cumberlege. 8s. 6d. [£0.425]

Brown, W. *Psychology and psychotherapy*. 5th ed., 1944, London: Arnold. 14s. [£0.7] Bibliography.

Dicks, H. V. *Clinical studies in psychopathology. A contribution to the aetiology of neurotic illness*. 2nd ed., 1947, London: Arnold. 15s. [£0.75]

Fink, D. H. *Release from nervous tension*. 1945, London: Allen & Unwin. 8s. 6d. [£0.425]

The author's method of treating nervous tension by relaxation.

Gregory, M. *Psychotherapy: scientific and religious*. 1939, London: Macmillan. 21s. [£1.05] Bibliography.

Harris, N. *Modern psychotherapy*. 1939, London: Bale. 7s. 6d. [£0.375] Bibliography.

Herzberg, A. *Active psychotherapy*. 1945, London: Research Books Ltd. 12s. 6d. [£0.625]

Horsley, J. S. *Narco-analysis. A technique in short-cut psychotherapy: a comparison with other methods and notes on barbiturates*. 1943, London: Oxford University Press. 8s. 6d. [£0.425] Bibliography.

Klapman, J. W. *Group psychotherapy. Theory and practice*. 1946, London: Heinemann. 21s. [£1.05] Bibliography.

Rippon, T. S. & Fletcher, P. *Reassurance and relaxation. A short textbook of practical psychotherapy describing the nature of anxiety and how to induce relaxation in the nervous patient*. 1940, London: Routledge. 6s. [£0.3]

Slavson, S. R., ed. *The practice of group therapy*. 1947, London: Pushkin Press. 21s. [£1.05]

Of value to practitioners and those working in the field of mental health.

Stekel, W. *Technique of analytical psychotherapy*. Translated by Eden & Cedar Paul. 1939, London: Bodley Head. 21s. [£1.05]

Wolberg, L. R. *Hypnoanalysis*. 1946, London: Heinemann. 21s. [£1.05]

\* \* \*

# Notes on Contributors

MISS RUTH DARWIN was for many years engaged as a worker in the field of mental health. From 1932 until 1949 she has been Senior Commissioner of the Board of Control. Miss Darwin was awarded the C.B.E. in 1938 in recognition of her services.

MISS OLIVE F. GRIFFITH was trained in general and mental nursing, and holds the certificate of the Florence Nightingale International Foundation in Hospital and Training School Administration. She has held administrative posts in mental hospitals, was Psychiatric Nursing Consultant to the UNRRA Mission to Greece, and until recently was an inspector of training schools for the General Nursing Council. She has now taken up an appointment in Canada.

MR. T. F. HOWARTH has been a member of the staff of the British Medical Association Library since 1927, and has held the position of Sub-Librarian since 1939.

MISS ISABEL M. LAIRD is a psychologist and teacher working independently in the field of preventive mental health. She is experienced in schoolwork with normal and educationally handicapped pupils of all ages, and was for some years headmistress of the special school at the Royal Scottish National Institution, Stirlingshire. During the war Miss Laird was an Inspector under the Board of Control (England and Wales), and was for a time seconded from this post for field-work for a national survey of the incidence of neurosis in the civilian population, which was begun in 1942. She is a Member of the College of Special School Teachers, a Fellow of the British Psychological Society and a former Fellow in Psychology at the London Child Guidance Clinic. She is also Chairman of the Association of Mental Health Workers, a member of the Scottish Advisory Council on Child Care, and a substitute-member of the Executive Board of the World Federation for Mental Health.

PROFESSOR AUBREY LEWIS is an Australian who qualified in Adelaide and, after psychiatric study in the USA and Germany, became attached to the Maudsley Hospital, now a teaching school of the University of London. He now holds the Chair of

Psychiatry in the University and is Director of the Professorial Unit of the Bethlem Royal and Maudsley Hospitals. He is also Honorary Director of the Medical Research Council Occupational Psychiatry Research Unit. His personal views on postgraduate education in psychiatry were set out in an article entitled "Education of Psychiatrists" (*Lancet*, 1947, 2, 79). He has previously contributed to the Bulletin an article entitled "On the Place of Physical Treatment in Psychiatry" (*Brit. med. Bull.*, 1945, 3, 22), with which a more detailed note on his early career was published.

PROFESSOR D. R. MACCALMAN was formerly Crombie-Ross Professor of Mental Health, University of Aberdeen, and in 1948 became Nuffield Professor of Psychiatry at the University of Leeds and Consultant Psychiatric Advisor to the Leeds City Council. He is a Fellow of the British Psychological Society and has, throughout his career, been constantly engaged in research work. At Boston Psychopathic Hospital, USA, he assisted in a large-scale scheme of research in the causation of schizophrenia and also worked on the subject of variations in the leucocyte count in response to change of mood. For three years in America and Scotland he worked on the Rorschach Test and its clinical application. In London he was responsible for the co-ordination of all research work done at the child guidance clinics in England and Wales. He is at present working on such research projects as the etiology of disseminated sclerosis, psychological factors in organic disease, methods of training mental health nurses, techniques in presentation of psychiatric material, the influence of archetypes on educability, and the use of group techniques in teaching and examination. He has contributed sections to a number of books and has published articles in various journals.

MISS E. M. MACDONALD is a teaching and founder member of the Association of Occupational Therapists (England). In 1938 she received a grant from the Pilgrim and York Trusts to study the development of occupational therapy in the USA and Canada. On her return she became Principal of the Dorset House School of Occupational Therapy and throughout the war was an organizer of the war-time courses run by the School at the request

of the Ministry of Health. She has now been invited to sit on the committee set up to consider and to make recommendations on the supply and demand, and training and qualifications, of occupational therapists in the National Health Service. With Dr. N. A. Haworth, Miss Macdonald is author of *Theory of occupational therapy* (1947) published by Baillière, Tindall & Cox, London.

DR. W. S. MACLAY is Medical Senior Commissioner of the Board of Control and Physician to the Out-patient Department of the Maudsley Hospital. After qualifying from Cambridge and St. Bartholomew's Hospital in 1927 he held various appointments in medicine, surgery and other specialties until 1931, when he took up full-time work in psychiatry. He worked at the Maudsley Hospital from 1931 to 1939 and, in addition, from 1938 to 1945 was Physician in Charge of the Department of Psychological Medicine at the West London Hospital. From 1939 to 1945 he was Medical Superintendent of Mill Hill Emergency Hospital which, along with Sutton Emergency Hospital, replaced the Maudsley Hospital during the war years. He is Vice-President of the Psychiatric Section of the Royal Society of Medicine.

DR. DEREK RICHTER has previously contributed to the Bulletin an article entitled "Somatic Aspects of Mental Health and Disease" (*Brit. med. Bull.*, 1949, 6, 44) with which a note on his work was published.

DR. KENNETH SODDY is Assistant Physician in the Department of Psychological Medicine, University College Hospital, and Psychiatrist to the Child Guidance Training Centre. Until recently he was Medical Director of the National Association for Mental Health, and in this capacity was intimately connected with recent developments in social work in the mental health field. During the war he was the senior technical member of a mission sent to India to establish modern scientific selection methods in the three fighting Services and in the Indian Civil Service. In this project he gained valuable experience in methods of intelligence, aptitude, and personality assessment of many races of widely different levels of culture and education.

\* \* \*

**I**N this issue of the Bulletin the arrangement of Part II has been altered; the books reviewed have been classified into a number of main sections which are listed below. Some of the sections are introduced by an article on recent developments in the field or by an essay-review drawing attention to the most important or useful publication received by us during the period covered by this issue. It is hoped that this new plan will facilitate reference to Part II by specialist readers, and that continuity of interest in the various fields of medicine will be maintained. There are, as before, sections devoted to shorter notices, historical notes, film reviews, and a guide to the contents of current British medical periodicals.

## Annotations & News

## MEDICAL CONGRESSES 1950

**Anatomy.** The International Anatomical Congress, 1950, will be held in Oxford from 25-28 July. Sections are being planned to include the following subjects: General Anatomy, Histology & Embryology, Morphogenics & Endocrinology, Neurology, and Physical Anthropology. Membership of the Congress is open not only to members of anatomical societies but to persons engaged in research or teaching in the above subjects and working in approved institutions. The Congress organizer is Miss A. M. Mayall, Department of Human Anatomy, University Museum, Oxford.

**Microbiology.** The Fifth International Congress of Microbiology will be held in Rio de Janeiro from 17-24 August, 1950. Further information may be obtained from Dr. H. G. Pereria at the Instituto Oswaldo Cruz, Rio de Janeiro.

**Ophthalmology.** The Sixteenth International Conference of Ophthalmology will be held in London from 17-21 July, 1950. The Conference is organized by the Royal College of Surgeons of England and information may be obtained from the Conference secretary, Mr. Frank W. Law, F.R.C.S., 45 Lincoln's Inn Fields, London, W.C.2.

**Optical Science.** Also in London, the International Meeting for Optical Science will be held from 17-26 July, 1950. The secretary of the conference is Professor L. C. Martin, Imperial College, Exhibition Road, London, S.W.7.

**Paediatrics.** Zurich will be the scene of the Sixth International Congress of Paediatrics. The Congress will be held towards the end of July, 1950, and will last from four to five days. It is proposed to hold two plenary sessions and a series of simultaneous group sessions, together with a scientific exhibition at which the lecturers' graphs, photographs, etc. will be displayed. Professor G. Fanconi is president of the Congress and the secretary-general is Professor Emmett Holt, Bellevue Hospital, New York 16, N.Y.

**Physiology.** The Eighteenth International Physiological Congress will be held in Copenhagen from 15-18 August, 1950. The Congress is intended for members of national physiological, biochemical and pharmacological societies. The organizing secretary is Professor E. Lundsgaard and the Congress Bureau is Zoofysiologisk Laboratorium, Juliane Maries Vej 32, Copenhagen.

**Radiology.** The Sixth International Congress of Radiology will be held in London from 23-29 July, 1950. The headquarters of the Congress will be at the Central Hall, Westminster, S.W.1. In addition to the meetings, there will be a scientific exhibition and a technical exhibition of apparatus. The subjects to be discussed at the General Congress Scientific Meetings are: (i) Radiological Achievement, 1937-1950; (ii) Mass Radiology of the Chest; (iii) Supervoltage Radiotherapy; (iv) Radiation Hazards. In addition, symposia will be held by the Diagnosis Section, Therapy Section, Biology Section and Physics Section. A special programme of social events is also being arranged.

The Conference is open to members of radiological societies and also to technical staffs of radiological departments, and of the x-ray industry. Further information may be obtained from the Faculty of Radiologists, 45 Lincoln's Inn Fields, London, W.C.2.

**Speech Therapy.** The International Association for Logopaedics and Phoniatriy will hold an International Speech Therapy Conference in Amsterdam from 20-26 August, 1950. There will be sessions on the following subjects: (i) Psycho-therapeutic Influence on Speech Diseases; (ii) Change of Voice and Voice Disorders; (iii) Cleft Palate; (iv) Aphasia, Alcxia, etc.; (v) Diction. One day will be devoted to visiting a number of institutions. The secretary of the organizing committee is Dr. Hanny Veldkamp, P. C. Hooftstraat 27, Amsterdam-Z, Netherlands.

1425

## MEDICAL RESEARCH COUNCIL

Professor H. P. Himsworth has been appointed Secretary of the Medical Research Council as from 1 October, in succession to Sir Edward Mellanby, F.R.S. Professor Himsworth, who is well known for his work on diabetes mellitus and on the liver, is 44 years of age and has had a brilliant career. From 1939 he was Professor of Medicine in the University of London and Director of the Medical Unit, University College Hospital.

1426

## ROYAL SOCIETY MEDAL AWARDS

The Royal Society announces that H.M. the King has approved the award of the two Royal Medals of the Society for the year 1949 to:

SIR GEORGE THOMSON, F.R.S., for his distinguished contributions to many branches of atomic physics.

PROFESSOR R. A. PETERS, M.C., F.R.S., for his distinguished biochemical researches; in particular for his investigations of the biochemical role of vitamin B<sub>1</sub> in tissue metabolism, and the mechanism of the toxic action of lewisite and other arsenical compounds.

Professor Peters has contributed a number of articles to *British Medical Bulletin*, the most recent being one on the "Development and Theoretical Significance of British Anti-Lewisite (BAL)" (*Brit. med. Bull.* 1948, 5, 313).

1427

## WORLD HEALTH ORGANIZATION A PLAN FOR MENTAL HEALTH

The Constitution of the World Health Organization places upon it specific responsibilities in the field of mental health; member States have undertaken "to foster activities in the field of mental health, especially those affecting the harmony of human relations". WHO plans to meet these responsibilities; at the International Congress on Mental Health held in London in August 1948, a World Federation for Mental Health was set up (*sec Off. Rec. World Hlth Org.* 18, 79). A large number of national organizations is affiliated with this body, which has been admitted to consultative status by WHO and UNESCO.

It is recognized that the need for work in mental health is urgent and world-wide. At this stage, the most pressing need is for factual information and for educative programmes to remedy the most obvious defects in the various schemes for the prevention and treatment of mental disorders; the schemes are at present limited by the scarcity of trained workers. It is proposed, therefore, to undertake a survey to collect data regarding the existing position in different areas, including the extent to which mental health problems have been assessed and provided for. It is planned to form field teams of WHO workers, not only for the carrying out of such a survey, but also for the demonstration of techniques of prevention and treatment.

In the field of education in mental health work, it is planned to make extensive use of WHO teams of field workers, and to direct efforts not only towards the medical and allied professions, but towards the general public. An enlightened public opinion is recognized as a factor of the utmost importance in the solution of mental health problems. The Republic of the Philippines is the first country to avail itself of WHO assistance in mental health matters; the country's resources and needs in this field will be surveyed under the direction of Dr. Krapf, Associate Professor of Psychiatry at the University of Buenos Aires.

1428

## THE FIRST YEAR OF THE NATIONAL HEALTH SERVICE

With a commendable lack of delay, the editors of *The Practitioner* have published an extra number devoted entirely to a survey of the first year's working of the National Health Service Act in Great Britain. In view of the well-established position in British medical

<sup>1</sup> *The Practitioner*, extra number; "A Review of the National Health Service Act." Autumn 1949, London. 5s. [£0.25]

journalism which *The Practitioner* enjoys, the reader may expect to find a comprehensive and unbiased presentation, and he will not be disappointed: the issue includes seventeen articles written by representative individuals actively concerned in the Service, who have been selected on the basis of their intimate knowledge of the everyday working of the Service and their freedom from political bias and other prejudice. After much consideration, the editorial decision was that the articles should be anonymous; one reason for this is that several of the contributions were jointly written by two or more authors.

The separate articles present the views of a physician, a surgeon, an obstetrician, and two general practitioners; an ophthalmologist, a dentist, a pharmacist, a medical administrator and two young doctors at the threshold of their medical careers add their views. There are further contributions from a representative of the Ministry of Health, a spokesman for the profession of nursing, and a hospital patient. The presentation is completed by a general article reviewing the first year of the Service, another surveying the Service in Scotland, a final article on the costs of the N.H.S. written by a professional economist, and a useful chart showing the organization of this somewhat complex Service. The net effect of these is to present a well-rounded view of medical practice in Britain during the past year; it is clear that the views of the contributors have been respected. The editorial hand has been restrained, so that a series of individual views rather than a consistent report is the result. This is a matter for congratulation.

It is not surprising, therefore, that fairly sharp differences of opinion are revealed. The physician feels that

there is no evidence that the health of the nation has benefited from the first year of the National Health Service. On the other hand, thanks largely to the integrity of an ancient and honourable profession, no great harm has resulted.

The obstetrician, however, takes the view that

the field is set for a wonderful experiment which could not fail to yield encouraging and possibly dramatic results. . . . The pooled experience of the various regions would tend progressively to up-grade the standard of work, and the day might well come when the dreams dreamed by old men would not be so different from the visions seen by the young.

The general practitioners agree that the amount of their work has been increased; apparently urban practice has been more changed than practice in the rural districts in this regard, perhaps because of the inherent conservatism of country folk. The two young doctors view the Service with measured doubt.

Perhaps no feature of the Service has led to more public controversy than the General Dental Service. In the dentist's view:

. . . the General Dental Service has unquestionably provided necessary dental treatment for millions of the adult population who probably would not otherwise have received it, with a consequent improvement in their general health. It has also brought a considerable measure of financial prosperity to a large number of the dental profession.

This dentist, however, goes on to point out two real dangers: it is much easier for dentists to obtain approval for extractions and for the supply of dentures than for long and often expensive conservative treatment. Herein lies one danger—the temptation for the dentist to take the line of the least resistance and to estimate only for the kind of treatment which he has found by experience, is easily and quickly approved by the Dental Estimates Board. The second danger is the effect of the new Service on the School Dental Service. Although this, and the maternity and child welfare dental services, were given priority by the Act, the attraction of much higher remuneration has resulted in the drift of dentists from the School Dental Service to private practice within the General Dental Service. The dental profession is therefore apprehensive that serious harm may be done to the important child and maternal dental services if this situation is allowed to continue. It is pointed out elsewhere, though not by the dentist, that payment by items of service may turn out to be extravagantly expensive and that payment by capitation fee is a fairer and more economical method. The remuneration to dentists is still under consideration and may be subject to further changes.

From the sociological point of view, the article on the cost of the Health Service is perhaps still the most controversial. The original estimate of its net cost to the taxpayer was £126 millions; this estimate was made in 1946 and was based largely on the cost of the old National Health Insurance Scheme. The final estimate for 1948-49 has swollen to £278 millions; a part of the increase is of course due to the rise in all costs during the past three years, but the major reason for the error in estimates has been the unexpected and unprecedented demand for medical services, especially pharmaceutical, dental and ophthalmic. Of the weekly contributions, which vary from a total of 9s. 1d. (4s. 2d. from employer and

4s. 11d. from employee) for male workers to 6s. 2d. for self-employed persons and 4s. 8d. from non-employed persons, an average of 6d. to 10d. is allocated towards the cost of the National Health Service. The balance of the contributions is in favour of unemployment insurance, sickness benefits and old age pensions. Contributions are payable by everyone between the school-leaving age and the pensionable age, with certain exceptions—notably housewives, who may elect either to contribute, thus receiving full pension benefits, or to enter the Scheme as dependants of their husbands. The health services provided are free of charge, except where any provision of the National Health Service Act expressly provides for the making and recovery of charges, and is available to all.

Let the economist speak on this vexed question of costs:

A country can only have the standard of living it can pay for; and the standard of living includes the National Health Service as one of its components, but only one, and not one with an overriding priority. It is often argued that a Health Service will increase the national income because it will bring better health to the workers with a consequent increase in their productivity. But the argument is just the same for all the social services. Workers will produce more if they are better educated, if they have more security, more comfortable houses, cheaper food, and the prospect of an adequate pension on retirement. Some of this may be true—in the very long run. In the short run, there is no escaping the fact that the social services have to be paid for out of taxation—in one form or another—and this taxation is placing a burden on the country at the very time when it can least support it, at a time when its main hope for weathering the present economic crisis is through a reduction of costs over its whole structure. When costs have to come down, the cost of Government cannot be allowed to rise indefinitely—not even on such an important item as the National Health Service.

Since this survey of the Service was written, it has been proposed to make a charge of not more than one shilling on prescriptions. It is generally felt that when the first rush is over the Service will settle down and some of the undoubted abuses will be eliminated.

The experience of Britain in this field will be carefully watched abroad, and will probably have important effects on the development of medical practice in other countries. For this reason, among others, *The Practitioner* has performed a very real service in bringing out this survey. No other such compact source of information is at present available.

D. F.

1429

## BRITISH COMMONWEALTH COLLECTIONS OF MICRO-ORGANISMS

At the British Commonwealth Scientific Official Conference in 1946 it was recommended that a directory of the important culture collections of the Commonwealth should be prepared. As a result the *Directory of collections of micro-organisms maintained in the United Kingdom and Crown Colonies* (His Majesty's Stationery Office, price 6d.) has been published. It gives a comprehensive list of the various institutions maintaining such collections in the United Kingdom and the Crown Colonies, together with a brief description of the various collections and the relevant information concerning the terms of distribution of specimens to research workers. The directory does not include the collections in the various Dominions, and is to that extent incomplete. However, it should provide much useful information for workers engaged in all types of bacteriological and protozoological research. Further information may be obtained from the Secretary, United Kingdom National Committee of the British Commonwealth Collections of Micro-organisms, 38 Old Queen Street, London, S.W.1.

1430

## A GERMAN-ENGLISH MEDICAL DICTIONARY

The late Dr. F. S. Schoenewald, when he was obliged to leave Germany, used his leisure to compile a German-English medical dictionary which would be more than a mere glossary, and would give as much help as possible in selecting the most suitable word. The words included are those found in some 30,000 pages of Anglo-American medical literature, which were translated into German to form the English-German section and then back into English to form the German-English section which is here reviewed.<sup>1</sup> It differs from most technical dictionaries in that it includes many words that are not purely technical terms and the use of most of the English translations is illustrated by one or more phrases. The different uses of the German words are not illustrated, and this

<sup>1</sup> For particulars, see p. 274.

makes the dictionary more useful to the German-speaking than to the English-speaking translator. The illustrations are not always very illuminating, and sometimes there are too many for one word and none for another. To take a word at random, *Farbe* is given as "colour—(am. color) the mucous membranes were of a good c.—the skin acquires a bright red c.—a dusky c. appears—c. blind c. blindness—the urine will be red in c.—; dye—the known strength of a d.—the d. excretion may fall low—the area was occasionally dabbled with the d. mixture—; hue—ashen-grey h. as sign of shock—leaden-grey h.— the skin assumes a dusky h.—; paint—lead p. was being applied by means of a spray—; stain—; tinge—of a slightly greenish t.—buff t.—; tint—lemon-yellow t.— to give a dark t. to the blood—buff t.—" The book is easy to handle and clearly printed, but some distinction in type might usefully have been made between the English word and its illustrations. Although details can be criticized in this, as in any other dictionary, Dr. Schoenewald has provided the translator of German medical literature with a tool of a new and useful kind, a dictionary in itself, sufficient for anyone reasonably familiar with German, and not merely a technical supplement to a general dictionary.

M. A. V.

1431

## NEW JOURNALS

Since the Second World War the number of medical journals has multiplied, and it requires courage of a high order to add to the increasing throng. Yet, where knowledge advances and techniques multiply, it is inevitable that the devotees of these new methods will want new channels of communication so that the proper development of their subject will be assisted if not assured.

*Electroencephalography and Clinical Neurophysiology*, the official organ of the International Federation of EEG Societies, is a new international journal which will fill an urgent need; that it is not hastily conceived is evidenced by the fact that plans for it were first drawn up in June 1947 by the Executive Committee of the International EEG Organization at their first meeting in London. The ramifications of neurophysiology in general and electroencephalography in particular are many, but as a special branch of medicine its distinguishing feature is perhaps the broad scientific basis on which it rests; it is clearly in the interest of all concerned that an authoritative journal, preferably of international scope, should be devoted to it, and such is the present journal. The annual volume will consist of approximately 500 pages, and will appear in quarterly issues; the subscription is \$8.00 (American or Canadian). The sponsors can be satisfied that in Herbert H. Jasper and W. Grey Walter they have found an able editor and co-editor who will be energetic and efficient. No. 1 of vol. 1 (February 1949) contains a symposium on the "Physiological Basis of Epileptic Discharge"; regular features, which follow the main articles, are Communications, Technical Notes, Proceedings of the EEG Society, and a very useful Index to Literature. The numerous figures and half-tone illustrations are of a high standard and the editors are to be congratulated on the production of a very fine journal.

*The Journal of the Faculty of Radiologists* (Bristol), a new quarterly of which the first issue appeared in July 1949, will henceforth serve as the official organ of the Faculty. It is edited by Dr. Peter Kerley and will be devoted to the publication of original articles dealing with both radiotherapy and radiodiagnosis. As one would expect, the editorial board includes many of the leading exponents of the specialty, and the fact that it is published by John Wright & Sons of Bristol will ensure that a high standard of production is maintained. The annual subscription is £2 2s.

The appearance in July 1949 of the first number of *Annals of the Institute of Laryngology & Otology* (London) means that henceforth the clinical experience gained in the Royal National Throat, Nose and Ear Hospital, the largest hospital in Great Britain devoted solely to this specialty, will be preserved in a more permanent form. Contributors will apparently be restricted to past and present members of the Institute, and the new publication will thus be analogous to the various Hospital Reports published by so many institutions; no doubt it will prove of equal value to the best of these. Frequency of publication and subscription rates are not given, but vol. 1, no. 1, which we have seen, is impeccably produced and of a high standard.

It is generally agreed that accurate, complete and up-to-date records are essential in the modern practice of medicine and a *sine qua non* of clinical research. The Association of Medical Records Officers has instituted a new journal, *The Medical Record* (Pontefract); it is hoped that this journal will help to disseminate news and views of development in record-keeping technique. This journal, of which we have received the number for May 1949, is to be a quarterly and will be issued free to members of the Association; to others, the price is 1s. per copy.

\* \* \*

From Holland it has been announced that the Dutch College for the Advancement of Surgical Science has undertaken the publication of a new journal—*The Dutch Archives of Surgery* (*Archivum Chirurgicum Neerlandicum*) (Arnhem). The constituent bodies of this College include the Dutch Societies for General Surgery, Orthopaedic Surgery, Urology, Neuro-surgery, Plastic Surgery, Thoracic Surgery, and Anaesthesiology; the new journal will serve as the official organ of these societies, and will be entirely devoted to the interests of surgery. For the most part articles will be printed in English, though manuscripts may be submitted in Dutch, German, French or English; it is the avowed policy of the editorial board to encourage contributions from workers in other countries of Western Europe. One interesting plan is the attempt which will be made to co-ordinate the treatment of varying aspects of the same disease by exponents of the different specialties; for instance, in 1948 the members of the College, including orthopaedists, urologists, and neuro- and thoracic surgeons as well as general surgeons, attended a Congress devoted to the study of tuberculosis from their various standpoints. The journal will be published quarterly. The subscription rate in the British Empire is £2 2s. annually, and the English agents are Messrs. Baillière, Tindall & Cox, London.

\* \* \*

From Argentina we learn that the Facultad de Higiene y Medicina Preventiva de la Universidad Nacional del Litoral, Santa Fe, has begun a new publication devoted to public health and preventive medicine. Vol. 1, no. 1 (March 1949) of *Anales de Medicina Pública* consists largely of articles written by members of the Faculty. It is well produced and each article has an English summary, which, unfortunately however, contains many typographical and other errors. The frequency of publication is not specified.

\* \* \*

In 1946 the medical officers of the municipal health services of São Paulo founded what has proved to be a very active professional society: the Sociedade Médica da Municipalidade de São Paulo. This medical society has now undertaken the publication of a quarterly journal, *Arquivos Médicos Municipais*; its chief function will be to preserve the papers delivered before the society in a more permanent form. If the high standards of the first two issues, dated March and June 1949, are preserved, its success will be assured.

\* \* \*

*Archivos del Hospital Universitario*. In Havana, a new series of hospital archives has been inaugurated. The new publication is sponsored by the Asociación de Internos del Hospital Universitario "General Calixto García"; it will be published bimonthly and the subscription rate is \$5.00 annually.

1432

## JOURNALS NEWLY RECEIVED

The papers presented at the second South American congress of neurosurgery, held in Santiago de Chile in April 1947, have since been published as vol. 4, 1948, of *Neurocirugía* (Santiago), organ of the Instituto Central de Neurocirugía y Neuropatología de Chile. The official subjects chosen for this congress were hydrocephalus, histology of tumours of the central nervous system in relation to their clinical aspects, and cerebral abscess. Twenty-two papers on these subjects, and four on others freely selected, are included. March 1949 was chosen as the date of the next congress, which was held in Buenos Aires.

\* \* \*

*Bollettino della Accademia Medica Pistoiese "Filippo Pacini"* (Pistoia), vol. 19, December 1948, contains the text of papers presented at meetings of the academy during the year, with reports of the discussions, and an account of the post-war restoration and

opening of the academy's new premises in the Ospedale del Ceppo, Pistoia. The 16 papers deal with varied subjects in clinical medicine and surgery. Besides the usual illustrations, views of the hospital and of other interesting buildings in Pistoia are included.

\* \* \*

The *Bulletin of the Institute of Marine and Tropical Medicine, Medical Academy in Gdansk, Poland*, of which we have received vol. 2, no. 1-2, 1949, is intended to provide information on the scientific work of the Institute and articles dealing with the problems of the Polish Marine Health Services. The journal is published in English, and the present number includes 16 articles, most of which are summaries of research work carried out in the laboratories of the Medical Academy in Gdansk.

\* \* \*

In the last number of this Bulletin, *A Crimça Portuguesa* (Lisbon) was the subject of a note which referred to the international outlook of this journal. This aspect is now further developed in vol. 8, 1948-1949, which is to be the first of a series of numbers devoted to paediatrics in other countries, beginning with Belgium. Written almost entirely in French, this number includes articles on the institutional care and education of mentally and physically defective or anomalous children, probation officers' work with children, school medical services, child guidance, and the training of clinical psychologists. If other countries are dealt with in the same comprehensive way, this series should provide a valuable source of information on modern paediatric practice.

\* \* \*

An editorial body made up largely of members of the faculty of medicine of Seville University is responsible for the production of *Acta Clinica* (Seville). We have received the number dated April-May-June 1949, which contains six original articles, dealing respectively with diazo reaction of biliary pigments, open-circuit endotracheal intubation anaesthesia with positive pressure apparatus, superficial punctate keratoconjunctivitis, persistent ductus arteriosus, and treatment of recurrent fever with penicillin. Book reviews, abstracts, and a report of the national congress on allergy are also included. Clear printing gives this journal an attractive appearance. It is a pity that the numbering of the volume and part has been left a matter of deduction; from this kind of omission spring those minor bibliographical mysteries whose unravelling can be either a pleasure or a plague, according to the amount of time at one's disposal.

*Archivos del Instituto de Medicina Práctica* (Barcelona) has completed 24 years of publication with the number which we have just received (second series, vol. 1, no. 1, July 1949). This number contains four original articles, on sensation in tonsillectomy (Drs. J. Ferré & J. Prades Pla), psychosexual physiology (Dr. N. Bonnin Segura), T. Levine's medium for *B. coli* cultures (Drs. A. Valls Conforto & L. Borrás Lafuente), and nerve lesions with neuritic irritation (Dr. J. Martí Abizanda).

\* \* \*

From time to time this Bulletin has published reviews of volumes in the *Colección Española de Monografías Médicas*, published by Ediciones B.Y.P. of Barcelona under the direction of Dr. J. Puig Sereda. This series has proved its popularity by growing in a few years to about 63 titles, some of which have been given a double number. The last volume we have received (1949, no. 95-97: *Leptospirosis: linderos actuales y posibilidades diagnósticas*, by Dr. A. Abellán Ayala) contains an announcement of another 13 monographs in preparation.

The orientation of the series is essentially clinical and practical, with emphasis on therapy, and the subjects chosen are usually of dimensions suitable for treatment in an essay of some 100 pages. A few wider subjects have also been attempted; there is, for instance, a two-volume manual of dietetics, and a three-volume manual of infectious diseases. Such homely themes as first aid, whooping cough, and the painful shoulder have not been despised; towards the other end of the scale there are volumes on plasma proteins, intracranial tumours and indications for thoracoplasty. The series is well produced in an attractive format.

The editors have not confined themselves entirely to Spanish contributors. There are translations from German, Roumanian, and English; the latter group comprises Dr. T. H. Howell's *Old age*, Dr. P. F. M. Bishop's *Gynaecological endocrinology*, and an American contribution, Dr. Milton B. Cohen's *Manual of allergy*. Bibliographies are usually included; some of these are prepared with obvious care, while others show a good many inconsistencies. Besides the main essay, each volume contains a section of "Practical notes on diagnosis and treatment", consisting of short original articles and translations from foreign journals.

These volumes are handy in size, well printed, and illustrated where appropriate with line-drawings, charts, and photographs in monochrome and colour; many of the latter appear as plates, instead of in the text, with advantage to their quality. The publishers are to be congratulated on initiating this useful and attractive series for the benefit of Spanish practitioners.

\* \* \*

The following journals have also been received:

- Anales Neuropsiquiátricos del Frenocamio de Mujeres* (Bogota), vol. 3, no. 11, 1949
- Archivos Argentinos de Kinesiología* (*Kinesiterapia y Kinefilaxia*) (Buenos Aires), vol. 2, no. 3, 1949
- Baletin de Infarmaciones Parasitarias Chilenas* (Santiago), vol. 4, no. 1, 1949
- Iparegészsegügy.* (*Hygiène du Travail*) (Budapest), vol. 2, no. 4, 1949
- Journal of the Faculty of Medicine, Baghdad, Iraq* (Baghdad), vol. 13, no. 1, 1949
- Medicina y Ciencias Afines* (Bogota), vol. 1, no. 1, 1949
- Medicina Práctica* (Saragossa), year 7, no. 62, 1949
- Revista del Instituto Médico "Sucre"* (Sucre, Bolivia), year 46, no. 86, 1949
- La Tunisie Médicale* (Tunis), year 37, no. 3, 1949

# Historical Notes

1433

## A NOTE ON BRITAIN'S CONTRIBUTION TO MENTAL NURSING

Early in the last century a system obtained in France whereby persons to be employed as attendants of the insane had opportunities to learn something of the work, by observation as assistants, before they were put in charge of patients; instruction of some kind was also given to attendants at New York Hospital in 1798. It was, however, in Britain that the first modern course of lectures was given to mental nurses, and that the first national system of examination for them was established.

As early as 1830 Dr. John Conolly advocated that every asylum should be "a school of instruction for male and female attendants."<sup>1</sup> Seven years later Dr. W. A. F. Browne, in a lecture delivered at Montrose Royal Lunatic Asylum in Scotland, also referred to the need for preparing "keepers" for their work and for raising their status. Dr. Browne later transferred to the Crichton Royal Institution, Dumfries, and there, from October 1854 to May 1855, he gave a course of 30 lectures to the medical and nursing staff.<sup>2</sup> It is believed that these were the first systematic lectures given to mental nurses in any country. The instruction embraced "a full, if somewhat popular, discussion of insanity in the different forms, intelligible by the shrewd and sensible, if somewhat illiterate class of persons, employed as attendants and nurses." About the same time there were other stirrings. Mrs. A. B. Jameson in her book, *Sisters of charity* (London, 1855), pointed out the need for a good feminine influence for insane men as well as for insane women, and the Commissioners in Lunacy, in their 9th report (London, 1855), recommended the appointment of head attendants of a superior type and referred to the experiment of placing a well-educated lady as "a companion to female patients of the upper classes".

It cannot, however, be claimed that much came of all this, for when Dr. Browne's son, Sir James Crichton Browne, had charge of the Crichton Royal in 1865, nurses were still there who had to get their mental patients to read the directions on the medicine bottles for them.<sup>3</sup> In 1876 Dr. T. S. Clouston read a paper to the Medico-Psychological Association, in which he recapitulated the points about the need for proper pay and status for asylum attendants, put forward by Dr. Conolly nearly 40 years previously and frequently referred to in the reports of the Commissioners in Lunacy. In addition he asked whether medical officers should not "spend a special time each day" in instructing attendants.<sup>4</sup>

Dr. Samuel Hitch, a founder of the Royal Medico-Psychological Association, had as early as 1841 been a pioneer in employing some women in the nursing of male patients at Gloucester Asylum. Following Dr. Clouston's address, the Association took a special interest in the training of nurses. In 1885 a subcommittee of Scottish alienists brought out the first edition of the Association's *Handbook for the instruction of attendants on the insane* (London, 1885). The object of the book was to enable mental attendants "to do their work with greater intelligence and usefulness". A review of it in the *Journal of Mental Science*<sup>5</sup> appeared on the same page as an obituary notice of Dr. W. A. F. Browne. The reviewer questioned the advisability of teaching attendants about such things as white and grey matter, but the handbook became very popular, and in 1888, for instance, was being used as the basis for lectures to nurses at Dordrecht Asylum in Holland. The book has been through many editions, the eighth, under the present title of *Handbook for mental nurses*,<sup>6</sup> being now in preparation. In 1889 another committee was set up, and as a result of its recommendations the Medico-Psychological Association started its examinations for mental nurses, the first of which was held in 1891. The examinations were the first, and remained for many years the only, uniform national system of training and certification for any body of nurses in any country. When the General Nursing Councils in England, Scotland and Ireland were set up in 1922, they arranged to conduct examinations for mental as well as for general nurses, the first final examination being conducted for England and Wales in 1925. The examinations for mental nurses, of both the General Nursing

Council and Royal Medico-Psychological Association, continued until recently when, in 1947, the General Nursing Council, by agreement, became the sole examining body.

Laurence Dopson

## JAMES COWLES PRICHARD AND "MORAL INSANITY"

James Cowles Prichard, the centenary of whose death fell at the end of last year, was a British alienist who originated the theory of "moral insanity" and was also a distinguished anthropologist. In addition to being a Fellow of the Royal Society, he was a corresponding member of the Institute of France, the French Academy of Medicine, the American Philosophical Society and the Academy of National Sciences of Philadelphia; he was an honorary Fellow of King's and Queen's College of Physicians in Ireland, and many of his books were translated into German and French.

Prichard was born at Ross in Herefordshire on 11 February 1786, of Quaker parents, and was educated at home. The studies to which he "most eagerly addicted himself" were history and languages—he learnt to speak French, Italian, Spanish and modern Greek. He turned to medicine as a career "not from any bias towards it but because it presented no difficulties to him as a member of the Society of Friends, and at the same time permitted of his pursuing his favourite studies."<sup>1</sup> In 1802 he became a student of medicine at Bristol, where he was then living with his parents. He afterwards moved to the medical school attached to St. Thomas's Hospital, London, and then put in three "hard years" of study at Edinburgh. Here, in addition to the medical lectures, he also attended the lectures of Douglas Stewart and Playfair on metaphysics and natural philosophy—the medical curriculum was less crowded in those days.

Early friends of the young Prichard have spoken of his great love of fun. At Edinburgh, however, he was already manifesting his interest in anthropology and in the varieties of the human race. A fellow student wrote: "A shade of complexion, a singularity of physiognomy, a peculiarity of form, would always introduce the one absorbing subject." After graduating M.D. from Edinburgh in 1808, Prichard resided for a year at Trinity College, Cambridge, and then returned as a doctor to Bristol. Here, in addition to his private practice, he attended and treated the poor, without fee. In August 1811 he was appointed physician to St. Peter's Hospital, Bristol—a most important event in his life since it was the beginning of his interest in mental illness.

On cases at St. Peter's, Prichard published in 1822 his first book devoted to mental illness (*A treatise on diseases of the nervous system*, London); it was marked "Part the First", but no subsequent parts were published. In this book Prichard took a view quite different from that which he was subsequently to adopt; thus in it he discountenanced the suggestion that an accident to a boy, in a case reported from Copenhagen, could have been the cause of the sudden development of a depraved moral character. "If stories of this kind gain credit, the College of Surgeons may expect one day to march in triumph and take possession of the vacant seats of the judges; and we shall proceed to apply the trepan where now the halter and gibbet are thought most applicable," wrote Prichard, using the sort of argument still heard even today.

Ten years later, however, when he was asked to contribute to the *Cyclopaedia of practical medicine*, he put forward for the first time the term "moral insanity", which he defined thus:

Moral Insanity, or madness consisting in a morbid perversion of the natural feelings, affections, inclinations, temper, habits, and moral dispositions, without any notable lesion of the intellect or knowing or reasoning faculties, and particularly without any maniacal hallucinations.<sup>2</sup>

He elaborated his views in a volume published in London in 1835, *A treatise on insanity, and other disorders of the mind*, which became a standard work for many years. In this, he noted that

these patients "often display great ingenuity in giving reasons for the eccentricities of their conduct, and in accounting for and justifying the moral feeling under which they appear to exist", and that the prognosis "is often more unfavourable than in other forms of mental derangement." Prichard makes it clear that this work would never have been written had he not been stimulated by the request to contribute to the *Cyclopaedia*, so it is to the editors of this, perhaps, that we are indirectly indebted for the proposition of moral insanity. In an article in *A system of practical medicine*, Prichard, who was a modest man, states definitely that he first introduced this theory.<sup>3</sup> In addition to papers on insanity, Prichard wrote for both the *Cyclopaedia* and the *System* on delirium, hypochondriasis, somnambulism, animal magnetism, soundness and unsoundness of mind, and temperament.

Prichard's book of 1835 is dedicated to Esquirol. Esquirol did not at first accept the proposition of moral insanity, but in 1838 admitted: "I have been obliged to submit to the authority of facts."<sup>4</sup>

In 1842 Prichard published a book entitled *On the different forms of insanity, in relation to jurisprudence, designed for the use of persons concerned in legal questions regarding unsoundness of mind* (London). It appeared at an appropriate time, for in this year a certain McNaghten was acquitted of murder, on the grounds of insanity, after he had shot the Prime Minister's secretary in mistake for the Minister; Prichard's book was quoted by counsel at the trial. It was as a result of McNaghten's acquittal that the House of Lords put a series of questions to the judges, whose majority replies (there was one dissentient) form the McNaghten Rules<sup>5</sup> which still govern the matter of insanity in relation to criminal acts in this country.

In 1835, on the occasion of the installation of the Duke of Wellington as Chancellor, the University of Oxford conferred on Prichard the degree of M.D. by diploma. Prichard was one of the Metropolitan Commissioners in Lunacy and when Dr. H. H. Southey, one of the new Commissioners in Lunacy created under the Act of 1845, resigned soon after his appointment, Prichard was appointed in his stead. He then left Bristol and moved to London. Whilst visiting Salisbury in his official capacity three years later he was taken ill and was brought back to London. "The disease baffled all the efforts of his medical friends, and, after great suffering, he died on the 23rd of December, 1848."<sup>1</sup> The *Lancet*, in an obituary notice,<sup>6</sup> states that in addition to rheumatic fever there was pericarditis (which, that journal then thought necessary to explain to its medical readers, was "inflammation of the membrane containing the heart")<sup>7</sup> and extensive suppuration in the knee-joint." The *Lancet's* epitaph of Prichard was that "he furnished, indeed, a bright example of the scholar, the gentleman, and the Christian." Tuke, after quoting an account of Prichard's modesty by Professor Gibson of Philadelphia, says the following lines are "eminently descriptive" of the man:

In manners gentle, of affections mild,  
In wit a man, simplicity a child.<sup>7</sup>

Symonds<sup>1</sup> gives this description of his person:

Dr. Prichard was in stature rather below the middle height, and of rather slight make. He had light hair, and grey eyes, which, though somewhat small, were of singularly intelligent expression. The form of his head was very fine, broad and prominent in the forehead, lofty and capacious in the crown. . . His voice was rather weak and low, but very distinct in articulation. His manners and deportment . . . were simple and unaffected.

In this note a brief reference only has been made to Prichard's contribution to psychiatry. Perhaps even more to his own heart was his work on anthropology. His earliest publication was *Researches into the physical history of man* (London, 1813). In 1819 he wrote *An analysis of the Egyptian mythology: to which is subjoined a critical examination of the remains of Egyptian chronology* (London). The first edition of his great work, *The natural history of man: comprising inquiries into the modifying influence of physical and moral agencies of the different tribes of the human family*, appeared in London, 1824. Another work was *The Eastern origin of the Celtic notions proved by a comparison of their dialects with the Sanskrit, Greek, Latin and Teutonic languages* (Oxford, 1831). A further facet of Prichard's interest is revealed by his *History of the epidemic fever which prevailed in Bristol, during the years 1817, 1818, 1819; founded on reports of St. Peter's Hospital and the Bristol Infirmary* (London, 1820). In 1829 there appeared *A review of the doctrine of a vital principle, as maintained by some writers on physiology* (London).

As to Prichard's contribution to psychiatry, his concepts led the

way to further progress. Tuke has summed it up in these words: "Though he did not live to see it, Prichard has had his triumph."

#### SIR GILBERT BLANE 1749-1834

The bi-centenary of the birth of one of the most illustrious medical men associated with the British Navy fell on 29 August 1949. Sir Gilbert Blane, who was chiefly instrumental in banishing scurvy from the Royal Navy, was born at Blanehead, Ayrshire. He entered Edinburgh University with a view to an ecclesiastical career, but changed his mind. William Cullen, who persuaded William Hunter, the famous obstetrician, to take up medicine instead of the church, was then Professor of Medicine at Edinburgh and one can speculate that he may have influenced Blane's decision too. Blane spent five years studying medicine at Edinburgh, and was president of the students' Medical Society there in 1775, but he qualified M.D. on 28 August 1778 at Glasgow, not Edinburgh. Here again one may like to trace the influence of Cullen, who also graduated at Glasgow.

It was Cullen who introduced Blane to William Hunter, who in turn recommended him to Lord Holderness, whose private physician Blane became (Payne, 1886). After a while the influence of Hunter and Holderness led to Blane's sailing as private physician to Sir George Rodney, who had been appointed Admiral of the Fleet in the year Blane qualified. In 1779 Rodney put to sea for the relief of Gibraltar and appointed Blane Physician to the Fleet. The new Physician, observing that more care was taken of the stores than of the sailors, immediately proceeded to "enlighten the commanding officers, as far as lay in my power, regarding the most effectual means of maintaining the health and vigour of the men" (Blane, 1822).

When Sir George Rodney returned to England in the autumn of 1781 Blane accompanied him and took the opportunity, on 13 October, of presenting a memorandum to the Board of Admiralty, setting out the medical needs of the Navy. On 3 December of that year Blane was also admitted a Licentiate of the Royal College of Physicians, a necessary step for anyone who wished to practise in London at that time. It was about this time that Sir George Rodney had audience with King George III, who expressed anxiety regarding the safety of the West Indies, then threatened by the French. With commendable dash Rodney promised the King that he would sail forthwith without waiting for reinforcements, and, accompanied by his secretary and Blane, he repaired to Portsmouth. The party sailed with the only four ships available, but weather delayed them, and eventually Rodney found himself at the head of the largest British naval force ever assembled up to that time on a foreign station. The French were decisively beaten in the Battle of the Saintes, 12 April 1782.

Blane was with Rodney on the quarter-deck of the *Formidable* throughout the action, and emerged as an early exponent of first aid (Blane, 1822).

It occurred to me . . . that I might possibly be of some use in this spot in case of any severe injury threatening life from hæmorrhage, and for this purpose I carried some tourniquets about me of a simple construction . . . Would it not be advisable at all times that some intelligent person, a warrant or petty officer, quartered on the quarter-deck, should carry in his pocket some such instrument? . . . He need not be a medical officer; and the only instruction necessary would be to point out to him the situation of the great artery in the thigh and arm; or with this information alone, the blood might be stopped by a handkerchief tied tight.

Peace came in 1783. Rodney was rewarded with a peerage and £2,000 per annum. Blane, who had been present at six general engagements during his period of service, was not forgotten (Munk, 1878):

Although the mode of his appointment precluded him from enjoying half-pay, yet, in consequence of the unanimous application to the Admiralty of all the principal officers who had been on the station, he was rewarded by a pension from the Crown, which pension at a later period was doubled by recommendation of the Lords of the Admiralty. . .

Rodney's influence and prestige was at its height, and in support of Blane his lordship wrote to the Governors of St. Thomas's Hospital (Payne, 1886).

To his [Dr. Blane's] knowledge and attention it was owing that the English fleet notwithstanding their excessive fatigue and constant service, were in a condition always to attack. . . In my own ship, the *Formidable*, out of 900 men not one was buried in six months.

As a result of Lord Rodney's recommendations and those of Sir Walter Farquhar, a former Army physician who had served at Gibraltar, and of Dr. R. Huck Saunders, Physician to St. Thomas's Hospital, 1768-1777, Blane was elected Physician to St. Thomas's on 19 September 1783 (Parsons, 1934).

The year 1785 was a fortunate one for Blane. On 13 January he was admitted a Fellow of the Royal Society (he delivered the Croonian Lecture on Muscular Motion, 13 and 20 November 1788), and through the Duke of Clarence's recommendation became Physician Extraordinary to the Prince of Wales, an appointment that was to lead to that of Physician in Ordinary to King George IV and later to King William IV. In 1785 too he published his *Observations on the diseases incident to seamen* (London), his best known work. On 18 November 1795 Blane resigned his post at St. Thomas's. It was in this year that he was appointed to a commission to improve the sanitary conditions in the Navy.

At last Blane was able to carry through his reforms. He had recognized that it was the want of lemon or lime juice that was causing scurvy in H.M. ships, and when, as the result of his efforts, the universal use of lemon juice was ordered the scurvy disappeared. Blane had also complained of the lack of soap and medical supplies, but he was not to see free soap for sailors and free issues of medicines to naval surgeons until 1804 (Comrie, 1932). From 1795 onwards the British Government continued to seek the advice of Blane, but perhaps the most noteworthy occasion was when he was charged with investigating the mortality among the troops on the island of Walcheren. The expedition was abandoned as the result of his report. Blane's many services were rewarded by a baronetcy conferred by the Prince Regent, 26 December 1812.

In 1821 Sir Gilbert Blane's health began to fail. He was attacked with prurigo senilis in its most inveterate form. For this he took opium in gradually increasing doses, but was actively writing almost until his death on 27 June 1834, in the eighty-seventh year of his age.

He was a brave and warm-hearted man, if rather austere. It is said that he was nicknamed "Chilblane" because of a certain coldness of manner, but he spared no pains in improving the conditions for the men under his care. He maintained his interest in the Royal Navy all his life, and in 1829, five years before his death, he founded a medal, which is still awarded, for the best journal kept by a naval surgeon. His most lasting claim to remembrance will be his untiring efforts to banish scurvy from the Navy by the universal use of lemon juice, which, though it was suggested by James Lind and others, owed its final introduction to Sir Gilbert Blane.

## VESALIUS : ANATOMIST (1514-1564)

### *Tabulae Anatomicae Sex*

Vesalius lived at a time when medical thought was undergoing a change from medieval mysticism to a more rational study of man. In the conflict of confusing ideas, in which many participated, Vesalius stands out as dominant; according to the two distinguished authors of *A prelude to modern science*\* (Charles Singer,

the well-known professor of the history of medicine, and C. Rabin, a noted Oriental scholar), his work "heralds the modern spirit of research".

His *Tabulae Anatomicae Sex* are reproduced in their book, in plates one-quarter of the actual size. The originals, apparently meant to hang on the wall for students to see, appeared in 1538, and only two sets are now extant, one in the Hunterian Library of Glasgow University and the other in St. Mark's, Venice. This modern publication does great credit to the authors, and to its publishers, the Wellcome Historical Medical Museum; and it opens our eyes to the tremendous difficulties under which our forefathers laboured, of which the confusion of nomenclature was only one. The book consists of three parts, of which the six extending plates form the third. The text falls into two parts: a historical and critical discussion of Vesalius and of the appearance and significance of the *Tabulae*, and a translation and running commentary of the printed matter on the plates, the commentary being largely concerned with the passage of anatomical terms from medieval to modern forms.

"The influence of renaissance art," remark the authors, "did not penetrate medical literature until late and then but slowly. Vesalius was himself the first effective pioneer of the application of art to anatomy." The *Tabulae*, however, are not all of the same genre, they are not beautiful and none has the charm of Leonardo's drawings. Singer & Rabin believe that the first three "were certainly drawn by Vesalius"; they are "mere 'physiological diagrams'", but are significant as being "the first pictorial exposition of the Galenic physiological system." Vesalius was brought up on Galen, but he changed, and this book discusses the question of how he changed.

The first plate, showing the liver, the portal venous system, and the male and female generative organs, is not impressive. A better picture of the portal system, from the *Fabrica*,<sup>1</sup> has been reproduced, much diminished in size, in the present volume (fig. 51). Looking at this, one wonders how the blood entering the radicles of the portal vein can ascend, reach the liver, traverse it and enter the vena cava—without the abdominal wall muscles, it could not happen! The drawing of the uterus, with its two great processes sticking out, one on each side, may interest the gynaecological student.

The second plate shows the liver, the vena cava and the whole venous system except the portal and pulmonary. Galen believed the liver to be the source of the blood and of the veins, and that the tissues were nourished by blood ebbing and flowing in the veins.<sup>2</sup> He got these ideas from Erasistratus (300 B.C.), against whom he constantly tilts. Nowhere in Galen have I found an explanation of the mechanism of this tidal process. Empedocles (ca 450 B.C.) had also thought that the blood ebbs and flows.<sup>3</sup> We know today that a reversal of the blood-stream does occur in tunicates and caterpillars, but that it is caused by the heart. Vesalius, however, follows Galen and heads his *Tabula II* thus: "Description of the vena cava . . . by which blood, nutriment of all parts, is distributed throughout the entire body."

The third plate shows the heart, the kidneys and the general arterial system; that of the lesser circulation is again excluded. There are criticisms of this system, e.g., the rete mirabile, which does not exist in man, is shown; "the aorta and branches here depicted are certainly not human. They are those of an ape . . ."; also, the right kidney is shown higher than the left, as Galen had taught, and Aristotle before him. Vesalius here seems to accept Galen's theory of the transmission of "pneuma" or "vital spirit" through the left ventricle and the arterial system. In his *Blood-letting letter*,<sup>4</sup> published a year after his *Tabulae*, but doubtless being prepared before, Vesalius writes that when the heart dilates, the left ventricle "takes in air", and when it contracts, "it diffuses the [vital] spirit into the aorta. . ." He writes not a word of the blood entering the left ventricle or leaving it. *Tabula III* is headed, "*Arteria magna* . . . arising from the left cavity of the heart; and carrying the vital spirit to the whole body, regulating the natural heat by contraction and dilatation." Thus, the idea that the aorta conveys the blood is in the dark, while its conveyance of "vital spirit" is illuminated. But it was also part of Galen's conception that blood does enter the left ventricle and presumably is discharged when that ventricle contracts; he also knew that an artery spurts blood when cut. Vesalius, too, must have known all this, and, therefore, this heading of *Tabula III* seems a little odd. Why did he not say that the aorta conveys blood instead of "vital spirit"? We may speculate on whether this is a conspiracy of silence, or whether it is human nature shutting its eyes to the most patent

\* For particulars, see p. 274.

truths and opening its arms to embrace the most fantastic of ideas.

The other three plates, representing the human skeleton from the front, from the side and from behind, are by Calcar, a pupil of Titian, and should have been good, but they lack "dignity and movement", and contain "many elementary errors". Singer criticizes them severely: they are nothing like "the noble poses of the *Fabrica* skeletons", the first of which is shown on page xi of the present volume. Saunders & O'Malley impute Calcar as illustrating both the *Tabulae* and the *Fabrica*, under the specific direction of Vesalius. Singer himself, in 1925, referring to the *Fabrica* drawings, said that the "artist's mind that conceived them was surely that of Vesalius himself."<sup>5</sup> It is clear that between the *Tabulae* and the *Fabrica* Vesalius developed, and that he further changed between the first and second editions of the latter.

Before Vesalius, anatomies were undertaken to "confirm and illustrate the entrenched tradition of ancient authority"; with Vesalius they became procedures of discovery.<sup>6</sup> The *Tabulae* present a transitional stage in his mental development, and their significance is that they led to the *Fabrica*. Singer & Rabin ask: "The *Fabrica* of 1543 is essentially a product of modern scientific research though it is set out in the renaissance humanist manner. What induced this change of outlook in the intervening years?" During the period up to the appearance of the *Fabrica* a progressive series of stimuli was playing on Vesalius. As a boy, he dissected all sorts of animals. As a student in Paris he "set his own hand to the business" of dissecting, hitherto a menial duty. Robinson pictures him so exasperated with an anatomy that he pushed the menial making the dissection aside, seized the knife, and proceeded with the affair, to the amazement of Guenther, who was presiding.<sup>7</sup> After that, first at Louvain and then at Padua, he lectured as he dissected, to crowded audiences. Thus did his ideas enlarge and become more defined.

The work of Vesalius is not only of great significance for the furtherance of medicine and science, but also of philosophy. The pre-Socratic philosophers thought that by studying the universe they would come to understand man. But as time passed, this opinion was reversed and we find many pure philosophers, Plato, Servetus, Descartes, Goethe, Nietzsche, studying man. Galen made many errors, but he said one good thing—"Medicine is the best of all professions . . ." If we understand man we shall understand all.

#### MEDICINE IN THE WESTERN WORLD

Since the unearthing of new data in the well-dug field of medical history is extremely difficult, the modern medical historian can best attain popularity by presenting his subject from a new point of view. The aim of the present work<sup>1</sup> is to discuss the development of modern medicine from the standpoint of its relations with social and intellectual development in general. In other words the book is an international and medical counterpart of Trevelyan's *Social history*, and might almost be regarded as a history of social medicine, using this term in the sense generally understood in England and not the pejorative sense current in the USA. The experiment is an interesting one. The weakness of the book would appear to lie in an attempt to make it attractive to wide audiences ranging from laymen, through social workers, to physicians. As in the case of textbooks written "for students and practitioners" the danger is that the author will end up by pleasing nobody. The layman may find the book heavy going and the medical man may be a little irritated by the author's need to "write down" to the lay level. Thus sentences such as "The most wicked bacteria could and did upon occasion lurk in the most translucent depths" may jar a little. The layman, on the other hand, may be put off somewhat by the formidable list of footnotes. Nevertheless, the book is well worth reading because of the large amount of information condensed into a small compass and should be of particular interest to students of social medicine. The greater part of the book deals with the history of medicine during the last 150 years. The last chapter betrays a divorce from clinical medicine. For example, the author is more optimistic about the value of influenza vaccines than most clinicians would be, and it is surprising to learn that cinchophen is of value in kidney diseases. Misprints and errors are few, but we note that surgeons employ "aseptic" technique and that gramicidin is incorrectly spelt on two occasions.

## A DUBLIN SCHOOL OF MEDICINE AND SURGERY

J. H. YOUNG M.D. D.Obstet.R.C.O.G.

Across the pages of medical history have moved many notable Irishmen. It is probably true to say that few medical men are today aware of the debt which medicine owes to Ireland. From the pens of such authors as Sir Charles Cameron, Dr. T. P. C. Kirkpatrick, and, more recently, Dr. W. Doolin and Professor O'Donel Browne, the student of medical history can learn much.

Dublin's earliest contribution to medicine was the idea of the voluntary hospital. In 1718, six Dublin surgeons opened a house for the reception of surgical patients of the poorer class. This institution is now the Jervis Street Hospital. The year 1745 saw yet another innovation when Bartholomew Mosse founded the first lying-in hospital for women—the Rotunda Hospital, which celebrated its bi-centenary very recently and the history of which has been so admirably described by Professor O'Donel Browne.

The names of Robert Graves and William Stokes are familiar to all on account of the diseases to which their names have become attached, but perhaps less well known is the fact that to them and their colleague, Robert Carmichael, is due the reformation of medical education. Robert Graves (1797–1853) in his very first lecture in Dublin attacked the current system of medical education, alleging that faulty treatment caused the death of many a patient. At that time hospital lectures were delivered in indifferent Latin, the student noting and memorizing what he could. Graves took his classes to the bedside, allocated a patient to each student, and introduced the system of bedside teaching as we know it today. He was as revolutionary in his methods of treatment as he was in his methods of teaching and it is said that he suggested his own epitaph: "He fed fevers."

His contemporary, William Stokes (1804–1878), the outstanding member of several generations of doctors, ably supported Graves' reforms. Before receiving his degree at Edinburgh University, he wrote a short work entitled *Introduction to the use of the stethoscope*, receiving the sum of £70 for his first efforts at authorship. His *Treatise on the diagnosis and treatment of diseases of the chest*, published in 1837, is a medical classic and was the greatest book on the subject since Laennec's immortal work. Seventeen years later, he published his *Treatise on diseases of the heart and aorta*. He was a foundation member of the General Medical Council. The reputation of Graves and Stokes spread far beyond their native shores and their reforms exerted a profound influence in Europe and America. For over a third of a century, Dublin enjoyed the reputation of being the leading medical school of the world. Robert Carmichael (1776–1848) strongly supported Graves and Stokes in their advocacy of stricter control of medical education. These three men clearly outlined the principles which formed the basis for the Medical Act of 1858.

Another notable figure in Irish medicine was Dominic Corrigan who, at the age of thirty, so perfectly described aortic incompetence and the characteristic pulse which accompanies it that it bears his name to this day. In the study of diseases of the eye and ear, Dublin again showed the way. Simpson's Hospital was founded in 1778 "for elderly men afflicted with gout and blindness." Several other hospitals for diseases of the eye were founded in Dublin during the nineteenth century, the two outstanding surgeons being Arthur Jacob and William Wilde.

Over sixty years have passed since Sir Charles Cameron wrote his monumental work on the history of the Royal College of Surgeons in Ireland and the Irish Schools of Medicine. To the pen of Dr. J. D. H. Widdess, librarian to the College, we are indebted for a new work, *An account of the Schools of Surgery, Royal College of Surgeons, Dublin, 1789–1948*.<sup>1</sup> It is the first separate work on the subject and contains material hitherto unpublished, as well as much that is now gathered together for the first time.

As early as 1703, surgeons made efforts to break away from their age-long union with the barbers, and by 1721 a separate surgeons' society was in being. The first examining body, the County Infirmary Board, examined all candidates for posts in the hospitals under their jurisdiction. Sylvester O'Halloran, a distinguished Limerick surgeon, was responsible for this step. The Dublin Society of Surgeons was founded in 1780 and, on the grant of a Royal Charter in 1784, became the Royal College of Surgeons. Samuel Croker-King was the first president, William Dease and John Halahan the first professors of surgery and anatomy, respectively. Among the first pupils were James Macartney, one of the greatest anatomists Dublin has produced, and Abraham Colles, whose name is familiar to all medical men from the terms Colles' fascia, Colles' fracture and Colles' Law. To Colles, too, we are indebted for the first anatomical work designed on topographical lines. It was entitled *A treatise on surgical anatomy* and was published in 1811. Dease and Halahan were evidently versatile individuals for, in addition to lecturing on surgery, Dease wrote a book on midwifery and Halahan resigned the professorship of anatomy to take up that of midwifery when it was founded in 1789. It is interesting to note that the College refused to subscribe to the current view that midwifery was a degrading occupation. A chair of pharmacology was founded in 1789, to be followed by those of medicine (1813), chemistry (1828), medical jurisprudence (1829), hygiene (1841), pathology (1889) and biology (1889). Professorships in botany, military surgery, logic, ophthalmology and dental surgery also existed for a time but are now abolished.

The founding of a chair of hygiene was a notable event, being the first of its kind in the British Isles. Henry Maunsell was the first holder. He foreshadowed a state-provided medical service, saying in one of his lectures that "the provision of suitable aid in sickness for the public generally, and especially for the poorer classes of it, is another and most important branch of political medicine; and one which, in every well-ordered community, should be recognized as a

<sup>1</sup> For particulars, see p. 274.

main object of Civil Government." Maunsell was succeeded in 1864 by Edward Dillon Mapother who became the first Medical Officer of Health for Dublin. Not until 1871 did the University of Dublin found its Diploma in State Medicine, but it was still the first of its kind in the United Kingdom.

The College flourished practically from the start and in 1804 extensions became necessary. These were completed during the following seven years with the aid of government grants and by 1812 the College was self-supporting. In 1825 the museum was founded, the first curator being John Shekleton who was succeeded by John Houston of rectal "valves" fame. In 1831 the possibility of founding a hospital in association with the College was explored. The City of Dublin Hospital was opened the following year and still flourishes, although the intimate connexion with the College has long since lapsed.

In 1878 the College introduced a licence in dental surgery, the first of its kind in Ireland. In 1889 it amalgamated with the two remaining private medical schools, the Carmichael and Ledwich schools. The combined schools were called "The Schools of Surgery of the Royal College of Surgeons in Ireland, including the Carmichael and Ledwich Schools", and were controlled by the President and Council of the College, as had been the practice hitherto.

For many years the standard of education and examination maintained by the College was the highest in the United Kingdom. It led the way in showing that the study of medicine and the study of surgery must go hand in hand and not be divorced the one from the other as had been the case for centuries. As Carmichael wrote in 1841 :

It is now generally admitted that this distinction between physic and surgery is so artificial and unnatural that it is totally impossible to draw any line of demarcation between them, so as to indicate to either physician or surgeon his particular province; and it is certain that there cannot be a good physician who has not the knowledge of a surgeon, or a good surgeon who has not the knowledge of a physician; therefore, it is obvious that both should be educated alike.

## 1439 Pulmonary Tuberculosis : Pathology, Diagnosis, Management and Prevention

G. Kayne, W. Pagel & L. O'Shaughnessy. Second edition, revised and partly rewritten by Walter Pagel, F. A. H. Simmonds, N. Macdonald & L. Fatti. London : Geoffrey Cumberlege, Oxford University Press, 1948. xviii + 720 pages ; 268 figures. 25 x 18 cm. £3 3s. [£3.15]

I. Pathology. (i) The tubercle bacillus ; (ii) tissue changes in tuberculosis ; (iii) resistance to tuberculosis ; (iv) the evolution of tuberculosis in man. II. Diagnosis. (v) History taking ; (vi) symptoms ; (vii) physical signs ; (viii) bacteriological investigations ; (ix) radiological examination of the chest ; (x) the tuberculin test ; (xi) examination of the blood ; (xii) forms of pulmonary tuberculosis ; (xiii) pleurisy with effusion ; (xiv) differential diagnosis ; (xv) the complications of pulmonary tuberculosis ; (xvi) conclusions. III. Prognosis. (xvii) Aids to prognosis ; (xviii) the outlook for the patient. IV. The management of pulmonary tuberculosis. (xix) Historical sketch ; (xx) objects of treatment ; (xxi) observation and out-patient management ; (xxii) modes of treatment ; (xxiii) the treatment of some complications and symptoms ; care of the dying patient ; (xxiv) the management of pregnancy and child-bearing in tuberculosis ; (xxv) criteria of progress and completion of treatment. V. Epidemiology and prevention. (xxvi) Epidemiology ; (xxvii) prevention. Appendix A : the classification of pulmonary tuberculosis. Appendix B : streptomycin and other chemotherapeutic agents. Index of persons. Index of subjects.

Since the 1st edition of this excellent volume appeared in 1939, two of the three original authors have died. Dr. Pagel has now secured the collaboration of Dr. F. A. H. Simmonds, Dr. N. Macdonald and Mr. L. Fatti. The book may thus now be regarded as the contribution of the former Middlesex County Tuberculosis Services to the literature of pulmonary tuberculosis. It is divided into three main parts, pathology, diagnosis and treatment, with

It is plain from the tributes paid to the Irish College at various times in Great Britain that its influence extended far beyond its own country. In Irish medicine, the foundation of this school was of the greatest importance ; for, when the teaching of medicine and surgery had descended to a very low level, the chief motive which prompted Irish surgeons to obtain a Royal Charter was the desire to raise the standard of medical education. Although the College was founded primarily to improve the teaching of anatomy and surgery, its progress has exceeded all the ambitions of its founders.

Dr. Widdess is to be congratulated on the production of an interesting, well-illustrated volume which will have much more than a local appeal, if only because of the contribution made by Dublin surgeons to the progress of medical education in these islands, a contribution which deserves to be more widely known. Specialism appears to be the order of the day in the practice of medicine. The same might apply to the study of the history of medicine. It cannot be given to any one person to know everything about so vast a subject. A series of monographs of this type might do more to encourage the student than large and weighty volumes of many hundreds of pages.

### SELECT BIBLIOGRAPHY

- Browne, O'D. T. D. (1947) *The Rotunda Hospital 1745-1945*, Edinburgh  
Cameron, C. A. (1886) *History of the Royal College of Surgeons in Ireland, and of the Irish Schools of Medicine ; including numerous biographical sketches ; also a medical bibliography*, Dublin  
Carmichael, R. (1841) *Plan of medical reform and reorganisation of the profession, without subverting the existing Colleges of Physic and Surgery, addressed to the Right Hon. Sir R. Peel, Bart.*, Dublin

two shorter sections dealing with prognosis and with epidemiology and prevention. Emphasis in each section is intentionally placed upon the personal experience of the authors. In addition, a fairly full bibliography appears at the end of each chapter.

The section upon pathology contains the maximum amount of information possible in some 200 pages, the text being lavishly endowed with references. The rest of the book is less factual and the order of presentation a little difficult to follow ; for instance, if one wishes to see what is written about some such condition as pulmonary cavitation, one has to refer to various parts of the book, and then one is left wondering if perhaps there are other relevant paragraphs which have escaped notice. It is claimed in the preface that the book may be of particular use to workers in sanatoria and dispensaries and, with this in mind, details of major surgical procedures are not given. This being so, perhaps a little more space might have been devoted to extra-thoracic complications of pulmonary tuberculosis which are fairly frequently encountered, such as ischio-rectal abscess and tuberculous discharge from the ear. The chapters upon out-patient management and rehabilitation are particularly well presented. Many will doubtless disagree with the treatment recommended for haemoptysis, namely, lying the patients down flat and giving them morphine.

This volume is unquestionably the best British work upon pulmonary tuberculosis and should be available at all sanatoria and dispensaries. The price may be regarded by some as a little excessive for a textbook upon a subject which is rapidly changing ; it is hoped that future editions will appear frequently in order to keep the contents up to date.

Neville C. Oswald

## 1440 Tuberculosis in Young Adults. Report on the Prophit Tuberculosis Survey, 1935-1944

Marc Daniels, Frank Ridehalgh, V. H. Springett & I. M. Hall. (Royal College of Physicians.) London: H. K. Lewis & Co. Ltd., 1948. xvi + 227 pages; 58 plates; 22 figures. 25 x 19 cm. £1 10s. [£1.5]

Section A: aims and methods of the Prophit Survey; section B: background of groups examined; section C: initial tuberculin reaction; section D: initial X-ray examination; section E: changes in tuberculin sensitivity during the period of observation; section F: cases of tuberculosis. Clinical analysis; section G: morbidity rates and incidence of tuberculosis arising after entry to Survey; section H: minimal tuberculosis. Aspects and prognosis of the small lesion; section I: discussion. Pathogenesis of pulmonary tuberculosis in young adults; section J: discussion. Epidemiology; section K: measures for the control of pulmonary tuberculosis. Summary and conclusions. Appendices. Bibliography.

The Prophit Tuberculosis Survey was made possible by a generous legacy received by the Royal College of Physicians in 1932 from the trustees of the late Mr. J. M. G. Prophit; its main object was to determine the possibility of picking out those persons or groups of persons most likely to develop tuberculosis. Between 1934 and 1943 observations were made on 10,100 young, presumably healthy, adults; each was given a preliminary Mantoux test and chest x-ray examination. The groups investigated were made up of: (i) contacts—persons living in a family with a case of pulmonary tuberculosis; (ii) controls—mainly office workers; (iii) nurses—those working in hospitals designated group A which admitted all types of patients, including chronic and advanced cases of tuberculosis, and those working in group B hospitals which rarely admitted cases of pulmonary tuberculosis; (iv) medical students, and (v) naval training establishments entrants. Most of those included in the Survey were English from urban areas, with the exception of nurses from group A hospitals, which group had a relatively high percentage of Irish and Welsh girls from rural areas. The mean age of the groups studied was 21 in the groups of nurses, medical students and controls, 18 in the contacts and 16 in the naval entrants.

The initial skin tests showed that in the English group about 85 % of males and 82 to 83 % of females were infected. These figures are higher than those for comparable groups in some parts of America and considerably higher than those for Denmark. The eradication of tuberculosis in cattle seems to have a direct bearing on the degree to which a rural community is infected; in urban areas, this factor is not so evident, as there the influence of human contact is paramount. As might be expected, the percentage of those infected increases with age; it is some 7 to 10 % higher at age 23 than at age 18. Those who have been in contact with tuberculosis show a higher incidence of infection than others; this is maximal where there is exposure to a living parent or sibling with the disease. Next highest come those experiencing recent exposure by nursing tuberculous patients. Contact, to be of significance, must be close, repeated and recent.

The initial chest x-ray examination showed the incidence of active pulmonary tuberculosis in the young adult population to be 0.5 %; nearly 1 % showed evidence of inactive tuberculosis and from 5 to 9 % showed evidence of healed lesions. The relationship between healed lesions and the possible development of active tuberculosis in later life is obscure, but the evidence suggests that several factors are involved, of which race and environment are important. The study of serial radiographs, the fact that a certain percentage of persons, particularly those who are in contact with open tuberculosis, develop stronger reactions to the skin test, and also the fact that there is often a reduction in sensitivity to the skin test in many who are removed from sources of infection, all suggest that re-infection does take place and has a bearing on the development of active lesions.

Of the 10,100 persons observed, 174 developed active tuberculosis during the Survey, giving an annual morbidity rate for females of 11.4 per 1,000 and for males of 6.2 per 1,000. The annual rate of active tuberculous infection arising among persons who had had an initial infection before they entered the Survey was only one-third of the rate found in those who had not been infected before entry. By far the highest morbidity rates were found in contact groups; female contacts, clear on entering the Survey, developed tuberculosis at an annual rate of 32.7 per 1,000. Irish and Welsh nurses in all hospitals showed a high morbidity rate which was 24 times greater than in other nurses; the difference held, irrespective of whether or not they had been initially infected.

The Survey has shown that cases of tuberculosis arise in two groups of young adults: (i) those who receive their primary infection at this age; in these cases, the lesions are a direct consequence of the primary infection; (ii) those who have been infected for some years; these constitute a large proportion of all cases in young adults (57 % in nurses). While there is some evidence that the lesions in these cases are due to lighting-up of old foci of infection, there is also a considerable amount of evidence to show that re-infection from without is responsible for a high proportion of cases.

There are also other factors which have an important bearing on the development of progressive phthisis. These are genetic, environmental and nutritional, and they combine to determine the sum total of resistance of an individual to tuberculous infection, whether it be exogenous or endogenous. Since morbidity is high in young adults not previously infected, it might be concluded that an important reduction of infection in childhood could produce communities of such low resistance that morbidity after infection would be excessively high. It is evident, however, that this will not be the case unless the infection rate in adult life is high; it is, therefore, safe to pursue the aim of reducing sources of infection in the community to a minimum.

The results of the Prophit Survey have justified the labour and expense of the undertaking. The work is open to criticism in that the controls cannot be taken as a fair representation of the average citizen. The differences between the nurses working in group A and in group B hospitals are not sufficiently emphasized, there being social and environmental factors which have an important bearing on the risk of developing active tuberculosis. It is probable that too much weight has been attached to the importance of exposure to infection and insufficient to the factors influencing the development and maintenance of native and acquired resistance in the individual.

## 1441 Medicine: Essentials for Practitioners and Students

G. E. Beaumont. Fifth edition. London: J. & A. Churchill Ltd., 1948. xvi + 831 pages; 71 illustrations. 24 x 16 cm. £1 10s. [£1.5]

(i) The alimentary system; (ii) the respiratory system; (iii) the cardiovascular system; (iv) the nervous system; (v) the urinary system; (vi) the haemopoietic system; (vii) the infectious fevers; (viii) infectious diseases of known and doubtful etiology; (ix) the locomotor system; (x) disorders of metabolism; (xi) the ductless glands; (xii) the tropical diseases; (xiii) the parasitic worms; (xiv) diseases due to physical agents; (xv) the poisons. Index.

It is impossible not to admire this volume, compiled by one physician and covering almost the whole of medicine. The work involved in its original production must have been enormous, and the preface to the new edition, listing the sections that have been added or rewritten, bears testimony not only to the advances in medicine but to the industry of the author. Yet it must be admitted that the book is disappointing. This is partly due to the classification of diseases, which must mislead the student. Thus, hepatitis appears as a heading with no mention of infective hepatitis and homologous serum jaundice; these are dealt with later under the heading of jaundice. There are separate accounts of subacute nephritis, of the oedematous type of chronic diffuse glomerulonephritis and of chronic nephrosis; all, apparently, descriptions of the same syndrome. Incidentally, no reference is made to Ellis's classification of nephritis. Hyperthyroidism and thyrotoxicosis are given separate sections, but no clear distinction is drawn between chronic adhesive pericarditis and the post-rheumatic adherent pericardium.

The new edition bears evidence of thorough revision, yet there is still much that might be pruned or altered. Alternative names for diseases, unless of historical interest, might well be excluded, for no student is likely to meet tonsillitis under the name of amygdalitis, or obesity as lipomatosis universalis. It is doubtful whether, today, autogenous vaccines are used in the treatment of delayed resolution in pneumonia or whether sweating is indicated in the treatment of acute nephritis. No mention is made of penicillin in the treatment of perinephric abscess. It is interesting to see that, though the author recommends the modified Meulengracht treatment for patients with haematemesis, the full Sippy diet,

with citrated milk, is still given as the routine treatment for uncomplicated cases of gastric ulcer. Fig. 65, which is stated to show unilateral exophthalmos, is a classical picture of unilateral lid retraction and does not reveal whether exophthalmos is present or not.

In his preface to the 1st edition in 1932, Dr. Beaumont maintained that, if a general physician with charge of general medical wards was expected to teach his students general medicine, then the day of the one-man textbook of medicine had clearly not passed. There is undoubtedly a great need for the general physician, who views his patients as a whole, who knows when to call on his specialist colleagues for assistance and who can pass on to his students his knowledge and experience by the bedside. But, when the student gets home and consults his textbook, he should find the latest, most expert and reliable information on whatever subject he looks up. The day when any single physician can produce a complete textbook of medicine has indeed passed, and such a volume must of necessity be either incomplete or inaccurate, and cannot present an up-to-date account of every disease.

## 1442 Textbook of Medical Treatment, by Various Authors

Edited by D. M. Dunlop, L. S. P. Davidson & J. W. McNee. Fifth edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xvi + 999 pages; 40 figures. 24 × 17 cm. £1 15s. [£1.75]

(i) Infectious diseases; (ii) the sulphonamide drugs; (iii) penicillin; (iv) antihistamine drugs; (v) dehydration and hypochloreaemia; (vi) tuberculosis; (vii) common diseases of the skin; (viii) venereal diseases; (ix) common tropical diseases and helminthic infections; (x) some common disorders in infancy and early childhood; (xi) the care of old people; (xii) industrial diseases; (xiii) metabolic diseases; (xiv) diseases of the ductless glands; (xv) diseases of the blood, spleen and lymphatic glands; (xvi) diseases of the alimentary canal; (xvii) diseases of the liver, gall-bladder and biliary tract, pancreas and peritoneum; (xviii) diseases of the heart and circulation; (xix) diseases of the blood vessels of the limbs and the effects of cold; (xx) diseases of the nose, throat and ear; (xxi) diseases of the respiratory system; (xxii) renal diseases; (xxiii) chronic rheumatic diseases and diseases of bone; (xxiv) diseases of the nervous system; (xxv) psychotherapy in general practice; (xxvi) technical procedures and oxygen therapy. Appendix: table of official preparations with their proprietary equivalents. Index.

The appearance of the 5th edition of this textbook in ten years is proof of the widely-felt need for a volume of this kind. All aspects of treatment, including not only drugs, but also the general management of the patient, are dealt with in a sensible and clear manner, and the style of writing is pleasant and straightforward. It is therefore not surprising that this book has become an indispensable guide to students and practitioners, and there can be few hospitals in this country where a well-thumbed copy does not bear witness to its value to the resident staff.

The chapters on infectious diseases, penicillin, venereal diseases and diseases of the nervous system have been rewritten, and in the other sections there is evidence of careful revision.

The first of the three new chapters deals with the antihistamine drugs. The various substances employed, and their dosage, are described, and there are clear instructions about the chances of success to be expected by their exhibition in allergic and other disease states. The second addition is a chapter on dehydration and hypochloreaemia. It is based on Marriott's Croonian lectures, and gives a lucid summary of the pathological physiology, and the treatment, of water and salt depletion; also, the simple and indispensable Funtus test for urinary chloride is described. More space might however have been given to the practical details of the management of dehydration in infants and children. Professor Aitken contributes an excellent new chapter on the care of old people, beginning with a description of the physical and mental processes of ageing. This is followed by some well-balanced and common-sense advice on problems of accommodation, retirement and alternative interests after retirement. The importance of an adequately balanced dietary regime for the aged is stressed.

It is gratifying to see that the official names of drugs have been used throughout, and that the bewildering, and constantly growing, list of proprietary preparations has been relegated to an appendix. Also, another attempt is made to familiarize the reader with the metric system by giving the metric equivalents in parenthesis after the apothecaries' dosages.

No mention is made of the use of sulphonamide mixtures, para-amino-salicylic acid and the anti-folic acid substances. The details

of the uses and dosage of streptomycin are lacking, but it is inevitable that in a book of this kind the interval between writing and publication should lead to some omissions. These do not in any way detract from the value of this very sound work.

B. Gans

## 1443 Médecine Pratique

Camille Lian et al. Paris: L'Expansion Scientifique Française, 1948. 191 pages; illustrations. 24 × 16 cm.

This volume is a collection of lectures delivered by the staff of the Hôpital Tenon, under the guidance of Professor Lian. The lectures are addressed to residents, postgraduate students and junior physicians, and the contributors maintain a very high level of excellence.

The introduction by the editor, on the history of medicine and the French medical schools, is followed by an article on spontaneous hypoglycaemia by Professor Laroche. Hypoglycaemic states due to pancreatic adenoma, hypophyseal dysfunction, Addison's disease, hepatic failure, and glycogen storage disease are described, in addition to a number of doubtfully investigated "polyglandular adenomatoses" which are said to lead to spontaneous hypoglycaemia. The steps necessary for the investigation of the various syndromes are described and followed by a note on the medical and surgical treatment.

Professor Bernard stresses the importance of tomograms in the localization of pulmonary cavities in the paravertebral gutter, in the apices, under effusions and in pleural thickening, though not much is made of their use in the investigation of neoplasms and intracardiac calcification. The x-ray plates, as elsewhere in the volume, are very badly reproduced.

Professor Haguenu discusses the neurological accidents associated with hypertension, and describes the clinical pictures found in spasm of the cerebral arteries, arterial rupture and cerebral haemorrhage, and cerebral anoxia and softening due to decreased blood flow and cerebral oedema.

This chapter is followed by an excellent monograph on acute leukaemia by G. Marchal. The misleading modes in which the disease may present itself are described, their great diversity being stressed. The frequent aleukaemic course, and the futility of strict subdivision into types, is emphasized. Though not all will agree with the etiological factors enumerated, and though no recent advances in treatment are mentioned, the article is an authoritative review of leukaemia, and contains a good bibliography.

The diagnosis and treatment of glycosuria, by G. Dreyfus, describes different glycosuric states and their investigation. Boulin's abbreviated blood-sugar curve does not seem as good as the Exton Rose test, which is not mentioned, and it appears that Fehling's solution is still used in France. The article ends with a note on the dietary treatment of diabetes.

M. Deparis contributes an article on the epidemiology and prophylaxis of typhoid and paratyphoid fever, and deals with the bacteriology, cultural characteristics, agglutination reactions and mode of spread of the relevant bacteria. His advice on management, disinfection and prevention follows standard lines. A short review of recent French epidemics and a list of famous names associated with the history of the disease are of interest.

The symptoms, radiological signs and differential diagnosis of gastric ulcers of the lesser curvature are discussed by P. Hillemand. Unfortunately there are no statistics on the incidence of peptic ulcer in France, which would have been of interest. The author accepts unquestioningly the possibility of carcinomatous change, and his ideas of treatment differ markedly from Anglo-American methods.

R. Even describes the steps in the early diagnosis of carcinoma of the bronchus, which follow customary lines, including microscopy of the sputum for carcinoma cells. Diagnostic lung puncture is advocated rather than thoracotomy. The article ends with a comparison of French and American postoperative survival rates, and makes the statement that American statistics of bronchial carcinoma include benign neoplasms.

The early diagnosis of pregnancy by clinical examination and hormonal test (several cases being described in detail) is discussed by F. Lepage, and the last article in the volume, by J. Voisin, describes the ophthalmoscopic findings in hypertension.

B. Gans

## 1444 Proceedings of the Annual Meeting, 1948

British Medical Association. London: Butterworth & Co. Ltd., 1949. xxvi + 415 pages; 81 figures. 25 × 16 cm. £1 15s. [£1.75]

(i) Section of Medicine; (ii) Section of Surgery; (iii) Section of Obstetrics and Gynaecology; (iv) Section of Anaesthetics; (v) Section of Diseases of the Chest; (vi) Section of Orthopaedics; (vii) Section of Pathology and Bacteriology; (viii) Section of Physiology and Biochemistry; (ix) Section of Preventive Medicine; (x) Section of Dermatology; (xi) Section of Child Health; (xii) Section of Radiology; (xiii) Section of Occupational Health; (xiv) Section of Ophthalmology; (xv) Section of Neurology and Psychiatry; (xvi) Section of Nutrition; (xvii) Section of Oto-Rhino-Laryngology; (xviii) Section of Anatomy and Anthropology; (xix) Section of Pharmacology; (xx) popular lecture. Index.

To the doctor with a wide range of interests—the “universalist” of Sir George Schuster—an annual meeting of a national medical association must be an unsatisfactory sort of entertainment. The scientific fare is so concentrated and so many Section meetings proceed simultaneously that his only hope of obtaining the maximum of enjoyment is by reading a bound volume of the proceedings. Such a person will find much to interest him in the volume here reviewed, for most of the lecturers deal with subjects of general appeal.

Thus, Himsworth extols the virtues of the thiouracil derivatives in hyperthyroidism in a lucid and charming style, and Whitby uses the macrocytic anaemias to point once again the moral that diagnosis precedes treatment. Denis Browne's paper on tuberculous adenitis is most stimulating and provocative; every general practitioner would benefit from reading it.

In Smithwick's discussion on the late results of operation for hypertension he confines his remarks to a selected group. Even so, one wonders how sympathectomy can improve the normal electrocardiogram in 14.5 per cent of cases.

The obstetricians and gynaecologists have chosen important and topical subjects for their discussions. The problem of infertility is considered from all angles, with the inevitable references to donor insemination in its legal aspects. As regards operative treatment of sterility, it is interesting to speculate on how many of the “8 to 18 per cent” said to benefit from operation on the Fallopian tubes would have eventually conceived in any case. Analgesia in labour is dealt with fully and Nixon stresses the importance of encouraging the pregnant woman. The third stage of labour is sure to prove a good debating ground. To interfere or not to interfere is the question. Sheehan makes some observations which suggest that non-intervention when the third stage is prolonged does not reduce the mortality rate.

It is clearly impossible to mention all the papers read. Many will enjoy Batten's down-to-earth chat on the treatment of pneumonia, and Capcner's advocacy of conservatism in treatment of the prolapsed intervertebral disk gives food for thought. The discussions on poliomyelitis and on its relation to tonsillectomy are timely. In the long section on human relations in industry, perhaps the most telling remark made was that a great obstacle in the development of an industrial medical service is the attitude of the healthy individual to the doctor.

Lastly, for those whose reading is not governed by purely utilitarian considerations, may we commend the short paper by Wood Jones, in which he is moved to righteous anger by the shortcomings of Darwin and Huxley and demonstrates that the present position of primate anatomy is highly unsatisfactory.

S. S. B. Gilder

## 1445 Clinical Endocrinology: for Practitioners and Students

Laurence Martin & Martin Hynes. London: J. & A. Churchill Ltd., 1948. viii + 222 pages; 33 figures. 22 × 14 cm. 15s. [£0.75]

(i) The pituitary; (ii) Frölich's syndrome and obesity; (iii) the pineal body; (iv) the thyroid gland; (v) the parathyroid glands; (vi) the thymus; (vii) the adrenal glands; (viii) the testes; (ix) the ovary; (x) the breast; (xi) hormone implantation. Index.

A few months ago I met a general practitioner who had been at Cambridge with me a quarter of a century ago. We exchanged greetings and polite mutual enquiries during which he said: “Endocrinology must be a very rare speciality because I have a very large practice and never see any endocrine cases.” I felt that his medical education must have had many gaps and that he had deceived the

examiners because his degree of mind-blindness was unusually high. But even he will want to learn something about endocrinology now that it has dramatically entered the field of rheumatism and is flirting with, or being seduced by, almost every branch of medicine and surgery. This book by Martin & Hynes could not be bettered for a simple practical introduction to a complex subject, especially written for the practitioner and student. It is a product of two Cambridge physicians, and Sir Lionel Whitby rightly finds it easy to write an appreciative foreword, which the reviewer has no hesitation in warmly endorsing as an endocrinologist. However, it should be pointed out that this convenient book of 200 pages is not suitable for candidates for the higher medical examinations, who will, for example, find themselves (after reading it) unable to discuss adequately the physiological and pathological differences revealed by the urinary assay of 11-oxosteroids and 17-ketosteroids in Cushing's disease and simple virilism respectively.

S. L. Simpson

## 1446 The Practice of Endocrinology

Edited by Raymond Greene. London: Eyre & Spottiswoode Ltd., 1948. (The Practitioner Textbooks.) xix + 366 pages; 53 plates; 19 figures. 25 × 15 cm. £2 12s. 6d. [£2.625]

(i) Introduction; (ii) the hypothalamus; (iii) the pituitary gland; (iv) the adrenal glands; (v) sex and reproduction; (vi) the thyroid gland; (vii) carbohydrate metabolism and diabetes mellitus; (viii) calcium metabolism and the parathyroid glands; (ix) the thymus and pineal body; (x) adiposity. Index.

This book is a notable addition to English books on endocrinology. It is a little difficult to believe that it was intended for general practitioners (as the preface says) because the presentation on the whole is somewhat involved and, in sections, scientifically academic, though in others the presentation is clear and brief. There are hardly sufficient clinical illustrations for a book of this size, and pages of uninterrupted print, sometimes without subdivisional headings, appear fatiguing. Nevertheless the subject-matter is comprehensive and up to date and should prove helpful to the careful reader. A. C. Crooke, an authority on pituitary cytology, has undertaken one chapter on this gland with conspicuous success. He also contributes a very detailed chapter on the adrenals, where the clinical aspect is relatively overweighed by more theoretical and experimental considerations. The chapter on sex and reproduction by the editor, Raymond Greene, contains a valuable biological introduction including the description and interpretation of several chemical and biological tests. His chapter on the thyroid has all the virtues of straightforward clinical presentation. Lawrence on diabetes could not be other than direct and lucid and Hunter on calcium and the parathyroids scintillates easily in a field in which he has pioneered. The experimental approach is well represented by Robson in a chapter on sex and reproduction and by Rundle on the thyroid gland; Sandifer deals with brevity and clarity on the extirpation of the thymus in myasthenia gravis. Altogether these sections comprise a valuable symposium which will probably achieve a better balance and co-ordination with a subsequent edition; the latter will certainly be forthcoming and welcome.

S. L. Simpson

## 1447 Sterility and Impaired Fertility: Pathogenesis, Investigation &amp; Treatment

Cedric Lane-Roberts, Albert Sharman, Kenneth Walker, B. P. Wiesner & Mary Barton. Second edition. London: Hamish Hamilton Medical Books, 1948. xxiii + 400 pages; 2 plates; 96 figures. 22 × 14 cm. £1 4s. [£1.2]

(i) General survey of the problem; (ii) the male factor in childless marriage; (iii) the constitution of semen; (iv) assay of male fertility; (v) the male reproductive mechanism and its disturbances; (vi) treatment of male sterility; (vii) sterility in the female; (viii) the treatment of female sterility. Appendix. References. Index.

This second edition is of far greater value than the first, in that it deals with many controversial matters and gives details of diagnosis and treatment which have been of proven value in the practice of the authors, the team of contributors having been much strengthened by the addition of Dr. Mary Barton. This is an excellent book which cannot fail to be of great assistance to all practitioners, for it is unique in this country.

The male side of the problem of sterility is first very thoroughly discussed and dealt with most helpfully. We are glad to read that the authors particularly emphasize the importance of the cervical mucus as a factor for observation, though it is not made clear that the probable cause of inimical changes in this mucus is very often the use of chemical contraceptives. It is doubtful whether sulpha compounds or antibiotics can be as useful as stated for intracervical conditions.

Much stress is laid upon the importance of ovulation and there are some excellent photographs of endometrial biopsies. This technique, adequately described, is by no means foolproof; it may, therefore, be thought wise to point out its dangers in the next edition. Only recently Halbrecht of Tel Aviv has recorded five cases of severe pelvic peritonitis subsequent to endometrial biopsy in his clinic.

The determination of tubal patency by gas or oil is well described. There are excellent illustrations denoting kymographic results, but the tracing on p. 242 is surely that of a case of hypoplasia, for Rubin teaches us that low oscillations under a pressure of 50 mm. Hg are characteristic of this condition and that such a recording gives a poor prognosis.

The chapter on insemination and cervical invasion is particularly good; that on treatment could, we think, be made more comprehensible if the hormonal approach to the subject could be made more clear, for nothing annoys the practitioner more than half a dozen titles being given to the same preparations on half a dozen pages.

There is one other criticism, namely that the published findings of Bacsich, Sharman & Wyburn, quoted on p. 9, are flatly contradicted by those of Goldblatt and Kurzrok on p. 47. It would seem therefore that the incidence and cure of hypoplasia, upon which the authors rightly lay great stress, depends very much upon the contact of healthy semen with the vaginal and cervical mucous membrane.

Finally we suggest that the findings of welfare clinics staffed by busy and inexpert practitioners are of no value on the matter of voluntary and involuntary sterility, for let not those words of Rubin be forgotten: "Contraceptive methods undoubtedly affect fertility for longer or shorter periods after their use has been stopped."

#### 1448 Sexual Disorders in the Male

Kenneth Walker & Eric B. Strauss. Third revised edition. London: Hamish Hamilton Medical Books, 1948. xiii + 260 pages; 10 figures. 22 x 14 cm. 15s. [£0.75]

(i) The physiology of sex; (ii) the male critical age; (iii) the classification of impotence; (iv) organic or secondary impotence; (v) psychogenic or primary impotence; (vi) premature ejaculation; (vii) the examination of the patient and the principles of treatment; (viii) the female partner; (ix) endocrinological and general medical treatment of impotence; (x) surgical treatment of impotence; (xi) priapism; (xii) psycho-sexual development; (xiii) the psychopathology of sexual deviations; (xiv) psychotherapy of the commoner sexual neuroses and deviations; (xv) masturbation; (xvi) pollutions; (xvii) sexual difficulties in marriage. Index.

It has taken several years and many impressions for this book to reach its present size and excellence. Indeed, Mr. Walker and Dr. Strauss have produced a volume of 250 pages, easy to read and light to handle, which cannot fail to be of extreme value, not only to consultants, but to all practitioners.

In the present conditions of practice there is neither the time nor the privacy for dealing with the very large number of sex problems in men, which are so often hidden or on the surface waiting for the good doctor to interpret. What we like about this volume is that there is very little pharmacopoeial or hormonal dosage. Much more important, the doctor is given a perfectly clear-cut picture of the psychosomatic problems which arise so plentifully.

Various common sexual deviations or disorders are clearly defined. Sympathetic treatment is advocated; if the male patient feels that his doctor really understands his case, half the battle is won.

The reviewer has one criticism to make, namely, that neither in the chapter on priapism nor in that on psychosexual development is there any mention of the value of oestrogens such as stilboestrol or ethinyl oestradiol when dealing with sudden or constant increase of libido. In recent years fairly large doses of these have proved to be of great value for such conditions whether in the adolescent, adult or senile patient.

#### 1449 Rheumatic Diseases. Proposed Scheme for the Development of a Diagnostic Treatment and Research Centre at Harrogate

Leeds Regional Hospital Board. Leeds: Leeds Regional Hospital Board, 1948. 31 pages; maps; illustrations. 31 x 25 cm.

This very handsomely produced brochure is published by the Leeds Regional Hospital Board to explain and advocate their progressive scheme for the organization of a large-scale centre for the diagnosis and treatment of sufferers from the chronic rheumatic diseases and for research into the causative factors. This centre is to be located in Harrogate where a full-time Director of Research and his staff have already been installed at the Royal Bath Hospital. The present plan advocates the purchase of several hotels and other buildings in order to extend the availability of the resources of the Royal Baths and of the Hospital.

The scheme is under the direction of the Regional Board, with the advantage of advice from many other interested bodies such as the Harrogate Town Council, the Board of Governors of the Hospital, and a special subcommittee of the Rheumatism Advisory Board of the University of Leeds—but not apparently of the Empire Rheumatism Council. The scheme itself follows the lines laid down by the Cohen Committee (1944), and consists of central and annex hospital accommodation in association with the Leeds teaching hospital centre. In addition there will be developed, elsewhere in the Region but linked with the centre, a number of peripheral rheumatism clinics. On this basis research beds and laboratories will be developed from the present very active nucleus. It is also clear from this report that the scheme will include the provision of beds for cases requiring prolonged rehabilitation.

Finally, plans are envisaged for the establishment of a school of physiotherapy, presumably under the auspices of the Chartered Society of Physiotherapy. This seems to be a progressive addition to what promises to be a large and imaginative scheme. The need for organized treatment centres for the sufferers from chronic rheumatic diseases is very urgent, and it is to be hoped that the Minister of Health, to whom this brochure is addressed, may be found willing to give assistance in spite of his present financial stringency!

#### 1450 II<sup>e</sup> Conférence, 24-27 Juin 1948. Le Rhumatisme Chronique Dégénératif. I. Rapports: II. Atlas

Conférence Scientifique Internationale d'Aix-les-Bains. Chambéry: Imprimeries Réunies de Chambéry, 1948. Rapports: 690 pages. 24 x 16 cm. Atlas: 82 plates; 24 x 16 cm.

(i) Généralités, historique; (ii) étiologie, pathogénie, anatomie pathologique; (iii) séméiologie, diagnostic; (iv) thérapeutique.

This Conference was held at Aix-les-Bains in June 1948, under the presidency of Professor P. Leriche, and the proceedings have now been published.

The first subject dealt with at the Conference was osteoarthritis; this was covered exhaustively by numerous papers. Treatment by drugs, physiotherapy and balneotherapy were fields in which few innovations were offered. Throughout the proceedings there was a tendency to stress the distinction between degenerative and inflammatory joint changes by reserving the term "arthrosis" for the former and "arthritis" for the latter; Martin & Junet, however, strayed from the straight and narrow path by suggesting that there was no clear distinction between the two, and that the one may merge into the other. In support of their view, they stated that the erythrocyte sedimentation rate is frequently accelerated, to a moderate extent, in osteoarthritis of the hip. Coste & Forestier agreed with this observation but added the warning that after the age of 55 the sedimentation rate, at least on the Westergren scale, may be accelerated in perfectly healthy subjects. Since a large proportion of sufferers come within this age-group and since traumatic effusions are not uncommon, the unorthodox views of Martin & Junet may perhaps be partly explained by these facts.

Lièvre & Bloch-Michel discussed pain in the upper extremity and "herniated disks"; they began by suggesting that cervical ribs do not cause pain and that this is being increasingly recognized.

In fact, all the ills previously attributed to them have been transferred to the scalenus anterior syndrome. Many of the protagonists of this syndrome, however, admit that the mechanism involved is one of costoclavicular compression by contraction of the scaleni. Lièvre & Bloch-Michel deal with the costoclavicular syndrome, which is so frequently diagnosed, as rudely as they deal with cervical ribs, pointing out that various criteria used in diagnosis, for example the loss of the radial pulse on certain manoeuvres, can be reproduced in the healthy subject. Their iconoclastic arguments, in fact, are so well marshalled that the bewildered reader, having seen his idols destroyed one by one, is ready to clutch at the straw which is, finally, proffered in the shape of "damaged intervertebral disk." This, they hint, will explain all troubles previously ascribed to other causes. However, not everyone will agree that once this diagnosis is firmly established operation is the only answer.

A good deal of time was spent discussing osteoarthritis of the hip-joint, the congenital and traumatic conditions which predispose to it, and the various methods of relieving pain and disability. Ravault & Graber-Duvernay made a plea for early diagnosis by stereoscopic x-ray examination and Timbrell Fisher favoured manipulation and stretching of the capsule under anaesthesia. Arthrodesis and arthroplasty, especially the "cup" variety, received due recognition but are obviously not applicable to all cases. The drastic methods frequently used abroad for the relief of pain may be illustrated by the work of Kahlmeter in Sweden. He has always advised rest in bed in the acute stage and deep x-ray treatment to the tendinous insertions of the adductors in the pelvis and of the glutei in the region of the great trochanter. The work of Reis and others on referred pain in this condition has made him decide in favour of posterior rhizotomy of the third and fourth lumbar nerves. He admits that pain frequently returns after several months but states that the period of painlessness enables him to institute energetic joint movements in addition to deep x-ray therapy. Tavernier favours a more direct approach and practises denervation—an operation which, he claims, can be applied to other joints such as the knee and shoulder. Section of the obturator nerve by a crural or iliac approach was found to be insufficient and he has gradually evolved a technique of one inguinal and one posterior incision in the buttock without any attempt to save motor fibres. Even in his skilled hands, however, a number of cases fail to get relief and have to undergo another operation. It has been suggested that any beneficial results obtained from stretching of the capsule (and the breaking down of adhesions) and capsulectomy are due to denervation. One would have expected, therefore, that the most direct approach of all (the injection of analgesic substances into and around the joint) would have received much attention, but the attitude adopted was one of caution. Copeman & Tegner referred to the work of Grant Waugh and suggested that serious thought should be given to the possibility of using such injections to prevent the onset of osteoarthritis in joints predisposed to it, or, at least, to limit its spread. The impression one obtains is that there is no unanimity on the subject of osteoarthritis of the hip and that the treatment adopted, as in many other conditions, depends on the views of the individual practitioner and his skill in one particular form of therapy.

The report of this Conference is in two parts. In the first and larger part are given the papers read, together with their lists of references: this volume is well indexed and individual authors and their work can be easily traced. Unfortunately the French text is marred by errors in spelling, of which a few examples will suffice. Reference to the "Journal of bones and joints of Surgery" should raise no bibliographical problems, but the "Leisch. f. Rlm. med." is more difficult to find; "Peto Peau" represents the name of a stronghold of rheumatology in London (Peto Place) and "Blondell Baukhart" that of the distinguished British surgeon, Blundell Bankart. The second smaller volume is entirely devoted to photographs, skiagrams, and twelve drawings by Tavernier and his co-workers to illustrate their operation of joint denervation:

W. S. C. Copeman

## 1451 Skin Diseases in General Practice

F. Roy Bettley. London: Eyre & Spottiswoode Ltd., 1949. (The Practitioner Handbooks.) 260 pages; 96 figures. 22 x 14 cm. £1 1s. [£1.05]

(i) Introduction; (ii) eczema—definition and diagnosis; (iii) contact eczema; (iv) constitutional eczema; (v) eczema—treatment and prognosis; (vi) infantile

eczema and flexural eczema; (vii) occupational dermatoses; (viii) the seborrhoeic state and acne vulgaris; (ix) seborrhoeic dermatitis; (x) psoriasis; (xi) impetigo contagiosa; (xii) fungus infections of the skin; (xiii) rosacea; (xiv) perineal pruritus; (xv) alopecia areata; (xvi) parasitic diseases; (xvii) naevi; (xviii) epithelial tumours—verruca and epithelioma. Appendix. Index.

This book has been written for general practitioners and Dr. Bettley has excluded all but the common skin diseases on that account. Unfortunately he has also excluded consideration of chilblains, leg ulcers, papular urticaria and the treatment of boils. Most general practitioners are so busy that they use their medical libraries only for reference when they require help in the diagnosis of some unusual condition or advice as to current therapeutic practice. It is in relation to the diagnosis of the less common, less familiar, conditions that the medical encyclopaedia or the larger special textbook is useful. A general practitioner considering whether a patient might have such a condition as erythema multiforme, lupus vulgaris or lichen planus would get no assistance from this book, although these are not rare diseases.

It does, however, summarize current views about some of the common skin diseases and gives details of their treatment. The chapters on the seborrhoeic state and on industrial dermatoses will be found particularly useful. The author mentions nothing of the importance of the parental background and of the psychological factors in infantile eczema in spite of the work of Barber, Woodhead, and others. He stresses the importance of allergy in eczema—many would think he over-stresses it—and discusses desensitization, which has little importance in general practice. The carrying out and interpretation of patch-tests is sometimes a complex affair and it seems doubtful whether it is justifiable to devote 18 pages to the subject in a book of this type.

Treatment is adequately considered in regard to most of the conditions dealt with, though there is no mention of tar baths or the use of dithranol in paste for psoriasis. The danger of carcinoma due to long-continued exhibition of arsenic is omitted, although its use in chronic cases is described. The risk of sensitization by the local application of penicillin and anaesthetic ointments might be emphasized more strongly.

There is, however, much useful information in this book and many of the illustrations, of which there are 96, are excellent.

S. T. Anning

## 1452 Nutritional Macrocytic Anaemia

George Sippe. London: published on behalf of the Government of Mauritius by the Crown Agents for the Colonies, 1947. vii + 76 pages; 12 illustrations. 25 x 16 cm. £1 1s. [£1.05]

Part I: nutritional macrocytic anaemia. Part II: aetiology and pathogenesis. Part III: pathology. Part IV: symptoms and physical findings. Part V: the blood findings. Part VI: diagnosis and differential diagnosis. Part VII: prognosis. Part VIII: treatment. Appendix I: Mauritius. Appendix II: technique. Appendix III: some particulars from fifty of the cases of nutritional macrocytic anaemia investigated in Mauritius. References.

This monograph is based on extensive experience of nutritional macrocytic anaemia in Mauritius. It is, indisputably, a model of what such a study should be, and has the outstanding merit of being brief and yet complete. Of special importance is the discussion of the part played by chronic malarial infection, which can convert potential macrocytic anaemia (due to defective nutrition) into the full picture of the disease, while it can also aggravate it, if already present. Malaria appears "to exert its destructive influence partly by direct parasitization of the red cells, partly by a toxic effect on the bone marrow, but mainly by hypertrophy of the reticulo-endothelial system, which then attacks the abnormal erythrocytes." Hookworm, on the other hand, is more likely to precipitate hypochromic nutritional macrocytic anaemia.

There is a short but excellent description of the bone marrow, which is said to contain both the megaloblastic and the normoblastic series, presumably because the failure of haemopoietic factor is not absolute, being, however, accentuated by constant haemolysis due to the enlarged malarial spleen. Perhaps the most valuable section is the clinical one, for the reason that no better one has ever been published, although Sippe emphasizes the need for laboratory investigation in order to assess the part played by malarial and hookworm infection. Although the book is, naturally, of special interest to physicians in the tropics, it is of great value to all those who meet cases of nutritional anaemia.

A. Piney

# 1453 Die pathologisch-anatomischen Grundlagen der Allergie

Wilhelm Eickhoff. Stuttgart: Georg Thieme, 1948. 95 pages; 40 illustrations. 21 x 14 cm. 8.40 Mk.

(i) Tierexperimentelle Allergie; (ii) tierexperimentelle Parallerergie; (iii) menschliche Impfallergie.

This short book, which is intended for undergraduates, is divided into three parts. The importance of allergy is illustrated by the example of rheumatism. Various terms and phenomena related to allergy, anaphylaxis and sensitization are explained partly by experiments on animals and partly by clinical experience. Though the symptoms and course of allergy are known the exact etiology remains unknown; for this reason many explanations have been put forward and most of these have been unsatisfactory. The author tends to accept Ehrlich's side-chain theory in order to understand immunology. In the second part parallerergic reactions are discussed and among the inflammatory parallerergic reactions what is now called collagenosis is mentioned. The last part deals with vaccination, serum-therapy, anaphylactic shock in man and idiosyncrasy. An attempt has been made to document allergic phenomena by histological preparations, but only a few of the photomicrographs are really good. An indication of the magnification and of the stain would surely be welcome in a book for students. Those looking for a bibliography are wisely referred to the larger books.

E. Neumark

# 1454 Essentials of Fevers

Gerald E. Breen. Second edition. Edinburgh: E. & S. Livingstone Ltd., 1948. xi + 351 pages; 16 plates; 24 figures. 19 x 12 cm. 15s. [£0.75]

(i) General features of infection; (ii) results of infection—disease and immunity; serum and serum reactions; (iii) spread and control of infection—elementary epidemiology; preventive isolation; (iv) examination and treatment of fever patients—prognosis in fevers; (v) the streptococcal infections—scarlet fever, erysipelas, and puerperal pyrexia; (vi) diphtheria; (vii) the intestinal infections—enteric, bacillary dysentery, and gastro-enteritis; (viii) variola, vaccinia, and varicella; (ix) infections of the nervous system—cerebro-spinal fever, poliomyelitis; (x) the respiratory infections—measles and whooping cough; note on coughs; (xi) rubella, glandular fever and mumps; (xii) typhus fever and influenza; (xiii) miscellaneous—infectious disease and the law; mechanical artificial respiration; some common mistakes; typical charts; table of incubation and segregation periods. Index.

A book which is confined to the "essentials" of a subject can never be easy to write. Successful compression requires the touch of a master. No wise student attempts to learn only the essentials of a subject; he knows that he can learn the essentials only by reading and learning more than these. This book cannot be recommended to the serious medical student. It is of the "chatty" type without references, without appraisal of the value of evidence from different sources, and full of general statements which, however humourously expressed at times, may be only the opinion of the author or of anybody for that matter: rarely is any clue provided as to the value which can or should be placed upon them.

Certain sections, however, bear the stamp of intimate personal experience and so are valuable to any medical reader. These include the short statements on epidemiology, serum sensitivity, the examination of patients and the management of the febrile state. Apart from these and a few other sections, the book would seem to be more suitable for nurses than for medical students. Indeed the form of writing suggests that the book has grown out of a set of lectures for nurses rather than from personal experience of the teaching of students. The author under-estimates the enquiring mind of the medical student of today when he states in his preface that the book contains more than enough theory to meet the student's needs.

There is also evident in this book a lack of acquaintance with the more modern conceptions of clinical work in fevers. It is surprising to find in the chapters on scarlet fever and measles little or nothing said about acute otitis media and no indication given of its importance to the individual and community, or of its treatment and prophylaxis. The chapter on cerebro-spinal fever is out of date, an example being the apparent recommendation to search for carriers and to segregate them. The chapter on poliomyelitis is probably the best example in the book of compression merely leading to confusion. Little knowledge of the haematology of

whooping cough is shown by the statement that the blood may show up to 16,000 white cells. Nothing is said about whooping cough in young infants and practically nothing about pulmonary collapse in this disease.

The 17 coloured plates are a novel feature of this book; these are not photographs but representations drawn and coloured by the author. This is a brave attempt to depict the eruptions and other clinical manifestations of the exanthemata, but it cannot be said to be quite successful. Although on the whole these pictures convey approximately the desired impressions, they are in some respects misleading. If they have considerably raised the cost of the book it is doubtful if they are worth it.

It is to be hoped that this book will not be widely read abroad for it does not represent the teaching of fevers in this country at its best.

H. S. B.

# 1455 An Inquiry into the Extent to which Cancer Patients in Great Britain Receive Radiotherapy

Report Based on Information Supplied to the National Radium Commission by National and Regional Radium Centres and London Teaching Hospitals

Margaret Tod. Altrincham: John Sherratt & Sons [1949]. 48 pages. 24 x 15 cm. 3s. 6d. [£0.175]

This valuable inquiry, carried out for the National Radium Commission, attempts to estimate the number of patients who need treatment by radiotherapy, and the number now receiving treatment, and so to indicate how far the needs of the population in this respect are being met.

The task was made difficult by the fact that there are no adequate morbidity figures for cancer at the various sites, and that the mortality figures from site to site are not very accurate even if the total figure for the country as a whole is fairly near the truth. Schemes for cancer registration have been used as a check upon the mortality figures in an attempt to estimate the incidence rates. These however tend to include a proportion of patients coming from outside the region served so that the population at risk is not accurately known, and patients dying from cancer without ever attending a hospital are not included in these registration surveys. Incidence rates found in other parts of the world are quoted for comparison. The incidence has also been calculated for the various sites on the basis of an estimate of the number of patients with cancer who are cured added to those who die of the disease.

It will be seen how difficult it is to obtain accurate figures. Those set out in this inquiry would seem to be as near to the truth as may be expected at present. It seems more likely that they err on the low side rather than the reverse.

The inquiry then deals with the estimate of the number of patients who need radiotherapy. A questionnaire was sent to radiotherapists all over the country and replies were received either on the basis of the percentage of cases by site which the radiotherapist thought should be treated, or on the basis of the number of cases seen and the number which did actually receive treatment. The more detailed replies showed the proportion of cases treated by surgery, the proportion by radiotherapy and the proportion that received no treatment. The conclusions of this section are that there are 86,600 cases of cancer in England and Wales per annum, that 40 per cent need radiotherapy, and that the number of cases requiring radiotherapy per million, per annum, is 840.

The next section deals with the number of cases treated by radiotherapy in hospitals recognized by the National Radium Commission. This is a factual survey based on returns and forms the basis for the comparison between the estimated number needing treatment and the number actually treated. The conclusions are that 77 per cent of those estimated to need treatment receive it, and that the number of patients who receive palliative radiotherapy is still too low, owing rather to a shortage of beds than to a shortage of radium or x-ray equipment.

This report will prove to be of great value to those whose duty it is to provide adequate treatment for cancer in a large population. It is also of interest in a much wider field, being an illuminating commentary on the way in which people with cancer in this country are treated today.

D. W. Smithers

1456 **Les Hématodermies**

P. de Graciansky & André Paraf. Paris: Masson & Cie, 1949.  
227 pages; 22 figures. 25 × 17 cm. 850 fr.

Introduction. (i) Le derme hématopoïétique; (ii) physiopathologie des organes hématopoïétiques; (iii) la métaplasie des organes hématopoïétiques. I. Les leucoses. (iv) Les leucoses lymphoïdes; (v) les leucoses myéloïdes; (vi) les leucoblastoses; (vii) les leucoses tumorales; (viii) le myélome multiple (maladie de Kahler). Les leucoses plasmocytaires. II. Les réticuloses. (ix) Les manifestations cutanées des réticuloses; (x) la maladie de Kaposi; (xi) l'urticaire pigmentaire. III. Les granulomatoses. (xii) Le mycosis fongique; (xiii) la lymphogranulomatose maligne de Patau-Sternberg; (xiv) les granulomes éosinophiliques. Conclusions générales. (xv) Considérations sur la nosologie des hématodermies; (xvi) traitement des hématodermies. Index alphabétique des noms d'auteurs. Index alphabétique des matières.

An attempt has been made in this book to classify the many disorders in which blood changes coincide with changes in the skin. For a long time atypical disorders in this group have presented difficulties and they are here grouped under three headings, the leucoses, reticuloses and granulomatoses. Each has many subdivisions.

The skin is involved in these diseases essentially by infiltration but in some cases such infiltration appears to be independent of any disease elsewhere. In some disorders it is difficult to distinguish between hyperplastic and neoplastic changes. In certain well-known skin disorders various associated diseases of the blood are recorded, but there is no certain evidence in these that the two are related. Kaposi's sarcoma and mycosis fungoides are given as examples.

The morphology of some of these skin disorders does not permit exact differentiation of the many conditions caused by proliferation of the undifferentiated mesenchyme. The rate of development may give some information on etiology; inferences may also be drawn from the series of successive but different appearances sometimes observed, such as a reticulosis with a leucosis preceding a Hodgkin's granuloma or the association of a granulomatous disorder with a leucosis.

It is concluded that in the present state of knowledge any classification must be provisional and unsatisfactory. Nevertheless, the authors appear to have made a useful summary in this field.

G. C. Pether

1457 **Medical Photography, Radiographic and Clinical**

T. A. Longmore. Fourth edition. London: The Focal Press, 1949. 1,008 pages; 120 plates; 320 figures. 19 × 13 cm. £2 10s. [£2.5]

(i) The photographic process; (ii) photographic considerations in radiography; (iii) clinical photography; (iv) clinical phototechnique; (v) reproduction and processing; (vi) colour photography; (vii) special techniques; (viii) appendix. Index.

This 4th edition, published after a long interval, is a somewhat massive volume, largely because the author has attempted to take the reader through the principles of medical photography, across the field of radiography, and up through the wide range of clinical photography to the heights of photomicrography.

It is clearly designed for student radiographers, who, in addition to their radiographic training, are expected to have a working knowledge of medical photography. The writer of this review is not qualified to judge the radiographic section. Owing to the rapid growth of radiography and medical photography, it is unusual to find an individual who can deal adequately with both subjects.

Mr. Longmore is unquestionably a first-class radiographer and photographer, but I cannot help thinking that his hospital experience of medical photography has been somewhat limited. Much of his teaching is theoretical; the basis for it, no doubt, is derived from experiments using selected live models. This inevitably leads to the introduction of a number of questionable recommendations, of which the following are examples.

The standardization of positioning of patients, which is here described in detail, though very necessary in many respects, should not involve the use of gadgets that tend to frighten the patient. In any case, to prolong the time occupied in preparation, with the patient possibly getting restive (as sometimes happens), is fatal. Once this occurs, the photographer's problems increase a hundred-fold.

Standardized lighting is also recommended. Such lighting in the photographic department of a general hospital can only lead to a large proportion of good photographs, that are clinically useless because they do not demonstrate the condition.

Filters are indicated in some circumstances in clinical photography, but the average patient is unable to keep still for the inevitably longer exposure which is required when a filter is used.

There are a number of very good photographic illustrations, almost entirely the work of Miss M. H. Shaw and Mrs. M. Crossley. A larger number of the author's pictures would perhaps have been more suitable. However, there are a great many excellent diagrams and charts.

In a very brief chapter on photomicrography the author infers that only a few departments need to consider this subject at all seriously and that a simple piece of apparatus will cover the needs of the hospital photographer. In support of this, it is true that most medical photographic departments either do not touch photomicrography, or else do very little, using elementary equipment and usually obtaining poor results. It is left to a mere handful of workers to produce first-class work. To me this is very strange; in each of the four departments with which I have been associated photomicrography has been of primary importance.

Summing up, this volume can best be described as a guide to medical photography. Apart from student radiographers, it may well help anyone who contemplates entering the field of medical photography to get a general insight into what will be required. The student medical photographer should not, however, regard this book as authoritative.

E. Victor Willmott

## OPHTHALMOLOGY : A DEFINITIVE ACCOUNT

W. J. B. RIDDELL F.R.S.Ed. M.D.

*Tennent Professor of Ophthalmology  
University of Glasgow*

About twenty-five years ago papers of fundamental importance to the elucidation of the physiological problems peculiar to the eye began to appear in the literature under the name of Duke-Elder; these were paralleled by clinical contributions displaying the application of a scientific training to the treatment of the human patient. It was soon apparent that a mind of outstanding brilliance was at work, summarizing, co-ordinating and focusing the basic subjects upon which our knowledge of ophthalmology is built. In 1932 the first volume of this textbook made its appearance and was immediately welcomed as a major contribution to the medical literature of the world. The original intention was to complete the work in three volumes but, as the panorama contained within the author's mind developed and unrolled, it became necessary to increase the scale of the whole project. This volume<sup>1</sup> is to be followed by a fifth on the ocular adnexa and injuries. A sixth and final volume will be devoted to operative surgery.

A revised edition of the first volume appeared just before the war when the opportunity was taken to "bring up to date certain sections wherein fundamental advances in knowledge had rendered the original text misleading." The development, form and function of the visual apparatus are the topics described with delightful lucidity. This book is difficult to lay down because the reader is stimulated and enthralled by the collateral attractions that he finds: a short biography of some well-known authority, a few sentences indicating the significance to the clinician of a basic physiological observation, a paragraph in smaller type detailing the comparative anatomy—such are the temptations to read more deeply.

This quality has been maintained in the later volumes. The second is devoted to clinical methods of examination, congenital and developmental anomalies, general pathological and therapeutic considerations and diseases of the

outer eye. Diseases of the inner eye form the subject of the third volume. New editions of all three volumes are in contemplation and are certain to be welcomed by all who can read English.

The present volume opens with a section of about four hundred pages devoted to the neurology of vision, commencing at the chiasmal pathway and passing on through the basal visual and intracerebral pathways to a detailed consideration of the higher centres and of the mechanism of perceptual and psychogenic visual failure. The author says that

to a large extent this is the territory of the neurologists—many of whom have turned surgeon—but the interest of the ophthalmologist in the intracranial visual pathways and centres is equally profound. Since in many cases the first and most obvious symptom characterizing these diseases is a failure in vision, the primary diagnosis frequently falls to him with all the responsibility which this entails both with respect to the sight and the life of his patient.

These words from the introductory paragraph are followed by a brilliant essay surveying the whole pathway with a breadth and depth of outlook which is quite phenomenal. Opening this section at random, the reader is led to trace, with ever deepening interest, the relations of the particular topic. Back and forward the account swings, with a reference to the earlier volumes here and a footnote to the projected volumes there. However abstruse the subject-matter may be, Duke-Elder never allows it to get out of control, and a homely simile or a well-chosen phrase makes us realize that he appreciates this need. Each sub-section terminates with references to the literature of the world in which the outstanding monographs, the key papers and the minor contributions are all listed.

The middle portion deals with the motor anomalies of the eye, commencing with a historical introduction, consideration of anomalies of movement, binocular fixation, concomitant squint, noncomitant squint, ocular deviations and pathological nystagmus. The final part is concerned with errors of refraction, anomalies of accommodation, aniseikonia, eye-strain and visual hygiene, spectacles and other optical appliances. A brief catalogue of contents such as this does scant justice to the delightful quality of the writing throughout, which has been sustained in all the volumes along with meticulous proof-reading. There are over five thousand references to the literature in this volume alone and the last illustration is fig. 3985. The whole book is encyclopaedic without pedantry and no other branch of medicine possesses anything comparable.

## 1459 The Essentials of Modern Surgery

Edited by R. M. Handfield-Jones & A. E. Porritt. Third edition. Edinburgh: E. & S. Livingstone Ltd., 1948. xix + 1,256 pages; 644 illustrations. 25 × 16 cm. £2 10s. [£2.5]

(i) Inflammation and repair; (ii) infection and immunity; (iii) non-specific infections; (iv) specific infections; (v) venereal diseases; (vi) tumours and cysts; (vii) wounds and burns; (viii) haemorrhage and shock; (ix) ulceration and gangrene; (x) general surgical technique; (xi) chemotherapy; (xii) physiotherapy and radiotherapy; (xiii) diseases of the skin; (xiv) infections of the fingers and hand; (xv) the surgery of the blood vessels; (xvi) the diseases of the lymphatic system; (xvii) the face, lips and jaws; (xviii) the mouth, palate, tongue and salivary glands; (xix) the surgery of the neck; (xx) the ear; (xxi) affections of the nose and accessory sinuses; (xxii) the pharynx and oesophagus;

(xxiii) the larynx; (xxiv) the chest; (xxv) the breast; (xxvi) the general surgery of the abdomen and peritoneum; (xxvii) hernia; (xxviii) the stomach and duodenum; (xxix) the small and large intestine; (xxx) intestinal obstruction; (xxxi) the rectum and anal canal; (xxxii) the diseases of the appendix; (xxxiii) the liver and biliary system; (xxxiv) the pancreas and the spleen; (xxxv) the kidney and ureter; (xxxvi) the bladder, prostate and vesicles; (xxxvii) the penis and urethra; (xxxviii) the testis and spermatic cord; (xxxix) diseases of the female genital organs; (xl) diseases of the scalp and skull; (xli) the brain and its coverings; (xlii) diseases of the spine and spinal cord; (xliii) injuries and diseases of the nerves; (xliv) injuries of bones and joints; (xlv) injuries of the upper limb; (xlvi) injuries of the lower limb and of the spine; (xlvii) diseases of bone; (xlviii) diseases of joints; (xlix) deformities; (l) diseases of the muscles, tendon sheaths and bursae; (li) amputations. Index.

There are several impressive features in this new edition of *The essentials of modern surgery*, edited by R. M. Handfield-Jones &

A. E. Porritt. The first is the excellence of the production, as regards binding, paper and general arrangement. The second is the great care taken by the editors with their illustrations, x-ray plates, and of which are in colour. As a high light, six x-ray plates by Anna Zinkeisen are included.

The subject-matter is attractively treated and the whole field of general surgery is covered, without the superfluity of operative details and obsolete theory which appears in many textbooks of surgery. Certainly Mr. Handfield-Jones and Mr. Porritt have produced a book which is easy to read—an unusual feature—but which presents to the practitioner and to the postgraduate working for a higher degree all the information they require. Chapters on chemotherapy and amputations have been included in this edition, at the expense of the chapter on anaesthesia. The section on the cleft palate has been rewritten. All the other chapters have been brought up to date—a most important feature, since chemotherapy now exerts a profound influence on surgical procedure. At the end of several chapters an operative appendix has been added and is most valuable.

The editors have wisely called in their colleagues to write certain of the chapters, and that on diseases of the chest, revised by Tudor Edwards shortly before his death, deserves special mention. Chapters by E. P. Broekman on diseases of bones and joints; Lionel Colledge on diseases of the ear, pharynx, etc.; Walter Mercier on deformities, and Dickson Wright on diseases of the brain and diseases of the scalp and skull, are noteworthy.

There is no doubt that this book will remain the favourite with the majority of students preparing for a qualifying examination in surgery. Both the editors are distinguished teachers and experienced examiners and know what the student wants. Furthermore the general practitioner and the postgraduate taking a higher examination will find it provides a complete survey of modern surgical opinion. It is a book that can be recommended unreservedly.

R. T. Campbell

#### 1460 Minor Surgery

Edited by Heneage Ogilvie & William A. R. Thomson. Second edition. London: Eyre & Spottiswoode Ltd., 1949. (The Practitioner Handbooks.) xiv + 192 pages; 34 figures. 22 x 14 cm. 14s. [£0.7]

(i) Minor wounds; (ii) burns of slight degree; (iii) sprains; (iv) bursae and ganglia; (v) some benign tumours and cysts; (vi) varicose veins, ulcers and phlebitis; (vii) the hand; (viii) the foot; (ix) the mouth; (x) the nose and throat; (xi) the ear; (xii) the eye; (xiii) the rectum; (xiv) the genito-urinary system; (xv) gynaecology; (xvi) the non-operative treatment of hernia: trusses and belts; (xvii) childhood; (xviii) anaesthesia and analgesia; (xix) chemotherapy. Index.

This book consists of a series of short articles on minor surgical procedures, compiled by men who are authorities in their subjects. As such, it is an eminently readable volume, but is not well illustrated. The chapter on the hand, by Norman C. Lake, is especially good, the anatomical and scientific bases of treatment being clearly pointed out. The chapters on the rectum, by W. B. Gabriel, the genito-urinary system, by Clifford Morson, and gynaecology, by Douglas MacLeod, are also noteworthy. The chapter dealing with children is worth while, and the inclusion of a short article on trusses and belts is unusual but extremely useful.

There are some points which will not pass unchallenged. It is much safer, in rendering the field bloodless for operations on the arm, to use an inflatable cuff rather than the Esmarch bandage recommended by Wakeley. Two weeks in bed after varicose-vein operations is neither practical nor necessary. The importance of a large fluid intake during sulphonamide therapy is not pointed out and is of special importance with out-patients. Still, this book abounds in practical tips and will be useful to the newly-qualified man holding a post as casualty officer, and to the general practitioner-surgeon.

R. T. Campbell

#### 1461 Handbook of Surgery

Eric C. Mekie & Ian Mackenzie. Second edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xvi + 764 pages; 29 figures. 19 x 13 cm. £1

(i) Inflammation; (ii) specific infections; (iii) the general effects of injury; (iv) wounds: burns and scalds; (v) ulceration and gangrene; (vi) tumours; (vii) lesions of the skin; (viii) surgery of the vascular system; (ix) lymphatic system; (x) autonomic nervous system; (xi) lesions of the head, skull and brain;

(xii) lesions of the mouth and salivary glands; (xiii) neck, thyroid, thymus; (xiv) lesions of the oesophagus; (xv) thorax; (xvi) breast; (xvii) spine and spinal cord; (xviii) abdomen; (xix) the abdominal wall and hernia; (xx) peritoneum; (xxi) lesions of the stomach; (xxii) the intestines; (xxiii) the appendix; (xxiv) rectum and anus; (xxv) gall-bladder, liver and pancreas; (xxvi) the spleen; (xxvii) the kidney; (xxviii) lesions of the bladder, prostate and urethra; (xxix) lesions of the testicle, penis and scrotum; (xxx) lesions of bone; (xxxi) diseases of the joints; (xxxii) muscle, tendon and fascia; (xxxiii) peripheral nerves; (xxxiv) lesions about the shoulder and of the arm; (xxxv) lesions about the elbow; (xxxvi) lesions of the forearm and about the wrist; (xxxvii) lesions of the hand; (xxxviii) surgery of the hip and thigh; (xxxix) surgery of the knee; (xl) surgery of the leg and ankle; (xli) the foot. Index.

This book should serve a very useful purpose not only for the undergraduate but perhaps even more for the postgraduate student. The main surgical topics are dealt with systematically, briefly and concisely, yet without sacrificing any essential details. However, the sections on treatment are inadequate for anyone above the undergraduate level; as one might expect, there is no reference to operative technique, and for any details of treatment reference must be made to larger volumes. Nevertheless, a great deal of useful material has been compressed into 750 small pages, and some detail is given which one often fails to find in larger volumes.

The book covers the whole field of surgery, including orthopaedic and traumatic surgery; the pathological and anatomical aspects are dealt with briefly, but at sufficient length to be of value to the non-specialist. The few diagrams are clear and helpful: in future editions these might even be increased in number at the expense of increasing the size and price of the book.

L. Eckert

#### 1462 Illustrations of Surgical Treatment. Instruments and Appliances

Eric L. Farquharson. Third edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xii + 391 pages; 61 plates; 319 figures. 25 x 16 cm. £1 5s. [£1.25]

Part I. Infusion and transfusion. (i) Intra-venous saline infusion; (ii) transfusion of blood and protein fluids. Part II. Vertebral column and ribs. (iii) Fractures and dislocations of the spine; (iv) tuberculosis of the spine (Pott's disease); (v) fractures of the ribs. Part III. Shoulder girdle and upper extremity. (vi) Injuries of the clavicle; (vii) dislocation and fracture dislocation of the shoulder; (viii) fractures of the humerus; (ix) the elbow region; (x) fractures of the forearm; (xi) injuries about the wrist; (xii) injuries of the hand and fingers. Part IV. Pelvic girdle and lower extremity. (xiii) Fractures of the pelvis; (xiv) the hip joint; (xv) fractures of the neck of the femur; (xvi) fractures of the shaft of the femur; (xvii) the knee joint; (xviii) fractures of the lower leg; (xix) injuries to the ankle joint; (xx) fractures of the calcaneum; (xxi) deformities of the foot. Appendix: instruments and appliances. Index.

The fact that this book has run into its 3rd edition since first published in 1939 must indicate a healthy appetite for instruction in surgical technique. Part I deals in a clear and detailed manner with intravenous infusion and transfusion techniques. Perhaps the importance of the rhesus factor outside obstetric circles is understated. In civil practice blood demands can usually be assessed far enough ahead to allow of full compatibility tests.

Part II is confined to the treatment of conditions affecting the locomotor system. In the space available only a very limited selection has been possible and it cannot therefore be in any way considered as a work of reference. In the main, where alternative methods of treatment are available all are described—the author showing obvious preference for particular methods. In the treatment of minor compression fractures of the lumbodorsal region of the spine it is surprising to find that active exercises, without recourse to splintage, find no place. It will amaze many orthopaedic surgeons to be told that it is necessary to remove a Thomas frame daily in order to perform skin toilet.

Excision of the outer end of the clavicle is not considered for unreduced acromioclavicular dislocations. The essential difference between the impacted and unimpacted fractures of the surgical neck of the humerus is neglected. Fractures of the metacarpals are apparently splinted even if no displacement is present.

In the description of the Watson-Jones' "lateral recumbency" method of treating fractures of the pelvis, the substitution of "affected" for "unaffected" shows careless reading of the original article.

The air of easy optimism assumed towards congenital dislocation of the hip is remarkable. Three attempts at manipulative reduction are allowed before the knife can be wielded; no attempt to assess the cause of failure by arthrography is advised. Apart from the Putti mattress which is reserved for infants, the frog plaster is recommended for all cases. As illustrated, this is a cumbersome affair extending from nipples to toes. The work of Leveuf, Batchelor and Denis Browne is, apparently, unknown.

Part III is an expurgated edition of the instrument maker's catalogue. The prize goes to Plate XX illustrating tourniquets which can only have come from the torture chamber or the museum at Surgeons' Hall.

All in all, this is a book which might profitably fill an idle half-hour, but cannot be recommended for serious study.

Guy Rigby-Jones

## 1463 The Surgery of Abdominal Hernia

George B. Moir. London: Edward Arnold & Co., 1948. 408 pages; 138 figures. 22 x 14 cm. £1 5s. [£1.25]

(i) General observations concerning abdominal herniae; (ii) the management and treatment of strangulated and obstructed hernia; (iii) anaesthesia; (iv) economic and legal significance of herniae; (v) anatomy of the inguinal canal; (vi) function of the inguinal canal and its associated structures; (vii) structure and classification of inguinal herniae; (viii) aetiology of inguinal herniae; (ix) clinical picture, diagnosis, and complications of inguinal herniae; (x) pathological and anatomical changes within the inguinal canal in consequence of inguinal hernia; (xi) rationale of treatment in inguinal hernia. Criteria for operation; (xii) cutis and whole skin graft repair; (xiii) operative technique in inguinal herniae; (xiv) femoral hernia; (xv) umbilical hernia; (xvi) ventral hernia; (xvii) obturator hernia; (xviii) sciatic hernia; (xix) internal hernia; (xx) lumbar hernia; (xxi) sliding hernia. Extrasaccular hernia; (xxii) hernia of the vermiform appendix; (xxiii) Richter's and Littre's hernia; (xxiv) hernia of the uterus and adnexae; (xxv) diaphragmatic hernia. Index.

In this book most of the modern views on all varieties of abdominal herniae are quoted and soundly discussed. The early chapters on such topics as anatomy, etiology, general management, and legal aspects are precise, detailed, and clearly presented. There follows a good description of each variety of hernia, together with any special features, complications, and particular points in operative repair. At the end of every chapter is a carefully selected bibliography which would provide a solid basis for those interested in a detailed study. On all topics, including operative treatment, the author has endeavoured to present both sides of controversial matters, but he rightly gives his own opinion as a guide to the less experienced in practical matters.

The sections on operative treatment are clearly described, and special techniques well illustrated. It is natural that a full description should be included of the author's own method of repair by whole skin grafts, but too much emphasis is given to a technique which still awaits the test of time. Eighteen pages are devoted solely to photomicrographs of histological sections of skin grafts, and here the book is, perhaps, a little unbalanced. After a survey of the evidence, the author condemns the Bassini type of repair, and although he finds the local result to be favourable in fascial darts, he objects to the short available strips in McArthur's operation and to the damage to the thigh in the Gallie repair. Other modern techniques such as darning with nylon, or steel wire, or the use of a sheet of polythene were too recently announced to find a place, but in general the author does not favour repair by unabsorbable materials.

On the question of postoperative rising, there are many these days who would side with the Air Force surgeon whom the author quotes as saying he "was all for getting cracking a day or two after operation." If it is necessary, as the author advises, for the patient to stay in bed for three weeks after the operation, his repair is not an attractive one by economic standards. Surely it is just as safe to let the patient rise as soon as possible, and so exercise his abdominal muscles, as to let him lie abed and endeavour to exercise his legs at the command of a zealous young woman.

On the whole it is a thoughtful, well-presented survey, and will be much appreciated by students and surgeons.

G. E. Moloney

## 1464 Genito-Urinary Surgery

John Thomson-Walker. Third edition, edited and revised by Kenneth Walker. London: Cassell & Co. Ltd., 1948. xviii + 956 pages; 282 figures; 58 plates. 24 x 16 cm. £3 10s. [£3.5]

(i) The kidney; (ii) the ureter; (iii) the bladder; (iv) the urethra; (v) the prostate; (vi) the seminal vesicles and Cowper's glands; (vii) the testicle; (viii) the tunica vaginalis; (ix) the spermatic cord; (x) the scrotum; (xi) the penis. Index.

The appearance of a 3rd edition of Thomson-Walker's *Genito-urinary surgery* will be a source of pleasure to urologists in this country. The 1st edition appeared in 1914, when urology was in its infancy. Much has happened since then—the perfection of a

wide variety of urological instruments; the introduction of intra-venous pyelography; the various methods of treating prostatic enlargement; ureteric transplantation; and the employment of sulpha drugs, penicillin and streptomycin in genito-urinary infections.

Mr. Kenneth Walker has been careful to preserve the personality and character of the original work and at the same time to bring it up to date. The illustrations, particularly the colour plates, are very good, and the English is clear and concise. There is a welcome chapter on male sterility, a branch of urology in which Mr. Kenneth Walker has been prominent, and which has been up till now grossly neglected. The chapter on the prostate is particularly good and the many operative procedures, including Millin's retropubic approach, are well described. Emphasis is laid on the fact that none of these procedures is the best or the only one: a surgeon must adapt the operation to the patient and to the type of prostatic obstruction which is present.

In the chapter on cancer of the bladder there is a welcome description by Mr. Anthony Green on radiation in bladder growths, and the necessity of team work between the urologist and the radiotherapist is emphasized. A fuller description of total cystectomy would enhance the value of this chapter. There is some confusion on the question of tuberculous bacilluria and not sufficient stress is laid on the fact that the primary renal lesion is bilateral in most cases. There is no mention of Medlar's work and no reference to transplantation of the ureter to relieve the "cystitis dolorosa" of the small tuberculous bladder. As to where to transplant the right ureter, most urologists would prefer the pelvic colon rather than the caecum or ascending colon: caecal transplantations are notoriously liable to break down.

It is to be regretted that separate chapters have not been allotted to urological problems in children and in women, and that no mention is made of such well-known procedures as Fey's operation for nephrectomy, Wilson Hey's technique of prostatectomy and McIndoe's operations for hypospadias and epispadias. Another criticism is that the lists of references are in several cases out of date and a false impression of the modern nature of the work may be created as a result of this. Although the text abounds in quotations from recent publications, it would be of distinct value, where no mention is made of these in the bibliographies, if the date of the publication were inserted in brackets after the author's name.

This is a sound British textbook, which can be heartily recommended as a work of reference for students and general surgeons, and as a faithful stand-by for urological specialists.

J. H. Carver

## 1465 Recent Advances in Oto-Laryngology

R. Scott Stevenson. Second edition. London: J. & A. Churchill Ltd., 1949. vii + 395 pages; 8 plates; 106 text-figures. 21 x 14 cm. £1 4s. [£1.2]

(i) Chemotherapy and antibiotics in oto-laryngology; (ii) hearing tests; (iii) hearing-aids; (iv) theories of hearing; (v) otosclerosis; (vi) the mechanism of the labyrinth; (vii) Ménière's disease; (viii) the conservative treatment of chronic middle-ear suppuration; (ix) the surgical treatment of facial paralysis; (x) aviation oto-laryngology; (xi) radiological examination of the nasal accessory sinuses; (xii) nasal sinusitis and its treatment; (xiii) malignant disease of the nasal sinuses; (xiv) tonsils and adenoids; (xv) malignant disease of the pharynx; (xvi) the mechanism of the larynx; (xvii) cancer of the larynx; (xviii) tuberculosis of the larynx; (xix) bronchoscopy and oesophagoscopy; (xx) cancer of the oesophagus. Index.

As the name of this book implies, it has been written with the object of mustering together new facts which have made their appearance in the otorhinolaryngological field in recent years and, as such, is a monumental review of the literature on the subject, all the more remarkable because it has been the work of a single author.

Fourteen years have passed since the 1st edition of this deservedly popular book, and in its present edition the text has been rewritten and enlarged, three new chapters taking the place of five which have been discarded. So numerous and so rapid have been the advances that little of the old text remains, and the 2nd edition is in reality a new book.

The publishers are to be congratulated on the way in which they have prepared this book. The general standard of the production is high, and binding, typography, and lay-out are excellent. The eight plates and the 106 text-figures have been carefully reproduced.

The 20 chapter titles are well chosen on the whole, and the text comprises some 387 pages in all. A notable feature of the book

is the excellent bibliography at the end of each chapter, and the ample references should prove a great help to future readers. The author first abstracts his subject-matter for a given chapter and then presents the differing views in a correlated manner which is easy to read. Finally, to help the reader still further, he crystallizes the whole chapter in a well-written conclusion which embodies his own opinion on the subject-matter which has been presented.

To pick out portions of the text for individual notice is difficult as the standard throughout is excellent. One would like to mention, however, certain chapters which are outstanding. In particular, the first chapter, which gives a general review of chemotherapy and the antibiotics in clinical practice, is a masterly review of our present knowledge. The danger of "masking" symptoms and signs is rightly stressed, and the necessity for surgical intervention when it is called for is emphasized.

The subject of audiology (hearing tests and hearing aids) is well presented. The surgical treatment of otosclerosis is dealt with in one of the best chapters, and aviation otolaryngology in another.

No mention is made of the important subject of blast deafness, and the recruitment phenomenon is also missed out. The text would have been improved by their inclusion. The chapter on tonsils and adenoids could have been omitted entirely without detracting from the value of the book as it contains little that is new, whilst the very beautiful pictures of tonsillectomy by dissection belong to a textbook proper rather than to a book of this nature.

This book is one which should be read by all interested in the specialty, for all will gain much from a perusal of its pages.

F. Boyes Korkis

#### 1466 Diseases of the Nose and Throat. A Textbook for Students and Practitioners

St. Clair Thomson & V. E. Negus. Fifth edition. London: Cassell & Co. Ltd., 1948. xix + 1,004 pages; 44 plates; 369 figures. 24 x 16 cm. £3 10s. [£3.5]

(i) Introductory; (ii) diseases of the nose; (iii) diseases of the accessory sinuses (paranasal sinus diseases); (iv) tumours of the nose and accessory sinuses; (v) diseases of the naso-pharynx; (vi) diseases of the pharynx and tonsils; (vii) diseases of the larynx; (viii) diseases of the trachea and bronchi; (ix) diseases of the oesophagus; (x) foreign bodies. Peroral endoscopy; (xi) chronic infective diseases; (xii) acute specific fevers in the nose and throat; (xiii) the nose and throat in some general affections. Formulæ. Index.

A period of 12 years has intervened since the appearance of the 4th edition of this excellent textbook. The present edition retains the spirit of the original work, and Mr. Negus has succeeded in the task of incorporating the many advances made in this field; a task made the more arduous because of the impact of chemotherapy and the many changes it has brought. The reviewer of such a book need hardly criticize: he can only indulge in the pleasure of praise. It is sufficiently comprehensive to more than satisfy the needs of the student, and the specialist reader will profit from the scholarly and balanced views on diagnosis and treatment which are presented in great detail.

In a short review it is difficult to give an adequate impression of the scope of the work. The 13 sections cover the field with admirable completeness. A full section is devoted to diseases of the accessory nasal sinuses, in which the various operative procedures are described and their attendant dangers discussed. For rhinodacryocystostomy West's operation is preferred to that of Dupuy-Dutemps, a view which is not held by all. A further section deals with growths of the nose and sinuses; in this, a combination of deep x rays and surgery (using diathermy) is advocated for the treatment of growths of the antrum and ethmoid. Removal of the hard palate is advised to permit thorough inspection of the cavity. The preference for this method is adequately supported by the statistics given. It is suggested that the growth may originate in or involve the frontal sinus; the great rarity of this might have been mentioned.

Present-day views on the question of the removal of tonsils and adenoids are fully discussed; this part of the book is most valuable. The operative techniques are again fully described; the La Force instrument for the removal of adenoids is preferred as doing less damage to the mucous membrane. The differential diagnoses of tonsillar infections are given fully. Other sections, especially that dealing with diseases of the trachea and bronchi, reflect the wide personal experience of the author.

This book is a *sine qua non* of every library dealing with otolaryngology; there are few who will not benefit from its perusal. There are full lists of references at the end of every chapter, and its value is further enhanced by profuse illustrations, including 13 excellent colour plates.

W. M. M.

#### 1467 A History of Oto-Laryngology

R. Scott Stevenson & Douglas Guthrie. Edinburgh: E. & S. Livingstone Ltd., 1949. vii + 155 pages; 52 figures. 22 x 14 cm. 17s. 6d. [£0.875]

(i) Introduction; (ii) ancient history; (iii) the Middle Ages and the Renaissance; (iv) the seventeenth and eighteenth centuries; (v) otology becomes science; (vi) the education of the deaf; (vii) laryngology in the nineteenth century; (viii) modern history. Bibliography. Index.

This small book which numbers only 137 pages of text is the first history of otolaryngology to be published. However, several different authors have previously published books dealing with the history of one or other branch of the specialty. Politzer has written a history of otology and Chauveau a history of pharyngeal diseases; these detailed studies have been consulted in the preparation of the present volume which is a short account of the rise of the specialty from the writings found in the Egyptian papyri, through the Middle Ages to modern times. To have packed so much history in so small a space is a fine achievement in concise writing but there are omissions which are inevitable in a book of this type. The authors have presented their subject-matter in a very readable manner, and, having read this book, one was left with the feeling that one wished that there had been much more of it. It is of ideal size to slip into the pocket for odd-moment reading, and it makes an excellent bedside companion.

The text is illustrated with 52 figures; among them there are some excellent reproductions of portraits of eminent historical persons, whilst others depict operations and instruments. The publishers are to be congratulated on the high quality of the reproductions throughout the book. The lengthy bibliography at the end of the book will be of help to those who wish to undertake further reading. Herein one finds listed the names of over 200 authors, containing even more references to their different publications. This book should appeal to a wider public than the ear, nose and throat specialist, and, in fact, every practitioner will find something to interest him and much to enjoy.

F. Boyes Korkis

#### 1468 A Handbook of Ophthalmology

Humphrey Neame & F. A. Williamson-Noble. Sixth edition. London: J. & A. Churchill Ltd., 1948. x + 336 pages; 189 figures. 24 x 15 cm. £1 1s. [£1.05]

(i) Examination of the eye and its accessories; (ii) action and accommodation; (iii) eyelids and lacrimal apparatus; (iv) of the eyeball; (v) the conjunctiva; (vi) cornea and sclera; (vii) body and choroid; (viii) the lens; (ix) the vitreous; (x) the retina; (xi) the optic nerve; (xii) glaucoma; (xiii) extrinsic muscles; (xiv) orbit; (xv) operations; (xvi) ophthalmological signs and symptoms in general diseases; (xvii) eye diseases in the tropics; (xviii) therapeutics. Appendix: services. Glossary. Index.

This is one of the shorter textbooks of ophthalmology, intended for the student and general practitioner; the fact that since 1942 a new edition (or reprint) has been called for every two years shows its popularity. The book is a concise and up-to-date presentation of the accepted teachings. The planning of the chapters is in line with the modern classification—congenital, traumatic, inflammatory, and neoplastic—except where such classification is inapplicable. The methods of examination and refraction occupy 64 pages. Instead of a selection of methods, only one is given and adequately described which, if followed, should satisfy most needs. The localization of the depth of a corneal lesion by means of focal illumination and parallax (without slit lamp) is too much to expect from a student. The duochrome test is used in association with the cross cylinder and it is emphasized that without checking and rechecking with the duochrome test it is easy to fall into the trap of misjudging the cylinder component with the cross cylinder. This is a point not appreciated sufficiently by many advanced students. For conjunctivitis the sulphonamide and penicillin treatments are well presented. In iritis the allergic factor is mentioned. The descriptions of the operations are clear and easy to follow. The illustrations are a notable feature of the book.

M. Klein

## 1469 Diseases of the Eye. A Textbook for Students and Practitioners

Eugene Wolff. Third edition. London: Cassell & Co. Ltd., 1948. x + 208 pages; 133 text illustrations; 5 colour plates. 25 x 19 cm. £1 1s. [£1.05]

(i) Diseases of the conjunctiva; (ii) diseases of the cornea; (iii) diseases of the eyelids; (iv) diseases of the iris and ciliary body; (v) ophthalmoscopy; (vi) diseases of the lens; (vii) glaucoma; (viii) diseases of the retina; (ix) diseases of the choroid; (x) diseases of the vitreous; (xi) diseases of the sclera; (xii) injuries of the eye; (xiii) congenital anomalies; (xiv) diseases of the optic nerve; (xv) diseases of the orbit; (xvi) diseases of the lacrimal apparatus; (xvii) the pupil; (xviii) the field of vision; (xix) strabismus or squint; (xx) nystagmus; (xxi) errors of refraction; (xxii) intra-ocular new growths; (xxiii) eye complications of some general diseases; (xxiv) operations; (xxv) bandaging, and medicinal applications. Index.

The 3rd edition of this book, like its predecessors, is written primarily for the student and general practitioner and with obvious sympathy for the examinee. The symptoms, signs, complications, sequelae and treatment of the common diseases and of injuries of the eye and orbit are dealt with in considerable detail, while short sections are devoted to the less common symptomatic conditions so that there is little, even among the rarer forms of eye disease, which does not receive at least some mention. There are separate chapters on congenital anomalies and on intraocular new growths. The theory and treatment of concomitant squint and of refractive errors are concisely explained. Surgical methods are described in some instances in their appropriate context but there is a separate chapter on the common ophthalmic operations and another on bandaging and nursing methods.

Perhaps the most valuable aspect of the book is the attention given to the medical side of ophthalmology in the short but excellent chapters on ophthalmoscopy, diseases of the retina and of the optic nerve, anomalies of the pupil, visual fields, squint and the eye complications of general diseases.

In criticism, the arrangement of the chapters is disconcertingly disconnected, though doubtless this is done with a purpose. A chapter on the differential diagnosis of common symptoms and signs would be helpful to the public for which the book is designed. Lastly one wonders how far the practitioner is expected to go with his treatment; for instance, in the treatment of burns so much can be done nowadays by the expert in the early stages to minimize the seriousness of the sequelae that one feels that early reference of these cases, and of others, to a specialist should be emphasized.

The illustrations are good, particularly the beautiful anatomical drawings from the author's *Anatomy of the eye and orbit*. There is a comprehensive index and the work is to be recommended as an attractive and practical handbook.

## 1470 Das Haftglas als optisches Instrument. Eine vergleichende Darstellung der optischen Wirkungsweise von Kontaktglas und gewöhnlicher Brille

E. Bürki. Basle: S. Karger, 1948. vi + 322 pages; 81 illustrations. 25 x 17 cm. 55 Sw. fr.

Einleitung. Vorbemerkungen zur allgemeinen Dioptrik. Das Auge und das Haftglas. A. Theoretischer Teil. B. Praktischer Teil. Anhang: die Heineschen afokalen Haftgläser. Literatur. Tabellenverzeichnis. Sachverzeichnis. Namenverzeichnis. Abbildungsstil.

Contact lenses have passed the experimental stage and have secured a permanent place in ophthalmic practice. They were first used on the Continent but for the last 15 years most developments have come from work in Great Britain and in the USA. Bürki's is the first substantial book outside the English-speaking world, and is a welcome addition to the existing literature. The book is well produced; paper, type and print are good. It deals comprehensively with the optics of contact lenses on the basis of Gullstrand's dioptric concept. A general introduction on optics is followed by a discussion of the special problems of the contact lens and the eye, and these are contrasted with the optical principles involved in lens at some distance in front of the eye. This parallel presentation facilitates the understanding of the differences between spectacles and contact lenses. Graphs and tables relating to the cardinal points, magnification, size of retinal image etc., are the result of long hours of patient work. The mathematics are fairly simple and numerical examples are worked out at the end of each chapter.

Only a relatively small part of the book is devoted to practical questions. The specification of the trial sets of different firms are

given. In the part dealing with the fitting, the statement that the trial contact lens with optical power ground on it should be of higher power than the spectacle correction in hypermetropes, and weaker in myopes, is too dogmatic, and neglects the relation of the inside curve of the contact lens to the radius of curvature of the cornea. In the instructions on how to insert and remove a contact lens illustrations would have been useful. In the procedure of fitting, the author does not mention his personal experience. The statement that with fenestrated types of contact lenses no veiling occurs hardly agrees with the experience of many surgeons. However, these are minor criticisms, and the book can be recommended. In a future edition the theoretical parts might be balanced by more practical details.

M. Klein

## 1471 Anaesthesia for the Poor Risk, and Other Essays

William W. Mushin. Oxford: Blackwell Scientific Publications, 1948. ix + 65 pages. 22 x 14 cm. 7s. 6d. [£0.375]

(i) The poor risk patient; (ii) convulsions during anaesthesia; (iii) haemorrhage and anaesthetic dosage; (iv) anaesthesia for thoracoplasty; (v) ether impurities; (vi) the hazards of pentothal; (vii) the ether war; (viii) refrigeration anaesthesia; (ix) synthetic substitutes for morphia; (x) analgesia in obstetrics; (xi) the efficacy of oily solutions of local anaesthetics; (xii) morbidity versus mortality; (xiii) anaesthesia by hypnosis; (xiv) some analgesics compared; (xv) record cards for the anaesthetist; (xvi) continuous caudal analgesia in obstetrics; (xvii) reviving the "dead"; (xviii) curare; (xix) delayed morphine poisoning in casualties; (xx) the wrong cylinder; (xxi) post-operative chest; (xxii) anaesthetics in the Pacific war zone; (xxiii) concerning relaxation in abdominal surgery; (xxiv) continuous spinal analgesia; (xxv) regional anaesthesia; (xxvi) the "safety" of nitrous oxide; (xxvii) what, no curare?; (xxviii) mechanical respirators.

This small book deals with many aspects of anaesthesia. The author's ideas are graphically told in 28 essays, many of them masterpieces of clear thinking; and they possess the charm of being written in good, simple English. There is much sound advice for the anaesthetist, the outcome, no doubt, of the author's long experience at Oxford. He has chosen an unusually wide range of subjects—as examples may be mentioned hypnosis, continuous spinal anaesthesia, the effect of peroxides in ether on induction time, and substitutes for morphia.

Although one essay only concerns anaesthesia for the poor risk patient, the administration of anaesthetics to shocked cases is seldom far from the author's mind and recurs again and again in his essays. His knowledge as a practising anaesthetist is constantly in evidence: he points out, for instance, the wisdom of washing out the stomach when faecal vomiting is present, and stresses the danger of spinal anaesthesia in shock; it is a satisfactory anaesthetic only for the good risk patient. To the little experienced he says "Give what you are used to" and "In the shocked patient it is the amount and the skill of administration rather than the drug which counts." It may, however, be said that some drugs are more toxic than others and put greater strain on the patient in eliminating them. He is a great ether protagonist, and there are many who will agree with him.

Speaking of the newer anaesthetics his remark, "Morbidity may no longer shadow the patient in the ward, but mortality is at his side in the operating theatre," is one whose truth cannot be denied. One must, however, believe that the author's experience of the young anaesthetist has been unfortunate, for when discussing the use of endotracheal tubes in abdominal surgery, he declares "... some of the patients will pay the price in terms of laryngeal trauma and infection." In an abdominal operation the anaesthetist often has so many duties, such as attending to transfusions, giving additional injections, taking blood pressure readings, that, unless he has an assistant, a perfect airway may be maintained throughout the operation only by the use of an endotracheal tube, and this method has certainly been used in many thousands of cases without mishap. In order to prevent postoperative respiratory complications the author suggests putting the patient into an iron lung; this novel plan may be good for the occasional case, but is hardly practicable in a busy hospital; and it is possible that more activity of the limbs than is obtainable in the iron lung may sometimes be desirable if thrombotic complications are to be avoided.

The essays make easy reading, and they are well worth while, for they are the product of an exceptionally active mind; moreover they contain food for thought, not only for the young, but also for the experienced, anaesthetist. The book looks well, and Blackwell Scientific Publications could be congratulated on their work were it not for the fact that the binding has a tendency to come unstuck.

## 1472 Recent Advances in Anaesthesia and Analgesia (Including Oxygen Therapy)

C. Langton Hewer. Sixth edition. London: J. & A. Churchill Ltd., 1948. viii + 380 pages; 149 figures. 21 × 14 cm. £1 1s. [£1.05]

(i) Theoretical aspects of inhalational anaesthesia; (ii) premedication; (iii) nitrous oxide and the hydrocarbon gases; (iv) carbon dioxide and helium; (v)

aspects of local analgesia; (xiii) drugs used in local analgesia; (xiv) recent advances in the technique of local analgesia; (xv) the present position of spinal analgesia; (xvi) collapse and resuscitation; (xvii) anaesthesia and analgesia for neuro-surgery; (xviii) anaesthesia and analgesia for dental surgery; (xix) anaesthesia and analgesia for endoscopy, for nasal, oral and maxillo-facial surgery, and for operations upon the pharynx and larynx. Use of suction; (xx) anaesthesia and analgesia for thyroid and thymic surgery; (xxi) anaesthesia and analgesia for thoracic surgery; (xxii) anaesthesia and analgesia for abdominal surgery; (xxiii) anaesthesia and analgesia in obstetrics—resuscitation of the new-born; (xxiv) anaesthetic sequelae; (xxv) psychological aspects of anaesthesia and analgesia; (xxvi) oxygen therapy; (xxvii) anaesthetic charts and records. Index.

A new edition of *Recent advances in anaesthesia* is always something of an event. Four years have elapsed between the appearance of this and of the previous edition; and they have been fruitful years. This edition follows the same plan as its predecessors, but it contains much fresh material and many new illustrations.

The outstanding advance during this period has been the introduction and widespread use of curare and other muscle relaxants—a development which has made a profound impression on the science of anaesthesia. This development is justly accorded a chapter to itself—a chapter already somewhat dated by the recent introduction of two new synthetic curarizing agents.

Continuous spinal analgesia is mentioned, and the section on therapeutic spinal block has been enlarged. The controversial subject of choice of anaesthesia for thoracoplasty is fairly dealt with, and the possibilities of extradural spinal block are briefly mentioned. Little change has been made in the chapter on anaesthesia for neurosurgery, and no mention is made of the new technique of obtaining an ischaemic field by controlled preliminary bleeding, and returning the blood to the patient at the end of the operation.

Mention is made of the use of intravenous procaine in the control of cardiac arrhythmias. The dosage of pethidine has been brought up to date, and the new synthetic analgesic "physeptone" is included. "Kemithal" is now given a place among the intravenous barbiturates, and a section on the detoxication of the barbiturates has been added.

The contribution of electroencephalography to our understanding of the mechanism of convulsions associated with anaesthesia is included in this edition. The section on the etiology of pulmonary embolism has been revised and its treatment by the anticoagulants is now included.

Altogether this volume upholds the high tradition of its predecessors. It is well produced, and contains very few errors. (A misprint in the graphic formula of amethocaine on p. 167 is one of these few.) A book which is so widely used for reference deserves a fuller index.

R. Woolmer

## 1473 Cunningham's Manual of Practical Anatomy, Vols. 1, 2 & 3

Revised and edited by James Couper Brash. Eleventh edition. London: Geoffrey Cumberlege, Oxford University Press, 1948. Vol. 1: General introduction. Upper limb, lower limb. xix + 387 pages; 44 plates; 144 figures. 19 × 12 cm. Vol. 2: Thorax and abdomen. x + 488 pages; 24 plates; 212 figures. 19 × 12 cm. Vol. 3: Head and neck; brain. x + 513 pages; 16 plates; 213 figures. 19 × 12 cm. £1 1s. per volume. [£1.05]

Vol. 1: (i) Upper limb; (ii) lower limb. Index. Vol. 2: (i) Thorax; (ii) abdomen; (iii) pelvis. Index. Vol. 3: (i) Head and neck; (ii) organs of hearing and equilibration; (iii) the eye; (iv) the brain. Index.

This well-known work is an excellent companion for the student who is undertaking systematic dissection of the body. Its value is increased by clear illustrations and a number of radiographs of bony structures and vessels injected with radio-opaque material.

The value of such detailed books depends on the amount of time to be devoted to patient and systematic dissection. There is, I

consider, no doubt that the medical student devotes too much time to this occupation in the majority of medical schools. As a result, the undergraduate, while in no sense an anatomist, has acquired temporarily, and only temporarily, an amount of detail far greater than is required for the practice of medicine in most of its branches and indeed far greater than he will be able to retain even should he be a practising surgeon—unless he be one of that small number of surgeons who have succeeded in retaining a sound knowledge of general anatomy while being expert in their chosen field.

For those who are in favour of the present system of patiently disintegrating the body from the scalp to the sole of the foot over a period of between three and five terms, there is no better textbook than this. Moreover, while acquiring much that he will forget, the student will cover the essential points which he is likely to need in subsequent surgical practice. My criticisms are in no sense criticisms of the work as such, which I consider to be an excellent one, but rather of a system which has already served its purpose and is no longer in touch with the needs of medicine as it exists today.

F. S. Gorrill

## 1474 A Synopsis of Regional Anatomy

T. B. Johnston. Sixth edition. London: J. & A. Churchill Ltd., 1948. viii + 436 pages; 17 illustrations. 21 × 14 cm. 18s. [£0.9]

Section I: The upper limb. Section II: The lower limb. Section III: The thorax. Section IV: The abdomen. Section V: The head and neck. Section VI: The central nervous system and organs of special sense. Section VII: Osteology. Index.

The 6th edition of this well-known work, which is such excellent value at 18 shillings, is substantially the same as the 5th edition except that it contains a more detailed account of the extra-pyramidal system. It is a matter for regret that the author has seen fit to increase the number of pages by 13: The general value of this book lies in the fact that it contains those essentials of regional anatomy which can reasonably be expected from the general surgeon or final-year student of surgery. Professor Johnston has shown admirable skill in selecting the essentials and discarding a vast mass of inessential material. When he comes to write the 7th edition, and the demand for the book is such that the time cannot be far distant, I trust that he will, if anything, prune still further the material at his disposal, so that the next edition may be smaller rather than larger.

It is my experience of students taking the Primary Fellowship Examination of the Royal College of Surgeons, that few have succeeded in accumulating a knowledge of regional anatomy more extensive than that comprised within this book. It need scarcely be said that the practising surgeon, outside his own specialty, will usually be found to have an even more scanty knowledge. I feel, therefore, that books larger than this are in general to be discouraged unless they can be looked upon as works of reference to be consulted only on specific occasions. Professor Johnston has emphasized that this book should be used only after the whole of the body has been dissected, but I feel that the earlier the student is introduced to it the better. In this way he may secure a more optimistic view of anatomy and come to the conclusion that it is a finite subject which he may ultimately grasp, instead of a conglomeration of facts, of such magnitude that no average person can hope to retain more than a fraction in his mind at any one time.

F. S. Gorrill

## 1475 Living Anatomy: a Photographic Atlas of Muscles in Action and Surface Contours

R. D. Lockhart. London: Faber & Faber Ltd., 1948. 71 pages; 149 figures. 25 × 16 cm. 12s. 6d. [£0.625]

This book sets out to stimulate the student's interest in the surface anatomy of living subjects. It is presented as a series of 149 well-produced illustrations, the majority of which are concerned with muscles in action. The clarity with which the muscles are demonstrated is a credit to models and photographer alike, as well as to Professor Lockhart, whose knowledge in this field is unrivalled.

The book will be of considerable interest to physiotherapists, orthopaedic surgeons and artists. The general surgeon and the undergraduate student of anatomy will also find material of value here, but they of course are more especially interested in the rela-

tions of the underlying vessels and nerves; these, and the corresponding bony points, find little or no mention in this work. At the end of the book is a small number of illustrations of the breast and eye, but these constitute only a fraction of the whole. It is not easy to see why they should be included while other structures of greater general importance are omitted. The sub-title of this work, *A photographic atlas of muscles in action and surface contours*, makes its content clear whereas the title of *Living anatomy* may perhaps lead to the expectation that the work is more extensive than is actually the case.

F. S. Gorrell

#### 1476 Detailed Atlas of the Head and Neck

Raymond C. Truex & Carl E. Kellner. New York: Oxford University Press; London: Geoffrey Cumberlege, 1948. xiii+162 pages; 136 figures. 31×24 cm. £3 15s. [£3.75]

I. Regional anatomy. (i) Posterior neck and back; (ii) spinal nerve and cutaneous areas; (iii) lateral neck and axilla; (iv) anterior neck and thorax; (v) lateral face, pharynx, and oral cavity; (vi) cranial cavity and contents; (vii) brain: circulation; (viii) brain: topography and dissection; (ix) cerebellum; (x) labyrinth, cavernous sinus, and orbit; (xi) eye and orbital contents; (xii) pharynx and esophagus; (xiii) larynx and trachea; (xiv) nasal cavity and paranasal sinuses; (xv) palatine tonsil and floor of oral cavity. II. Skeletal structures. (xvi) Cervical vertebrae; (xvii) skull; (xviii) ear bones; (xix) median section; (xx) hyoid bone; (xxi) atlanto-axial joint; (xxii) paranasal sinuses. III. Frontal sections. IV. Transverse sections. Index.

In this atlas the majority of the plates are conventional pictures of the anatomy of the head and neck. The authors have not transected the body abruptly at the root of the neck but, where appropriate, have wisely followed structures further, in some cases as far as the diaphragm. Although, as the title implies, a considerable amount of detail is represented, the quality of the illustrations is so good that the detail stands out well and the relative position of different structures can be clearly seen. The blood

supply of the brain is well shown and the attachments of the various cranial nerves can be seen in relation to the blood-vessels. The sections of the central nervous system show the structures which could normally be seen by the naked eye. The gasserian ganglion and its relations are shown from a variety of angles and with the utmost clarity. The orbital contents, the larynx, pharynx and nose are separately illustrated. The paranasal air sinuses receive perhaps less than their share of the authors' efforts.

The pictures of the skull bones are essentially the same as those found in a standard textbook of anatomy though the detail is a little greater and the quality of reproduction higher. The auditory ossicles are generously represented.

Figs. 105 to 136 consist of a series of sections through the head and neck. They are most painstakingly produced and it is clear that considerable labour has been expended on this section. Its value, however, will be limited for most surgeons, and even the majority of anatomists will look askance at some of these figures. Most of us find a section through a limb a puzzling matter and to orientate oneself correctly requires more than momentary effort. In the case of the head and neck, where the basic anatomy is so complex, the section becomes still more an intellectual exercise. I feel that these illustrations might with advantage have been replaced by further pictures of "dissections," comparable with those illustrated, for example, in figs. 9 and 10 (vessels, nerves and muscles of the neck), 21 and 22 (infratemporal region), and 54 and 55 (middle cranial fossa, gasserian ganglion and infratemporal region).

The work is well indexed and excellently produced. There has obviously been the closest co-operation and understanding between the artist and the anatomist. The book will appeal to dental surgeons, otorhinolaryngologists and neurosurgeons. General surgeons with special interest in the thyroid, parotid and other related structures will find much of value in this atlas.

## OBSTETRICS AND GYNAECOLOGY

1477

### TRAINING AND RECRUITMENT OF MIDWIVES

C. SCOTT RUSSELL M.A. F.R.C.S. M.R.C.O.G.

University of Manchester

In April 1947 a Working Party was appointed to enquire into the reasons for the shortage of midwives in Great Britain. The Party consisted of two midwives, one woman doctor, one statistician and a lay chairman. Their report<sup>1</sup> has recently been published and has been well received; already the conclusions reached in its many pages have given those of us who are interested in the maternity services much food for thought. The Report is a document of just over 100 pages, in which is given a most comprehensive survey of the present position of midwives in Great Britain. The historical background is reviewed and the attempts to raise the status of the midwife are clearly shown; the relationship—unfortunately not always a happy one—with the medical profession is discussed. The important Midwives Act, 1902, which established the Central Midwives Board, the Midwives Act, 1936,

which placed the responsibility for providing an adequate service of certified midwives on the county or county borough councils, and the National Health Service Act, 1946, which transferred this responsibility to the local health authorities, illustrate the steady growth and improvement in midwifery services. The Working Party remind us that the midwife is a practitioner of normal midwifery and emphasize that she is a practitioner in her own right.

The present shortage of midwives is acute even though in 1937 considerably more of them notified their intention to practise than in 1929. Various factors have contributed to this anomaly. The birth rate has been higher, and antenatal and postnatal care has taken up relatively more of the midwife's time, compelling her to reduce the number of cases under her care.

One of the first difficulties the Working Party met was that the available statistics were often incomplete and sometimes at variance. They were driven, therefore, to make an independent collection of facts; this was done, most successfully, by means of questionnaires. Chapter II of the Report is concerned with the examination of these facts. In Chapter III, "The midwife's place in the health team", the duties of the midwife are discussed. Her training, which next comes under scrutiny, is clearly of the greatest importance and the Working Party have made some important recommendations for the future: they advise a common basic training for nurses and midwives and the union of the present

<sup>1</sup> For particulars, see p. 274.

Part I and Part II of the State Certificate Examination of the Central Midwives Board into one examination; this would normally be held after one year's training, which would be divided into three equal periods—normal midwifery, district midwifery, and abnormal midwifery. They go on to examine pay, promotion and the working and living conditions, and make many valuable suggestions. They stress the importance of proper avenues for promotion for both domiciliary and institutional midwives. We must all agree that this is a most important point if the right sort of woman is to be attracted to the profession. They are certain that proper transport must be made available and they insist that the midwife must have adequate means of relieving labour pain.

The chapter on recruitment brings into the open the much

wider issue of the use that is to be made of available woman-power in the country. Clearly there are not enough girls from secondary schools to meet the many and varied demands for them, so that women over 30 and even a few over 40 must also be attracted into midwifery; for them a more individual training may have to be arranged.

Many other interesting matters are discussed and important conclusions reached which cannot be mentioned in this brief review. It is a time of great change, and, with the start of the National Health Service, new difficulties and opportunities will present themselves. The Working Party have clearly been aware of these and they have recommended in the strongest terms that the whole subject be reviewed in three to five years' time.

\* \* \*

### 1478 Management in Obstetrics

Andrew M. Cloye. London: Geoffrey Cumberlege, Oxford University Press, 1948. viii + 186 pages; 17 figures. 19 x 12 cm. 12s. 6d. [£0.625]

(i) Abortion; (ii) antenatal supervision; (iii) breech in pregnancy; (iv) diet in pregnancy; (v) twins; (vi) excessive vomiting; (vii) retroversion with pregnancy; (viii) fibroids with pregnancy and labour; (ix) pre-eclampsia; (x) ante-partum haemorrhage; (xi) management of labour; (xii) forceps delivery; (xiii) relief of pain; (xiv) difficulty with shoulders; (xv) occipito-posterior position; (xvi) breech in labour; (xvii) force and breech presentations; (xviii) transverse lie; (xix) prolapse of cord; (xx) obstetric operations; (xxi) the force membranes; (xxii) low puncture of the membranes; (xxiii) post-partum haemorrhage; (xxiv) resuscitation; (xxv) puerperium; (xxvi) retention of urine; (xxvii) breast feeding; (xxviii) intramuscular injection; (xxix) on calling in consultants; (xxx) instructions on masks; (xxxi) prevention of puerperal sepsis. Appendices. Index.

Professor Cloye has written a practical manual of obstetrics intended especially for the general practitioner-obstetrician. In his preface he points out the need for an improvement of present standards of midwifery and for better training of those undertaking it. This book should contribute perceptibly towards such an improvement. It consists of a series of short but brilliant essays on all the topics with which an obstetrician is likely to be concerned and constitutes an excellent revision course in practical obstetrics.

There are a few minor points for criticism. Many of the references given are out of date. This may be due to delay in publication necessitated by post-war conditions and no doubt these defects will be remedied in later editions. De Ribes' bag, rightly condemned as obsolete in the treatment of placenta praevia, is recommended for the treatment of uterine inertia—dangerous advice and difficult to carry out even in a well-equipped hospital. The value of penicillin for mastitis and breast abscess is not adequately emphasized nor is the necessity for adequate dosage.

These criticisms are not meant to detract from the excellence of the book as a whole. The emphasis throughout is on the practical aspects of midwifery and the style is so clear and the use of words so economical that it contains as much useful information as will be found in many larger books.

It can be thoroughly recommended to the general practitioner-obstetrician for whom it is chiefly intended. Many experienced obstetricians, also, will find it useful. The book is representative of the best in modern British obstetrics.

Josephine Barnes

### 1479 Practical Obstetrics

Bruce T. Moyes. Sydney: Australasian Publishing Co. Ltd. (Distributors: George G. Harrap & Co. Ltd.), 1948. xv + 306 pages; 20 coloured plates; 123 figures. 23 x 16 cm. £2 5s. [£2.25]

(i) Post-partum haemorrhage; (ii) breech presentation (including Lovsett technique); (iii) local anaesthesia to the pelvic floor and perineum; (iv) episiotomy; complete tear of the perineum—technique of repair and nursing care; (v) occipito-posterior; (vi) forceps delivery; (vii) the long labour and its management; (viii) lower segment Caesarean section; (ix) pre-eclamptic toxæmia; (x) diagnosis and management of toxæmia of pregnancy; (xi) eclampsia; (xii) hydatid mole and toxæmia of pregnancy; (xiii) induction of labour; (xiv) induction of therapeutic abortion—hysterotomy; (xv) sterility; (xvi) sterility (continued); (xvii) artificial insemination; (xviii) acute inversion of the uterus; (xix) abdominal pregnancy; (xx) the Rh factor in pregnancy; (xxi) rubella and

pregnancy; (xxii) queries and views; pethidine, caudal analgesia; diabetes and pregnancy, dysmenorrhoea, Caesarean section in placenta praevia, Hoggben (Zenopus) pregnancy test, constipation in pregnancy, thrombosis in obstetrics, brow presentation, pyridoxine in morning sickness and hyperemesis. Index.

In 1944 the author wrote a series of bulletins on obstetrics for war-time graduates in the fighting Services. Each of these original contributions has been expanded and the series now appears in book form. Professor Bruce Moyes of Sydney University was persuaded to put his experience in a practical form so that graduates who had been divorced from the practice of obstetrics during the war would be able to revise quickly the more usual complications of obstetrics they would meet in general practice. Most obstetrics in Australia is done by the general practitioner, a person who has had a sound training. But in the words of the author—"Nevertheless, certain difficult problems persist whose solutions are by no means a matter of routine management, and which, in the event of failure, can be humiliating, even in the face of conscientious effort."

The contents of the book are such that they cover those abnormalities with which every general practitioner should be able to cope. Appropriately, the first chapter is devoted to post-partum haemorrhage. All would agree that this subject should occupy first place since there are still many maternal deaths from this complication; haemorrhage now occupies second place as a cause of maternal mortality. The author has devised an interesting method of presenting the subject. Two cases are fully discussed and the method of treatment is carefully elaborated. The advice he gives is clear and unequivocal and any reader following this would have no difficulty in dealing adequately with the emergency.

Since this edition was published practice has been changing and oxytocic drugs are being given before the delivery of the placenta. They are being used not only for the control of haemorrhage due to retained placenta, but also as prophylactic treatment. In some clinics complicated deliveries are given pitocin (5 units) or ergometrine (0.125 mg.) with the birth of the head or shoulder. Again, removal of the placenta in the absence of haemorrhage is performed within an hour of delivery. The colour plates showing eight manoeuvres of the operation of manual removal are so clear and original that they should be included in every obstetric textbook.

There are, in addition, 18 other coloured plates and 123 illustrations, all of which emphasize the value of visual aid in teaching. In the chapter on breech delivery, 26 illustrations are used to show the different complications and methods of extraction. The author was one of the first to use the Lovsett technique for delivering extended arms. By this simple method foetal mortality due to this complication has been considerably reduced.

The description of the lower segment caesarean section operation is so clear that a novice would not fail to appreciate each step. The operator wears two gloves on the right hand until the delivery of the placenta when the outer one is removed. The head is delivered into the uterine wound by using the hand as a lever. This method has much to commend it.

The author has succeeded admirably in his intention of presenting his subject in a number of practical clinical discussions rather than in the form of a textbook. His is an original method of presentation and the advice throughout is given by one who is obviously a versatile teacher and practitioner of obstetrics.

W. C. W. Nixon

**1480 Textbook of Midwifery**

Wilfred Shaw. Third edition. London: J. & A. Churchill Ltd., 1949. xiv + 649 pages; 4 plates; 235 text figures. 22 x 14 cm. £1 2s. 6d. [£1.125]

Section I. Physiology of reproduction. (i) Anatomy, physiology and embryology; (ii) anatomy and physiology of pregnancy; (iii) physiology of labour. Section II. Clinical midwifery. (iv) Symptoms and signs of pregnancy; (v) pre-natal examination; (vi) pre-natal advice to pregnant women; (vii) asepsis and antisepsis in midwifery; (viii) normal labour; (ix) management of the puerperium; (x) analgesia and anaesthesia during childbirth. Section III. Complications of pregnancy. (xi) Pregnancy complicated by maternal diseases; (xii) gynaecological complications of pregnancy; (xiii) pathology of pregnancy; (xiv) toxæmias of pregnancy. Section IV. Abnormal labour. (xv) Mal-presentations; (xvi) multiple pregnancy; (xvii) obstetrical haemorrhages; (xviii) contracted pelvis; (xix) the use of radiology in obstetrics; (xx) abnormalities of uterine action; (xxi) obstructed labour and rupture of the uterus; (xxii) injuries of the birth canal; (xxiii) complications of the third stage of labour; (xxiv) abnormalities of the puerperium. Section V. Abnormalities of the amnion, placenta, umbilical cord and foetus. (xxv) Abnormalities of the placenta. Section VI. Management and diseases of the new-born. (xxvi) Care of the new-born baby. Section VII. Operative midwifery. (xxvii) Obstetrical investigations and operations; (xxviii) the clinical aspect of cases of difficult and prolonged labour. Section VIII. Results and statistics. (xxix) Maternal and foetal mortality and morbidity. Index.

That there is a long time-lag between the handing of the manuscript by the author to the publishers and the appearance of his work in the bookshop is well illustrated by this book in the sentence "when penicillin becomes available for general use. . .". Penicillin has been generally available for at least three years and yet we find a book published under the date 1949 referring to conditions of three or four years ago. This is no fault of the author, but it is nevertheless a serious disability from which British books on medicine must suffer in competition with those of other nations, and a depressing thought for the author who contemplates writing a book on a rapidly progressing subject. But, having made every allowance for the technical delays due to the printers and binders, Mr. Shaw retains opinions and teaches lines of action which have been discarded by most of us for twenty years.

Almost every chapter will show examples. External pelvimetry is given six illustrations and covers about four pages in the section on antenatal care and is again described in some detail in the section on contracted pelvis. Few obstetricians who work in association with their medical colleagues in a teaching centre would agree that dietary protein should be reduced in the treatment of toxæmia. The book is littered with examples of the teaching of bygone years of which we could give many more examples were space available. Uncritical acceptance and teaching of untried theories and methods is an equally serious error, but there is room for prudent discrimination so that the student may be taught the solid new knowledge which has proved its value.

A useful improvement in the next edition would be to bring certain maternal mortality statistics up to date. It is surely useless to quote the statistics of 1932 relating to deaths from various causes when the death rate from puerperal sepsis accounted for nearly half the total maternal mortality, and to devote a considerable space to comment on these obsolete figures.

However, despite these criticisms, the book presents a clear exposition of important general principles and essential details which are needed by the undergraduate. The section on the Rh factor, where a complex subject is clearly explained in simple language, is a good example of this.

A. W. Bourne

**1481 Diseases Affecting the Vulva**

Elizabeth Hunt. Third edition, revised. London: Henry Kimpton, 1948. 211 pages; 36 illustrations; 19 colour plates. 25 x 16 cm. £1 5s. [£1.125]

(i) Introduction; (ii) anatomy of the vulva; (iii) histology of the vulva; (iv) development of the vulva; (v) diseases affecting vessels; (vi) diseases of glands; (vii) anomalies of pigmentation; (viii) inflammation of the skin; (ix) inflammation of the skin (continued); (x) drug eruptions; (xi) affections in general and visceral diseases; (xii) urticaria; (xiii) lichen simplex chronicus; neurodermatitis; (xiv) intertrigo; (xv) psoriasis; (xvi) seborrhoeic dermatitis; (xvii) lichen planus; (xviii) leucoplakia. Leucokeratosis; (xix) kraurosis; (xx) ulcers of the vulva; (xxi) malignant neoplasms; (xxii) benign neoplasms and hypertrophies; (xxiii) microbial affections; (xxiv) vaginal and intestinal organisms; (xxv) tuberculosis; (xxvi) venereal diseases; (xxvii) venereal diseases (continued); (xxviii) venereal diseases (continued); (xxix) parasitic infections; (xxx) diseases due to filter passing viruses; (xxxi) affections in children; (xxxii) pruritus. Appendix I: the pH scale. Appendix II: treatment. Index.

The fact that Dr. Elizabeth Hunt's book, which was first published in 1940, is already appearing in its 3rd edition is in itself an indication of its usefulness.

It is a complete treatise on all diseases of the vulva, including venereal diseases. As the author very rightly points out, such

diseases must be considered, not as entities, but as part of some general condition. She objects to the term vulvitis being applied, for instance, to a skin eruption affecting the labia majora and also the thighs and lower abdomen; and she emphasizes the fact that when a patient complains of vulval irritation, the whole patient must be systematically examined.

This book of 211 pages is divided into 32 short chapters and this arrangement makes it easy to look up any particular condition. The descriptions of skin lesions are unambiguous and vivid, so that it should be easy for anyone to visualize the condition without previous knowledge of it. The 19 coloured photographs of vulval conditions are excellently reproduced from Dufay films, and are clear and instructive. One slight criticism is that the plates are scattered through the text, not necessarily in the chapter to which they refer. The references to the plates in the text do not state the number of the page facing the plate; the plate number only is given.

Treatment forms a prominent part of each chapter, and there are a number of excellent prescriptions. This edition has been brought up to date by the inclusion of new remedies such as penicillin, but no reference is made to the antihistamine drugs. This omission will probably be remedied in later editions. There is a very valuable list of external agents which may produce inflammation of the skin. The author stresses the fact that alkaline baths, which are so commonly resorted to by patients suffering from pruritus vulvae, are actually themselves one of the causes of dermatitis venenata. There is a chapter devoted to the vulval affections in childhood, which include a number of conditions from napkin rash to gonorrhoea. The statement that non-gonococcal vulvovaginitis of children usually clears up in two or three weeks is rather surprising. The chapter devoted to pruritus vulvae is instructive; the possible causes are clearly set out and there are valuable suggestions for treatment. It is interesting to see that the author states that x-ray therapy is rarely indicated in vulval affections, though she advocates both ultra-violet light and grenz-ray therapy in certain cases.

Altogether it may be said that this book will prove valuable to general practitioners and gynaecologists as well as to dermatologists.

I. M. Gaddum

**1482 Die gynäkologischen Operationen und ihre topographisch-anatomischen Grundlagen**

Heinrich Martius. Fifth edition. Stuttgart: Georg Thieme, 1947. xvi + 424 pages; 427 illustrations. 26 x 17 cm. 58 Mk.

(i) Die gynäkologischen Laparotomien; (ii) die vaginalen Operationen; (iii) die Operationen wegen Häminkontinenz; (iv) die Ausschabung der Gebärmutter; (v) die Hysterotomien; (vi) Operationen am Darm. Sachverzeichnis.

The 5th edition of this work should be of great value not only to the postgraduate student but also to the experienced operator. The illustrations are excellent; they consist of coloured diagrams showing the progressive manipulations in the course of each operation. This type of illustration is clearly more effective than photographs when proceedings in the depths of the abdomen are being presented, since by emphasizing light and shade the essential points can be more clearly demonstrated.

In cases of abdominal myomectomy, the author prefers supra-vaginal amputation to total hysterectomy because of the lower operative mortality and because, in his view, the danger of the occurrence of a later carcinoma in the cervical stump is almost negligible (0.32-0.39 per cent). In younger women he favours conservative myomectomy to make a later pregnancy possible, in spite of the risk of recurrence of another myoma.

Wertheim's operation for total hysterectomy in carcinoma of the uterus is clearly illustrated and fully described. The author does not advise the removal of all the regional lymphatic glands; in his view only neoplastic glands should be extirpated. However, whether lymphatic glands are cancerous can be decided only by histological examination, and this would unduly prolong the operation.

The author confirms the view that every ovarian cyst should be removed as soon as it is diagnosed. He points out the danger of ovarian cysts in pregnancy; they can form an obstacle to delivery by becoming incarcerated in the pouch of Douglas.

The concluding chapter on certain abdominal operations which the gynaecologist is sometimes called upon to perform is especially welcome. In summary, the volume provides a comprehensive and authoritative description of all the major procedures in operative gynaecology; it should prove stimulating reading for all those interested in the subject.

## CHILD HEALTH

1483

## NEONATAL MORTALITY

PROFESSOR DUGALD BAIRD

*Department of Midwifery  
University of Aberdeen*

This Report is the work of a joint committee of distinguished obstetricians and paediatricians representing the Royal College of Obstetricians and Gynaecologists and the British Paediatric Association. Its scope is much more comprehensive than the title suggests, since stillbirths are considered as well as neonatal deaths. The subject is dealt with in 10 chapters, chronologically, from conception to the neonatal stage. The contents of the Report<sup>1</sup> are well indicated by the chapter headings. A noteworthy point is the lists of references which follow each chapter, and which together form a comprehensive and valuable guide to the literature.

In a short statistical analysis, which opens the Report, it is concluded that the present neonatal mortality and stillbirth rate could be reduced by one-third to one-half; this would result in the saving of some 15,000 babies each year in England and Wales.

Apart from the general recommendations of the committee, which form the last chapter, certain conclusions are drawn and suggestions made in the course of the Report. In discussing the use of analgesics in childbirth, the conclusion is reached that the ideal anaesthetic has yet to be discovered; also, it is recommended that the appointment to all maternity hospitals of full-time resident anaesthetists, with obstetrical experience, should be considered. The beneficial effects of improved social and economic conditions and of higher nutritional standards on the stillbirth and neonatal death rates are pointed out, instrumental interference in labour is discussed and it is urged that "the treatment of the child injured during birth is of great importance and should be in the hands of an experienced paediatrician who can call upon the assistance of suitably trained nurses."

In certain respects the Report is disappointing and some of the chapters are rather difficult to read, owing in part, at least, to the use of numerous tables of statistics from hospital reports, which by their very nature must have limited value. This point is well illustrated in the chapter dealing with pre-eclamptic toxæmia. It is stated, for example, that the foetal mortality from toxæmia is 46% in Newcastle, and 21% in Liverpool, and that this difference may be explained by the large amount of industrial depression in Newcastle at the time. The year is not given, however, and no evidence is furnished to indicate how the amount of industrial depression was calculated. The Report states that the percentage of all stillbirths assessed as due to toxæmia is the same in both places (20%). But we are told that the neonatal deaths per 100 live births in Manchester and Newcastle were 9.7 and 19.8, respectively. From figures given in the table it is possible to calculate that the abortion and stillbirth rates in the same

series of cases are 21 and 14 per 100, respectively, but no comment is made to explain why there are more neonatal deaths, and fewer stillbirths and abortions due to toxæmia, in Newcastle than in Manchester. In Dublin, 16% of premature births are to mothers with toxæmia, corresponding percentages for Belfast and London being 49 and 30. It is clear that no conclusions can be drawn from these figures and there seems little point in including them in the text.

Under the heading of "Research" the committee states that medical reports of maternity hospitals should be standardized. (A standard form of annual report for maternity hospitals has been drawn up by the Royal College of Obstetricians and Gynaecologists.) While it is important that maternity hospitals should keep accurate records of their results, there are limits to the usefulness of these. They may be helpful in assessing the relative value of various methods of treatment, but they cannot be used, as they are in this Report, to compare the incidence of pathological conditions in various parts of the country. For this purpose data collected on a regional basis are required. This is, of course, difficult, but should become easier administratively under the National Health Service. The collection of mortality data is comparatively easy but, with regard to morbidity, the difficulties of securing uniform standards of definition, observation and recording, even in the large teaching hospitals, are great, while on a regional basis, i.e. in smaller hospitals and in domiciliary practice, they are very great indeed. Till some such information is available, comparison between one region and another cannot be made and the use of hospital statistics can be very dangerous. The results, besides being influenced by the efficiency of medical treatment, are also affected by the proportion of "booked" and "non-booked" cases, and by the type of district which the hospital serves. There is a correlation between the type of district and such factors as health, physique, age, parity of the mothers, and the amount of co-operation of the patients. The last named may closely affect the possibility of early diagnosis and treatment.

It seems worth while to re-emphasize several salient points stated in the Report but scattered throughout its pages in such a way that they may be overlooked by the average reader.

Under the best existing conditions, i.e. in the Registrar-General's social classes I and II, where the standard of medical and nursing care is generally very good, the stillbirth and neonatal mortality rates are low—in each case about 10 per 1,000 births. This superiority over the general rate is unlikely to be due to any genetic superiority in the power of physical survival. It must therefore be due to the benefits of optimal environment, i.e. housing, exercise, hygiene, food and education. No amount of expenditure of money and effort on improving medical and nursing services will, by itself, reduce to the lowest possible level either the stillbirth or the neonatal mortality in social classes IV and V, which constitute about 40% of the population. Unless a high standard of medical care is accompanied by a greatly improved standard of living for "the masses" its results will be disappointing.

In the light of this general statement it is disappointing that the committee decided to make only a short general recommendation about research and limited itself to the

<sup>1</sup> *Neonatal mortality and morbidity.* For particulars, see p. 274.

advocacy of three routine procedures. The first deals with the standardization of medical reports in maternity hospitals and has already been commented upon. The second recommends that "post-mortem examination of babies born dead or dying in the neonatal period should become the rule . . ." While it is of course important to see that this is done, the limitations of a routine procedure as a method of research should be stressed. It has been pointed out by several writers that even where post-mortem examination has been done as a routine, over 30 % of foetal deaths still remain unexplained, even when no account is taken of the 10 % of stillbirths where the foetus is too macerated to make examination profitable. The autopsy may show asphyxia, cerebral haemorrhage or atelectasis; that is, it may show how the baby died but not why. If the mother's health has been good during pregnancy and the labour "normal", the problem is even more obscure. In nearly 50 % of stillbirths and neonatal deaths the baby is premature—5½ lb. (2.5 kg.) or under. The premature baby is very liable to die from any of the three causes mentioned above so that prematurity, while not the actual cause of death, is a most important predisposing factor, so much so that, in most cases, in the absence of prematurity foetal death would not have occurred. The study of the causes of prematurity is therefore a most important project for research, especially since it is estimated that in about 50 % of cases the cause is unknown.

The third recommendation calls for a general adoption of the accepted standards of immaturity and prematurity, the

words being used synonymously. Surely something much more comprehensive is necessary. How far is the weight of the baby an index of maturity? How often does the baby weigh less than 5½ lb. at birth because it has been born prematurely? Small women, under 61 inches (1.55 m.) tall, constitute a large proportion of those living in the poorer parts of our large cities and they give birth at full term to babies of 5½ lb. (2.5 kg.) or less in about 20 % of cases. Do these babies suffer any disadvantage as a result of this, and how do they differ from babies of the same weight born at about 36 weeks to taller women? What factors determine the birth-weight, length and vitality of the baby? A comprehensive study of the physiology of human pregnancy seems indicated.

There is great scope for the research worker in the field of obstetrics. More information is required about the physiology of pregnancy in general and pre-eclampsia and uterine dysfunction in particular. The creation of more whole-time senior clinical posts both inside and outside the universities should increase the chance of work of this type being undertaken. The task before the administrator and the practical obstetrician and paediatrician is the general application of what is already well known. The results achieved will depend on their efforts, and on progress in education, housing and the future economic position of the country. The large amount of information in the present Report is a valuable addition to knowledge and will make the task easier.

#### 1484 Annual Report on Child and Youth Welfare, Based on Information Received from Member Governments Between 1 April 1947 and 31 March 1948

United Nations, Department of Social Affairs. Lake Success,  
New York: United Nations, 1948. 236 pages. 23 × 15 cm.  
12s. 6d. [£0.625]

The General Assembly of the United Nations have "authorized the publication of an Annual Report on Child and Youth Welfare based on and summarizing information transmitted by Member Governments and having for its purpose to provide, each year, particulars of the progress made in child and youth welfare in the various countries, from both the legislative and administrative points of view." The first of these reports, which is a continuation of similar reports published by the League of Nations Secretariat, has now been published and contains not only a general survey of the situation as regards child welfare at the present time but, in many instances, it also covers the war years. Following a letter from the Secretary-General, 32 countries have forwarded information to the Secretariat. Some of the countries have interpreted the term "child welfare" to include only those measures which protect and support the child when normal parental care breaks down or is destroyed, but others have given a wider interpretation and have touched on those services which contribute to the child's material, physical and psychological well-being, either in its own home or elsewhere. This, in many cases, has included information on the care of the expectant and nursing mother.

The report, as a whole, shows that countries which before the Second World War showed little, if any, interest in maternal and child health, are now beginning to plan programmes for their areas. In such areas, the fundamental problem is the training of personnel, not only for the preventive child health services, but also for the hospital services. Hospital beds, too, are in short supply even though personnel may be available. In the programmes for education in health matters great and increasing use is being made of

broadcasting, and this would appear to be particularly useful in countries where a large proportion of the population is illiterate. In some areas, where the population is scattered, information is given by the regular despatch of letters to mothers with young children, giving them advice on how to bring up these children. In other areas there are mobile clinics, sometimes in motor vehicles, while in others, there are maternal and child welfare units housed in railway cars. Some States undertake the whole of the responsibility for child care, while others put the responsibility on voluntary organizations, paying a subsidy towards their cost. In those countries where the State assumes responsibility, the organization of these services may rest entirely with the central government, whereas in others, the responsibility is placed on local municipalities with financial aid from the central government.

The problems of countries recently under enemy occupation are very similar, whether they be in the Far East or in Europe, and in these the toll of child life during the war years has been heavy. Many countries are still at the stage when they have to organize registration of births and deaths so that they may have a "yardstick" with which to measure their progress. In some countries the effect of the occupation on the adolescents has been particularly severe, not only with regard to delinquency but also on the rate of their growth and development. Family allowances are becoming more frequent and these are, in some cases, supplemented by mothers' allowances, which are paid to the mother to make it unnecessary for her to go out to work. The course of development of provision for the care of boarded-out children, placement of children for adoption, and for delinquent children, is much the same in many countries. In one area at least pre-nuptial medical certificates are required from both spouses. These certificates are not meant to prevent undesirable marriages but are merely to make each partner aware of the physical condition of the other.

Altogether, in reading this report, an encouraging picture is presented of the efforts which are taking place throughout the world to improve child health.

Jean Mackintosh

## 1485 The Premature Baby

V. Mary Crosse. Second edition. London: J. & A. Churchill Ltd., 1949. viii + 167 pages; 14 figures. 21 x 14 cm. 12s. 6d. [£0.625]

(i) Definition and characteristics; (ii) general scheme of management and care; (iii) institutional care; (iv) home care; (v) clothing; (vi) methods of feeding; (vii) complications liable to occur in the premature baby; (viii) statistics in relation to the premature baby. Appendix. Index.

The chief value of this volume lies in the detailed description of the organization, equipment and methods employed at the Sorrento Premature Baby Unit, Birmingham. The emphasis on practical details makes the book useful to anyone responsible for the running of such a unit, and the somewhat dogmatic approach employed by the author is justified by her results.

The larger part of the book describes the methods used at the Birmingham centre, together with the instructions given to the nursing staff. Of special interest is the chapter on the care of the premature infant in its own home, and the notes on the training of the mother in the care and after-care of her child. Sound advice is given on the choice of clothing, and the exact technique of pipette, oesophageal and gastric feeding is described, together with tables showing nutritional requirements. The danger of overfeeding in the early days is adequately stressed.

The usual list of modified milk foods is given, but the reviewer feels that a definite statement about the feeds used at the unit might have been more useful than a mere enumeration of them. Also the value of a separate milk room might have been stressed more forcibly.

The chapters on complications and illnesses occurring in premature babies are—perhaps intentionally—somewhat brief. The treatment advised for atelectasis seems unduly conservative in view of the good results obtained by skilled endoscopic removal of secretions from the bronchial tree. The statements that antibiotics are valueless in gastroenteritis, and that replacement transfusion is not warranted in haemolytic anaemia, will also need revision. Lastly, the technique for subcutaneous, intravenous and intramedullary infusions might have been described in greater detail.

The book ends with a valuable statistical appendix on the incidence, distribution, cause and complications of prematurity.

B. Gans

## 1486 Clinical Pediatrics

I. Newton Kugelmass. Second edition. New York: Oxford University Press; London: Geoffrey Cumberlege, 1947. 409 pages. 22 x 14 cm. 12s. 6d. [£0.625]

(i) Growth and development; (ii) diseases of the newborn; (iii) nutritional disorders; (iv) diseases of the eye; (v) respiratory disorders; (vi) circulatory disorders; (vii) blood disorders; (viii) urogenital disorders; (ix) skin disorders; (x) bone and joint disorders; (xi) diseases of the nervous system; (xii) infectious diseases; (xiii) neuropsychiatric disorders. Index.

In his preface to *Clinical Pediatrics* the author states that "the purpose of this epitome is to emphasize the determining features of pediatric problems." Whatever this may mean, it is difficult to imagine to what use the book could be put. It is arranged in the manner of lecture notes under headings of diseases, each heading followed by a profusion of alphabetically and numerically arranged sub-headings—none, incidentally, being provided for prognosis, which is not considered. The book is of little value to the undergraduate as its arrangement makes reading difficult. More important, the amount of space given to individual conditions bears no relation to their relative importance: chronic bronchitis receives 14 lines, whereas porphyria has 70, and the Hand-Schüller-Christian syndrome 116! Apart from these errors of emphasis the text is often vague, and statements that "a small head is associated with defective brain development" and "the chief cause of [premature] death is cerebral hemorrhage, prevented by prenatal vitamin K therapy" are of little use to the undergraduate student.

Neither can the book be recommended as a reference work, as the index is poor, the treatment is superficial, there are no references, and, more important, the text is full of the most astonishing number of inaccuracies and omissions. These are too numerous to mention more than a few: "Chronic parenteral focus of infection is the most common cause [of celiac syndrome]." "Catarrhal jaundice is due to swelling and obliteration of the biliary passages"—no mention of a virus. "Increased blood destruction is the underlying cause [of physiologic jaundice]"—the hepatic immaturity is not mentioned. The section on cardio-vascular diseases is perhaps the most astonishing, as these two random samples will show: "patent ductus" is associated with "pulmonary stenosis, transposition of great vessels or stenosis of the aorta" and "Increased intracranial pressure... may cause malignant hypertension." Lastly, the following quotation will give an idea of the type of English the author indulges in: "Grape sugar is the coin of currency of animal life."

In view of these serious shortcomings it appears particularly regrettable that Oxford University Press, from which one has come to expect a high standard, should have published the book.

## NEUROLOGY AND PSYCHIATRY

## 1487 Modern Discoveries in Medical Psychology

Clifford Allen. Second edition. London: Macmillan & Co. Ltd., 1949. xi + 236 pages. 22 x 14 cm. 12s. 6d. [£0.625]

(i) Mesmer and the discovery of hypnosis; (ii) Janet and the structure of consciousness; (iii) Morton Prince and multiple personality; (iv) Freud and the discovery of psychoanalysis; (v) the further discoveries of the psychoanalysts; (vi) Adler and the power instinct; (vii) Jung and the hinterlands of the mind; (viii) Kretschmer and the relation of body and mind; (ix) Pavlov and the machinery of the mind; (x) Wagner-Jauregg and his followers. Index.

The reasons for the success of previous editions of this book and for its translation into several languages are not far to seek. It gives a succinct, accurate, and entertaining if necessarily somewhat superficial account of the historical evolution of psychopathology from Mesmer to Freud and his followers. Kretschmer's work on the relation between physique and temperament is discussed, and there is an excellent account of Pavlov's discoveries and their psychiatric implications.

The volume is intended primarily for neophytes in the field of psychiatry and is an excellent historical introduction to the subject. It could however be read with profit by any educated layman and the literary style is not one which would offend his susceptibilities. It is a common American criticism of British psychiatry that in its anxiety to avoid speculation it tends to become mechanistic, and to find refuge in a pessimistic genetic determinism. It is refreshing to read a British psychiatric author who is not afraid of speculation and who can write of psychopathology with understanding and without patronage.

The last chapter deals with the newer physical methods of treatment of psychiatric illness. The author points out that these advances are not yet completely evaluated and that routine applications of such methods without careful preliminary psychiatric study of the individual patient can lead only to rule of thumb practice and a progressive lowering of standards.

Henry G. Miller

1488 **A Text-book of Mental Deficiency (Amentia)**

A. F. Tredgold. Seventh edition. London : Baillière, Tindall & Cox, 1947. xvi + 534 pages ; 9 tables ; 47 plates. 22 x 14 cm. £1 10s. [£1.5]

(i) The concept and nature of mental deficiency ; (ii) incidence ; (iii) aetiology ; (iv) classification and definitions ; (v) psychology ; (vi) pathology ; (vii) physical characteristics of amentia ; (viii) idioy ; (ix) imbecility ; (x) feeble-minded children ; (xi) educational defect and disability ; (xii) feeble-minded adults ; (xiii) the clinical varieties of primary amentia ; (xiv) secondary amentia and its clinical varieties ; (xv) idiots savants ; (xvi) moral deficiency ; (xvii) amentia with other forms of mental disease ; (xviii) clinical examination ; (xix) diagnosis and prognosis ; (xx) treatment and training ; (xxi) the law of England relating to mental defectives ; (xxii) sociology—the ament and the community. Appendix: the case of Neville G. C. Heath. Index.

In the forty years of its existence this volume has become an institution. The 1st edition brought a new attitude of mind to the subject of mental deficiency and, now in its 7th edition, having been responsible for the bulk of textbook education in this subject in several continents, this book remains by far the most comprehensive and satisfactory work on mental deficiency.

The strength of this new edition lies as before in the powers of description of the author. All the known syndromes are described with a care worthy of the great traditions of British clinical medicine. The chapters on practical procedure are clear and concise. They have been invaluable in the past and will be a godsend to a new generation of medical officers. The passage of the Education Act, 1944, has materially altered the administrative aspects of the subject and the author has brought this edition right up to date in these matters.

On re-reading this book, one cannot help wondering how the wide-spread idea that mental deficiency is mainly or even entirely a matter of intellectual failure was ever propagated. Few people would admit such a belief if directly challenged but it is implicit in much thinking and planning for mental defectives. This volume brings into sharp relief the fact that mental deficiency is a state of deficiency of all the attributes, physical, mental and moral ; though the emphasis may vary from case to case.

It is not the author's fault that he has most to say about the cases which are met with the least. Although the feeble-minded are fifteen times as common as idiots, physical and mental anomalies are naturally to be met with far more often towards the lower end of the scale. At the upper end the quiet, well-behaved defectives with nothing particular to show for themselves greatly outnumber the others. A textbook on mental deficiency which started by describing the life of the "social problem" group family and how the world appeared to the dull children brought up in this group with all its social complications, and thence working down the scale to the cases of gross defect, might enable the medical profession to see a new perspective.

The author does not expect everyone to accept his description of "moral deficiency" ; nor will readers trained in concepts of dynamic psychopathology find this section of the book satisfying. No doubt his contention that those who show chronic antisocial traits may on this account be deemed feeble-minded in the strictest sense of that term is legally justified ; but few practitioners dare to interpret the definition in a non-cognitive sense. Many will feel that this obscure subject receives more illumination from the application of principles derived from the study of the dynamic modifications of instinctive drives in childhood. Undoubtedly, moreover, the chapter on psychology would be more satisfactory if brought more up to date.

It was probably unwise to attempt to describe the case of the murderer Heath in an appendix, partly because the subject is of too ephemeral interest to merit inclusion in an enduring book, and partly because the *Times* law reports on which the account depends can give very little light on motive. The case, in fact, demands a psychoanalytical type of approach to render it comprehensible.

The lay-out of the book is refreshingly good after wartime standards and the illustrations are excellent. For a combination of pictorial and anecdotal description, of clinical observation and statistical fact, of humanitarian understanding and legal practical-mindedness this book remains unique.

Kenneth Soddy

1489 **Modern Practice in Psychological Medicine, 1949**

Edited by J. R. Rees. London : Butterworth & Co. Ltd., 1949. xii + 475 + 13 pages. 25 x 17 cm. £2 10s. [£2.5]

(i) Health ; (ii) ourselves—the normal individual ; (iii) abnormal psychology in relation to emotional development ; (iv) the diagnostic interview ; (v) intelligence—its ascertainment and significance ; (vi) the types of personality ; (vii)

psychosomatic medicine ; (viii) psychiatry and neurology ; (ix) nature and nurture—the factor of inheritance ; (x) development and care of the child ; (xi) anxiety states ; (xii) hysteria ; (xiii) obsessional states ; (xiv) sexuality and the sexual disorders ; (xv) abnormal and delinquent conduct ; (xvi) mental deficiency ; (xvii) depression and mania ; (xviii) the schizophrenic disorders ; (xix) the organic reaction types ; (xx) physical methods of treatment ; (xxi) psychotherapy ; (xxii) industrial stress and psychiatric illness ; (xxiii) medical social work ; (xxiv) psychiatric social work in Great Britain ; (xxv) the medico-legal aspects of psychiatry. Appendix: classification of psychiatric illness. Index.

This book, intended for medical students and general medical practitioners, covers the entire field of psychological medicine, as well as the relationship of psychiatry to other medical and social disciplines. Apart from chapters on the conventional subjects of mental medicine—the various neurotic and psychotic syndromes, their causation and their treatment—there are important contributions from workers in child psychiatry, delinquency, sex abnormality, and psychosomatic medicine, as well as introductory chapters on the problems of personality, psychopathology, and the psychological management of patients. Finally there is a very clear and adequate treatment of the legal aspects of psychiatric illness, and of the increasingly important role played by the general, and especially the psychiatric, social worker.

The 29 contributors are all specialists in the subjects which they treat, so it would be impertinent to criticize their facts or method of presentation except from a very general point of view. Not all aspects of psychiatry are of equal interest and significance to the general practitioner. The more felicitous presentations are, on the whole, on subjects of general importance, in the chapters headed "Industrial stress and psychiatric illness", "Psychotherapy", "Development and care of the child", and "Nature and nurture: the factor of inheritance". The authors dealing with more specialized aspects of psychological medicine have perhaps not always been equally successful in presenting their material with sufficient selection of essentials, and have tended to deal too fully with matters of special significance to themselves rather than to the general medical reader. For instance, a full and academic review of Spearman's work on intelligence seems as much out of place in a book of this kind, as a lengthy discussion in the chapter "Psychosomatic medicine" on the psychological effects of blindness, while appropriate treatment of the much more frequently encountered emotional consequences of deafness is omitted.

Though the contributors of this volume are representative of all shades of psychiatric opinion in this country and America, and frequently there is some overlap between the presentations of several authors, certain chapters have appeared too dogmatic to the present reviewer. This seems particularly evident in the chapter on "Abnormal psychology in relation to emotional development", in which the author confines himself almost entirely to expounding Freudian theory without acquainting the student with the views of other schools of psychopathology. It is feared that such one-sided presentation is likely to antagonize the discerning and critical reader, when a broader, more eclectic and less dogmatic approach might have served to guide him towards realizing that the dynamics of psychological illness lie beyond the reach of unaided common sense.

On the other hand, in the treatment of most subjects the book is clearly intended for the mature and experienced reader, and a mere presentation of factual information in an easily assimilable form is evidently not intended. The authors do not conceal the inchoate state of psychiatric thinking and knowledge. Indeed, it seems doubtful whether this volume can be recommended to the average medical student unless he has already worked his way through an introductory textbook and has mastered the non-controversial aspects of mental medicine. It is much more suitable for the postgraduate student during specialist training in other medical subjects ; he will, on the whole, find in *Modern practice in psychological medicine* a very comprehensive and stimulating presentation of the state of psychiatric knowledge in this country today.

Felix Post

1490 **Lehrbuch der allgemeinen Kinderpsychiatrie, Einschliesslich der allgemeinen Psychiatrie der Pubertät und Adoleszenz**

M. Tramer. Third edition. Basle : Benno Schwabe & Co., 1949. 550 pages. 25 x 17 cm. 38 Sw. fr.

(i) Einführendes in die Kinderpsychiatrie ; (ii) Überblick über die psychologischen Betrachtungsweisen für die Kinderpsychiatrie ; (iii) der Massstab für die Entwicklung ; (iv) Untersuchungsmethodik ; (v) allgemeine Psychopathologie : Grundformen ; (vi) allgemeine Ätiologie ; (vii) Fortsetzung der allgemeinen Psychopathologie : besondere Formen ; (viii) Krankheitsformen ; (ix)

Diagnostik und Prognostik; (x) Therapie; (xi) soziale Funktion der Kinderpsychiatrie; (xii) Psychohygienische Aufgaben der Kinderpsychiatrie; (xiii) Abschliessendes; (xiv) Anhang: Kasuistik. Sachregister. Autorenregister.

This textbook on general child psychiatry appears in its 3rd edition, the 2nd edition having been out of print after only one year and a half. It consists of fourteen sections, each of which is divided again into several chapters and sub-chapters. The author calls his approach anthropobiological and likens it to that of Adolf Meyer and C. von Monakow.

A great deal of material has been collected and the work of many German, Swiss, French, and American psychiatrists is discussed, the chief being Homburger, Stirnimann, Hanselmann, Bühler, Baumgarten, Cotte, Schachter, Stern, and Kanner. Only a few British psychiatrists are mentioned such as Lowenfeld, Maberly, and Bierer. Most diseases of childhood, in which a change in the mental stage of the child may occur, are listed and discussed from the psychiatric point of view. In the section on general psychopathology we find chapters on instincts, drives, affects and moods, intelligence, character, and so on. The author particularly concentrates on the description of types. Amongst about 60 types he has collected we find descriptions of such types as the "abnormally cheerful", the "abnormally irritable", the "abnormally sad", and the "indifferent".

The author believes that in childhood up to the age of puberty one is dealing mainly with pre-neurotic or pre-psychotic states and not with psychoneuroses or psychoses in the adult sense. Many British psychiatrists will consider that the author does not sufficiently acknowledge the fact that there are specific forms of neuroses in childhood, such as the childhood phobias and obsessional states. He gives a few hints as to the diagnostic criteria of childhood psychosis, but he is of the opinion that in childhood schizophrenia and manic-depressive states are very rare. Many American and British child psychiatrists will disagree with this point of view and will maintain that the childhood form of schizophrenia and manic-depressive psychosis can frequently be found even in young children on thorough investigation. One would certainly agree with the author that diseases of childhood differ in their symptomatology from the same condition seen in the adult but nevertheless early diagnosis of serious childhood neurosis or psychosis is important, as the hope of satisfactory treatment depends on this. So often such children apparently recover, only to become more seriously ill again in adult life. The early diagnosis of a serious neurosis or psychosis is the more essential as treatment of very ill young children is proving to be more and more successful, particularly when treatment is by psychoanalysis.

The section on treatment deals both with somatic and psychotherapeutic methods. Under the heading "Individual psychotherapy" there are short chapters on the mother-child relationship, play therapy persuasion, suggestion, hypnosis, individual psychology, and psychoanalysis, etc. The fact that the author describes so many approaches has some disadvantages, as he does

not give a sufficiently clear picture of any one treatment. For example, the psychoanalysis of children is discussed on only one page. Anna Freud and Melanie Klein, the leaders of psychoanalysis of children, are mentioned, but the author does not refer to the progress made since 1920 when Melanie Klein introduced a new method of play analysis. In this, the observation of the child playing spontaneously with a few selected toys is used by the psychoanalyst in the same way as the free association in the adult analysis. With this method it has been possible to treat and cure even very ill young children. Under the heading of psychoanalysis the non-psychoanalytical methods of Stekel and Jung are also mentioned; this will be confusing to the reader.

The section on normal development is on the whole useful, but it is to be regretted that in discussing the infantile development of the first year of life, the work of English psychiatrists and psychoanalysts, such as M. Klein, S. Isaacs, M. Middlemore and D. Winnicott, is not mentioned at all. The author thinks that social contact between the infant and his mother exists from the second or third month onward, which is in agreement with the views of a number of child psychoanalysts who believe that a real emotional relationship between the baby and his mother exists from earliest infancy.

As the author stresses the importance of the early social contact of the infant with the mother one is surprised to read that he is mainly concerned with the question of disciplining the small infant. The mother is advised to maintain a friendly attitude to the baby, but there is no discussion of the problems and anxieties arising from the infant's helplessness and no discussion of feeding and weaning difficulties.

I have not been able to find in the whole book any detailed discussion of the question of toilet training and the problems arising therefrom. The only hint as to the author's view on this very important subject is his statement that one of the causes of enuresis may be that the toilet training of the baby has not been started *early enough*. Here again most British psychiatrists take the opposite point of view and maintain that toilet training should not be started early. They consider that if the major training in bowel and bladder habits is delayed until after weaning and until some degree of independence has been achieved later difficulties over control of bladder and bowels are more likely to be avoided.

Generally speaking, the problems of early infancy are insufficiently dealt with in this book. The author has chiefly concentrated on the problems of children between the ages of 6 and 16.

The value of this textbook is chiefly in that it gives a general survey of child psychiatry. Such textbooks are needed and Tramer is one of the few pioneers in this field. One hopes that in the next edition there will be more discussion of detailed diagnostic and therapeutic approaches, which will be useful to those who wish to specialize in this important field.

H. Rosenfeld

## TROPICAL MEDICINE

### BRITISH SCHOOLS OF TROPICAL MEDICINE

G. M. FINDLAY C.B.E. D.Sc. M.D. F.R.C.P.

*Editor, Abstracts of World Medicine  
and Abstracts of World Surgery, Obstetrics and Gynaecology  
Consulting Physician in Tropical Medicine  
West African Forces, 1942-46*

When in 1885 the Colonial Powers of Western Europe, assembled at the Conference of Berlin, bound themselves "to promote the moral and material well-being of native populations" in the tropics they probably failed to recognize both

the immensity of their task and how ill-equipped they were to accomplish their self-imposed work. In the field of health alone there were few trained workers, and those medical men who had acquired some knowledge of tropical diseases had had painfully and laboriously to teach themselves. The causation of most tropical diseases was still largely unknown though in 1880 Laveran, by the discovery of malarial parasites, had dispelled the old theory of the role of miasmata in febrile conditions. Only in 1895, however, did Ross discover the process of exflagellation and the emission of microgametes in the mosquito and in 1898 the mosquito-transmission of an avian malarial parasite. In 1885 Bruce showed that nagana, the "fly disease" of horses, oxen, and other domestic mammals in Africa, was due to a trypanosome, since known as *Trypanosoma brucei*. It soon became ap-

parent that, if the fields opened up by these new protozoological discoveries were to be fully exploited, provision must be made for systematic teaching in these subjects so that properly equipped physicians might enter the field of tropical medicine. Thus it came about that at the turn of the century both in Great Britain and in Germany the idea of founding schools of tropical medicine was translated into fact.

The first of these schools was that at Liverpool which was founded by Sir (then Mr.) Alfred Jones on 12 November 1898. This School was officially opened in 1899 and the teaching of tropical medicine was begun in April of that year. It is of interest to recall that this School owes its origin not to the encouragement of Government departments but to the generosity and far-sightedness of Liverpool business men who were convinced that fundamental research and the provision of trained medical men were essential if trade with tropical countries was ever to be prosecuted on a large scale. It may be noted that this interest on the part of Liverpool business men still continues, for the Board of Messrs. John Holt & Company (Liverpool) Limited, anxious to do something to develop research in malaria, in 1948 provided £10,000 to be paid over the ensuing four years.

The London School of Tropical Medicine, now known as the London School of Hygiene and Tropical Medicine, incorporating the Ross Institute, was founded in 1899 a few months after the Liverpool School. In this case it was Sir Perceval Nairne of the Seamen's Hospital Society who took up the challenge and founded the School as a result of the public declarations of Sir Patrick Manson, more especially his address at St. George's Hospital in October 1897. These declarations were reinforced by the vigorous support of that far-seeing Colonial Secretary, Joseph Chamberlain. Some account of the founding of these two schools is given in their Annual Reports.<sup>1</sup> One year after the inauguration of the London School, Hamburg founded its Tropen Institut, which avoided one of the errors of the British schools in that a research institute and a hospital for tropical diseases were incorporated in the same building. It is scarcely too much to say that all the great advances of the past half century in tropical medicine have been due directly or indirectly to the inspiration of these three schools.

It is not uninteresting to look back on what has been accomplished in these fifty years. Following on the work of

Ross in malaria, Reed and his associates were able to prove Carlos Juan Finlay's theory of the mosquito transmission of yellow fever. This enabled Havana and Cuba to be freed from yellow fever and malaria, and the Panama Canal to be built by the American engineers where in the eighties of the last century the French had completely failed. Further studies of yellow fever provided a successful means of vaccination and fully elucidated its epidemiology and enzootology. There is now no further excuse for epidemics of yellow fever. New insecticides and antimalarial drugs have revolutionized the control of malaria. Typhus can be controlled by antibiotics and lice by insecticides. Methods for the control of trypanosomiasis have vastly improved. Penicillin and arsenicals provide a rapid means of treating yaws, and the former drug acts like a charm in tropical ulcer. There are now in fact methods for controlling all the more important parasitic diseases in the tropics and limiting their spread. Anyone who knows the tropics will be aware that there are still many problems to solve and that in many areas the standard of health among indigenous populations is deplorable. The next fifty years, however, should witness on a larger and ever more effective scale the application of methods already discovered. If parasitic diseases are to be limited and controlled, nutritional problems will become even more pressing than at present, for it is realized that multiple deficiencies due to lack of vitamins, amino-acids, and inorganic salts are rife in tropical countries and that already in many areas the population is pressing on the means of subsistence. It would be ludicrous, if it were not tragic, that people should be saved from death by parasitic disease only to die of malnutrition. The next half century must therefore see a revolution in the nutrition of tropical peoples. In this nutritional revolution students of tropical medicine will play an important and essential part, but if true health is to be attained their burden must increasingly be shared by veterinarians, agricultural experts, engineers and economists.

In the tropics the day of the medical man armed with a microscope, a box of slides, and a bottle of stain is now over. Henceforth only teams of experts can cope with the problems and eliminate disease. In the formation and guidance of these expert teams schools of tropical medicine will undoubtedly play an ever increasing part and will save them from many an error; as Goethe said, "there is nothing more terrible than ignorance in action."

## 1492 Pathological Processes in Malaria and Blackwater Fever

Brian Maegraith. Oxford: Blackwell Scientific Publications, 1948. xi + 430 pages; 22 figures. 22 x 15 cm. £1 15s. [£1.75]

(i) Human malaria. Blackwater fever; (ii) the malaria parasite; (iii) the blood cells; (iv) the blood; (v) the liver: clinical evidence of hepatic dysfunction; (vi) the liver: pathology and pathogenesis; (vii) the kidney: clinical signs of dysfunction. Pathology; (viii) the kidney: pathogenesis; (ix) the brain; (x) the spleen and bone marrow; (xi) the adrenals and heart; (xii) pathological processes in malaria. References. Index.

Aeschylus was correct when he said that knowledge comes through suffering, for it has taken the sufferings of two world wars to bring home to western medical men the ravages of malaria, a disease which by a conservative estimate infects one in three of the population of the world. One sign of the renewed interest in malaria is this work, the first attempt to present a coherent picture of the basic physiological and pathological processes which determine the reactions of the animal body to invasion by the malaria

parasite. Although, owing to some of the appalling gaps in our knowledge, it has not been possible to arrive at anything like a complete account of malaria as a whole, certain processes have been found common to the development of lesions in all the organs; these processes are generalized anoxaemia, vascular endothelial damage, and general and local circulatory changes which result in the production of tissue anoxia. These lesions form, as it were, the leitmotif running through the whole book.

The opening chapter gives a brief account of the clinical manifestations of malaria and blackwater fever, together with notes on their diagnosis and treatment; treatment involves a consideration of the chemotherapeutic drugs now available. Although designed specially for those who are not familiar with malaria this succinct account will be read with profit by those who have already acquired a considerable knowledge of the subject. The parasites of human malaria are next described by Dr. R. H. Black, who has carried out much original work on the tissue culture of malarial plasmodia. In addition to the morphology of the parasites there are useful sections on their cultivation and metabolism. An all too brief section deals with the mode of action of antimalarial drugs.

As malarial parasites are most easily recognized when they attack the red blood cells it is appropriate that the action of malaria on the formed elements of the blood should first be considered: this is followed by a study of the biochemical changes in the blood, both in the uncomplicated malarial attack and in blackwater fever. The various organs are then systematically considered, anaemia being of special importance in the liver and kidneys. The theory which attributed the anaemia of blackwater fever to mechanical obstruction of the renal tubules here receives its quietus.

The pathology of the brain, spleen, bone marrow, and heart in malaria are then described and in a final chapter the pathological and biochemical changes are ably summarized. The section on immunity might well be expanded and a clear distinction drawn between tolerance and specific immunity. References are collected under chapter headings at the end of the book, which is beautifully produced on good paper and provided with an adequate index. As an attempt to weld together and to give logical form to what has hitherto been a somewhat inchoate mass of observations this clear and well-written book has an important service to perform. It should be read and thoroughly digested by all those to whom a clear conception of malaria is essential; and as malaria, with malnutrition and venereal disease, is one of the three greatest of medical problems, its readers should be numerous.

G. M. Findlay

#### 1493 Malaria Control by Coastal Swamp Drainage in West Africa

A. B. Gilroy. London: Ross Institute of Tropical Hygiene, The London School of Hygiene and Tropical Medicine (University of London) Incorporating the Ross Institute, 1948. viii + 97 pages; 10 figures; 22 plates; 3 maps. 22 x 14 cm.

(i) Introduction; (ii) details and practice of swamp drainage; (iii) the organization of a swamp drainage team; (iv) the financial aspects of swamp drainage; (v) legal aspects of swamp drainage; (vi) the maintenance of drained swamps.

One of the few advantages of war is that it allows sanitary works which have long been delayed because of governmental parsimony or procrastination to be undertaken and carried through to a successful conclusion. The malarious condition of Lagos, the capital of Nigeria, and of its wharves at Apapa, had long been an outstanding example of colonial maladministration. Early in the war it became obvious that if European troops, airmen, and sailors were to use the Lagos docks something must be done to reduce the appalling malaria rates which prevailed up till 1942. An extensive scheme was therefore begun to drain more than six square miles of swamps, lying within the urban district of Lagos, in order to eradicate the breeding places of the chief malaria vector *Anopheles melas*. The task was begun by the fighting Services and until 1944 the European staff of the team came entirely from the Army and the RAF. The continuation of the scheme then became a Government project financed from Colonial Development and Welfare Funds. None of the European staff had had previous experience of swamp drainage and very few of the African labourers knew even how to use a spade. In Dr. (then Lieutenant Colonel) Gilroy West Africa was, however, fortunate in obtaining the right man for the work, which despite the empirical approach was throughout based on careful calculations and controlled by scientific investigations. The conventional use of sea walls (bunds), drains and controlled outfalls had to be most carefully adapted to a very small tidal range and its efficacy in the control of anopheline breeding established. Some of the methods employed will undoubtedly appear unorthodox to engineers, while to medical authorities it came as a surprise that occasional ponding of drainage water could be used to so great an extent with impunity. Nevertheless, as the writer can testify from personal experience, these lapses from what was previously thought to be orthodox procedure were fully justified by admirable results.

In this short book Gilroy fully describes with wit and restraint the methods employed and the results achieved: what he does not mention are the tact and charm of the direction which enabled a large staff of Europeans and Africans to work together harmoniously under the most trying tropical conditions. Gilroy has here written a classic of malaria control and, as Sir Hubert Walker, Director of Public Works in Nigeria at the time, has said, "the value of the work to the war effort, the general health of Lagos and as a guide to similar work in future is incalculable."

#### 1494 Trypanosomiasis in British West Africa

T. H. Davey. London: His Majesty's Stationery Office, 1948. 15 pages. 33 x 21 cm. 2s. [£0.1]

I. Extent of human trypanosomiasis in West Africa. II. The parasites responsible for the trypanosomiasis of man and stock in West Africa. III. Technique of diagnosis and methods of treatment. IV. The results of treatment. V. Methods of control of human trypanosomiasis. VI. The organization of sleeping sickness control in British West Africa. VII. Comments on the control of sleeping sickness in the Sudan and the foreign territories visited.

#### Trypanosomiasis in Eastern Africa, 1947

P. A. Buxton. London: His Majesty's Stationery Office, 1948. 44 pages. 33 x 21 cm. 3s. [£0.15]

A. Introduction. B. Current problems and research. C. Methods of reclamation from tsetse. D. Results of reclamation. E. Organization of research and reclamation. F. Summary.

#### The Anchau Rural Development and Settlement Scheme

T. A. M. Nash. London: His Majesty's Stationery Office, 1948. 22 pages; 4 plates; 10 figures. 33 x 21 cm. 3s. 6d. [£0.175]

(i) Introduction; (ii) an account of the initial work and preliminary investigations; (iii) building the villages; (iv) propaganda and upkeep of the villages; (v) the new town of Takalafiya; (vi) the new market for Anchau district; (vii) the improvement of old towns; (viii) the provision of fruit and shade trees; (ix) crops introduced or encouraged; (x) attempts to increase live stock and manure in the corridor; (xi) communal forest areas and forest reserves; (xii) education in the corridor; (xiii) anti-tsetse stream clearings; (xiv) the future of the corridor; (xv) suggestions from lessons we have learnt. Summary. Acknowledgments. References. Plates.

#### Tsetse Flies in British West Africa

T. A. M. Nash. London: His Majesty's Stationery Office, 1948. 77 pages; plates; maps. 33 x 21 cm. £1 10s. [£1.5]

Part I. Nigeria. Part II. The Gold Coast. Part III. Sierra Leone. Part IV. The Gambia. Part V. West Africa.

Although trypanosomiasis in Africa had been described in the 18th century it was not until after the First World War that its extent was fully recognized. It was then seen that the tsetse fly which bites man and his domestic animals indiscriminately was one of the greatest enemies to the progress of Africa south of the Sahara. Many panaceas have been offered for the eradication of the tsetse or, if that were not possible, for the elimination of trypanosomiasis in man and animals. Some have pinned their faith to shifting indigenous populations and their domestic animals to areas free from tsetse; others have believed that slaughtering all the big game in an area would eliminate infection; still others have favoured the clearing of bush and vegetation so that the breeding places of tsetse could be destroyed. A fourth group of experts has thought that mass diagnosis and treatment of all human patients would be sufficient. Each of these measures has produced good results in some areas but not in others, and in many areas trypanosomiasis has, if anything, appeared to be extending its boundaries. In Uganda, for instance, areas which some forty years ago maintained flourishing herds of cattle are now covered with impenetrable bush. The tsetse is an inveterate traveller and no one in Africa could have welcomed more enthusiastically the cessation of intertribal wars and the coming of the bicycle and the motor car.

Gradually, in the period between the wars, it became evident that the only hopes of success against trypanosomiasis lay in a combination of measures, coupled with a very intensive study of the breeding habits and general ecology of the different species of *Glossina*. Much knowledge was gained, especially by the work of the late C. F. M. Swynnerton, but the plans and activities of many of the African Colonies were seriously impeded by the economic blizzard of the early 1930's. With the ending of the Second World War and the passing of Colonial Welfare and Development Acts, new possibilities came to light in the application of the recently discovered insecticides and in chemoprophylaxis for man and animals.

In order to take stock of what has already been accomplished, four reports have been prepared for the Tsetse Fly and Trypanosomiasis Committee, appointed by the Secretary of State for the Colonies; they have been edited for publication by the staff of the Bureau of Hygiene and Tropical Medicine. Professor T. H. Davey's *Trypanosomiasis in British West Africa* and Professor P. A. Buxton's *Trypanosomiasis in Eastern Africa, 1947* are the results of

fact-finding tours. The former deals especially with the four British West African Colonies and more generally with the Anglo-Egyptian Sudan, French West and Equatorial Africa, the Belgian Congo, and Liberia. A useful, if rather superficial, summary of information on both human and cattle trypanosomiasis in these areas is given but it was obviously impossible for the author to cover so vast an area satisfactorily in the time at his disposal. In East Africa the problems differ very considerably from those in West Africa, for whereas in the latter region trypanosomiasis is conveyed directly from man to man by the bite of the tsetse, in the east human infection is closely interconnected with big game and the tsetse which associates with them, *Glossina morsitans*. Even more serious is the cattle problem, as wild game again constitutes the reservoir of infection for cattle trypanosomiasis, *G. pallipides* and *G. swynnertonii* acting as transmitters as well as *G. morsitans*. Up to the present it has had to be conceded that cattle and big game cannot exist together in the same area. How far spraying with DDT or gammexane will reduce the fly population, and how far chemoprophylaxis can be used, are now being investigated. The high hopes centred on antrycide are probably doomed to disappointment in view of the ease with which trypanosomes become resistant to this drug. Already in Tanganyika, by eradication of game and bush clearing, some 1,300 square miles have been reclaimed and now contain more than half a million head of cattle. In Southern Rhodesia, by the eradication of *G. morsitans*, from 300 to 350 farms, each of 3,000 acres, are being provided in the more elevated regions of this territory for cattle which previously would have died.

The two most interesting reports, however, are those by Dr. Nash, who has devoted so much time to the study and amelioration of trypanosomiasis in West Africa. In 1934 it was found that much of the Anchau district in the Zaria Province of Northern Nigeria was infected by *G. tachinoides* and that no less than one-third of the whole population had sleeping sickness. It was decided to construct a fly-free corridor and as a result of what has been called the Anchau Rural Development and Settlement Scheme an area of some 712 square miles has been completely cleared. The actual clearing was preceded by most careful survey work and in the carrying through of the scheme, which cost only £95,000, the Geological, Veterinary, and Forestry Departments of the Nigerian Government co-operated with the Medical Department. It is a great pity that the services of an anthropologist also were not enlisted, for the scheme has involved the resettlement of 13,000 people who were previously living in indescribable squalor. Not only have tsetse flies been eliminated but a model town has now been constructed; more than 18,500 fruit and shade trees have been planted and successful pig-breeding initiated. This report shows convincingly how the solution of a specific medical problem may be combined with the general amelioration of the African's standard of life.

Dr. Nash's other contribution on the tsetse flies of West Africa is a mine of information, illustrated by excellent maps, on the distribu-

tion of the various species in relation to rainfall and vegetation: it will long remain a standard work of reference. It is to be hoped that other African countries may produce similar reports, so that exact and comprehensive tsetse distribution maps can be made available and the trypanosomiasis problem, which is not limited by artificial political frontiers, can be viewed as a whole.

G. M. Findlay

#### 1495 A Handbook for the Identification of Insects of Medical Importance

John Smart. With chapters on fleas, by Karl Jordan and on arachnids, by R. J. Whittick. Second edition. London: printed by order of the Trustees of the British Museum, 1948. xi + 295 pages; 178 figures; 13 plates. 25 x 18 cm. £1

The species of protozoa and helminths which are of medical importance are not numerous and, with certain exceptions, are easily identified. The medically important arthropods, on the other hand, are relatively numerous, and in many instances their identification involves a more than rudimentary knowledge of their anatomy. The 1st edition of Dr. Smart's book, which was published in 1943 and which met with immediate and well-deserved success, had the avowed object of assisting the medical officer serving abroad to identify all the more important arthropods he was likely to encounter. To accomplish this formidable task in a reasonable space the author and his collaborators made but few references to the medical aspects of their subject and omitted, in most instances, any account of medically important arthropods occurring only in the New World. This latter omission was justified under wartime conditions, but when a 3rd edition of the book is called for, as the reviewer believes it will be, it is to be hoped that this omission will be remedied and that accounts of such medically important New World species as *Dermatobia hominis* will be included even at the cost of omitting some of the Old World species, such as *Hypoderma bovis*, which are of little medical significance.

The present edition has been lengthened by some 30 pages of text and contains a number of new illustrations. The section on tsetse flies has been extended and includes fresh information regarding the geographical distribution and breeding places of various species. Dr. Karl Jordan has rewritten and extended by some 11 pages the chapter on fleas, now named *Suctoria*. Dr. Kenneth Mellanby has revised Mr. R. J. Whittick's article on arachnids, and Mr. H. S. Leeson has contributed a new table showing the anopheline vectors of malaria, ranked in order of importance.

Economy of space and weight severely limits the number of books packed by the medical officer proceeding abroad. Nevertheless, he would be well advised to include a copy of "Smart" amongst the chosen few; nor need economy of cost deter him from the purchase, for, in these days of expensive editions, the present well-produced and well-illustrated work is cheap at 20 shillings.

R. M. Gordon

## SOCIAL MEDICINE

1496

### THE POPULATION PROBLEM

FFRANGCON ROBERTS M.D.

Addenbrooke's Hospital, Cambridge

The population problem is of special interest to the medical profession for several reasons. In the first place, the increase in numbers and the change in age-structure which have occurred have been due mainly to the progress of medical science. Again, productive efficiency is dependent, at least

in part, upon the standard of health; and it is productive efficiency which largely determines the maximum population which a country can support. Perhaps most important of all, the medical profession combines with specialized knowledge a peculiar intimacy with family affairs; it thus possesses in unusual degree the power to influence future population trends.

It should at the outset be clear that, apart from public-health measures, the role of the doctor is limited by the doctor-patient relationship. With national policy the doctor has no direct concern. In treating infertility he is correcting a pathological disorder; the State cannot employ him as a recruiting sergeant in the world of the unborn. Except in those cases where future pregnancies would be dangerous,

his advice on contraception is given only because of his knowledge of the physiological processes involved and in order to meet the wishes of his patients.

In the nineteenth century there was a rapid increase in population accompanied by a steady rise in the standard of living. At the same time new social classes were delineated, based on great inequalities in the distribution of wealth. There was poverty in the midst of plenty. The creation of a large family was generally found to be inconsistent with the attainment of a high standard of living. In the early decades of this century, therefore, the time was ripe for the widespread adoption of the techniques of birth control. Indeed, after the First World War the falling birth-rate caused concern lest British stock should fail to replace itself; the differential fertility among the social classes gave rise also to the fear that there would be a reduction in quality as well as in quantity.

In our own day, the planning of the Welfare State has further focused attention on population problems. The new humanitarianism decrees that the world's resources should be shared alike by all nations, irrespective of race, colour, and degree of social development. Two world wars and a major economic depression have led to a widespread feeling of insecurity. There is a demand by all for the luxuries previously enjoyed by a few, and a strong feeling that the risks of life must be shared by all classes alike. These factors, together with the political uncertainties of the future, underline the importance of the study of population trends.

In the last two years four important reports dealing with this subject have appeared. In April 1948 l'Alliance Nationale contre la Dépopulation held a three-day conference for the study of the ageing of the population. The published report<sup>1</sup> shows that the subject was treated exhaustively from every angle. The dangers in France are particularly acute because of the serious fall in the birth-rate and because of the presence on her eastern frontier of a traditional enemy of far more prolific habits. These dangers she attempts to counter by substantial inducements to parents and by large-scale immigration.

The Family Planning Association of Great Britain has published a report<sup>1</sup> on an International Congress on Population and World Resources in Relation to the Family, held at Cheltenham, England, in August 1948. Its cosmopolitan character compelled it to recognize the international point of view—the equalization of standards of living both as a matter of equity and as a means of inducing the more prolific races of the East to lower their birth-rates. The meeting was much influenced by the grave warning given by Lord Boyd-Orr and others of the risk of a world food shortage. The avoidance of disaster would depend upon the outcome of a race between diminishing food supplies and restriction in numbers. At the same time, the conference expressed concern at the fall in the population of Western Europe.

In 1948 also appeared *Population policy in Great Britain*,<sup>1</sup> a volume published by the organization known as P E P (a voluntary group concerned with political and economic planning). Finally, in June 1949 there was released the long-awaited Report<sup>1</sup> of the Royal Commission on Population. It is with these last two publications that we are chiefly concerned; the remarkable similarity in their points of view is noteworthy.

### Phases of Demographic Evolution

According to *Population policy in Great Britain*, the changes in population which civilization brings can be divided into three phases: (i) a phase of high and uncontrolled birth-rate, and similarly high death-rate, resulting in a stationary population; (ii) a fall in the death-rate causing an increase in the population and (iii) a later check in expansion caused by a fall in the birth-rate, with the result that the population then tends to become stationary or even to decline.

This scheme oversimplifies the picture; the five phases described by C. P. Blacker (1947) give a truer conception. These phases are (i) that of a stationary population, with high birth-rate and high death-rate; (ii) an expansion of the population, due to high birth-rate and low death-rate; (iii) the phase in which both birth-rate and death-rate decline, the latter more rapidly than the former, so that the population continues to increase though more slowly; (iv) the phase in which birth-rate and death-rate are equally low, so that the population is stationary and (v) a phase, which may or may not occur, in which an excess of deaths over births leads to a fall in the population. Blacker's fourth phase may with advantage be subdivided into (a) a period in which both birth-rate and death-rate are declining equally so that a stationary population results and (b) a period in which both birth-rate and death-rate are permanently low. While (a) may be temporary and unstable, (b) may be permanent and stable. Great Britain is now in the later stage of (iii) and will shortly enter upon phase (iv, a).

### Accuracy of Population Projections

In delineating future population trends there are so many imponderables that there must be some margin for error. For such projections to be of value, this margin must be small. It is interesting to compare the projections of the total population as given by the Royal Commission with those contained in *Population policy in Great Britain*. Since the former deals with the whole of Great Britain and the latter with England and Wales only, we must express the changes as percentages of the starting-points, making the reasonable assumption that the inclusion or exclusion of Scotland has no significant effect. The only difference, and that a minor one, between the assumptions on which these two projections are based, is that the Commission assumes a constant family-size as among couples married between 1927 and 1938, while the P E P projection adopts the 1938–1939 level. Table I shows that there is wide disagreement between the two projections.

When the figures of the Royal Commission are compared with those of Lord Beveridge's report on social insurance and allied services, published only seven years previously, the disagreement is just as marked. The Royal Commission gives three sets of figures based upon three different assumptions: assumption A, family-size at the same level as among couples married between 1927 and 1938; assumption B, family-size at a level 6% higher than A; assumption C, a fall of 20% in family-size on A (see Table II). The Beveridge Report figures for 1971 are compared with the Commission's figures for 1977 based on these assumptions.

<sup>1</sup> For particulars, see pages 274 & 275.

**TABLE I. A COMPARISON OF POPULATION PROJECTIONS**

Report of Royal Commission Projections assuming family-size constant at same level as among couples married 1927-1938 and with a continuance of declining mortality trends of recent years				PEP (Political and Economic Planning) Report Projection assuming fertility constant at 1938-1939 level, with mortality falling			
Year	Total population of Great Britain (millions)	Change from 1947		Year	Total population of England and Wales (millions)	Change from 1944	
		Millions	%			Millions	%
1947	48.2			1944	42.4		
1977	50.7	+2.5	+5.2	1974	41.1	-1.3	-3.1
2007	48.9	+0.7	+1.4	2004	35.2	-7.3	-17.2
2047	45.5	-2.7	-5.6	2044	28.0	-14.4	-33.9

The fact emerges that there is more difference between the projection of the Beveridge Report and those of the Commission than there is between the various projections made by the Commission based on widely varying assumptions. Both of these projections, however, are founded on the statistics of the Registrar-General. If the disparity is due to improvements in the methods of projection made in the past seven years, one wonders whether further improvements will result in further differences. And yet on such projections hang momentous consequences, e.g., the actuarial calculations of the National Health Service Act and the National Insurance

Act, 1946, and the population policy advocated by the Commission. Allowing for the differences in assumptions, these discrepancies rudely shake one's faith in the soundness of such calculations and the policies based on them. Recent experience would indicate that there is, in fact, no satisfactory way of selecting the group of assumptions most likely to prevail in the future.

#### Proposals of the Royal Commission

The Commission recommends a policy which would increase the total population by 1.8 millions in 1977, by 3.4 millions in 2007 and by 7.2 millions in 2047. This increase would be achieved by encouraging an increase in family-size from the present 2.2 children per family to the figure of 2.6. The means advised fall into two groups of measures: financial inducements to parents and the better conservation of life from the moment of conception. An annual expenditure of £37.5 millions more in increased children's allowances is advocated, together with a substantial reduction in income tax for parents in the higher income group.

These proposals raise many questions. If the Commission is right in believing that economic considerations are now the chief deterrents to large families, the proposals, in effect, remove or reduce the automatic check to a large population increase, namely, the demand for a higher standard of living. What guarantee have we that the removal of the deterrents will not result in the large increase in the population which the Commission emphatically and rightly considers undesirable? The special treatment of the higher income groups is unassailable on grounds of equity and justice, but the Commission gives no estimate of the cost nor does it tell us from what source the money is to be derived. This proposal will no doubt be strenuously resisted by that large body of opinion which believes that in the lower income groups there is a wealth of ability now lost to the community through financial stringency. One needs more information about the extent to which the upper income groups are continuously replenished from the lower.

The optimum population of this country is influenced by three factors: the world food-supplies, the balance of payments from foreign trade, and the cost of maintaining the population in the standard of living and state of health which it demands. If there is to be a food shortage of the magnitude predicted by many authorities, two or three million people more or less will make little difference. The Commission admits that there are many uncertainties in the future of foreign trade, but considers that a stable balance of payments at a slightly higher figure than the present is likely to obtain. This is a matter upon which only economists are competent to express opinions. But in the matter of the cost of maintaining the population in health, it seems that the Commission has not fully realized the significance of present trends, nor has it realized the aggravation of these trends which would without doubt ensue from its recommendations.

To consider first the ageing process of the population: by 1977 old age pensioners will have increased to 9.6 millions, or nearly 19% of the total population. In 1978 the cost of pensions alone will reach the figure of £501 millions. This must be borne entirely by the Exchequer, that is to say, by the working section of the population, whose numbers will meanwhile have undergone a considerable diminution. This

**TABLE II. PROJECTED POPULATION OF GREAT BRITAIN BY AGE GROUPS**

The projection in the Beveridge Report (1942) is compared with the three projections given in the Report of the Royal Commission. The estimates from the Beveridge Report are based on the assumptions as to fertility and mortality given in the White Paper on "Current Trends of Population in Great Britain". The Commission places women aged 60-64 in the workers' group, and estimates that the number of these will remain almost constant at 1.4 millions. An adjustment has therefore been made to make the two sets of figures comparable.

Age groups	Beveridge Report	Royal Commission		
	Year 1971 (millions)	Year 1977 (millions)		
		Assumption A	Assumption B	Assumption C
0-15	7.6	9.8	10.5	8.1
Men 15-64 Women 15-59	28.8	31.3	31.8	30.8
Men over 64 Women over 59	9.6	9.6	9.5	9.7
Total Population	46.0	50.7	51.8	48.6

sum is probably an underestimate; as the Commission admits, the number of pensioners will probably be much larger, owing to the advance of medical science. The Commission hopes that some relief of the financial burden will accrue from the improved health of the elderly and from prolongation of their capacity for work, though the frustrating effect of such a situation upon the young is recognized. Present trends in medicine, however, indicate that any economy from the increased working capacity of the old will be more than counterbalanced by the increased cost of their medical care. Medical progress is likely to result in slowing down without curing the degenerative processes which are the inevitable accompaniments of old age.

Numerous proposals are made by the Commission for the preservation of young life. There must be more domestic helps, nurseries, nursery-schools, sitters-in, better laundry facilities, and holidays for mothers. There must be more adequate treatment of involuntary childlessness and research into its causes, instruction in contraception, improved health and maternal services, a larger number of midwives, convalescent and rest homes for mothers and more education in child health. Many of these are in course of being provided by the National Health Service.

Though the Commission does not expressly subscribe to the optimistic hopes of the results of an improved health service entertained by the writers of the P E P report, it appears to think that prolongation of life is achieved by the simple process of medication. The truth is very different. In previous communications (Roberts, 1948, 1949) I have given abundant reasons for believing that the cost of the Health Service will exceed even the highest of the growing estimates. These reasons are, in brief, that the cost of medical care increases with a rising standard of living and also with an ageing population; that an extension of the Health Service involves a high capital expenditure in buildings and equipment; and that its cost will be further increased by the competition, pride in craftsmanship, and the desire of the medical profession for perfection.

Our understanding of disease is becoming ever more complex. Our ability to treat patients and to maintain them in subnormal health advances far more rapidly than our ability to cure them and keep them at work. We attack the gap between the vulnerability of the normal cell and the vulnerability of the causative agent of disease only under the most careful pilotage of expensive and elaborate laboratory tests. Contrary to the popular belief, the inevitable effect of medical progress is to increase the cost of ill-health.

Even more formidable than the cost in money is the cost in man-power. The Commission, in common with other planners, neglects to add up all its individual requirements. It admits that many of its proposals are long-term policy, but we are not told what is meant by "long". In man-power the future is menacing in the extreme. The future relation between workers and dependants calculated from the Commission's figures is shown in Table III.

It can be seen that the number of dependants per 100 workers will rise considerably if present population trends continue. This position, of course, will be materially worsened should the emigration of young workers continue or increase. If the Commission's assumption B is implemented, the rise in the number of dependants will be aggravated by 3.4% in 1962 and by a further 3.3% in 1977. Not

TABLE III. PROPORTION OF DEPENDANTS TO WORKERS

This table is derived from the population projections of the Royal Commission and shows the combined number of people over 65 and children under 15 (dependants) per hundred people aged 15-64 (workers).

Year	Assumption A		Assumption B		Assumption C	
	Number of dependants per 100 workers	Increase on 1947 (%)	Number of dependants per 100 workers	Increase on 1947 (%)	Number of dependants per 100 workers	Increase on 1947 (%)
1947	47.0	—	47.0	—	47.0	—
1962	50.0	6.4	51.6	9.8	49.0	4.3
1977	54.4	15.9	56.0	19.2	50.9	8.3
2007	53.8	14.5	54.0	14.9	50.9	8.3
2047	56.9	21.6	56.8	20.8	57.4	21.3

until 2007 would there cease to be any difference between figures based on assumption A and figures based on assumption B. Until we know the effect of the medical and social plans now coming into operation, is it wise to aggravate the burden by financial inducements to greater procreation?

### Conclusions

We all desire long life as well as prosperity. Increased expectation of life is a component of a rise in the standard of living. The standard of living, then, includes medical care of all sorts. The provision of medical care is becoming increasingly expensive, and the time must come when its cost must conflict with the enjoyment of the amenities and luxuries of life—alcohol, tobacco, entertainment, and shorter working hours. Indeed, we shall be fortunate if it does not conflict with the provision of the bare necessities of life.

We may classify the factors involved into uncertainties, probabilities, and certainties. The future of world food-supplies, the balance of payments from foreign trade and the validity of official population projections are uncertainties. The probabilities are that food-supplies and balance of payments will deteriorate. The certainties are that in the next thirty years the shortage of man-power will be greatly aggravated, and that the cost of the health and social services will rise to such an extent that it will constitute a menace to our export trade upon which depends our standard of living. In view of all this, one is forced to the conclusion that, unless we are prepared to adopt a lower standard of living, a policy of increasing the population by financial inducements should not be undertaken.

## 1497 The National Health Service

Charles Hill & John Woodcock. London: Christopher Johnson, 1949. clx + 283 pages. 19 x 13 cm. 16s. [£0.8]

(i) Introduction. Hospital and specialist services. (ii) The general hospital plan; (iii) the administrative structure; (iv) terms and conditions of service for specialists; (v) private accommodation and fees: some other points. General medical services. (vi) General features; (vii) compensation; (viii) regulations; (ix) certification; (x) maternity services; (xi) remuneration; (xii) disciplinary procedure and investigation of complaints; (xiii) supplementary ophthalmic services. Other services. (xiv) General dental services; (xv) pharmaceutical services; (xvi) health services provided by local health authorities; (xvii) mental health services; (xviii) superannuation; (xix) transfer and compensation of officers. Addenda. (xx) The Amending Bill; (xxi) other matters. Appendices. Index.

As the State spreads its controls ever wider it becomes increasingly difficult for the individual citizen to appreciate how he or she is affected by new legislation. When in addition, as has been cogently pointed out more than once by the judiciary, some modern Acts of Parliament are so drafted that their exact meaning may be incomprehensible even to the trained legal mind, there is little encouragement for the average individual to try and find out precisely what are his rights and duties. In the case of the National Health Service Act, however, the issues involved are so vital to the individual that it is incumbent that, whether doctor or layman, he should be made conversant with exactly what is involved. In spite of the publicity the Service has received, little of an informative or explanatory nature has been published hitherto. Government pamphlets have either been so simplified as to be of little value or have dealt only with particular aspects of the Service.

It has been left to the versatile Secretary of the British Medical Association, in collaboration with a colleague, to provide the first authoritative and comprehensive explanation of the working of the Act. In clear, concise, non-technical language they have provided a running commentary on the Act which could scarcely be bettered. One of its great values is that it is not a mere paraphrase. Drawing upon his unrivalled experience acquired in the prolonged negotiations preceding the introduction of the Service, the senior author has not hesitated to stress when necessary what the Act does *not* say as well as what it does say, and to point out on occasions the full implications of certain sections of the Act. For instance, after noting that the Minister of Health cannot acquire, except by purchase or gift, any new hospital or nursing home that anyone may establish in the future, it is pointed out that he has the power to acquire by compulsion, if necessary, any land required by him for the purposes of the Act and, to quote the authors, "legally speaking—land includes any building on that land."

There will be few who will not learn something from a perusal of this book. How many people, to take two examples, are aware that the certificate of a private practitioner enables a private patient to draw his cash benefits under the National Insurance Act, and that an individual can "obtain his general practitioner service privately without losing the right to obtain his specialist service at the public expense"? It is in this precise interpretative manner that the whole Act is analyzed, and the book is completed by a valuable set of appendices, giving details concerning membership of regional hospital boards, travelling allowances, pay-bed accommodation, and so forth. In view of the delays in publication in this country, the book is amazingly up to date, and in this alone reflects credit both on the authors and the publishers. This is a book which can justifiably be called "invaluable" for all members of the medical profession and all laymen who are concerned with the working of the National Health Service. It can also be recommended to the ordinary citizen who wishes to have a reliable idea of how the Service works. In addition, it can be recommended without reservation to the foreign observer who wishes to cut through the maze of inexact information with which the Service has been noised abroad, and learn the anatomical details of the structure of the National Health Service. The book makes no attempt to deal with the functioning of the Act; it is, therefore, no criticism to say that for a study of function, as opposed to design, the observer will need to turn elsewhere. The answer to the age-long question, "Can these bones live?", will not be found here. This is a work which deals with facts—not with the future.

W. A. R. Thomson

## 1498 The National Health Service Act, 1946: Annotated Together with Various Orders and Regulations Made Thereunder

S. R. Speller. London: H. K. Lewis & Co. Ltd., 1948. xc + 497 pages. 22 x 14 cm. £2 2s. [£2.1]

The National Health Service Act, 1946: arrangement of sections. (i) Central administration; (ii) hospital and specialist services; (iii) health services provided by local health authorities; (iv) general medical and dental services, pharmaceutical services and supplementary ophthalmic services; (v) special provisions as to mental health services; (vi) general. Schedules. Statutory instruments. Index. Supplementary index.

This important book is primarily for the administrator of public services in Great Britain. It is an essential desk companion for any one whose work involves an exact knowledge of health services legislation.

The National Health Service Act, 1946, which came into force in July 1948, affects the majority of the country's medical and ancillary services and in many parts of these it makes fundamental changes. The Act did not prescribe the detail of these changes; it set out the principles to be followed and established the administrative machinery, leaving details to be laid down in Regulations to be made by the Minister of Health, usually after consultation with the interests involved. It was clear that the Regulations would be voluminous, and indeed, even before the Act came into force, they far exceeded the Act in bulk. Inevitably some Regulations are amended in important respects by later Regulations. It is difficult to keep abreast of this growing and changing legislation and those who must do so owe a debt of gratitude to Mr. Speller.

The first part of the book is a reprint of the Act with brief, lucid, and practical comments. The comments are printed immediately below the section or subsection to which they refer and are of various kinds, e.g., reference to other relevant sections of the Act and title of Statutory Rules and Orders and Statutory Instruments made under the section, legal implications of the sections, and lastly a reference to section 79 of the Act for all words defined in the Act. This oft repeated reminder is of great value, for many everyday words bear special meanings in the Act. Thus "hospital" has a much wider meaning than in general parlance. It includes, for example, tuberculosis clinics and venereal diseases clinics, even where these are separate and independent units. It is easy, in reading the legislation, to lose sight of the extended meaning, and the discreet note "For definition of 'hospital' see s. 79" and similar reminders are most useful. Similarly, the references to other relevant sections and to Regulations are great helps to accuracy in interpreting the law. They lead the reader directly to the information he requires without the need of lengthy searching through the legislation.

After the text of the Act follow the Statutory Rules and Orders and Statutory Instruments made under it. These are given separately in chronological order. Subsequent amendments, deletions and additions are marked by marginal notes giving reference to the latest Regulations. Regulations issued too late for inclusion in the book appear in chronological order in a supplementary index. This quotes full titles of Regulations and gives a brief summary of the subject-matter of each. A good general index covers all parts of the book except, of course, the supplementary index of Regulations.

The flow of Regulations continues and is likely to continue for some time to come, for the Health Services are still evolving. Hence "Speller" was, as the author points out in his preface, already to some extent out of date before publication. This inevitable shortcoming does not greatly detract from the book's value; it is no small advantage to have so wise a guide through almost five hundred pages of legislation.

D. B. Bradshaw

## 1499 Introduction to Public Health Law

John J. Clarke. London: Cleaver-Hume Press Ltd., 1949. 138 pages. 22 x 14 cm. 12s. 6d. [£0.625]

(i) Introduction; (ii) the administrative framework; (iii) the legal system and local authorities; (iv) the Public Health Act, 1936, and its local administration; (v) sewerage and sewage disposal; (vi) private sewers, drains and sanitary conveniences; (vii) provisions and by-laws with respect to buildings; (viii) removal of refuse and cleansing; (ix) nuisances and offensive trades; (x) provisions concerning water supply; (xi) the Water Act, 1945; (xii) prevention, notification and treatment of disease; (xiii) baths, washhouses, common lodging houses, canal boats, etc.; (xiv) the Food and Drugs Act, 1938; (xv) cognate powers and functions; (xvi) notification of births, maternity, child welfare;

(xvii) the National Health Service Act, 1946. Appendix: a century of public health legislation. Short bibliography. Index to statutes. Index to cases. General index.

Mr. J. J. Clarke has made many contributions to setting out clearly the law relating to social administration. This is a small book compared with such immense volumes as his well-known *Social administration, including the Poor Law*, but it has the same characteristic judicious choice of really important subject-matter and accuracy of fact and reference.

After a short historical introduction, essential always to the understanding of British institutions and customs, the administrative local bodies and their functions are described with the assistance of reference tables. There follows a chapter on the legal system and the way in which the judicial and administrative functions of statute law relating to public health and other social services are divided between the judicial authorities and the local councils. There is a particularly clear section on the liabilities of authorities and their members for their actions.

In 1936 the law on public health was codified and amended, and the Public Health Act of that year, although much amended by post-war legislation, still contains the main body of the public health law of England. In a series of chapters this Act is examined in detail, and commentaries on interpretations and legal decisions resulting from judicial interpretations in disputes are set out in each section. In this way the volume provides a useful introduction in method to the student who later may have occasion to consult one of the larger legal textbooks.

Other important acts, such as the Water Act, 1945, and the Food and Drugs Act, 1938, are treated in similar fashion. Finally, the National Health Service Act, 1946, is described, particularly in relation to the changes resulting in public health law and practice.

This book can be recommended strongly as an introduction to its subject or as a handbook for rapid reference which will often save much searching in more bulky volumes.

Alan Carruth Stevenson

## 1500 Modern Trends in Public Health

Edited by Arthur Massey. London: Butterworth & Co. Ltd., 1949. xi + 581 pages; 42 figures. 25 × 17 cm. £2 10s. [£2.5]

(i) The idea of a family health club; (ii) nutrition and the public health; (iii) social medicine as an academic discipline; (iv) recent laboratory contributions to epidemiology; (v) general practice and its contribution to preventive medicine; (vi) the future scope of infectious diseases hospitals and associated services; (vii) the combat with atmospheric pollution; (viii) public health nursing; (ix) chronic rheumatism as a public health problem; (x) occupational health and the universities; (xi) the contribution of dentistry to the public health; (xii) housing and the home—the new outlook; (xiii) school health service; (xiv) the mental health aspect of public health; (xv) health centres in their relation to social medicine and public health; (xvi) child health and the universities; (xvii) day nurse developments; (xviii) health centres; (xix) laboratory services. Index.

It is always a pleasure to see a new volume in the Modern Trends Series of Butterworth's medical publications and *Modern trends in public health* is a well-written, well-printed and well-produced addition. The names of the 23 contributors command respect and assure the reader of authoritative guidance in each chapter.

New ground is broken by K. E. Barlow in his discussion of the idea of a family health club. Barlow has been a most prominent follower of Scott Williamson of the Peckham Pioneer Health Centre, of which he is now the deputy director. Fraser Brockington follows with an exceedingly well-informed survey of nutrition and the public health; this section is the fruit of special study. F. A. E. Crew brings new light on the idea of social medicine; a fine historical undercurrent runs throughout the chapter. R. Cruickshank gives a clear picture (as can be expected from his pen) of the subject of epidemiology. This section not only makes good reading but is a mine of practical help.

In a well-written chapter dealing with general practice and preventive medicine there is evidence of the new outlook of the general practitioner on public health. More formal subjects such as atmospheric pollution, infectious diseases hospitals, and public health nursing, are adequately dealt with. The sections "Housing and the home" (J. M. Mackintosh), "School health service" (A. A. E. Newth), "Health centres in their relation to social medicine and public health" (R. H. Parry), "Health education" (R. Sutherland), "Health control at the ports" (H. C. M. Williams), "The new organization of public health laboratory services" (G. S.

Wilson), "Day nurseries" (H. Paul), all bear the stamp of first-hand and first-class knowledge.

This is a fine book and represents British public health practice at its best.

J. Burn

## 1501 Measurements of the Public Health. Essays on Social Medicine

F. A. E. Crew. Edinburgh: Oliver & Boyd, 1948. xix + 243 pages; 57 figures. 22 × 14 cm. 18s. [£0.9]

(i) Population; (ii) birth and fertility-rates; (iii) illegitimacy; (iv) multiple births; (v) the sex-ratio; (vi) marriage; (vii) the biology of death; (viii) stillbirth, infant mortality and maternal mortality. Definitions. Index.

Since the days of Graunt the interpretation of vital statistics has been to many people a fascinating study and has led to the discovery of strange and romantic facts that have had an important bearing upon the welfare of mankind.

Professor Crew has made splendid use of the material copiously provided by the Registrar-General for Scotland in producing a work which will be of value not only as a textbook but as a stimulus to anyone interested in the deductions which may be drawn from the trends and constitution of the population. He mentions the strange paradox that "War loosens the structure of society, weakens conventions and lowers standards. At the same time war and its inevitable concomitants focus enlightened public opinion upon problems of vast social importance and create a widespread demand for their solution." Certainly a realization of the significance of and the responsibility for an ageing population in the modern world has come as almost a shock to a post-war people and has led to the starting of many schemes for the welfare of the aged as well as to the appearance of a certain apprehension at the continuation of compulsory retirement at what is now coming to be regarded as a comparatively early age. A declining birth-rate and an increase in the school-leaving age may well mean that the maintenance and care of both young and old will throw an insupportable burden upon the working section of the population. The increasing interest in social medicine is, moreover, a sign of a healthy re-orientation of medicine away from the laboratory—whose failure to solve, or even to appreciate, some of the wider problems with which man is faced was beginning to be obvious—back to the study of the patient as an individual and of his surroundings. No matter how great a knowledge of bacteriological technique is available to Mrs. Jones and her advisers, it will but little avail her if her home remains insanitary and her water supply polluted by her neighbours' sewage. Many of the more important and essential facts of environmental hygiene have been accepted, and even if some of them are from time to time in danger of being forgotten in a welter of jargon, yet they are established and recognized. It is with the extension of environmental hygiene, under the austere and rather terrifying name of social medicine, that the modern worker is interested, and of which Professor Crew gives so fascinating an introduction.

Scotland, with a total population of just over 5,000,000, forms a convenient unit for a demographic survey, and many significant facts emerge. For example, it is of considerable importance to know that in 1945 the birth-rate was 16.86 per 1,000 of the population, the lowest ever recorded, but that this, being paralleled by a death-rate of 13.20, allowed for an over-all increase of population, although at the expense of the lower age-groups. From a detailed consideration of the birth-rate of other countries, it is clear that in Europe there is a general decline compared with India, China and the USSR, and that the fall in the European rate has been contemporaneous with the increasing industrial development of the Continent. It seems likely that such an association will continue to exist and will, in time, affect those countries that have not hitherto shared in the doubtful advantages of industrial progress.

Professor Crew's sensible pages on marriage and on death should be widely read, for they are the fruit of considerable thought and of a mature wisdom. His remark that "To the social biologist marriage possesses a special interest for the reason that its frequency and durability constitute delicate and fairly accurate measures of the healthiness or otherwise of the community" should give food for thought to those who tend to decry the value of marriage as a social institution. While discussing marriage Professor Crew manages to find strange facts among various national figures, and it comes as a surprise to read of the low marriage rate in the Catholic countries of Spain, Portugal and Eire, while the figures for the slow

and steady increase of non-ecclesiastical marriages in Scotland, from 11.85 per cent in 1940 to 14.1 per cent in 1945, fit in well with the progressive emptying of the churches in that country. But whether the deduction that the influence of the Church is stronger in the country than in the town, because there is a higher percentage of ecclesiastical marriages in the country than in the town, can be maintained is more doubtful—the absence of convenient register offices in country districts may have something to do with it.

It is difficult to decide when to stop quoting from Professor Crew's luminous deductions. In the increasing proportion of widowers who remarry he sees an indication of housekeeping difficulties and of the lack of domestic help. He pertinently remarks, also, that although we know that heart disease is the commonest cause of death the student of social medicine wants to find out what was the cause of the disease of the heart. The knowledge that the steady increase in the total number of deaths from cancer, without a corresponding rise in the standardized death-rate, is to be expected among a population with an ever-increasing number of people reaching the "cancer age", and does not necessarily mean an increase in the causes of cancer, is a comforting reflection, though not conducive to idle complacency.

Professor Crew has produced a valuable introduction to the statistical method which will be of use both to the uninitiated student and to those who have already experienced the delight and fascination of the study of figures. He guides well and surely. With gentle wit and irony he points out the many pitfalls and fallacies that beset the path of anyone searching for the truth of figures.

Amulree

## 1502 Text-Book of Public Health

W. M. Frazer & C. O. Stallybrass. Twelfth edition. Edinburgh: E. & S. Livingstone Ltd., 1948. ix + 571 pages; 78 illustrations. 22 x 15 cm. £1 10s. [£1.5]

(i) Introduction: public health administration; (ii) meteorology; (iii) lighting, ventilation, and warming; (iv) atmospheric pollution and smoke abatement; (v) water; (vi) drainage; (vii) sewerage and sewage disposal; disposal of refuse; (viii) housing and town planning; disinfection; (ix) occupational hygiene; (x) port health administration; (xi) nutrition: food inspection; (xii) vital statistics; (xiii) epidemiology; (xiv) infective diseases: disinfection; (xv) venereal diseases; (xvi) tuberculosis; (xvii) maternity and child welfare; (xviii) the School Medical Service; (xix) genetics; (xx) mental hygiene; (xxi) the welfare of the blind; (xxii) hospital administration; (xxiii) the social services. Appendix. Index.

The new edition of this old friend is a disappointment. It is clear that a textbook on public health published in 1948 would be outdated on publication by much important new legislation, but more should have been done to bring it up to date. Although the National Health Service Act did not become operative until 1948, it became law in 1946 and there was, therefore, time for revision in the light of its provisions. The Act is referred to in Chapter I, "Public health administration", and again in Chapter XXII, "Hospital administration", but its importance is not made clear. We might reasonably have expected many parts of the book to have been rewritten in conformity with the new Act, but this has not been done. The occasional footnote reference to the National Health Service Act is not enough. To quote just three examples, important parts of the sections dealing with hospitals, venereal disease services, and tuberculosis services are misleading as they stand.

The authors say that they have found "... no need to alter, in any material way, the more purely scientific parts of the book." With this opinion we disagree. The technical side of the book is in many respects in need of revision. Brief notes on air bacteriology and air disinfection are to be found in different chapters. These need to be brought together and considerably expanded. Be it admitted that this field is very imperfectly explored and that findings are still somewhat tentative; there is nevertheless a useful body of information upon these topics which should find mention. It is not unlikely that the next important advance in disease prevention will be made in this field and its importance should be made clear. It is surprising to find no reference in the section on smoke pollution to the estimation of sulphur dioxide in air. This is now a routine investigation and yields results of value. The section dealing with food control contains no reference to ice-cream. This is a serious omission. Ice-cream is now an important article of diet and local authorities are required to supervise manufacture and distribution. The section on food poisoning needs revision. "Outbreaks due to *staphylococci* are not infrequent" is the only information given on the important role of the staphy-

lococcus in this condition. This is not an adequate summary of present knowledge.

The tables illustrating the chapter, "Vital statistics", would be much more interesting if brought up to date, as they could be without difficulty. A table giving no information later than 1942 (Table xxii, p. 275) can scarcely be accepted as representative of "the last 40 years." The same criticism applies to some of the material in the section on maternity and child welfare. The paragraph dealing with neonatal mortality is so out of date as to mislead. It implies that England has not yet brought the rate down to 30 per 1,000 births. In fact the rate has been below 30 ever since 1937, falling progressively to 24.46 in 1946.

It would not be difficult to add to these points of criticism, but enough has been said to make it clear that the next edition of this book must undergo extensive revision if it is to regain the place of honour it has held in the past.

## 1503 Public Health Administration in the United States

Wilson G. Smillie. Third edition. New York: The Macmillan Co., 1947. xx + 637 pages; 43 figures. 24 x 16 cm. £1 12s. 6d. [£1.625]

Part I. (i) Functions of a health organization; (ii) development of public health administration in the United States. Part II. Administrative control of communicable diseases. (iii) Administrative principles of communicable disease control; (iv) administrative methods in control of diphtheria; (v) administrative control of streptococcal infection—respiratory; (vi) other communicable diseases of childhood; (vii) administrative control of typhoid fever and allied diseases; (viii) administrative methods in control of tuberculosis; (ix) venereal disease control; (x) acute respiratory infections; (xi) administrative control of smallpox; (xii) malaria; (xiii) rabies; (xiv) poliomyelitis; (xv) meningococcus meningitis; (xvi) intestinal parasites; (xvii) a miscellaneous group of diseases of public health importance. Part III. Basic activities of a health organization. (xviii) Vital statistics; (xix) epidemiology; (xx) the public health laboratory; (xxi) public health nursing; (xxii) sanitation and sanitary inspection; (xxiii) child hygiene; (xxiv) public health education; (xxv) mental hygiene; (xxvi) industrial hygiene; (xxvii) nutrition; (xxviii) adult hygiene. Part IV. Organization of public health programs. (xxix) Municipal health administration; (xxx) rural health administration; (xxxi) state health administration; (xxxii) health administration in the Federal Government; (xxxiii) voluntary health organizations; (xxxiv) disaster relief. The Red Cross; (xxxv) the practicing physician and the public health department; (xxxvi) training of public health personnel; (xxxvii) budgets and budget making; (xxxviii) the national health program. Appendix. Index.

This comprehensive book is partly a textbook for the practising public-health officer, partly a general survey of current public-health practice in the USA and partly a critical and forward-looking work which frankly acknowledges faults and urges progress. Anyone, whether doctor or layman, who is curious about American public-health practice will find the information for which he is looking, but it is no reflection on the author to say that the British health officer who reads the book will learn rather by negative than by positive information, for the over-all picture is one of abounding ambition tempered by certain features of social structure which seriously impede what Britain has learnt to call public-health progress.

Dr. Smillie, for instance, is presumably reflecting current American practice and opinion when he regards the activities of the infant welfare clinic, as it is known in Britain, as not really the function of the health department. The health department's job is considered almost entirely educative and even the type of general activity which he calls the "well child clinic" is to him a matter for the general practitioner; the health department should provide only for those who cannot afford a "family doctor". He is content with a total of three full medical examinations during the child's school life and suggests that more frequent inspections are unnecessary, in interesting contrast to the British aim of increasing the frequency of inspection. It would certainly seem from what he says that the USA draws too strict and arbitrary a line between the preventive and the curative. The British idea, that the "normal" is a field with wide limits and that the care of the child in the shadowy zone between the normal and the obviously ill, as well as the positive building of the fair or good into the better, is a medical specialty in its own right, is apparently not yet accepted in America.

Though a public health medical service is not acceptable to the USA, a nursing service rouses less objection. Dr. Smillie is able to think in terms of one nurse to every 5,000 of the population for duties comparable to those of the British health visitor, or one to every 2,000 if the duties include also what Britain calls "district nursing". He thinks in terms of a health education service far

more highly developed than the British one, and of educators far more ambitiously trained. Appendices to the book, in fact, dealing with the training of all public-health staffs, suggest standards higher than any country at present demands.

The peculiar local government structure of the USA has had its own limiting effect on public-health legislation and sanitary practice, but here and there an attractive virtue has grown from a necessity. More than would many English writers, Dr. Smillie sees the value and stresses the need of understanding co-operation between the health department and the general practitioner. He is impressed by the advisory committees of people active in the social life of the community, which are a common feature of health work in the smaller areas. He sees important virtues in the small, intimate, "county" health unit for the rural and semi-rural area. In fact, the fullness and candour of this account of one country's efforts to deal with public health make the book one which can be useful to public-health officers anywhere at the present time.

J. D. Kershaw

### 1504 Forensic Medicine: a Textbook for Students and Practitioners

Sydney Smith & Frederick Smith Fiddes. Ninth edition. London: J. & A. Churchill Ltd., 1949. xii + 659 pages; 173 figures. 22 x 14 cm. £1 10s. [£1.5]

(i) Legal procedure in England, Scotland and Ireland; (ii) the signs of death and subsequent phenomena; (iii) sudden death from natural causes. Presumption of death and survivorship; (iv) post-mortem examination of the body. Exhumations, Embalming, Cremation; (v) identification; (vi) wounds; (vii) injuries in various parts of the body; (viii) self-inflicted wounds and fabrications; (ix) wounds from firearms; (x) differential diagnosis in states of insensibility; (xi) examination of blood stains; (xii) injuries from burns and scalds. Corrosive fluids. Spontaneous combustion. Injuries from electric current. From heat. Cold. Starvation and neglect; (xiv) asphyxia from breathing irrespirable air; (xv) rape and indecent offences; (xvi) forms of pregnancy. Birth in its civil and medical aspects; (xvii) infanticide; (xviii) abortion. Responsibility. Lunacy certification; (xxii) toxicology; (xxiii) corrosive poisons; (xxiv) metallic poisons; (xxv) common hypnotics, antipyretics and anaesthetics; (xxvi) vegetable poisons; (xxvii) miscellaneous poisons; (xxviii) food poisoning. Cadaveric alkaloids. Appendix I: systematic analysis of the viscera for poisons. Appendix II: preservation of specimens. Appendix III: weights and measurements of organs. Composition of normal blood and normal urine. Appendix IV: forensic medicine in the East. Index.

This well-established standard work on legal medicine and toxicology has achieved for the Edinburgh School—and for Sydney Smith in particular—a world-wide repute. This 9th edition has received considerable revision in textual matter, notably in the section on blood-grouping, and contains many references to significant contributions to the subject in the last five years—Holbourn's work on head injury, Szent-Györgyi's contribution to

the study of muscle contraction, Shapiro's observations on foetal lung microscopy, Peters' and his collaborators' on BAL therapy and the like. It is a remarkable book, varying little from section to section in the authority and vision of its text, though covering the whole field—even including an appendix on analytical methods. A joint authorship has the advantage of relieving the original author of much routine reading whilst retaining the flavour of his writing and his sage evaluation of contemporary work: Fiddes has an important task and, on his first showing, has discharged it with no small success. The book needs no new recommendation to its vast public.

Keith Simpson

### 1505 Social Biology and Welfare

Sybil Neville-Rolfe. Chapter VIII contributed by A. E. W. McLachlan, together with a Handbook-Appendix on Social Problems, edited by Ethel Grant. London: George Allen & Unwin Ltd., 1949. 416 pages. 22 x 14 cm. £1 1s. [£1.05]

(i) Social biology; (ii) values; (iii) the individual; (iv) age cycle and behaviour pattern; (v) sex behaviour; (vi) family relationships; (vii) prostitution; (viii) venereal diseases; (ix) health and behaviour; (x) social work in the Colonial Empire; (xi) current problems of social hygiene. Handbook appendix on social problems. Index.

The attitude of society towards prostitution, venereal disease, illegitimacy and similar problems has profoundly changed in the past three or four decades; these problems are now dealt with in a more realistic way, and with, one feels, considerably more success in minimizing and repairing the harm done to the persons involved. Few have done more to bring about this change than Sybil Neville-Rolfe, who has been actively engaged in the study of these questions since before the First World War. Through her work on the British Social Hygiene Council, the National Council for the Unmarried Mother and her Child, and the Eugenics Society, she has played an important part in changing public opinion and in bringing about practical schemes to deal with these problems. Her work has extended beyond Britain into colonial and international spheres.

This volume presents an immense mass of data and information about conditions and developments throughout the world. There is an interesting autobiographical note about the author. Unfortunately, the book is not well organized; there is a lack of continuity and it is difficult to find any given topic without prolonged search. It is not an easy book to read because of the frequent change of subject, and it is not free from factual error, as on page 262 where Montreal and Quebec are referred to as French-Canadian provinces. Non-medical readers should find of value the chapter on venereal diseases. The book should be of interest to social workers and others whose professional life brings them into contact with these problems.

D. F.

## MEDICAL SCIENCES AND RESEARCH

1506

### CHEMISTRY OF PENICILLIN

JAMES WALKER Ph.D. D.Phil. D.Sc.

National Institute for Medical Research, Mill Hill, London

When crude preparations of penicillin became available at Oxford, the chemical study of this powerful chemotherapeutic agent began long before it had been isolated as a homogeneous substance, the risk being accepted that substances identifiable as the result of degradative changes might originate from impurities rather than from penicillin itself. Preliminary work in Sir Howard Florey's laboratory showed penicillin to be an

acid, and a barium salt was prepared in 1941 by Dr. E. B. Chain, the process being improved later in collaboration with Dr. E. P. Abraham. Abraham and Chain were then joined in the chemical work by Sir Robert Robinson and Dr. Wilson Baker, conveniently located in the nearby Dyson Perrins Laboratory, and a provisional, but incorrect, molecular formula for the barium salt was soon suggested. Hydrolysis was also shown to yield carbon dioxide, a volatile acid, and the crystalline salt of a base. Interest in penicillin increased and the study of its chemistry was taken up in other laboratories. At the Imperial College of Science a concentrate was shown to give, on degradation, what was taken to be an amino-acid, while, in the United States of America, a crude ammonium salt was isolated. These observations comprised the whole of the information disclosed up to the end of 1942.

Early in 1943 a report from the Wellcome Laboratories in Great Britain described the conversion of penicillin by acid into a crystalline substance called penicillic acid, and American workers prepared esters of penicillin, which were more stable than salts, by the action of diazoalkanes. By this time the great therapeutic value of penicillin had become apparent and its potential military importance for the quick return of casualties to active service was fully appreciated. The publication of chemical information was then suspended entirely although reports on the chemotherapeutic applications of penicillin continued to appear from time to time. That information on the medical aspects was relatively unrestricted was doubtless sound psychology as well as a requirement of medical ethics, for it helped to build up the public consciousness of the powerful tool which was in the possession of the Allies but not available to the enemy.

### Anglo-American Collaboration

Unremitting work on the chemistry of penicillin went on and, in Great Britain, the Therapeutic Research Corporation became interested in the production and chemistry of penicillin. The progress reports rendered to the Penicillin Subcommittee of its Research Panel were known as the "PEN" reports, and the chemical information contained in them was privately communicated to recognized workers in the field. When the Ministry of Supply formed a General Penicillin Committee in October 1942 other interested groups were included, notably Imperial Chemical (Pharmaceuticals) Ltd., and an unofficial Conference of Chemists continued the handling of information on the chemistry and structure of penicillin. In the meantime, following the visit to the USA of Sir Howard Florey and Dr. N. G. Heatley in 1941, certain American pharmaceutical houses had become interested in the production of penicillin, and the information secured by these firms was communicated to the Committee on Medical Research of the Office of Scientific Research and Development and transmitted by it, via the Medical Research Council, to the Therapeutic Research Corporation, Imperial Chemical (Pharmaceuticals), and the various academic groups in Britain. In the autumn of 1943, when many of the structural features of the penicillin molecule had emerged and large-scale production had not yet been satisfactorily achieved, the problem of possible synthesis became a pressing one, and the Medical Research Council set up a Committee for Penicillin Synthesis "to initiate, coordinate and make investigations on the synthesis of penicillin and analogues"; the confidential reports which were issued and exchanged were known as the "CPS" reports. At the same time, the Committee on Medical Research, having undertaken the co-ordination of chemical work on penicillin in the USA, agreed to exchange with the Medical Research Council information on anything having a bearing on the problem of the synthesis of penicillin, and a group of industrial and academic research organizations collaborated in these studies under contract with the Office of Scientific Research and Development. Throughout the collaboration copies of all reports were filed with the American and British co-ordinating bodies for distribution to the various participants in both countries. When these confidential reports were written :

it was never intended that they should be made available in their original form to a wider circle of readers. They were essentially interim reports, jottings from laboratory note-books, hastily

produced and circulated so that all engaged in the urgent co-operative effort could take immediate advantage of any recorded gain in knowledge.

As time went on, the success of the deep-culture method for the production of penicillin made the economics of any practical synthesis extremely exacting, and, in fact, a synthesis, intended either as a means of production or of providing unequivocal proof of structure, still remains to be accomplished. With the end of hostilities, the need for secrecy disappeared and it was decided that the findings, embodied in the long series of confidential reports, should be published in the form of a monograph for obvious reasons. As dissolution of the Office of Scientific Research and Development was imminent, the production of the monograph was sponsored by the National Academy of Sciences. The distribution of the subject-matter into monograph chapters according to organic chemical classification and physico-chemical techniques was determined, and authors for these chapters were selected in 1946. As we learn from the preface :

These selections were made on the basis of special familiarity with the field and it was agreed that authors should regard themselves as impartial reporters of pertinent information, irrespective of source.

Let it be said at once that the authors have faithfully kept to their terms of reference because, although the historical development is there for anyone to read, the book is astonishingly free from sordid considerations of priority; in fact, this book and the work which it describes are a lasting monument to what can be achieved in the field of international collaboration when the guiding impulses are fundamental scientific matters, untainted by thoughts of commercial gain or political advantage. In December 1945 a brief account of the principal findings was published simultaneously in *Science* and in *Nature* with the consent of all the participants. The chemical work is now described in full for the first time in this monograph<sup>1</sup>, and it must be emphasized that it will be published in no other form. It is essential therefore that the abstracting organizations should be aware of this fact, and that the volume should be abstracted with the same thoroughness as is accorded to journal publications. The book is not merely the province of penicillin specialists for it contains much of lasting value to chemists with interests far removed from penicillin, and it should be found, side by side with contemporary volumes of the *Journal of the Chemical Society* and the *Journal of the American Chemical Society*, in every chemical library with any pretensions to completeness of coverage.

### Early Stages in Development

The first chapter summarizes the history of the chemical study of penicillin and draws attention to the essential developments, which, with much else besides, are treated in greater detail throughout the rest of the book. One of the first complications overcome was the fact that the Oxford, the Imperial College, and the American investigators were examining no less than three different compounds, and instead of there being a single unique substance called penicillin a group of closely related compounds existed. In view of the distinguishing groups which these three penicillins contain they were later designated 2-pentenylpenicillin, which was the form encountered at Oxford, *n*-amylpenicillin, the form studied at the Imperial College, and benzylpenicillin, the form

<sup>1</sup> For particulars, see p. 275.

examined by the American workers. The next three chapters (ii-iv) report upon the impressive progress made in the study of these three substances up to the end of 1943. By October of that year the Oxford workers were in a position to suggest the thiazolidine-oxazolone formula (I),  $R = C_5H_9$ , as the simplest expression for their form of penicillin. A similar formula (I),  $R = C_6H_5CH_2$ , was proposed independently by the Merck, Squibb, and Abbott groups for benzylpenicillin, but the lack of basic properties in penicillin led both the Oxford and Merck groups to propose as a possible alternative the  $\beta$ -lactam structure (II). Both formulae accounted satisfactorily for the products of degradation, and although some of the shortcomings of the thiazolidine-oxazolone formula were realized from the outset it nevertheless dominated the subsequent synthetic programme.

At first glance chapter v seems to be out of place and to interrupt the continuity of the story but it is difficult to see where else it could have been placed since the isolation and characterization of the different "natural" penicillins belong to the early stages of the penicillin saga. The demonstration by the Northern Regional Research Laboratory group that the addition of phenylacetic acid raised the penicillin titre when added to lactose corn steep liquor, and the acute observation by the Imperial Chemical (Pharmaceuticals) group, that the British strain of *Penicillium notatum* yielded 2-pentenylpenicillin when grown in surface culture on synthetic media and benzylpenicillin under the same conditions on a lactose corn steep liquor medium, threw a much-needed flood of light on the apparent vagaries of the mould, and paved the way for the elegant studies on the biosynthesis of penicillins carried out in the Lilly Research Laboratories, and described in chapter xix.

#### Transformation and Degradation Products

Chapters vi, vii, and viii reveal the continuing progress made in the study of transformation products of penicillin and of its degradation products. In chapter ix there is described the felicitous desulphurization of benzylpenicillin by the Merck group using Raney nickel, which afforded the first, and still the most direct, chemical evidence for the  $\beta$ -lactam structure. The products of desulphurization were desthio-benzylpenicillin, in which the  $\beta$ -lactam ring has now acquired a degree of stability considerably greater than it had in penicillin, and phenylacetyl-L-alanyl-D-valine; what could have been of more engaging textbook simplicity? Further evidence for the  $\beta$ -lactam structure is given in chapter x.

"The subtlety of the constitutional problem presented by the penicillin molecule led to the use in the attack on the problem of almost every known applicable physical method," and

the succeeding four chapters (xi-xiv) give admirable accounts of the x-ray-crystallographic investigations, infra-red spectroscopic studies, electrometric titration data, and ultra-violet absorption of penicillin. Of these methods, it fell to the x-ray technique to provide the data which ensured final acceptance of the  $\beta$ -lactam formulation of penicillin. Chapter xv is an entertaining chapter which starts by recapitulating the degradation reactions of the penicillins, passes on to consider theoretical aspects of their reactions, and closes with a spirited attack by Sir Robert Robinson on the "plain"  $\beta$ -lactam structure (II), which he considers not to indicate adequately the reactivity of penicillin, and arguments in favour of an alternative expression (III), a "formula" about which the x-ray crystallographers are critical (p. 351).

The next three chapters (xvi, xvii, and xviii) describe various aspects of degradation products of the penicillins. Although now known to represent a structure of inordinate instability with respect to both rings (chapter xxiv), the thiazolidine-oxazolone formula (I), as mentioned above, dominated the synthetic programme, and this is amply evidenced by the fact that chapter xxi, describing the considerable advances made in the chemistry of oxazoles and oxazolones, is the longest in the book, while chapters xxii-xxiv and xxviii present various aspects of attempted syntheses of penicillins. Various groups studied the possibility of synthesizing structure (I) by the condensation of suitably substituted 4-alkoxymethylene-5-oxazolones with penicillamine ( $\beta\beta$ -dimethylcysteine) and observed traces of biological activity in their crude products. By persisting in the study of this reaction, du Vigneaud and his collaborators finally isolated traces of pure benzylpenicillin by using the effective, though tedious, Craig counter-current distribution technique. There are also chapters describing extensions in our knowledge of thiazolidines (xxv) and  $\beta$ -lactams (xxvi), the synthesis of ring homologues of penicillin (xxvii), and methods for the assay of penicillins (xxix). An appendix gives information as to the origin, date of issue, and date of receipt of the individual progress reports which formed the basis of the monograph. Although it must be admitted that the final chapter in the chemistry of penicillin has not yet been written, this book greatly enriches the literature of organic chemistry and will form for many years to come a source of inspiration not only for those who would accept Nature's challenge and essay the writing of the final chapter but for many others besides.

#### Conclusion

At the end of the volume there is a subject index which is offered somewhat apologetically in the introduction (p. 1069), but it is, on the whole, a workable index, if not a complete one. It would have been helpful if a formula index had also been given. The glossary of trivial names of penicillin derivatives is valuable and will be of great assistance to newcomers to the literature of penicillin, although it would have been helpful if formulae had been used as liberally here as

they are elsewhere in the volume. It is one of the functions of editorship to decide between alternative methods of nomenclature, notation, and enumeration, and several unfortunate results are noted as the outcome of the lack of firm editorial direction. For example, there are no entries in the index under "enumeration," "numbering," or "nomenclature," and the numbering given in the glossary on p. 1070 appears to be the only hint of direction in the matter. As a result, the x-ray crystallographers have adopted a system on p. 338 (fig. 17) and proceed to use it on subsequent pages, but it does not correspond with the system on p. 1070. Then again, the first half of chapter xiii records infra-red spectroscopic data in terms of wave-numbers, while observations, and sometimes the same ones, are recorded in terms of wavelengths in the second half of the same chapter. As wavelengths are used, almost without exception, in recording data on ultra-violet and visible light absorption, it is desirable to adopt that convention also for recording infra-red absorption, as it is more familiar to organic chemists. How many

organic chemists, the reviewer wonders, could say without hesitation if they had ever used light of 16,970 and 18,312  $\text{cm}^{-1}$  and, if so, for what purposes? As far as technical editing is concerned, the handling qualities of the book would have been enhanced if at the tops of left-hand pages there had been given the numbers of the chapters and their titles as running headlines, with sectional headings at the tops of right-hand pages. The plates depicting the historic "motley assortment of dairy, garden, and domestic plumbing fittings" should be beside the text on p. 35 and not facing p. 22. There are a few tri- and penta-valent carbon atoms but generally a high standard of accuracy is maintained throughout the book.

The publishers deserve special praise for this beautiful example of modern book production, as both printing and binding are excellent examples of the respective crafts. The print in the theoretical sections is large and clear, and structural formulae, given with unusual liberality, are spaciouly laid out. A smaller size of type has been used to record experimental data but generous spacing ensures easy legibility.

### 1507 Principles of Biological Assay

C. W. Emmens. London: Chapman & Hall Ltd., 1948.  
xv + 206 pages. 22 x 14 cm. £1 1s. [£1.05]

(i) The application of mathematics to biological measurements; (ii) means, variances and degrees of freedom; (iii) comparisons between groups; (iv) dose-response lines; (v) further discussion of dose-response lines; (vi) restrictions in design; (vii) polynomial coefficients; (viii) covariance; (ix) predicting from dose-response lines and planning assays; (x) the estimation of relative potency; (xi) the estimation of relative potency with unbalanced dosage groups; (xii) a  $2 \times 4$ -point assay with restrictions in design; (xiii) further designs for assays; (xiv) discontinuous variation; (xv) calculations involving probits; (xvi) probit assays; (xvii) assays based on reaction times; (xviii) groups of tests; (xix) choosing and measuring the response; (xx) the response linearly related to the dose. Appendix: notation. Index.

The controlled experiment is essential for most scientific advances. More especially is this true in biology and as a result biological assay is now a recognized tool for the study of certain properties of living matter, and for the standardization of drugs. Since the end of the First World War biological standardization has acquired a new and added significance as a result of the advances in chemotherapy and pharmacology. Therapeutic substances such as the antitoxins and tuberculins, vitamins and endocrine preparations, arsenicals and antimonials used in chemotherapy, cardiac drugs and antibiotics, all require accurate standardization. These standards, it is emphasized by Sir Percival Hartley in his foreword, were worked out on a firmly established international basis by the Permanent Commission on Biological Standardisation of the Health Organisation of the League of Nations. The establishment of these international standards has thus permitted statistical methods to be widely applied and fully exploited. This book very fully sets out the wide variety of biological reactions which have now been successfully exploited for the assay of therapeutic and other substances, together with the varying methods of treatment of the results of assay.

Those who carefully study this work will be fully informed on such subjects as the means of making comparisons between groups, dose-response lines, prediction from dose-response lines, discontinuous variations, probits and probit assays and how best to choose and measure the response. The importance of the provision of healthy stocks of animals is emphasized, for if intercurrent disease is present the basis of an assay may be obscured and even falsified. Adequate stocks of healthy, well-fed animals are as essential to the worker in biological assay as the balance, the microscope, and other instruments of precision are to workers in other scientific fields. Much of the work recorded in this admirable book owes its origin to the fact that the Department of Biological Standards at the National Institute for Medical Research at Hampstead was from its inception in the closest possible touch with professional statisticians. As a result it is no mere accident that a Continental writer has described Great Britain as "the home of modern biometry". An authoritative textbook from such a source is therefore of the greatest significance and value.

G. M. Findlay

### 1508 Etudes Chimiques sur la Tuberculose

Jean Paraf, Jean Desbordes, André Girard, S. Lewi, A. Abaza & Madeleine Paraf. Paris: L'Expansion Scientifique Française, 1948. 130 pages. 21 x 13 cm. 300 fr.

(i) Rôle des lipides et plus particulièrement des acides polysubstitués dans l'infection tuberculeuse; (ii) étude de l'équilibre enzymatique et vitaminique du tuberculeux; (iii) la chimiothérapie antituberculeuse—(progrès récents, promesses d'avenir); (iv) travaux récents sur la chimiothérapie antituberculeuse; (v) les antibiotiques (en particulier la streptomycine) dans le traitement de la tuberculose; (vi) étude de l'acide para-amino-salicylique dans le traitement de la tuberculose pulmonaire.

Ten years ago very little was known of the chemical composition of the tubercle bacillus and even less of the possibility of chemotherapeutic action on Koch's bacillus. Now, a very considerable knowledge exists of the protein, carbohydrate and lipid composition of this organism and much has been learnt of the role of fatty acids in determining the general symptoms of the disease such as fever and cachexia. After a brief introduction by Jean Paraf, he and Jean Desbordes give an account of the fatty acids of the tubercle bacillus and of the synthetic disubstituted fatty acids by means of which it has been possible to prove the role of these fatty acids in the genesis of the classical histological tubercular lesions. If the tubercular lesions are due to these acids it might be possible to destroy or transform them by means of enzymes or vitamins. This conception entails a study of vitamins in the tuberculous subject. Special consideration is given to the inhibition by nicotinic amide of the toxic effects of fatty acids obtained from the tubercle bacillus. Dr. A. Girard next describes the various types of chemotherapeutic compounds now available. These compounds include long-chain fatty acids, sulphones, *p*-amino-salicylic acid, 5-nitro-furaldehyde semi-carbazone, vitamin D<sub>2</sub>, and the antibiotics streptomycin, actinomycin, licheniform and certain products of *Pseudomonas aeruginosa*. More-detailed studies are given of the sulphones by Lewi, of streptomycin by Abaza, and of *p*-amino-salicylic acid by Madeleine Paraf. Each chapter contains a short list of references, some of which will be of considerable value to English readers since they refer to medical theses published in France. As in most French books there is no index, only a wholly inadequate "Table des Matières"; the paper is poor, and many of the chemical formulae are so smudged and in such small type that even with a magnifying glass it is not always possible to be certain what is represented by the general blur. Despite these minor criticisms a very large amount of useful information is compressed into this short book.

## 1509 Streptomycin und Tuberkulose

Edited by G. Fanconi & W. Löffler. Basle: Benno Schwabe & Co., 1948. 357 pages; 233 illustrations; 35 colour plates. 24 × 17 cm. 30 Sw. fr.

(i) Einleitung; (ii) allgemeines; (iii) hämatogene Streuung; (iv) Organ-tuberkulose; (v) pathologische Anatomie; (vi) Literaturverzeichnis.

This is probably the most important and comprehensive volume so far published on the action of streptomycin in human tuberculosis. It embodies the results obtained in Switzerland in the treatment of all forms of tuberculosis with streptomycin.

After a brief introduction by the editors there are four introductory papers. H. Fischer deals with the experimental basis for streptomycin treatment; A. O. Fleisch describes the influence of streptomycin and of *p*-amino-salicylic acid on cellular respiration; O. Bucher compares the toxic action of streptomycin, *p*-amino-salicylic acid and sulphone on cells in tissue culture, and S. Moeschlin and his colleagues discuss the comparative effects in experimental tuberculosis of streptomycin, sulphone, *p*-amino-salicylic acid and combinations of these compounds. There then follow two long sections, the first dealing with tuberculosis as a blood infection and the second with tuberculosis of special organs. The toxic effects of streptomycin on the eighth nerve and the allergic reactions seen in those who handle streptomycin are well described, together with experimental toxic results in guinea-pigs. In a final section the pathological anatomy of miliary tuberculosis and tuberculous meningitis after treatment with streptomycin is very fully described and attention is drawn to the occurrence of myelomalacia in tuberculous meningitis treated with streptomycin. A very full bibliography ends the book. Most of the chapters are in German but a few are written in French and all the most important have English summaries. This is a work which should be read and carefully studied by all those who are investigating the effects of streptomycin in tuberculosis.

## 1510 Studies in Air Hygiene

R. B. Bourdillon, O. M. Lidwell & J. E. Lovelock et al. London: His Majesty's Stationery Office, 1948. (Medical Research Council Special Report Series No. 262.) 356 pages; 104 figures; 33 plates. 24 × 15 cm. 7s. 6d. [£0.375]

(i) Methods of sampling air for bacteria; (ii) air disinfection by chemicals; (iii) air disinfection by ultraviolet radiation; (iv) air disinfection by heat; (v) air disinfection by recirculation through filters; (vi) masks; (vii) airborne bacteria observed in field trials; (viii) air hygiene in H.M. ships under wartime conditions; (ix) animal tests with infective aerosols; (x) general conclusions. Appendices. References.

The control of air-borne infection is one of the major problems of preventive medicine. The diversity of conditions in which control has to be attempted and, until recently, the lack of precise methods for measuring the bacterial content of air are among the reasons why air hygiene has not kept pace with advances in the control of water- and food-borne disease. This report is a symposium written principally by three workers who have studied air-borne infection at the National Institute for Medical Research, Hampstead, London, since 1942. It is not intended to be a comprehensive treatise on air hygiene: its purpose is to describe instruments which have been devised for sampling air for bacteria and to outline the theoretical and practical tests to which the instruments were submitted. The report also deals with many techniques for disinfecting air and with the conditions determining the effectiveness of these techniques, and it includes a critical evaluation of the various methods now available.

There are several ways of measuring the bacterial content of air. Much of the present work, however, was carried out with slit samplers in which air is sucked at high velocity through a narrow slit and allowed to impinge on a revolving plate of culture medium. This method allows the exact time when particular organisms are collected to be determined and hence it is of especial value when the concentration of air-borne organisms is changing rapidly. The technique enables the number of bacteria-carrying particles to be measured, but when it is desirable to measure large numbers of bacteria in air it is better to collect into a liquid rather than on a solid medium. The prevalence of bacterial clusters in the air of occupied buildings has obvious bearing on several aspects of air hygiene and this, together with possible errors and limitations of the methods employed, is fully discussed.

The second part of the report begins with a description of the test room in which the efficiency of chemicals as air-disinfectants was estimated. Attention is drawn to the need for circulating air in any test chamber at high rate when using agents which kill bacteria quickly. Of the many disinfectants tested the  $\alpha$ -hydroxy-acids, such as lactic acid, are of great interest because of their high efficiency. In preliminary trials one of these substances,  $\alpha$ -hydroxy- $\alpha$ -methylbutyric acid, was effective when allowed to evaporate from the surface of paper or fabric at room-temperature. The potential advantages of air disinfection at room-temperature are great and the method could probably be used in office or dwelling-house. Brief accounts are given of the disinfection of air by ultra-violet light, by steam and by passing air through furnaces where a temperature of 300° C. for half a second is required for complete sterilization. The purification of air in a military canteen by recirculating through filters and past ultra-violet lamps was found to be possible, but recirculating systems are costly and may be inconvenient.

Many other matters of practical importance are also described in the report. The value of various types of masks has been tested and attention is again drawn to the fact that air in the upper stories of a hospital or other building is much less contaminated than air at ground-level. Many hospital operating theatres have exhaust fans which suck in dirty air from surrounding rooms or corridors: this can be prevented by using an input fan of greater power than the exhaust fan. Studies were also carried out in submarines, warships and factories and it is suggested that present standards of ventilation which depend on the detection of body odour might well be replaced by a standard based on the bacterial content of the air. In addition to these and related subjects a short but valuable account is given of experimental techniques for the air-borne transmission of bacterial and virus infections to animals.

The aim of air hygiene is to reduce the contamination of air by pathogenic organisms, for it is unlikely that complete elimination of respiratory-spread infection will be attained by the methods described. However, a significant reduction of the respiratory pathogens in the air may well be important as there seems little doubt that the severity and mortality of these infections are closely related to the dose of organisms inhaled. As is pointed out in the general conclusions, daylight and sunlight, adequate ventilation and techniques for dust suppression all help in the elimination of bacteria from the air. The report is primarily concerned with the basic facts about air hygiene and it has laid reliable foundations on which future work can be built. The experiments are described lucidly and in detail and the worker in this field will also be grateful for the comprehensive list of references on the subject. The report should, however, be read by a much wider public than specialists on air hygiene. It contains important information for those who design hospital and other buildings, for the epidemiologist and indeed for all who are concerned with the advance of preventive medicine.

A. Macdonald

## 1511 Annual Review of Physiology. Volume XI

Edited by Victor E. Hall et al. Stanford, California: Annual Reviews, Inc. & American Physiological Society, 1949. ix + 643 pages. 23 × 16 cm. \$6

(i) Developmental physiology; (ii) reproduction; (iii) metabolic functions of the endocrine system; (iv) liver; (v) digestive system; (vi) visceral functions of the nervous system; (vii) somatic functions of the nervous system; (viii) bioelectric potentials in the nervous system and muscle; (ix) the electrical activity of the brain; (x) hearing; (xi) vision; (xii) physiological psychology; (xiii) muscle; (xiv) hematopoiesis; (xv) the lymphatic system; (xvi) heart; (xvii) peripheral circulation; (xviii) respiration; (xix) kidney; (xx) radiation; (xxi) permeability; (xxii) pharmacology. Indexes.

In the present volume of this well-known year-book, there is evidence of the editors' attempt to break away from the mere cataloguing of recent papers on physiology, and to bring to the reader's notice only the more important work. In a volume in which all aspects of physiology are covered by some 28 contributors, it is clear that some departure from this ideal is to be expected. Some contributors, such as the writers of the section on haematopoiesis, have by rigid selection produced a good and readable summary of recent work in a limited field—the formation of the erythrocyte in the present case. Others, like the writer on the physiology of vision, have found that their subject defies compression and merely listed the papers published. It might be well for the editors to pursue their policy even further and persuade contributors to emphasize the well-written and important papers and to

criticize where criticism is necessary. Thus, W. G. & V. J. Walter, the only British contributors, have given an admirable, though (on their own admission) unavoidably biased, summary of the electrical activity of the brain. For this they need scarcely apologize since the only point in having the articles written by authors of their standing is to ensure rejection of the bad and publicity for the good.

There is, as usual, much to interest the clinician in this volume. Such topics as anti-thyroid substances, experimental hypertension, pregnancy tests, experimental production of peptic ulcer, kidney function and liver function tests, and the pharmacology of the newer analgesics and of the ganglionic and adrenergic blocking drugs are in the province of the physician as well as of the physiologist. Attention may also be drawn to the summary of work on effects of radiation, unfortunately of importance to all, and to the interesting review of physiological psychology.

S. S. B. Gilder

## 1512 Lecciones de Patología Médica (Enfermedades del Hígado). Volume VI

C. Jiménez Díaz. Madrid: Editorial Científico-Médica, 1948. viii + 998 pages; 360 figures. 25 × 17 cm.

Few subjects can compete with the liver in attracting enquiring minds. Professor Jiménez Díaz has aimed to review everything worth knowing about the functions of this organ and the diseases to which it is subject.

Physiology and functional tests occupy eight lectures, greatest reliance being placed on the cephalin-cholesterol and thymol turbidity tests and on the estimation of plasma cholesterol esters. The inability of the failing liver to provide the materials for building enzymes needed by the vital organs ("dysenzymatic state") would account for the varied clinical features of cholaemic patients, their metabolic, neurological and renal upsets. This sounds rather speculative in view of the difficulties in substantiating it experimentally.

Many pages are devoted to jaundice and necrosis of the liver with a complete review of the modern literature on hepatitis. Jiménez Díaz thinks a lesion of the capillaries and the reticulo-endothelial system, by the virus of hepatitis, is the primary event in hepatic necrosis. Rossie's "serous inflammation" is analyzed in that connexion.

In dealing with cirrhosis he broadly agrees with Himsworth's classification into three main types: Laennec's, post-necrotic scarring, and cholangitic. Emphasis is placed on histology and an attempt is made to define the structural changes in the spleen. Clinical pictures are not neglected. Full descriptions are given and numerous cases presented. Hanot's cirrhosis is narrowed to these features: clinically—juvenile patients, early jaundice, recurrent fever, hepatosplenomegaly, "rheumatic pains" and arthritis, adenitis; histologically—round-cell infiltration of portal spaces and around sinusoids, proliferation of the reticulo-endothelial system, hyperplasia of reticulum amongst the cells, a sort of intralobular fibrosis, gross dilatation of sinusoids, and fibrosis of spleen and kidneys. An impressive series of photomicrographs is shown and a slowly evolving infection, perhaps by a virus, is suggested. A relationship with the agent of rheumatic fever is hinted. The exposition, however, is more interesting than convincing.

Banti's syndrome, apparently common in Spain, is considered to be of varied etiology, some cases being due to thrombophlebitis of the splenic vein, occasionally following abdominal trauma.

There are three interesting lectures on hydatid disease. The condition, very common in Spain, can mimic varied clinical syndromes (biliary colic, portal obstruction, suppurative cholangitis). Syphilis, abscess, cancer, and cirrhosis in children are also discussed. In fact, every aspect of liver pathology (excluding the biliary passages) is covered. Experimental, biochemical and histological works are widely quoted and many personal investigations are brought forward to support opinions favoured, but it is hard to achieve a critical synthesis of the enormous amount of information displayed. This series of lectures seems hardly appropriate for students. Perhaps it is for future professors or highly specialized research workers. On the average student the impact must be formidable and bewildering.

Despite its incredibly extensive and erudite information this cannot be called a reference book as it lacks a bibliographical index. This omission, perhaps, is less serious than it sounds, if one considers that Jiménez Díaz and his collaborators have published

numerous papers on liver pathology with original observations and extensive references. However, a list of personal publications seems indispensable.

With adequate bibliography the book would be one of the most outstanding and up-to-date treatises on the liver.

## 1513 Fatty Liver Disease in Infants in the British West Indies

J. C. Waterlow. London: His Majesty's Stationery Office, 1948. (Medical Research Council Special Report Series No. 263.) 84 pages; 12 plates. 24 × 15 cm. 2s. [£0.1]

Introduction; previous work. Part I. Clinical, biochemical and pathological observations. Part II. Pathogenesis and relationship of some features of the syndrome. Summary and conclusions. References.

This is a report on the investigation of infantile liver disease, prevalent in the British West Indies, the outstanding features of which are fatty infiltration of the liver, accompanied by oedema and muscular wasting. It is assumed, without conclusive evidence, to be due to prolonged feeding on a diet poor in protein and relatively rich in carbohydrate. The number of cases investigated was no greater than 15, to describe which a brochure approaching 100 pages would seem more than sufficient. The syndrome dealt with has been described under the African name of kwashiorkor ("red boy") dermatosis, or as "infantile pellagra", but Dr. Waterlow cautiously prefers to avoid these terms, which emphasize the skin lesions (which as often as not were absent), and to speak of "fatty liver disease." Similar syndromes have been described in diverse parts of the world, mainly in tropical and subtropical countries; all seem to have in common the especial incidence in infancy, a high mortality, lack of response to vitamins, and the presence of a severe degree of fatty infiltration in the liver. It is the opinion of Dr. Waterlow that the latter lesion dominates the disease and is the cause of failure to respond to treatment and of death when this occurs.

In the 15 cases analyzed, the average age was about nine months; all were breast-fed and thrived until weaned and on an average two to six months elapsed thereafter before the infant was admitted to hospital. Oedema and vomiting were the presenting signs and by this time the condition was often grave. The diet after weaning consisted of maize porridge, arrowroot, sweet potatoes, plantains or oatmeal; some milk, judged to be rarely more than half a pint (0.284 l.) a day, was given. There was no real evidence that children not developing "fatty liver disease" had a strikingly different diet from those who did develop this.

In the affected cases the liver was enlarged in all but one, and at post-mortem examination was found to be grossly fatty, the percentage of fat in the moist tissue being of the order of 35 to 45 per cent. Twenty-seven liver biopsies were made which revealed fat; a fuller account of these would have been desirable as post-mortem estimations of liver adiposity are liable to be misleading quantitatively. Oedema was frequently, but not always, present, and its severity was not related to the degree of liver change. It was noted that fat was lost from the omentum, mesentery and perinephric region, but often the thighs and legs had considerable subcutaneous fat and in many cases the face remained chubby; in contrast to this, marasmic children without this liver disease showed universal wasting and a shrunken facies. Other findings were a loss of weight of 25 to 30 per cent, and deficiency in serum protein, especially albumin, in cases with oedema.

Amongst other observations of interest was the presence of a mild hypochromic anaemia—for which iron was given with little effect—and post mortem an excess of microscopically demonstrable iron in both liver and spleen; but a similar siderosis was found in infants dying of malnutrition without fatty livers, and it is concluded that this change was due to a failure of utilization. A curious observation was that the faeces contained an excess of fat; the total quantity of this was not influenced by treatment, which merely reduced the percentage of neutral fat and increased that of soaps.

The prognosis was in general bad: of the 15 cases followed, six died. Treatment was not very satisfactory; best results were obtained by increasing the milk in the diet to about a litre a day. Vitamin B deficiency was present in some cases and was improved by specific therapy, but this had no effect upon the course of the main malady. Choline and methionine, in the few cases in which these substances were given, produced no improvement.

An attempt was made to correlate this fatty infiltration with the development of cirrhosis. In Jamaica (but not in Trinidad or British Guiana) cirrhosis in children is stated to be common, which might support the idea of a causal connexion. A few cases of liver fibrosis were encountered and their histology described, but no definite sequence is proved.

The general conclusion is that the disease described is the same as the African kwashiorkor, but the latter is complicated by an associated vitamin B<sub>2</sub> deficiency, causing skin lesions, which are not present in the West Indian cases. Dr. Waterlow states that the specific feature of the syndrome is the appearance of exogenous (i.e., dietary) fat in the liver and that the cause of this is inadequate feeding after breast-feeding has been stopped. From this there follows gross muscular wasting, anaemia, plasma protein deficiency, oedema and some liver deficiency as judged by the bromosulphthalein clearance test, and it is suggested that hepatic cirrhosis may be a late result. This sequence is not altogether easy to follow and requires the presumption that the children were unable to utilize fat and were therefore, in effect, suffering from starvation, and as a consequence were deficient in protein. When this was supplied in the form of milk, improvement set in. It is open to further investigation to show at what point the chain of events was set going, and it would seem probable that some as yet undetected factor must intervene if, as it appears, these children had essentially the same diet as many others who remained well. It is of importance to note that the pure "lipotropic" substances such as methionine, choline and inositol produced no improvement, whereas milk did.

#### 1514 Pathologie des Kohlehydratstoffwechsels

E. Frank. Basle: Benno Schwabe & Co., 1949. 342 pages; 17 illustrations. 23 x 16 cm. 24 Sw. fr.

(i) Experimentelle Diabetesforschung; (ii) Hypophysäre Diabetesformen in mus; (ix) die Glykogenspeicherkrankheit; (x) hydrastoffwechsels bei der B<sub>12</sub>-Avitaminose; (xi) (xii) die selteneren Formen der Melliturie.

This is a most interesting and useful book. It is written by a pupil of Minkowski who had an authoritative account, from the lips of the master himself, of the steps which led to the removal of the pancreas from a dog and of the subsequent observations of laboratory assistant and professor. (Incidentally, this should give the quietus to many stories circulating in physiological laboratories about the elusiveness of the discovery that the animal's urine contained glucose. Further, it may result in a greater appreciation of Minkowski's work in laying the foundation of our modern knowledge of diabetes mellitus.) It is also interesting because, though the book is thoroughly German in its comprehensiveness and its massing of detail, it recaptures the spirit of liveliness and critical insight which characterized Minkowski's life and work, but which has been so lacking in German science, and other affairs, for decades.

It is an extremely useful book in that it is no mere collation of facts about diabetes mellitus, but gives a comprehensive view of the whole of the disturbances of carbohydrate metabolism, both from the experimental and the clinical aspect. The author has held throughout the view that the knowledge of the experimental pathology of diabetes is best appreciated by one versed in clinical research—by one who has been captivated by the problems of carbohydrate metabolism in his student years and has steadfastly worked on them at the bedside and in the laboratory. And it may be said that the author has achieved his object in demonstrating the value of this view. The book can therefore be recommended to anyone—physiologist, biochemist or clinician—who wishes to understand and do work upon the disturbances of carbohydrate metabolism. The research worker and the clinician will, of course, criticize the emphasis on and interpretation of different phenomena, but they will nevertheless be stimulated to further thought and work. As the author himself says, "If you solve a riddle another presents itself at once."

Space does not permit of a list of the subjects treated under the title *Pathologie des Kohlehydratstoffwechsels*. The reader who is attracted by the above had better borrow the book from a medical library and glance through it. He is almost certain to want a copy for his own.

V. H. Mottram

#### 1515 Bone Marrow Biopsy. Haematology in the Light of Sternal Puncture

S. J. Leitner. English translation revised and edited by C. J. C. Britton & E. Neumark. London: J. & A. Churchill Ltd., 1949. xi + 433 pages; 7 plates; 194 text-figures. 26 x 16 cm. £2 2s. [£2.1]

(i) Introductory and historical; (ii) technique of sternal puncture; (iii) cell counts on the sternal marrow; (iv) marrow cells; (v) maturation curves; (vi) sternal puncture; (vii) disorders of marrow; (viii) disorders of thrombocytopoiesis; (ix) disorders of the marrow; (x) disorders of maturation; (xi) sternal marrow in liver disease; (xii) disorders of haemopoiesis in endocrine disorders; (xiii) the effects of radium and X-rays on bone marrow; (xiv) the demonstration of pathogens in sternal marrow; (xv) metabolism of marrow and blood cells; (xvi) the defence reaction of marrow cells; (xvii) tissue culture of marrow cells; (xviii) summary. Index.

Several attempts have been made to rewrite haematology, starting with the formative tissues and working down the genealogical tree until the formed elements of the peripheral blood are reached. Such a method became possible when marrow puncture, as introduced by Arinkin, became widely used.

There are several books in which this more modern method is followed: there was the enormous war-time work of Thaddeus, which formed an almost inexhaustible reference book of the Continental literature up to 1942; Rastelli's well-illustrated monograph; Forteza Bover's admirable volume; and, smaller but therefore more widely useful, the work of Émile-Weil & Perlès. Thus there were books in German, Italian, Spanish and French, while the only English book on the subject is the small volume, mainly of personal experiences, *Sternal puncture*, by Piney & Hamilton-Paterson, of which a new edition was published in April 1949.

All the European books that have been mentioned are either too large and costly, like that of Thaddeus, or too parochial (being purely Gallie) like that of Émile-Weil & Perlès. Hence the need for a volume of reasonable size, with an adequate but not excessive review of the literature. This need was met by the original Swiss edition of Leitner's book, which, however, suffered from inevitable lacunae, because European and American medical journals were not obtainable during the war.

Britton and Neumark have done more than translate the book: they have amplified the bibliography considerably, mainly by addition of American and British references, while they have excised some masses of Teutonic verbiage—much to the benefit of the reader. The original edition gave the full titles of all the references, but, unfortunately, paper-shortage has made that impossible in Great Britain. The bibliography is, therefore, less useful than it could have been.

The text is full enough for every purpose; and there is no truth in the assertion that this translation is redundant because those persons who need so highly specialized a book can read the original Swiss edition. This pays too great a compliment to the linguistic knowledge of the Anglo-Saxons; and even if it were true, the translation would still not be redundant because Britton and Neumark have modified the original so much that it is now a new (and much better) book.

The illustrations are plentiful but of varying quality. The coloured plates are perhaps rather diagrammatic but are both instructive and beautifully executed. Many of the photomicrographs are quite unrecognizable, while a few are excellent.

For those who need a fairly large book on the histology and histopathology of the bone marrow, this book can be highly recommended.

A. Piney

#### 1516 An Atlas of Bone-Marrow Pathology

M. C. G. Israëls. London: William Heinemann Medical Books Ltd., 1948. x + 79 pages; 12 plates; 3 figures. 25 x 19 cm. £1 10s. [£1.5]

(i) Nomenclature and development of the blood cells; (ii) technique; (iii) the morphology of the marrow cells; (iv) the normal bone-marrow picture; (v) bone-marrow changes in disease; (vi) bone-marrow in infants and children; (vii) differential diagnosis and indications for sternal puncture. Bibliography. Index.

This book "sets out to provide an authoritative, accurately illustrated account of the bone marrow in health and disease for the guidance of physicians and pathologists." Unfortunately, the goal has not been reached. The nomenclature has been kept as simple as possible, and the extremely brief descriptions of each

type of cell are accurate and can easily be followed. One of the gravest defects of the book is that the descriptions of the staining reactions of the cells are not accurately reproduced on the plates.

The first seven plates illustrate several examples of each type of marrow cell but it is true to say that relatively few of them present any close resemblance to the elements as seen under the microscope. These plates are followed by five others, on each of which there are four microscopic fields. This plan is excellent inasmuch as the plate is on one page and the description on the opposite one. Unfortunately, a "flimsy," on which are printed outline guides, is interposed between the plate and the text, a plan which makes it extremely difficult to see to which elements the legends apply.

Among these plates there is again a grave defect, in that the staining appears to be peculiar. Thus, on Plate 8 the red corpuscles are bright yellow, but on Plate 9 they have the pinkish colour to which we are accustomed. On some of the plates, the tints are so faint as to make it quite impossible to hazard a guess at the nature of the cells. Indeed one gains the impression, from the pastel-like characters of the plates, that accuracy has been sacrificed to artistic charm.

It is difficult to understand to whom a book of this sort would be valuable: for the pathologist who is not primarily a haematologist it is inadequate; for the general physician it is too incomplete; for the student it contains too much detail; while for the professional haematologist it is both too elementary and too incomplete.

That a book of this sort is needed in English has been shown by the success of Blaekfan & Diamond's *Atlas of the blood in children*, so that a new edition of Israël's book, with really accurate well-printed plates, would fill a need, especially as the Continental books are large and expensive.

A. Piney

### 1517 Sternal Puncture: a Method of Clinical and Cytological Investigation

A. Piney & J. L. Hamilton-Paterson. Fourth edition. London: William Heinemann Medical Books Ltd., 1949. xv + 89 pages; 14 colour plates; 4 figures. 22 x 14 cm. 15s. [£0.75]

(i) The myelogram; (ii) the marrow in leukaemia; (iii) neoplastic and allied conditions of the bone-marrow; (iv) the anaemias; (v) erythraemia and allied states; (vi) infective diseases; (vii) hypoplasia and aplasia of the bone-marrow; (viii) some protozoal diseases; (ix) the technique of sternal puncture. Index.

The 4th edition of this useful little book is characterized by several additions and changes, most of which are improvements. The chapter on neoplastic and allied conditions of the bone marrow is largely rewritten, but clinicians and pathologists want to know more about the marrow changes in this far from homogeneous group of diseases. Although modern opinion has returned to Aschoff's original view that most myelomata are of the plasma-cell type, the authors continue to recognize plasma-cell, erythroblastic, myeloblastic and lymphoblastic types. The statement that "Ewing's tumour is a clear example of a growth that arises from the reticulo-endothelium of the marrow" is a most surprising one, especially in view of some paragraphs on this controversial topic only six pages away. In the chapter on erythraemia and allied states the authors have misinterpreted Duesberg's paper on anaemia due to faulty differentiation of erythroblasts.

Several misprints which were in the previous edition remain. The authors puncture the sternum through the angle of Louis, but do not state how much marrow should be aspirated. While the precursor of the red cells is called the *pro-erythroblast*, the authors continue to use the term *premyelocyte* instead of *promyelocyte*. That there are 2-3 per cent megaloblasts in the normal bone marrow, and small numbers of megaloblasts in haemolytic or aplastic anaemia and in sedormid purpura and kala-azar, is at least doubtful. Considering that mitotic figures are so rarely seen in myelocytes, the statement that "in health, almost all the polymorphs arise from mitotic divisions of pre-existing myelocytes" is hardly correct.

The new plates of colour photomicrographs of megaloblasts and plasma cells are instructive as are the plates retained from previous editions, but the barbed wire type of reticulocytes is surely very unusual. The index remains almost unchanged, but might usefully be enlarged. This reviewer is a little puzzled as to the reason why in Lord Horder's foreword and on the spine of the book the name of only one of the authors appears.

E. Neumark

### 1518 Studies on the Formation of Cellular Substances During Blood Cell Production

Bo Thorell. London: Henry Kimpton, 1947. 120 pages; 59 figures. 23 x 14 cm. 12s. [£0.6]

Part I. (i) The development of the cells of the blood in the adult; (ii) the endocellular organization for the formation of protein; (iii) the procedure for microspectrographic analysis of living bone marrow cells; (iv) cytochemical analyses of normal bone marrow; (v) the endocellular growth mechanism during the blood cell formation; (vi) the relationship of the cellular growth processes to the gene material. Part II. The relationship of specific cell differentiation processes to the growth of the cell. (vii) Erythropoiesis; (viii) growth and differentiation processes during the formation of other tissue cells. Part III. Cytochemical analyses of the formation of blood cells in certain pathological conditions. (ix) Disturbances of growth in the nucleated blood cells; (x) disturbances in the erythropoiesis. References.

The work carried out in the Department for Cell Research of the Caroline Institute, Stockholm, under the direction of Professor T. Caspersson, has led to the postulation of a "cytoplasmic protein-forming system". Part of the nuclear chromatin of the cell, designated the nucleolus-associated chromatin, produces substances composed of ribose nucleic acid, and proteins rich in diamino-acids. These accumulate to form the main bulk of the nucleolus from whence they diffuse outwards through the nuclear membrane into the cytoplasm, where an intense production of ribose nucleic acid occurs. Concurrently the amount of cytoplasmic proteins increases. The present monograph is concerned with investigations carried out to determine whether similar intracellular processes occur during the growth phases of haematopoiesis.

The author describes the theory and technique of the cytochemical analysis of living bone marrow cells. Microspectrographic methods were employed enabling quantitative determinations to be made of their polynucleotide and haemoglobin content. For the former he used a photographic method combined with photometry for use with ultra-violet radiations, and for the latter a photoelectric method for working in the visible spectral range. Additional methods which were employed included ultra-violet micrography, Feulgen staining, cytometry and macrochemical analyses.

The results of this investigation demonstrate that the new formation of intracellular proteins (growth) during haematopoiesis takes place at an early stage of development in the presence of high concentrations (more than 5%) of ribose polynucleotides both in the cytoplasm and nucleolus, and that the cellular mechanism involved is similar to that of other growing cells previously studied, e.g. embryonic cells. After the initial phase of growth the cytoplasmic ribose nucleotide concentration falls to less than 0.5%. During erythropoiesis the main synthesis of haemoglobin does not begin until the fall in intracellular ribose polynucleotide content has occurred.

With increased pathological growth, as in acute myeloid and lymphatic leukaemia, there is a definite hypertrophy of ribose polynucleotide metabolism correlated with the new formation of cellular proteins. In certain anaemic conditions, such as pernicious and haemorrhagic anaemia, there can be demonstrated an abnormal polynucleotide and haemoglobin content of the cytoplasm during cytogenesis.

This work is a good example of the value of the techniques of ultra-violet micrography and microspectrography for investigating cytological problems. The author has provided another convincing illustration of the intimate relation between cell growth and nucleotide metabolism. The postulated mode of functioning of the intracellular mechanism during the growth of the cytoplasm may, however, need reconsideration when more is known about the function of such cytoplasmic organelles as the mitochondria and microsomes.

R. J. Ludford

### 1519 Human Embryology and Morphology

Arthur Keith. Sixth edition. London: Edward Arnold & Co., 1948. xii + 690 pages; 578 figures. 22 x 14 cm. £2

(i) Early changes in the development of the ovum and embryo; (ii) the manner in which a connection is established between the foetus and uterus; (iii) the primitive streak, notochord and somites; (iv) physiological and pathological embryology; (v) age changes in the embryo and foetus; (vi) the spinal column and back; (vii) the segmentation of the body; (viii) central nervous system—differentiation of the brain and the spinal cord; (ix) the mid- and hind-brains; (x) the fore-brain or prosencephalon; (xi) the fore-brain or prosencephalon (*continued*); (xii) the cranium; (xiii) development of the face; (xiv) the teeth and apparatus of mastication; (xv) the nasal cavities and olfactory structures; (xvi) development of the structures concerned in the sense of sight; (xvii) the organ of hearing; (xviii) pharynx and neck; (xix) tongue, thyroid and structures developed from the walls of the primitive pharynx; (xx) organs of digestion; (xxi) organs of digestion (*continued*); (xxii) circulatory system; (xxiii) circula-

tory system (continued); (xxiv) respiratory system; (xxv) urogenital system; (xxvi) urogenital system (continued); (xxvii) urogenital system (continued); (xxviii) development and differentiation of the limbs; (xxix) development of bones and dages. Index.

This well-known textbook was first published in 1902 when its author was lecturer in anatomy at the London Hospital Medical College. For many generations of British medical students its successive editions have been the introduction to some of the more stimulating aspects of human anatomy. The reviewer, for one, well remembers his excitement when the volume first came into his hands. In it there was an escape from the minutiae of topography which, coupled with fascinating vistas of the phylogenetic and ontogenetic background to human structure, revealed human anatomy as a science rather than an examination hurdle and a discipline. No one who met this book in his salad days can fail to hold it in affectionate regard.

The first edition was unpretentious enough, having for its criterion, as Sir Arthur discloses in the preface to the present volume, clinical utility. "In subsequent editions my utilitarian ideal retreated more and more into the background. Who can tell what the clinical utility of any newly-discovered fact may prove to be?" This change in Sir Arthur's viewpoint is most interesting, for not only does it represent a change in his personal attitude but it reflects an alteration in the mental climate of British work in anatomy in the course of the present century. In the nineteenth century, in spite of much lip-service to the Hunterian tradition and method, and the neglect of the fundamental revelations of the theory of evolution, anatomy in the English-speaking world was largely the handmaiden of surgery—ancillary in the worst sense of the word. It is not the least of Sir Arthur's distinctions that he was one of the small group that broke the thralldom of his subject to operative surgery and established human anatomy quite firmly in the field of biology. And his book has had a part in bringing about the change.

The present edition has been carefully brought up to date. The references to the recent literature are not only full but are accompanied by notes which are always helpful and sometimes extremely sagacious. The style, as is to be expected from the author's pen, is easy. Indeed, considering the complexity of many of the problems discussed, it can even be said to be graceful. It is in this very ease of presentation that a possible defect of the book may, rather paradoxically, be found. The reader may be so carried away by the easy style that he may consider he understands a difficult problem when, in fact, he has been, always engagingly, it must be admitted, "fobbed off" with a re-statement. And, often, statements are made with an almost cavalier disregard for the facts and difficulties of the problem. For example: "We are at least justified in assuming that the parachordal part of the skull is the oldest, and is therefore known as the *palaeocranium*"; whereas the prechordal part is more recent and is for this reason known as the *neocranium*" (p. 231). The introductory words to this almost certainly incorrect statement (indeed Sir Arthur gives weighty authority for an alternative explanation in a note to this passage) are so completely disarming that the unwary will almost certainly be "taken in" by the whole statement. There are many equally deceiving passages elsewhere in the text. The figures, too, are often unworthy of the text and of the subject.

Notwithstanding any critical remarks, however, this edition is an extraordinary achievement for a man of Sir Arthur's age, varied interests and activities. To few of us will be given his years; to even fewer the ability and zest, after having actively lived those years, to present a complicated subject so freshly and so currently.

J. D. Boyd

## 1520 *Éléments d'Embryologie*

A. Celestino da Costa. Second edition. Paris: Masson & Cie, 1948. viii + 583 pages; 492 figures. 24 × 16 cm. 2300 fr.

Part I. Préliminaires. (i) Reproduction des organismes; (ii) les gamètes; (iii) le zygote, fécondation et parthénogénèse; (iv) mécanisme cytologique de la transmission héréditaire. Part II. Embryologie générale. (v) Segmentation; (vi) gastrulation; (vii) annexes embryonnaires; (viii) formation générale du corps de l'embryon; (ix) facteurs et mécanismes du développement; (x) anomalies du développement. Part III. Embryologie spéciale. (xi) Formation du squelette et des organes de mouvement; (xii) formation de la peau et ses annexes, du système nerveux et des organes des sens; (xiii) formation du sang et de l'appareil circulatoire; (xiv) formation des appareils digestif et respiratoire, des dérivés branchiaux et des sécrètes; (xv) formation des appareils urogénital et surrénal. Appendice: aperçu de l'histoire de l'embryologie. Table alphabétique des matières.

Embryologists will generally welcome this new edition of Professor Celestino da Costa's book. To include in one manageable volume the "elements" of embryology is no small feat, and the selection of items for inclusion must necessarily be a matter of preference. It is probably because the author's intention was to provide, at the same time, a core of basic information on subjects related to embryology that he has devoted over a hundred pages in his book to gametogenesis, fertilization, and mendelian genetics. The importance and value of these subjects in medical education need no emphasis, but it is a matter for consideration whether it is advantageous to include them as a sort of preface to a work of embryology of this kind. The treatment accorded to them is a trifle old-fashioned, and the space so occupied is at the expense of the more legitimate subjects which a reader would expect to find under the title of the book.

With special attention to the mammalian and human types, the author describes the chief events in the development of the embryo, and the various organ-systems are dealt with in turn. While these accounts are well balanced and complete, the work is not quite up to date on some points. For instance, the recent work on the derivatives of the neural crest and their significance for the theory of the germ-layers has largely exploded the importance of the latter, a fact of which the reader of this book would perhaps not become aware.

The section on the development of the skeleton is hardly adequate in view of the information now available, and the same is the case with the placenta. As regards general principles, the obsolete theory of recapitulation still rears its unfortunate head in the pages of this book and stands in the way of more modern and objective interpretations of the relations between ontogeny and phylogeny.

For all that, however, the book remains a solid contribution to the teaching literature of a difficult subject.

## 1521 *The Physiology of the Eye*

Hugh Davson. London: J. & A. Churchill Ltd., 1949. xii + 451 pages; 301 illustrations. 22 × 15 cm. £1 12s. [£1.6]

Introduction. (i) Structure of the eye. Section I. Intra-ocular dynamics and the transparent tissues. (ii) Aqueous humour and the intra-ocular pressure; (iii) the transparent structures. Section II. The mechanism of vision. (iv) Structure of the retina; (v) measurement of the stimulus; (vi) general aspects of vision; (vii) electrical effects of stimulation; (viii) photochemical aspects; (ix) flicker; (x) visual acuity; (xi) adaptation; (xii) theory of colour vision. Section III. The muscular mechanisms. (xiii) Extra-ocular muscles and their actions; (xiv) torsion and Listing's Law; (xv) binocular movements; (xvi) nervous mechanisms in the control of the eye movements; (xvii) the pupil; (xviii) accommodation; (xix) the protective mechanism. Section IV. Visual perception. (xx) The visual pathway; (xxi) higher integrative activity; (xxii) projection of the retina; (xxiii) monocular perception of depth; (xxiv) cyclopean projection; (xxv) stereoscopic depth perception; (xxvi) retinal rivalry and ocular dominance; (xxvii) binocular aspects of the light, colour and form senses; (xxviii) the perception of motion. Section V. Optics. (xxix) Reflection; (xxx) refraction at plane surfaces; (xxxi) refraction at a single spherical surface; (xxxii) refraction by spherical lenses; (xxxiii) refraction by the eye; (xxxiv) ametropia and accommodation; (xxxv) non-spherical lenses and astigmatism; (xxxvi) neutralization and decentring; (xxxvii) contact lenses; (xxxviii) ophthalmoscopy; (xxxix) retinoscopy; (xl) optical constants of the eye; (xli) defects in the image; (xlii) interference, etc. Index.

It is never an easy matter to provide an adequate review of a textbook and *Physiology of the eye* is no exception to this. The chapter titles illustrate the general lines on which it is written; each topic is treated with clarity and a wealth of important detail, some of it relating to investigations carried out by the author and his co-workers.

One has the feeling that if modern papers on ophthalmology are to be read intelligently, this book provides the indispensable groundwork for them. Adequate accounts are given, for example, of the mechanics of the formation of the aqueous humour, of the electrical phenomena associated with stimulation of the retina, of alpha and beta adaptation, of Granit's work on colour vision and of many other subjects of modern research, such as the use of x rays for measuring the length of the eye, its refractive power and the size of the retinal image. Fundamental matters are also not neglected and the ophthalmologist who is a little hazy as to the meaning of Listing's plane, Panum's circle, or the horopter, will find these clearly explained.

It may seem invidious to offer criticisms of such an admirable volume, but since future editions are certain to be called for, they may have some value. It occurred to the reviewer that: (i) The description of the actions of the vertically acting, extra-ocular muscles might be simplified; the author appeared to be so anxious to include everything, so to speak, that he has produced an account

which is difficult to follow, at any rate on a first reading. (ii) The explanation of retinoscopy is also difficult to follow and so are the figures, particularly figs. 266-271, in which a ray of light is shown apparently passing through the observer's iris. (iii) There did not appear to be any account of those entoptic phenomena which allow the observer to see his own retinal blood vessels and corpuscles.

These are all minor matters, however, and the author is to be congratulated upon having produced a classical volume which will be of the greatest value to students and to those whose fate it is to attempt to teach them. Job is reputed to have wished that his adversary had written a hook; had his adversary been Dr. Davson, however, the quarrel would surely have ended when the hook was read and it would have, as Job says, been bound as a crown to him.

F. H. Williamson-Noble

## 1522 Vitamin A Requirement of Human Adults : an Experimental Study of Vitamin A Deprivation in Man. A Report of the Vitamin A Sub-Committee of the Accessory Food Factors Committee

Compiled by E. M. Hume & H. A. Krebs. London: His Majesty's Stationery Office, 1949. (Medical Research Council Special Report Series No. 264.) 145 pages; 3 plates. 24 x 15 cm. 3s. [£0.15]

(i) Concise account of the experiment; (ii) elaboration of special aspects; (iii) details of the evidence. General summary. References.

Most research is planned to answer a question or solve a problem, and the best and most fundamental are generally posed by the investigators themselves, for they are the only people likely to be well enough acquainted with the subject to be able to do this. They tend to set themselves problems, moreover, which they are likely to be able to solve with the means at their disposal and which will give them interesting results, for only by so doing are they likely to get any return for their labour within a reasonable time.

During the war the Ministry of Food asked the Medical Research Council for information about the vitamin A requirement of human adults. No good answer could be given to this question and it was not a problem which would have attracted many investigators in times of peace, for it involved the almost impossible task of collecting enough subjects to represent the general population and of subjecting them to a deficient diet for a considerable time. Owing to the war, however, subjects were obtainable and a place where they could be accommodated was ready to hand. The Vitamin A Sub-Committee of the Medical Research Council, therefore, undertook to try to solve this problem and this report, No. 264, is a description of how their team set about it and of the results which were obtained.

It proved to be a much more difficult problem than was expected because it took a surprisingly long time to use up the stores of vitamin A present in the subjects when the experiment began, and until this had been done it was impossible to find out how much the daily food had to supply to promote good health. The 23 subjects had to live on a very monotonous diet which was reckoned to contain less than 70 i.u. of  $\alpha$ - and  $\beta$ -carotene a day, and practically no vitamin A. Seven subjects were given vitamin A supplements from the first, sixteen were not, and it was intended to continue the experiments until the latter showed definite signs of deficiency. Some of the subjects lived on this diet for two years,

which speaks very highly both for their own devotion and for the persistence and inspiration of the investigators. The organization of the experiment was most elaborate and is worth studying as a model for similar work in the future. Vitamins were assayed in foods, plasma and faeces by several different laboratories. Clinical examinations were made and dark adaptations tested. In short, "... the greatest possible variety of examinations which might be relevant" were carried out—but few of the subjects developed any signs of deficiency, and in the end only three out of the sixteen starters showed unmistakable signs of it. Of these, two were treated with carotene and the other with vitamin A. Some of the earlier work was confirmed. It was shown, for instance, that it was easy to produce a fall in the blood carotenoids, and that a deterioration in dark adaptation was undoubtedly associated with a deficiency of vitamin A. It was not, however, possible to reproduce many of the signs which have been held to indicate this—hyperkeratosis, for example, or xerophthalmia. Two of the subjects developed tuberculosis during the course of the experiment, and one would give a great deal to know if the disease could have been caused by the deficiency, but the authors refrain from drawing any conclusions. After reviewing all the available information the authors state guardedly that the vitamin A requirement of man may be about 2,500 i.u. per day and of carotene 7,500 i.u.

The word "heroic" can be overdone, but these experiments almost justify it, and similar ones are not likely to be made for some time. The medical world is indebted to these twenty-three men and women who acted so gamely as the subjects, to the large numbers of clinical and laboratory investigators, and particularly to the two authors, who gave up so much of their time to a problem from which they could hope to gain little, if any, personal reward.

R. A. McCance

## 1523 Textbook of Practical Pharmacognosy

Brian E. Hébert & Kenneth W. Ellery. London: Baillière, Tindall & Cox, 1948. xii + 372 pages; 331 figures. 22 x 14 cm. £1 1s. [£1.05]

(i) The seeds. General method of examination; (ii) subterranean structures. General method of examination; (iii) the leaves and herbs. Preparation and examination; (iv) the barks. General method of examination; (v) the woods; (vi) the flowers. General method of examination; (vii) the fruits. General method of examination; (viii) the insects; (ix) the unorganised drugs. General method of examination; (x) the starches; (xi) surgical dressings; (xii) filtering materials; (xiii) numerical estimations. Appendix: reagents. Index.

"Textbook" is perhaps rather a misnomer for this work. "Handbook" would be a more accurate description, and as a handbook of practical pharmacognosy it can be thoroughly recommended. The authors, in their preface, have accurately described the purpose of their joint effort: "No attempt has been made to present a complete course on the subject, only to assist the student in following and developing the practical instruction received in the laboratory." As such an aid to the student the book subserves a most useful function. The arrangement is logical, the text is clear, concise and accurate, and the illustrations are excellent. Indeed, the illustrations are outstanding in their demonstration of how much can be conveyed by simple line drawings. There is a tendency at the present time to assume that colour and elaboration are essential for accurate delineation. The illustrations in this book are a most convincing demonstration of how much more can be shown by an accurate line drawing than by the most complicated of colour processes. This is a book which will appeal to both teachers and taught in schools of pharmacy.

Carpenter ; (xxviii) synthetic benzylpenicillin, by Vincent du Vigneaud, Frederick H. Carpenter, Robert W. Holley, Arthur H. Livorn & H. B. ; (xxix) assay of penicillins, by John V. Scudi & ; (xxx) index.

# Shorter Notices

## Basic Principles of Ventilation and Heating

Thomas Bedford. London: H. K. Lewis & Co. Ltd., 1948. x + 401 pages; 123 illustrations. £1 5s. [£1.25]

The present work is an expansion of the author's previous *Modern principles of ventilation and heating*, published in 1937. The title is to be taken very literally, since the "purpose in preparing this volume has been to deal with ventilation and heating in terms of basic human needs". As such, it should prove of considerable value to public health and industrial medical officers and is well calculated to give them much valuable information without detailed discussion of engineering practice.

D. T. R.

## Understand your Diabetes. A Guide-book for the Diabetic Patient

John W. Coldwell. Toronto: Oxford University Press; London: Geoffrey Cumberlege, 1949. xv + 146 pages; illustrations. 18 x 13 cm. 7s. 6d. [£0.375]

This short manual joins the many designed to smooth the path of the diabetic patient. Originally written for his own patients, the book reflects the views of a younger man who none the less has had a considerable experience with the disease. In clear but not over-simplified language it sets out the elements of the pathological physiology of the disease and its complications; there follows a considerable discussion of its treatment, diabetic hygiene, complications and dietary hints. It perhaps errs on the side of bluntness in describing the various complications, but it may be that the armour of truth is, in the end, most satisfactory. The book should answer all or nearly all the questions which a diabetic patient is likely to ask his physician.

D. F.

## Occupational & Physio-Therapy: Scope, Training and Prospects

R. H. Finnegan. London: Actinic Press, 1948. 127 pages; 5 plates. 19 x 13 cm. 6s. [£0.3]

This book contains descriptions of the "scope, training and prospects" of occupational therapy and physiotherapy, the major part of the text being given to occupational therapy since, as the author remarks, this is a less widely known profession in Britain.

The section on occupational therapy is sadly misleading—sadly, because, though some of the matter is correct, it is very "popularly" written. It misses the more real and serious implications of the work, and refers to that which should be a scientific and expert treatment in superficial and expansive terms. The physiotherapy section contains many inaccuracies such as the inclusion of physical training colleges in the list of recognized schools and the statement that the starting salary of a physiotherapist "in accordance with the Rushcliffe award is £362". Also, the inclusion of a hyphen in physiotherapy may be a personal foible of the author's, but it is surely inexcusable to mis-spell the name of the Chartered Society of Physiotherapy.

The book is presumably intended for prospective students. The descriptions of the work done by occupational therapists and physiotherapists would certainly be of interest to young people who are deciding on a career. It does, however, seem useless

to publish in book form full details about training schools and examinations which are constantly changing and can be accurately obtained only from the professional associations concerned.

M. Williams & E. M. Macdonald

## Public Health and Social Services. An Elementary Textbook for Midwives

D. H. Geffen & L. Farrer-Brown. Third edition. London: Edward Arnold & Co., 1949. 123 pages. 19 x 12 cm. 5s. [£0.25]

This small book was specially written for midwives, and it is therefore not surprising that it deals chiefly with that aspect of public health with which midwives are concerned. It presents the basic information which all who are actively engaged in the field should have. The present edition brings the volume up to date and includes reference to the recent legislative changes which have had such far-reaching effects.

D. F.

## Techniques in Physiotherapy

Edited by F. L. Greenhill. London: Hodder & Stoughton Ltd., 1948. x + 222 pages; 37 illustrations. 22 x 14 cm. 12s. 6d. [£0.625]

The author states in her preface that "the present volume is an effort to present, in as practical a way as possible, some of the newer concepts of physical methods and their application to the problems of rheumatism and other medical and surgical ailments." The book is designed to provide the practising physiotherapist with a selected number of techniques that have successfully passed the hard test of actual practice. Dr. Greenhill is assisted by Dr. Heald in the chapter on rheumatism and arthritis, by Mr. Barron in that on burns and injuries of the hand, and by Mr. Colson in that on occupational therapy. Dr. Bowden undertook the section on peripheral nerve lesions and Miss Finlayson is largely responsible for that on techniques in chest conditions. There are also chapters on exercises and games for small groups, exercises for abdominal conditions, suspension therapy, complications following trauma, some specialized methods in physiotherapy, and medical practitioners and physiotherapy. Only a few of the techniques employed in orthopaedic clinics are included, since these have been fully described in other books. The conditions are discussed and the reasons for the different techniques are explained.

There are a few statements which this reviewer finds difficult to believe. One, for instance, is that 2-5 mA of direct current may be employed in order to reduce oedema, with the anode distal to an injury, when it cannot be applied over it, and the cathode on some other part of the body. It seems more likely that the elevation of the limb, which accompanies this treatment, is responsible for the reduction of oedema. Another such statement is that surged sinusoidal current, applied locally by means of padded electrodes, produces painless muscle contractions.

Physiotherapists will find much valuable information in this book. It should also interest specialists in physical medicine.

E. B. Clayton

## An Introduction to Pharmacology and Therapeutics

J. A. Gunn. Eighth edition. London: Geoffrey Cumberlege, Oxford University Press, 1948. ix + 301 pages. 8s. 6d. [£0.425]

The author of this Introduction is Chairman of the British Pharmacopoeia Commission; previous

editions have already established the great usefulness of the book. The 8th edition contains new sections on chemotherapy, penicillin, sex hormones and blood coagulation, and the whole has been revised to conform with the 1948 *British Pharmacopoeia*.

D. T. R.

## Artificial Pneumothorax in Pulmonary Tuberculosis

T. G. Heaton. Toronto: The Macmillan Company of Canada Limited, 1947. xvi + 292 pages; 3 figures. 21 x 14 cm. £1

The author has had many years of experience in tuberculosis and diseases of the chest in civilian life, in the Canadian Army, and now as clinician in charge of the chest service at a large war veterans' hospital in Toronto. This book summarizes his experience in the use of artificial pneumothorax; it describes the history of this technique, the physiological principles upon which it is based, the indications for its use, and the management and treatment of the complications which may arise. There is a very full bibliography at the end of each chapter, and the book represents a fairly comprehensive review of the literature dealing with artificial pneumothorax. There are also chapters on extrapleural pneumothorax, oleothorax and pneumoperitoneum. It should prove of great value to all those concerned with the long-term care of tuberculous patients.

D. F.

## Pasteurisation

Horry Hill. Second edition. London: H. K. Lewis & Co. Ltd., 1947. viii + 296 pages; 73 illustrations. £1 1s. [£1.05]

The aim of the author has been to emphasize the need for efficient pasteurization of milk and to provide a thorough understanding of the methods to be employed. It is unfortunate that the production of a 2nd edition was not made the occasion for a more drastic revision of the text. No doubt much useful information is embedded in it, but the style certainly militates against the better understanding of the subject which the author desires.

D. T. R.

## The Sulphonamides in General Practice

Edward D. Hoore. London: Staples Press, 90 pages. 17 x 10 cm. 5s. [£0.25]

This volume should be a useful addition to the literature of general practice; it gives in very clear and brief form the necessary information which should direct the chemotherapeutic volleys fired by the general practitioner. So guided, the practitioner should be in a position to avoid blind prescribing, and should rarely be baffled by the non-response of a case to sulphonamide therapy. It is perhaps debatable that the sulphonamides and penicillin are both equally effective in bronchopneumonia (page 73). Surely the relative non-toxicity of penicillin favours its use? In general, however, the author follows orthodox teaching in presenting the relative merits of the two agents. Perhaps a further volume dealing more extensively with other antibiotics and covering the whole field of chemotherapy and antibiotics for the general practitioner will be forthcoming; such a volume, written with the same clarity and concision, would be extremely useful.

D. F.

## Food and the Principles of Dietetics

Robert Hutchison. Revised by V. H. Mottram & George Graham. Tenth edition. London: Edward Arnold & Co., 1948. xxvii + 727 pages. 22 x 14 cm. £1 1s. [£1.05]

Eight years have passed since the last edition of this standard textbook. Despite much condensation, the book runs to 70 extra pages, owing to the advances in the science of nutrition made during and since the war.

Part I, "Diet in normal life", has been rewritten. The wide variation in intake which is compatible with health receives attention, and a salutary warning is given against attempts to fit the individual to the average requirements of the community. The dynamic concept of protein is lucidly set out, but this can hardly be said for the arguments which back the recommendation of 37 g. of first-class protein daily for the average adult male. Part II, "The nature of foods", has been compressed and rearranged, and there are many changes in Part III, "The principles of feeding in infancy and childhood" (by Charles Harris) and in Part IV, "Diet in the treatment of disease", where much that is needed in general practice is conveniently set out.

The book is a thoroughly useful one both for practitioners and dietitians.

W. T. C. Berry

### The Diabetic ABC. A Practical Book for Patients and Nurses

R. D. Lawrence. Tenth edition. London: H. K. Lewis & Co. Ltd., 1948. vii + 80 pages. 4s. [£0.2]

In the preface to the 1st edition, published in 1929, the author said his book contained what he would like to teach every patient if he had enough time. Through the many editions and reprints many patients have been so taught. This 10th edition renews the value of the work by the inclusion of fresh recipes "included to try to vary the general dullness" occasioned by the post-war food situation. The whole work presents a practical guide based on the author's "line diet" system.

D. T. R.

### The National Health Service

Prepared by the Ministry of Health & the Central Office of Information. London: His Majesty's Stationery Office [1949]. 36 pages. 22 x 14 cm. 6d. [£0.025]

At last we have an official presentation of the National Health Service, designed for the layman. This pamphlet describes why and how the Service came into being, outlines its administration, and states the benefits available under it. Reasonably enough, the pamphlet is non-controversial, and the wisdom or non-wisdom of the scheme is never questioned. The advantages to the layman are sufficiently emphasized: the various points of friction with the medical profession are not aired. Nor is the latter to be expected in such a pamphlet. It is well written and deserves to be widely read. A useful diagram sets out the administrative structure of the Service; this should help to clarify in the layman's mind the function of the various bodies which operate under it.

D. F.

### The Nuffield Foundation. Report of the Trustees for the Year Ending 31 March 1949

The Nuffield Foundation. Oxford: University Press, 1949. 127 pages. 22 x 14 cm.

At a time when the increasing domination of the State, combined with high taxation, threatens to dry up the springs of private philanthropy which have, in the past, been such a source of strength to academic and scientific workers, it is refreshing to

read such a Report. Clearly, Viscount Nuffield has realized the immense power for good which benefactions on such a scale as his are capable of wielding. The Nuffield Foundation has availed itself of the very best expert advice, and the result is that its benefactions are at once effective and efficient. Almost no branch of medical science has not benefited; the present Report is an inspiring record of progress, and it illuminates the various pressing problems which assail our time, not only in the field of medical science but also in the vast territories of other natural sciences and general social welfare.

D. F.

### Anaesthetics and the Patient

Gordon Ostlere. London: Sigma Books Ltd., 1949. (Sigma Introduction to Science, 15.) 166 pages; 4 plates; 6 figures. 19 x 12 cm. 7s. 6d. [£0.375]

In *Anaesthetics and the patient* Dr. Gordon Ostlere has set himself the task of stimulating and holding the layman's interest in a highly technical subject without, as he says, talking either down to his readers or above their heads. He seems to have succeeded remarkably well. His book gives a clear and simple picture of current anaesthetic practice, set in perspective by short historical interpellations indicating the main lines along which anaesthesia has progressed during its first hundred years.

Dr. Ostlere is particularly good at making the action of anaesthetics in the human body appear understandable; and his descriptions of such special procedures as the use of curare, controlled respiration in thoracic surgery, and anaesthesia in childbirth, are vivid and interesting. But he occasionally nips a finger in that trap set especially for experts: he tends to over-estimate the general reader's ability to comprehend the working of machines (for example, flowmeters) from short verbal descriptions, and to underrate his general knowledge—"Fish obtain oxygen from the water in which they swim, and flowers and plants, too, require oxygen for survival."

It is surely right to consider the history of anaesthesia a fascinating story, and Dr. Ostlere has chosen his illustrative excerpts with discrimination, but he sometimes seems on uneasy terms with the protagonists. The first specialist anaesthetist was "known as John Snow" because that was his name, but Hewitt, who among other important things devised an airway, was probably not often "called Hewitt." Nor was Snow "a pupil of the famous anatomist and surgeon, John Hunter," for when Snow attended the Hunterian School of Medicine, in Windmill Street, London, Hunter himself was long since dead.

But such small inaccuracies, and occasional repetitions, do not seriously detract from a book which came to be written because its author wished above everything "to help the nervous patient to face his operation in a better state of mind," for, as he says, "it is now the anaesthetic that has come to be feared rather than the surgical procedure itself." One may think that Dr. Ostlere over-simplifies when he claims that "knowledge does more than give courage, it removes the bogey itself," but his exposition of the nature of anaesthesia and the duties of the anaesthetist towards his patient certainly ought to reassure the man-in-the-street. Nevertheless the timid reader may do well to pass over Plate IV. This shows an abdomen being opened under light anaesthesia, with and without curare, and although it is very indistinct it is also very suggestive of gruesome detail.

Barbara M. Duncum

### Textbook for Midwives

Wilfred Shaw. London: J. & A. Churchill Ltd., 1948. viii + 689 pages; 223 illustrations. 19 x 13 cm. 12s. 6d. [£0.625]

This new textbook is based on the recognition of the increased importance and improved status of the midwife. "The book is intended for serious students who have a real and intelligent interest in midwifery" and is the outcome of the author's practical experience in training pupil midwives. It thus offers a much wider and fuller exposition of its subject than has been the case with the majority of such works in the past. The price is most reasonable for a well-illustrated book of such length.

D. T. R.

### Foods: their Values and Management

Henry C. Sherman. New York: Columbia University Press, 1945. viii + 221 pages. 22 x 14 cm. \$3.25

"Food management" is the technique of making the best use of food production and distribution to satisfy nutritional needs" and though Professor Sherman is dealing with the production of food in the USA he bears in mind the nutritional needs of the rest of the world. The book deals with the relation of food production to nutrition, not only from the view-point of those concerned with the food policies of nations, but also of the average American consumer whose demands influence agricultural production to a large degree. It aims to guide the consumer to a more informed selection of his food, for example, by an increased consumption of milk rather than meat, and by the acceptance of grass-fed beef. By moves such as these the consumer's diet will more closely approach optimal standards, and more land will become available to satisfy the needs both of the poorer sections of the American public and of other countries. Written by so high an authority this book should do good.

W. T. C. Berry

### Midwifery: by Ten Teachers

Edited by Clifford White, Frank Cook & William Gilliett. Eighth edition. London: Edward Arnold & Co., 1948. viii + 360 pages; 217 figures. 22 x 14 cm. £1

This work has earned its reputation not so much as a series of individual contributions as a consensus of authoritative opinion. A different section has been allocated to each author for thorough revision, but "only on occasion has it been necessary to accept the views of a majority." In this edition H. G. E. Arthur, A. C. H. Bell and F. W. Rogers are among the authors.

D. T. R.

### Human Physiology

F. R. Winton & L. E. Bayliss. Third edition. London: J. & A. Churchill Ltd., 1948. xv + 592 pages; 243 illustrations. 24 x 15 cm. £1 5s. [£1.25]

This 3rd edition appears after an interval of 12 years. It is designed for the medical student of physiology, not so much to include all the accepted facts as to encourage "the intellectual attitude of an alert explorer". The temptation, ever present in revision, to enlarge the work beyond the limits of a small textbook, has been resisted. As in the 2nd edition, a number of collaborators has been invited to make contributions in their special fields under the guiding influence of the original authors, but, since this influence is exerted throughout, there is no sense of disjointedness and a consistent standard is maintained.

D. T. R.

# Books Received

May 1949—August 1949

Reviews of many of these books appear in this number of the Bulletin or will appear in future numbers

Abellán Ayala, A. *Pancreopatas agudas no dramáticas. (Aspectos diagnósticos.)* Vols. 1 & 2. (Colección Española de Monografías Médicas.) 1949. Ediciones BYP (Barcelona), 20 ptas each volume

## Films

1526

### His Fighting Chance

made at St. Mary's Hospital, Carshalton, Western Fever Hospital, Fulham, and Wingfield Morris Orthopaedic Hospital, Oxford, 1949; a Central Office of Information film; technical advisers, Dr. C. J. L. Wells, Dr. T. Fisher & Dr. W. H. Kelleher; produced by Gordon Smith; directed by Geoffrey Innes; unit, Crown Film Unit; distributed by Central Film Library; available in 35 and 16 mm. sound, 918 feet [280 m.] and 366 feet [112 m.] respectively; monochrome; 10 minutes

This is a 10-minute film which was included in the programmes in 3,000 British cinemas in the autumn of 1949; it is largely made up of material from last year's film "Polio—Diagnosis and Management", which was a 50-minute film for medical audiences. It refers to President Roosevelt, who did not let this illness defeat him, and Mrs. Roosevelt has recorded part of the commentary. The film refers only briefly to diagnosis and deals chiefly with the hospital care and rehabilitation of patients. A two-year-old baby is seen in an early stage and again after a year, still in hospital, still improving; and a young man is shown at the beginning of his illness, at various stages of his recovery, and while training for a new job. The film also shows Mrs. Richmal Crompton, the writer, and an almoner, both working after having triumphed over their illness.

The film was not made specifically to meet the possibility of an epidemic in Great Britain, its object being to reassure the public about this illness by showing the active steps that are being taken in British hospitals to restore patients to good health. It is the first of a new series of films designed to be shown in public cinemas. Not all will be on health; others will deal with various scientific and technical subjects, but all will have a similar approach. It is admittedly difficult to say much about a technical subject in a 10-

minute film but these films will make themselves more easily remembered if they explain more about the background of the problems. "His Fighting Chance", for example, could not deal with methods of diagnosis but it could have explained that the nerves to some muscles are damaged by the acute illness; that many of these damaged nerves may quickly recover completely if not overtaxed, and that the remainder are encouraged and helped to recover by the graduated exercises shown. However, the film conveys well the importance of keeping up the patient's morale, and the cheerfulness of a small boy (aged 3), after a year in hospital, is indeed inspiring. In its standard of production the film will compare favourably with other films appearing in the same programmes, and it is to be welcomed.

1527

### A Technique of Subcutaneous Hormone Implantation

demonstrated by G. I. M. Swyer; produced by Brian Stanford for Roussel Laboratories Ltd.; obtainable free on application to Roussel Laboratories Ltd., 4 Golden Square, London, W. 1; available in 16 mm. mute, 220 feet [67 m.]; colour; 7 minutes at 24 frames per second

This silent film is designed as a teaching aid, to be shown to postgraduate audiences by a competent lecturer. It shows in very clear detail the rather simple procedure of subcutaneous hormonal implantation via a skin incision. Only the usual surgical instruments are used and the operation, performed under local anaesthesia, is of such simplicity that it should be within the range of any practitioner. The film does not deal with the indications for such hormonal therapy, with the problems of dosage, nor with the results to be expected; this is left to the lecturer, who, as has been said, is indispensable to the proper showing of the film. The film, after all, is designed as a teaching aid. However, the surgical procedure involved is so elementary that this reviewer, at least, wonders if cinematographic presentation is necessary to enable postgraduate students to grasp it.

# Guide to the Journals

## Anaesthesia

4: July 1949

- Chance in anaesthetic investigation. (H. J. V. Morton) 100-107  
The effect of curare on blood flow. (W. M. Brown) 108-117  
Convulsions during anaesthesia. (F. G. Wood-Smith) 118-124  
Pioneering in anaesthesiology. (R. M. Waters) 125-130  
Amniotic embolism. A possible bazaar in obstetric cases. (E. H. Seward) 131-132  
Anaesthesia in obstruction of the airway. Report on a case of obstructive goitre. (L. Wislicki) 133-135  
A case of cardiac arrest during anaesthesia. (E. A. Pask) 136-137  
The design and calibration of a vaporiser for trichlorethylene. (A. R. Hunter) 138-140  
Tubocurarine in the Trendelenburg position. (J. Clutton-Brock) 141-142  
Wide-bore endotracheal connections. (H. L. Thornton & H. L. Ozorio) 142-143

## Annals of Eugenics

14: June 1949

- The genetics of the sickle-cell trait in a Bantu tribe. (E. A. Beier) 279-284  
A pedigree showing some rare Rh genotypes. (S. D. Lawler & D. Bertinshaw) 285  
A non-existence theorem for an infinite family of symmetrical block designs. (M. P. Schützenberger) 286-287  
Parental and fraternal correlations for fitness. (J. B. S. Haldane) 288-292  
The incidence of parental consanguinity in diabetes mellitus. (H. Harris) 293-300  
The meaning of "fitness" in human populations. (L. S. Penrose) 301-304  
Note on the elimination of insignificant variates in discriminatory analysis. (M. H. Quenouille) 305-308  
The sib-sib age of onset correlation among individuals suffering from a hereditary syndrome produced by more than one gene. (H. Harris & C. A. B. Smith) 309-318  
The truncated binomial distribution. (D. J. Finney) 319-328  
A quantitative survey of the finger-prints of a small sample of the British population. (S. B. Holt) 329-338  
A test for homogeneity of records of familial abnormalities. (J. B. S. Haldane) 339-341

## Annals of the Rheumatic Diseases

8: June 1949

- The potential reversibility of rheumatoid arthritis. (P. S. Hench) 90-96  
The effect of a hormone of the adrenal cortex (17-hydroxy-11-dehydrocorticosterone: compound E) and of pituitary adrenocorticotrophic hormone on rheumatoid arthritis. Preliminary report. (P. S. Hench, E. C. Kendall, C. H. Slocumb & H. F. Polley) 97-104  
Drugs in the treatment of rheumatic disorders. (N. Mutch) 105-119  
Massive salicylate therapy in rheumatic fever. (G. Watkinson) 120-124  
Thiouracil administration and thyroidectomy in experimental polyarthritis of rats. (H. B. Tripi, W. C. Kuzell & G. M. Gardner) 125-131  
Comparative results of copper salts and gold salts in rheumatoid arthritis. (J. Forestier) 132-134  
Serum anti-tryptase in chronic rheumatic disease. (H. Coke) 135-138  
The familial incidence of rheumatoid spondylitis. (B. Rogoff & R. H. Freyberg) 139-142  
The aetiology of ankylosing spondylitis. (H. F. West) 143-148  
The opaque arthrography of the knee joint. (A. E. Jowett) 149-155  
Rheumatoid arthritis and amyloid disease. (B. Lush, E. Fletcher & J. F. Buchan) 156-157  
Generalized myositis fibrosa: case report. (J. A. Strong) 158-160

## Annals of the Royal College of Surgeons of England

4: May 1949

- The life and achievements of Joseph Thomas Clover. (A. D. Marston) 267-280  
Early stages of human development. (W. J. Hamilton) 281-294  
Congenital obstruction at the bladder neck. (A. W. Badenoch) 295-307  
The problem of closed head injury. (G. F. Rowbotham) 308-316  
The female breast and its development. (C. M. West) 317-325

4: June 1949

- John Hunter and his museum. (F. W. Jones) 337-341  
Some observations on the pathology and surgical treatment of labyrinthine vertigo of non-infective origin. (T. Cawthorne) 342-359  
Surgical problems involved in breast cancer. (F. E. Adair) 360-380  
Malignant disease of the mouth. (S. Cade) 381-391  
Liver function tests. (L. E. Glynn) 392-399

5: July 1949

- The surgical manifestations of sarcoidosis. (R. W. Raven) 3-28  
Some unpublished letters of William Clift relating to John Hunter's death. (G. Gordon-Taylor) 29-31  
Some proportional weights and measurements of the human body. (F. W. Jones) 32-33  
Report by the Director of the Imperial Cancer Research Fund. (W. E. Gye) 34-51  
Non-union of fractures of the mandible. (R. Mowlem) 52-63

5: August 1949

- Odontogenic and osteogenic tumours of the jaws. (K. H. Thoma) 73-88  
The general pathology of the lymphadenopathies. (G. Hadfield) 89-105  
Fibro-fatty tissue and its relation to certain "rheumatic" syndromes. (W. S. C. Copeman) 110-129

## Annals of Tropical Medicine and Parasitology

43: April 1949

- Investigations in the chemotherapy of malaria in West Africa. VI. Suppressive cure of malaria by sulphonamides. (G. M. Findlay) 1-3  
Post-stilbamidine neuropathy, with reference to the retention of the drug in the body. (M. H. Sadi) 4-12  
Experimental schistosomiasis. I. The culture of the snail vectors *Planorbis boissyi* and *Bulinus truncatus*. (O. D. Standen) 13-22  
Anopheles pupae (Diptera, Culicidae) from West Africa. (P. F. Mattingly) 23-25  
Air movement under mosquito- and sandfly-nettings. (W. Koch & D. Kaplan) 26-31  
Antimalarial studies in the quinoline series. (A. Gray & J. Hill) 32-38  
Comparative efficiency of different methods of packing the snail vectors of *Schistosoma haematobium* and *S. mansoni* for transport by air. (M. A. Azim & J. M. Watson) 39-40  
Comparative efficiency of various methods of infecting mice with *Schistosoma mansoni*. (J. M. Watson & M. A. Azim) 41-46  
Malarial immunity in Africans: effects in infancy and early childhood. (P. C. C. Garnham) 47-61  
Observations on sandflies (*Phlebotomus*) in Delft Island, North Ceylon. (H. F. Carter & P. Antonipulle) 62-73  
An outbreak of sylvan yellow fever in Uganda with *Aedes (Stegomyia) africanus* Theobald as principal vector and insect host of the virus. (K. C. Smithburn, A. J. Haddow & W. H. R. Lumsden) 74-89  
The differentiation of the polymorphic trypanosomes. (H. Fairbairn & A. T. Culwick) 90-95  
Observations on *Litomosoides carinii* (Travassos, 1919) Chandler, 1931. II. The migration of the first-stage larva. (W. E. Kershaw) 96-115

## Archives of Disease in Childhood

24: June 1949

- Celiac disease: a relation between dietary starch and fat absorption. (W. Sheldon) 81-87  
Blood volume studies in healthy children. (S. J. M. Russell) 88-98  
Some etiological factors in the celiac syndrome. (A. Brown) 99-106  
The effect of toxæmia of pregnancy upon the foetus and newborn child. (A. A. Brash) 107-116  
The nose in relation to the cerebrospinal fluid and lymph stream. (J. M. Yoffey) 117-124  
Renal venous thrombosis in the newborn. (M. L. Fallon) 125-128  
Congenital right-sided diaphragmatic hernia. Some difficulties in differential diagnosis and operative repair. (R. Belsey & J. Apley) 129-134  
Fugitive pericarditis. (O. D. Beresford) 135-136  
Congenital toxoplasmosis: report of two cases. (H. G. Farquhar & W. M. L. Turner) 137-142  
Osteopetrosis in successive generations. (J. Thomson) 143-148  
Gangrene and thrombosis in an infant with congenital heart disease. (J. D. L. Hansen) 149-151  
Gangrene in congenital syphilis. (W. P. Foster & R. G. G. Taylor) 152-156

## Biochemical Journal

44: 1949

- The influence of the pituitary on phosphorus metabolism of brain. (M. Reiss, P. E. Badrick & J. H. Halkerton) 257-260  
Studies on cholinesterase. 6. The selective inhibition of true cholinesterase *in vivo*. (R. D. Hawkins & B. Mendel) 260-264  
The absorption of vitamin A in ruminants and rats. (E. Eden & K. C. Sellers) 264-267  
The decarboxylation of  $\alpha$ -hydroxyphenylalanine. (H. Blaschko) 268-270  
Reducing-group production from starch by the action of  $\alpha$ - and  $\beta$ -amylases of barley malt. Activity of  $\alpha$ - and  $\beta$ -amylases. (I. A. Freese & M. Shadakhshary) 270-274  
Changes in the extracellular and intracellular fluid phases of muscle during starvation and dehydration in adult rats. (S. E. Dicker) 274-281  
Colorimetric determination of potassium by folin-ciocalteu phenol reagent. (M. A. M. Abul-Fadi) 282-285  
The nicotinamide-sparing action of tryptophan and the biosynthesis of nicotinamide by the intestinal flora of the rat. (P. Ellinger & M. M. A. Kader) 285-294  
The measurement of glucuronide synthesis by tissue preparations. (G. A. Levy & I. D. E. Storey) 295-299  
The frequency distribution of the zinc concentrations in the dental tissues of the normal population. (D. B. Cruickshank) 299-302  
A biochemical study of *Pseudomonas putrefaciens* Wormald I. Pectin esterase. (G. B. Mills) 302-305  
The measurement of the cytochrome oxidase activity of enzyme preparations. (E. C. Slater) 305-318  
Studies on the absorption of proteins: the amino-acid pattern in the portal blood. (C. E. Dent & J. A. Schilling) 318-333  
Addendum. Conjugated amino-acids in portal plasma of dogs after protein feeding. (H. N. Christensen) 333-335  
The metabolism of sulphonamides. 6. The fate of some  $N^4$ - $n$ -acyl derivatives of amide (marfanil) and the sulphone, V 335, in the rabbit. (R. L. Hartles & R. T. Williams) 335-340  
The fluorimetric estimation of riboflavin in foodstuffs and other biological material. (E. Kodicek & Y. L. Wang) 340-343  
The fluorimetric estimation of nicotinamide in biological materials. (D. K. Chaudhuri & E. Kodicek) 343-348  
The tryptophanase-tryptophan reaction. 9. The nature, characteristics and partial purification of the tryptophanase complex. (E. A. Dawes & F. C. Happold) 349-361

## GUIDE TO THE JOURNALS

Metabolism of polycyclic compounds. 5. Formation of 1:2-dihydroxy-1:2-dihydronaphthalenes. (J. Booth & E. Boyland) 361-365  
 The excretion of synthetic oestrogens as ethereal sulphates and monoglucuronides in the rabbit and in man. (S. A. Simpson & A. E. W. Smith) 366-368  
 Some reactions of hydrogen carriers by haematin-catalyzed peroxidations. 2. The substrate specificity of the tyrosine decarboxylase of *Streptococcus faecalis*. (G. H. Sloane-Stanley) 373-377  
 The effects of applied pressure on secretion by isolated amphibian gastric mucosa. (R. E. Davies & C. Turner) 377-384

44 : 1949

Globulin complexes with oestrogenic acids. (W. Hausmann & A. E. W. Smith) 385-386  
 Seed globulins of the Gramineae and Leguminosae. (C. E. Danielsson) 387-400  
 Carotenoids of loquat (*Eriobotrya japonica* Lindl.). (J. C. Sadana) 401-402  
 Improved separation of sugars on the paper partition chromatogram. (M. A. Jermyn & F. A. Isherwood) 402-407  
 Accumulation of glutamic acid in isolated brain tissue. (J. R. Stern, L. V. Eggleston, R. Hems & H. A. Krebs) 410-418  
 Displacement chromatography on synthetic ion-exchange resins. 1. Separation of organic bases and amino-acids using cation-exchange resins. (S. M. Partridge & R. G. Westall) 418-428  
 Purification of alkaline phosphatase. (M. A. M. Abul-Fadl, E. J. King, J. Roche & Nguyen-van Thoa) 428-431  
 Purification of faecal alkaline phosphatase. (M. A. M. Abul-Fadl & E. J. King) 431-433  
 Reactivation of alkaline phosphatase by tryptic digestion. (M. A. M. Abul-Fadl & E. J. King) 434-435  
 The action of trypsin on monophenols. (L. P. Kendal) 442-454  
 Polysaccharides synthesized by aerobic mesophilic spore-forming bacteria. (W. G. C. Forsyth & D. M. Webley) 455-459  
 The pathway of the adaptive fermentation of galactose by yeast. (J. F. Wilkin-Studies on the lens. (M. Langham & H. Davson) 467-470  
 Breakdown of cozymase by a system from nervous tissue. (H. McIlwain & R. Kerr, J. G. Campbell & L. P. Kendal) 477-487  
 Concentration of lipids in the brain of the uterus and other organs. (L. M. H. McNabb & R. J. Rossiter) 487-494  
 Effects of amides on oxidases of *Escherichia coli* and adults. (A. C. Johnson, A. R. Gordon & E. Sowden) 498-501  
 The quantitative determination of barbiturates in tissues by ultraviolet absorption spectrophotometry. (G. V. R. Born) 501-505  
 Nicotinamide biosynthesis by intestinal bacteria as influenced by methyltryptophans. (P. Ellinger & M. A. Kader) 506-509  
 The linkage of glutamic acid in protein molecules. (F. Haurowitz & F. Bursa) 509-512

44 : 1949

Displacement chromatography on synthetic ion-exchange resins. 2. The separation of organic acids and acidic amino-acids by the use of anion-exchange resins. (S. M. Partridge & R. C. Brimley) 513-521  
 Displacement chromatography on synthetic ion-exchange resins. 3. Fractionation of a protein hydrolysate. (S. M. Partridge) 521-527  
 The distribution of urethane in animal tissues, as determined by a microdiffusion method, and the effect of urethane treatment on enzymes. (E. Boyland & E. Rhoden) 528-531  
 An immune globulin fraction from bovine precolostrum. (E. I. McDougall) 531-541  
 A further study of hydrolysates of gramicidin. (R. L. M. Syngé) 542-548  
 A study of the acidic peptides formed on the partial acid hydrolysis of wool. (R. Consden, A. H. Gordon & A. J. P. Martin) 548-560  
 The use of the tyrosine apodecarboxylase of *Streptococcus faecalis* R for the estimation of codecarboxylase. (G. H. Sloane-Stanley) 567-573  
 A quantitative study of complex formation in heated protein mixtures. (A. Kleczkowski) 573-581  
 Nitrogenous excretion in Chelonian reptiles. (V. Moyle) 581-584  
 The concentration and distribution of haemoglobin in the root nodules of leguminous plants. (J. D. Smith) 585-591  
 Haemoglobin and the oxygen uptake of leguminous root nodules. (J. D. Smith) 591-598  
 The inhibition of  $\beta$ -glucuronidase by saccharic acid and the role of the enzyme in glucuronide synthesis. (K. C. Karunaratnam & G. A. Levy) 599-604  
 The metabolism of chrysene: the isolation of 3-methoxychrysene by methylation. (R. Schoental) 604-606  
 Bile acid enteroliths; with an account of a recent case. (F. S. Fowweather) 607-610  
 The Bence-Jones protein of multiple myelomatosis: its methionine content and its possible significance in relation to the aetiology of the disease. (C. E. Dent & G. A. Rose) 610-618  
 The fate of certain organic acids and amides in the rabbit. 7. An amidease of rabbit liver. (H. G. Bray, S. P. James, I. M. Raffan & W. V. Thorpe) 618-625  
 The enzymic hydrolysis of glutamine and its spontaneous decomposition in buffer solutions. (H. G. Bray, S. P. James, I. M. Raffan & W. V. Thorpe) 625-627  
 The effect of various diets on the metabolism of nicotinic acid and nicotinamide in the rabbit. (P. Ellinger & M. A. Kader) 627-631  
 Regulation of urinary steroid excretion. 1. Effects of dehydroisandrosterone and of anterior pituitary extract on the pattern of daily excretion in man. (M. Reiss, R. E. Hemphill, J. J. Gordon & E. R. Cook) 632-635  
 The use of the Waring blender in biochemical work. (R. Stern & L. H. Bird) 635-637  
 A mercury gasometer for the preparation of gas mixtures. (E. F. Hartree & C. H. Harpely) 637-639

45 : 1949

A comparative study of the succinic dehydrogenase-cytochrome system in heart muscle and in kidney. (E. C. Slater) 1-8  
 The action of inhibitors on the system of enzymes which catalyse the aerobic oxidation of succinate. (E. C. Slater) 8-13  
 A respiratory catalyst required for the reduction of cytochrome *c* by cytochrome *b*. (E. C. Slater) 14-30  
 Nitrogen in human dental enamel. (D. J. Anderson) 31-32  
 Interrelationship of certain vitamins of the B group in aneurin, riboflavin and biotin deficiencies. (K. Bhagvat & P. Devi) 32-38  
 The fractionation of weak electrolyte mixtures by ion-exchange resins. (C. W. Davies) 38-41  
 Direct transformation of oxalacetate, without intermediate formation of malate, by *Clostridium saccharobutylicum*, strain GR 4. (G. Cohen-Bazire & G. N. Cohen) 41-45  
 The fate of certain organic acids and amides in the rabbit. 8. Toluic acids and amides. (H. G. Bray, W. V. Thorpe & P. B. Wood) 45-50  
 Properties of the acid phosphatases of erythrocytes and of the human prostate gland. (M. A. M. Abul-Fadl & E. J. King) 51-60  
 The micro- and ultramicro-determination of chlorine in organic compounds. (J. D. Judah) 60-65  
 Studies in detoxication. 25. The characterization of phenylglucuronide, and its rate of hydrolysis compared with that of phenylsulphuric acid. (G. A. Garton, D. Robinson & R. T. Williams) 65-67  
 Some effects of glucose and calcium upon the metabolism of kidney slices from adult and newborn rats. (J. R. Robinson) 68-74  
 The estimation of trichloroethylene in blood. (F. H. Brain & P. J. Helliwell) 75-79  
 Vitamin P. 3. (S. S. Zilva) 79-83  
 The micro-estimation and origin of methylamine in *Mercurialis perennis* L. (B. T. Cromwell) 84-86  
 The metabolism of and origin of methylamine in *Mercurialis perennis* L. (B. T. Cromwell) 84-86  
 The kinetics and specificities of deamination of *N*-acetylglucosamine by strains of *Streptococcus haemolyticus* and other streptococci. (H. J. Rogers) 87-93  
 An investigation of the intracellular fluid of calf embryo muscle. (A. H. Gordon) 99-105  
 The effect of dietary oleic and palmitic acids on the composition and turnover rates of liver phospholipids. (J. G. Campbell, J. Olley & M. Blewett) 105-112  
 Renal function as affected by experimental unilateral kidney lesions. 2. The effect of cyanide. (T. F. Nicholson) 112-115

Brain

72 : March 1949

Muscle spindles in human extrinsic eye muscles. (S. Cooper & P. M. Daniel) 1-24  
 On amyotonia congenita. (J. W. A. Turner) 25-34  
 Proprioception and the motor cortex. (E. Gellhorn) 35-62  
 The significance of Tinel's sign in peripheral nerve injuries. (J. R. Napier) 63-82  
 État marbré of the thalamus following birth injury. (R. M. Norman) 83-88  
 Disorders of the body image caused by lesions of the right parietal lobe. (M. Roth) 89-111

72 : June 1949

Observations on essential (heredofamilial) tremor. (M. Critchley) 113-139  
 Tridione therapy in minor epilepsy. (G. R. Davies & J. D. Spillane) 140-149  
 Cerebral lesions due to intracranial aneurysms. (E. G. Robertson) 150-185  
 Quantitative observations on the olfactory system of the rabbit. (A. C. Allison & R. T. T. Warwick) 186-197  
 Experimental "allergic" encephalomyelitis. (C. E. Lumsden) 198-226  
 The orbital gyri. (E. Sachs, S. J. Brendler & J. F. Fulton) 227-240  
 Some observations upon the otological effects of streptomycin intoxication. (M. R. Dix, C. S. Hallpike & M. S. Harrison) 241-245  
 Hereditary stenosis of the aqueduct of Sylvius as a cause of congenital hydrocephalus. (D. S. Bickers & R. D. Adams) 246-262

British Dental Journal

86 : 6/5/49

Two cases of macrostomia described with some observations on the incidence of defective development of the mandibular arch in the sheep. (J. Davies) 217-225  
 Human enamel protein. (P. Pincus) 226-227  
 The anodic treatment of aluminium and its alloys for use in the mouth. (G. G. Tregarthen) 227-228  
 Dental Board of the United Kingdom. Chairman's address at the opening of the fifty-sixth session. (E. W. Fish) 241-244  
 Paget's disease of the maxilla. (J. F. Carr) 245-247  
 The removal of resistant teeth. (A. E. Meeson) 247-252  
 Fatigue studies on some dental resins. (W. Johnson & E. Matthews) 252-253

86 : 20/5/49

The effect of topical applications of potassium fluoride and of the ingestion of tablets containing sodium fluoride on the incidence of dental caries. (H. H. Stones, F. E. Lawton, E. R. Bransby & H. O. Hartley) 263-271  
 An unrecorded form of the simplest type of the dilated composite odontome. (E. K. Tratman) 271-275

86 : 3/6/49

A fact-finding investigation concerning the dentures and relevant matters of pure blood aboriginal children in Central Australia. (J. Heath) 287-293  
 Operative correction of mandibular protrusion and asymmetry. (H. Myrhaug) 293-297  
 A test for the end-point of decalcification of histological specimens. (A. E. W. Miles) 297-299

86 : 17/6/49

87 : 1/7/49

- Presidential address. (J. M. Macrae) 1-4  
 Val-dictory address. (P. G. Capon) 4-6  
 Hereditary dentinogenesis imperfecta (opalescent dentine). (W. R. Roberts) 6-10  
 Abrasion resistance of dental materials. (J. Osborne) 10-12

87 : 15/7/49

- An assessment of the values of porcelain versus methyl-methacrylate in jacket crown and bridge work. (H. A. P. Roche) 25-32  
 A preliminary investigation into the shrinkage of the oral tissues due to embedding in paraffin wax. (E. B. Brain) 32-38  
 The application of injections of absolute alcohol to local anaesthesia in dentistry: a report on ten cases. (A. J. Clement) 39-41

87 : 5/8/49

- Topical application of solutions of fluorides to the teeth. (G. J. Parfitt) 53-58  
 General principles of apicectomy with special reference to posterior teeth. (W. Lindley) 58-70  
 Preservation of study and teaching models. (P. A. Trotter) 70-72

87 : 19/8/49

- Symposium on oral diseases in tropical countries:  
 I. The effect of betel chewing on the dental and oral tissues and its possible relationship to buccal carcinoma. (W. Balendra) 83-87  
 II. Incidence of oro-dental diseases in Malaya. (E. K. Tratman) 87-91  
 General principles of apicectomy with special reference to posterior teeth. (W. Lindley) 91-97  
 A technique for the individual fabrication of plastic eye prostheses. (A. J. W. Turrell) 97-100

## British Heart Journal

11 : April 1949

- Arteriovenous aneurysm of the lung. (C. Baker & J. R. Trounce) 109-118  
 The heart rate with exercise in patients with auricular fibrillation. (J. A. C. Knox) 119-125  
 Calcified aortic valve. Clinical and radiological features. (C. E. Davies & R. E. Steiner) 126-136  
 Right bundle branch block and cardiac infarction. (P. Meyer) 137-144  
 Right ventricular stenosis (Bernheim's syndrome). (T. East & C. Bain) 145-154  
 Mitral stenosis in later life. (H. Cookson) 155-164  
 Circulation times in congenital heart disease. (K. D. Allanby) 165-169  
 Morbus coeruleus. A study of 50 cases after the Blalock-Taussig operation. (C. Baker, R. C. Brock, M. Campbell & S. Suzman) 170-195  
 Appendix on cardiac catheterization. (G. A. Zak) 195-200

11 : July 1949

- Hypertensive and ischaemic heart disease: a comparative clinical and pathological study. (C. V. Harrison & P. Wood) 205-229  
 Sino-auricular block, interference dissociation, and different recovery rates of excitation in the bundle branches. (H. B. Burchell) 230-236  
 Electroradiographic studies in cretins. (B. Schlesinger & B. Landman) 237-248  
 The effects of thiocyanate on basal and supplemental blood pressures. (K. S. Alsaid) 249-256  
 Radiokymography in patent ductus arteriosus. (K. S. Smith & F. G. Wood) 257-263  
 Mass miniature radiography in the detection of heart disease. (A. Maclean & A. Rogen) 264-270  
 The electrocardiogram of posterior cardiac infarction. (P. Meyer) 271-278  
 Transposition of the aorta and pulmonary artery demonstrated by angiocardigraphy. (J. F. Goodwin, R. Steiner & E. J. Wayne) 279-286  
 The results of medical and surgical treatment of essential hypertension. (M. A. Keith, B. Woolf & A. R. Gilchrist) 287-295

## British Journal of Cancer

3 : March 1949

- The mortality from cancer of the skin and lip in certain occupations. (M. Atkin, J. Fenning, J. A. Heady, E. L. Kennaway & N. M. Kennaway) 1-15  
 The treatment of retinal glioma. (E. M. Japha) 16-26  
 The study of connective-tissue reaction to radiation. The sieve or chess method. (B. Jolles) 27-31  
 Further observations on the protection effect in radiation chemistry. (W. M. Dale, J. V. Davies & W. J. Meredith) 31-41  
 Urinary cholesterol in cancer: urinary cholesterol excretion in cancer patients and control subjects. (M. M. Burchell, J. H. O. Earle & N. F. MacLagan) 42-51  
 Urinary cholesterol in cancer: chemical state of urinary cholesterol and methods of estimation. (M. M. Burchell & N. F. MacLagan) 52-61  
 A qualitative study of urinary 17-ketosteroids in normal males and in men with prostatic disease. (A. M. Robinson & F. Goulden) 62-71  
 The cultivation of tumours in the fertile egg, with special reference to associated ectodermal lesions of the chorioallantoic membrane. (J. G. Campbell) 72-85  
 Intranasal administration of mammary tumour milk factor. (A. M. Begg) 88-90  
 An attempt to demonstrate neutralizing antibodies to the mammary tumour "milk agent" in mice. (P. A. Gorer & L. W. Law) 90-93  
 Inhibition of the carcinogenic properties of urethane by pentose nucleotides. (P. N. Cowen) 94-97  
 The induction of mutations by a carcinogen. (L. C. Strong) 97-108  
 An experimental study of the initiating stage of carcinogenesis, and a re-examination of the somatic cell mutation theory of cancer. (I. Berenblum & P. Shubik) 109-118  
 The induction of tumours with nitrogen mustards. (E. Boyland & E. S. Horning) 118-123  
 Carcinogenic activity of lipid substances. (I. Hieger) 123-139  
 Investigations on the serum proteins in rats during the development of hepatic tumours due to feeding *p*-dimethylaminoazobenzene. (C. Hoch-Ligeti, H. Hoch & K. Goodall) 140-147

- The effect of 1:2:5:6-dibenzanthracene on the ascorbic acid content of the liver of rats maintained on high and low protein diets. (L. A. Elson, E. L. Kennaway & M. M. Tipler) 148-156  
 Experiments on the identification of 3:4-benzpyrene in domestic soot by means of the fluorescence spectrum. (F. Goulden & M. M. Tipler) 157-160

3 : June 1949

- Cancer and occupation in the Netherlands. (J. J. Versluys) 161-165  
 The malignancy of cancer at different ages: a histological study. (J. C. Lees & W. W. Park) 166-197  
 Spontaneous hepatocellular and cholangiocellular carcinoma in the duck. An experimental study. (J. G. Campbell) 198-210  
 The effects of castration and stilboestrol on prostatic tumours in mice. (E. S. Horning) 211-230  
 Mammary tumours in hybrid mice: the presence and transmission of the mammary tumour agent. (L. Foulds) 230-239  
 Mammary tumours on hybrid mice: hormone-responses of transplanted tumours. (L. Foulds) 240-246  
 Survival of the milk factor in a transplantable breast tumour in mice. (L. Dmochowski) 246-249  
 A pressure mincer for the preparation of tumour suspensions. (J. Craigie) 249-250  
 A drying apparatus for the study of tumour transmission. (J. Craigie) 250-255  
 A study of cell survival in embryonic tissue grafts in inbred strains of mice under various conditions. (I. Mann) 255-259  
 The survival of activity of mouse sarcoma tissue after freezing and drying. (W. E. Gye, A. M. Begg, I. Mann & J. Craigie) 259-267  
 The preservation of suspensions of tumour cells in dextrose at low temperatures. (J. Craigie) 268-274  
 The effect of a restricted diet on mitotic activity in the mouse. (W. S. Bullough) 275-282  
 Epidermal mitotic activity and the induction of skin tumours in mice. (F. Bielschowsky & W. S. Bullough) 282-285  
 Primary pancreatic tumours in rats fed *p*-dimethylaminoazobenzene. (C. Hoch-Ligeti) 285-288  
 Attempts to induce epithelial tumours in fowls. (A. Peacock & P. R. Peacock) 289-295  
 The influence of solvents on tissue response to carcinogenic hydrocarbons. (P. R. Peacock, S. Beck & W. Anderson) 296-305  
 3:4-Benzpyrene as an -SH inhibitor. (G. Calcutt) 305-310

## British Journal of Dermatology and Syphilis

60 : December 1948

- Notes on a case of colloid pseudomillium. (G. H. Percival & D. A. Duthie) 399-404  
 A case of orf (contagious pustular dermatitis): identification of the virus. (F. Blakemore, M. Abdussalam & W. N. Goldsmith) 404-409  
 A peculiar, pellagra-like skin sensitization to light in starving persons. (M. Grzybowski) 410-415  
 Rash and toxic symptoms ascribed to "U.F.I." (H. St. H. Vertue) 415-417

61 : January 1949

- Milestones on a dermatological journey. (J. M. H. MacLeod) 1-16

61 : February 1949

- Observations on the structure and formation of bullae. I. (G. H. Percival & P. W. Hannay) 41-54  
 A droplet culture method for fungus isolation, and a staining method for diagnosis of epidermophytosis. (J. Curry) 54-58  
 Pruritus hiemalis. A review of the literature and a case report with new observations. (P. Arnold) 59-66

61 : March 1949

- Observations on the structure and formation of bullae. II. (G. H. Percival) 77-89  
 Dermatitis herpetiformis in an infant. (D. R. Evans) 89-94

61 : April 1949

- The clinical reaction of the skin to mustard gas vapour. (D. C. Sinclair) 113-125  
 Epithelioma arising on lupus erythematosus. (G. E. W. Wolstenholme) 126-130  
 A case of multiple benign angiomas. (S. Canter) 130-131

61 : May 1949

- Kaposi's varicelliform dermatosis: a virus pyoderma. (T. Anderson) 157-166  
 A case of Kaposi's varicelliform eruption (systemic herpes simplex) with dendritic ulceration of the cornea. (R. Varley & T. Klez) 166-170  
 A fatal case of Kaposi's varicelliform eruption. (J. C. S. Leverton & F. A. Whitlock) 170-173

61 : June 1949

- Congenital cutaneous dystrophy (Thomson's type). (A. Rook & I. Whimster) 197-205  
 The new ointment bases of the British Pharmacopoeia 1948. (J. Soulsby) 206-210  
 Nutritional disorders of the skin among prisoners of war in the Far East. (R. D. G. P. Simons) 210-215  
 A clinical study of eczema of the nipple and areola, and its treatment with oestrogenic hormone. (A. H. Shaaban & H. S. El-Nasr) 216-221

61 : July 1949

- Malignant lupus erythematosus. (J. M. Beare) 233-247  
 The histology of granuloma annulare compared with that of the necrobiotic nodules of rheumatoid arthritis. (R. E. Bowers) 247-250  
 Acanthosis nigricans associated with bronchial carcinoma. Report of two cases. (B. K. Ellenbogen) 251-254

## 61 : August-September 1949

- Fibrous changes in the dermis, with special reference to senile elastosis. (G. H. Percival, P. W. Hannay & D. A. Duthie) 269-276  
 Liver function in Darier's disease and pityriasis rubra pilaris. (A. Porter & S. R. Brunauer) 277-281  
 The achievement of Robert Willan. (G. H. Findlay) 281-286  
 Mepacrine drug eruption affecting a tooth. (G. A. G. Peterkin) 287-288

## British Journal of Experimental Pathology

## 30 : February 1949

- Rift Valley fever; the neurotropic adaptation of the virus and the experimental use of this modified virus as a vaccine. (K. C. Smithburn) 1-16  
 Hyperplasia of the parathyroids associated with osteitis fibrosa in rats treated with thiouracil and related compounds. (J. Malcolm, W. E. Griesbach, F. Bielschowsky & W. H. Hall) 17-23  
 Thyrotropic hormone in thyrotoxicosis, malignant exophthalmos and myxoedema. (H. D. Purves & W. E. Griesbach) 23-30  
 The effect of acridine compounds on mitosis and oxygen consumption in the isolated brain of the embryonic chick. (R. J. O'Connor) 30-34  
 Rift Valley fever; transmission of the virus by mosquitoes. (K. C. Smithburn, A. J. Haddow & W. H. R. Lumsden) 35-47  
 Factors involved in influenza haemagglutination reactions. (W. Smith & M. A. Westwood) 48-61  
 The effect of heat upon diphtheria toxin-antitoxin floccules. (M. Barr) 61-72  
 The Lewis blood groups of 79 families. (R. R. Race, R. Sanger, S. D. Lawler & D. Bertinshaw) 73-83

## 30 : April 1949

- Ovomucin, a substrate for the enzyme of influenza virus. I. Ovomucin as an inhibitor of haemagglutination by heated Lee virus. (A. Gottschalk & P. E. Lind) 85-92  
 The application of paper partition chromatography to the production of diphtheria toxin; two-dimensional chromatography. (F. V. Linggood & A. J. Woitwod) 93-100  
 Laterosporin A and laterosporin B, antibiotics produced by *B. laterosporus*. (E. M. Barnes) 100-104  
 Acute experimental calcium chloride acidosis. (A. D. T. Govan & J. Parkes) 105-114  
 Antibiotics from *Aspergilli*. (D. Gill-Carey) 114-118  
 The nature of some antibiotics from *Aspergilli*. (D. Gill-Carey) 119-123  
 The effect of triphenylmethane dyes on the intracellular growth of influenza virus A. (L. Hoyle) 123-129  
 An antibiotic produced by *Staphylococcus aureus*. (J. F. Gardner) 130-138  
 Electron-microscopical studies on the mechanism of lysis and the multiplication of bacteriophage of *Bact. coli*. (K. B. E. Merling) 139-150  
 Antibiotics from penicillia. (H. S. Burton) 151-158

## 30 : June 1949

- The influence of chemical constitution on antibacterial activity. Part IV: A survey of heterocyclic bases, with special reference to benzquinolines, phenanthridines, benzacridines, quinolines and pyridines. (A. Albert, S. D. Rubbo & M. I. Burvill) 159-175  
 Antibiotics active against bacterial viruses. (I. N. Asheshov, F. Strelitz & E. A. Hall) 175-185  
 The erythrocyte receptor for pertussis haemagglutinin. (S. Fisher) 185-189  
 Enzyme adaptation in bacteria: fate of nitrate in nitrate-adapted cells grown in the absence of substrate. (S. D. Wainwright & M. R. Pollock) 190-198  
 The "Lewis" blood group characters of erythrocytes and body-fluids. (R. Grubb & W. T. J. Morgan) 198-208  
 Alvein. (K. Gilliver, A. M. Holmes & E. P. Abraham) 209-213  
 The antibacterial properties of some species of aerobic spore-forming bacilli. (K. Gilliver) 214-220  
 Serological diagnosis in mumps. (H. Lundback) 221-231  
 An electrophoretic study of the components of the serum proteins in cirrhosis of the liver. (N. H. Martin) 231-236

## British Journal of Industrial Medicine

## 6 : July 1949

- The care of the lead worker. (R. E. Lane) 125-143  
 An outbreak of cases of Raynaud's phenomenon of occupational origin. (J. N. Agate) 144-163  
 Skin sensitivity to cetrimide (CTAB). (C. N. D. Cruickshank & J. R. Squire) 164-167  
 The problem of consistent radiological diagnosis in coalminers' pneumoconiosis—an experimental study. (C. M. Fletcher & P. D. Oldham) 168-183  
 Talc pneumoconiosis. (A. I. G. McLaughlin, E. Rogers & K. C. Dunham) 184-194

## British Journal of Nutrition

## 2 : 1949

- Dietary intakes of vitamin C in Iceland. (J. Sigurjonsson) 275-281  
 Inadequacy of the 24 hr. dietary history as a true estimate of food intake in times of acute food shortage as demonstrated by experience in Vienna in 1946. (H. S. Collins) 282-289  
 Lambing in relation to the diet of the pregnant ewe. (A. M. Thomson & W. Thomson) 290-305  
 Permanent colostomy in the rat. (L. R. C. Agnew) 305-309  
 The losses of edible food due to plate waste, in Army dining halls. (G. C. Arneil & D. R. Badham) 310-313  
 Diet and resistance to experimental tuberculosis in mice. (S. R. Sengupta & J. W. Howie) 313-320  
 Antibody production in pyridoxin-deficient rats. (L. R. C. Agnew & R. Cook) 321-329

## British Journal of Ophthalmology

## 33 : May 1949

- Pathogenesis of concurrent eye and joint diseases. (E. Godtfredsen) 261-270  
 Ox vitreous humour. 2. Hyaluronic acid relationships. (A. Pirie) 271-283  
 Leiomyoma of the iris. Report of a case. (K. O'Day) 283-290  
 Recession of the inferior oblique. (I. Lloyd) 291-296  
 Statistical data of my cataract operations performed with a new suture of the sclera. (F. Papolczy) 296-305  
 The illumination of the Snellen chart. (M. Gilbert & R. G. Hopkinson) 305-310  
 The formation of the intra-ocular fluids. Studies of the urea component of the aqueous humour. (E. J. Ross) 310-323

## 33 : June 1949

- Studies on the intra-ocular fluids. 2. The penetration of certain ions into the aqueous humour and vitreous body. (S. Duke-Elder, H. Davson & D. M. Maurice) 329-338  
 Diseases of the eye in relation to dental surgery. (J. H. Daggart) 338-347  
 Concentration in the aqueous of various sulphonamides after systemic administration. (A. Sorsby) 347-358  
 The significance of ocular complications following vaccination. (E. Roscn) 358-368  
 The treatment of hypopyon ulcer of the cornea. (E. H. Cameron) 368-371  
 Modern views of surgery of the cornea. (M. Sobhy) 372-376  
 Injection of the retinal vascular system in enucleated eyes. (I. C. Michaelson & H. F. Steedman) 376-379  
 Severe lesion of the visual path in pregnancy. (G. Peremy) 379-381  
 An unusual congenital defect. (A. H. Briggs & D. W. McLean) 381-384  
 A case of ocular myiasis. (E. E. Cass) 385-386  
 The lacrimal strip and the precorneal film in cases of Sjögren's syndrome. (M. Klein) 387-388  
 The relation between peripheral retinal cysts and dialyses. (S. Duke-Elder) 388-389

## 33 : July 1949

- Toxoplasmosis, a summary of the disease with report of a case. (H. Ridley) 397-407  
 Vascular changes in diabetes with particular reference to the retinal vessels. Preliminary report. (N. Ashton) 407-420  
 Contact lenses: an analysis of the results of use. (A. G. Cross) 421-445  
 The nature of the malignant choroidal melanomata. (E. Wolff) 445-452  
 Studies on the intra-ocular fluids. Part 3. The penetration of some nitrogenous substances into the intra-ocular fluids. (S. Duke-Elder, H. Davson & A. M. Woodin) 452-454  
 Interstitial keratitis occurring in a case of Reiter's disease. (E. E. Cass) 454-455

## 33 : August 1949

- Psychosomatic phenomena in ophthalmology. (E. Hartmann) 461-476  
 Final results of squint operations in which restoration of binocular single vision was not expected. (A. Stanworth) 477-484  
 The cornea in polarized light. (Preliminary communication.) (A. Stanworth) 485-490  
 Hereditary myopia in identical twins. (R. A. Burns) 491-494  
 Traumatic or "concussion" chronic glaucoma. (A. D'Ombrian) 495-500  
 Bilateral symmetrical tuberculous ulcers of the bulbar conjunctivae treated with streptomycin. (B. K. Das Gupta & M. Usman) 501-505  
 The photopic luminosity curve and visual purple. (L. C. Thomson) 505-508  
 Iridoschisis in a case of chronic primary glaucoma. (R. R. Garden & A. R. Wear) 509-511  
 A note on the effect of sleep on glaucoma. (E. M. G. Galton) 511-512  
 Eye-lash in the lacrimal punctum. (A. J. Boase) 513  
 The subconjunctival *ab externa* approach in glaucoma. (E. Wolff) 514-518  
 On the use of amniotic membrane. (C. Dansey-Browning) 518-520  
 Unusual ocular foreign body. (N. K. Ghose) 520-521

## British Journal of Pharmacology and Chemotherapy

## 4 : June 1949

- Some pharmacological actions of piperidine, pyrrolidine, and of precursor concentrates from dog urine. (M. F. Lockett) 111-119  
 Studies on the metabolism and mode of action of DDT. (J. D. Judah) 120-131  
 Contribution to the thrombocytopenic action of urethane in dogs. (W. O. Cruz & E. M. da Silva) 132-134  
 A study of the toxicity of the protamine, salmine. (L. B. Jaques) 135-144  
 A contribution to the physiology and pharmacology of *Ascaris lumbricoides* from the pig. (E. Baldwin & V. Moyle) 145-152  
 The action of histamine on hydrochloric acid and pepsin secretion in man. (C. A. Ashford, H. Heller & G. A. Smart) 153-156  
 The effect of antihistamine substances on gastric secretion in man. (C. A. Ashford, H. Heller & G. A. Smart) 157-161  
 The action of sodium thiocyanate on cardiac output. (Z. M. Bacq, R. Charlier, E. Philippot & P. Fischer) 162-167  
 Some observations upon the pharmacological activity of di-isopropyl fluorophosphonate. (J. P. Quillam & F. G. Strong) 168-176  
 The toxicity of trichlorethylene. (A. R. Hunter) 177-180  
 The enzymic hydrolysis of triacetin (glyceryl triacetate). (H. Blaschko & P. Holton) 181-184  
 The assay of anticholinesterase drugs by the chromodacryorrhoea response in rats. (A. S. V. Burgen) 185-189  
 The specificity of the trimethylammonium group in acetylcholine. (P. Holton & H. R. Ing) 190-196  
 Some pharmacological properties common to atropine, pethidine, procaine, and quinidine. (N. K. Dutta) 197-201  
 Liberation of noradrenaline from the suprarenal gland. (E. Bülbring & J. H. Burn) 202-208  
 Intracorneal infection as a method for testing antituberculous substances. (P. A. Gardiner, R. J. W. Rees & J. M. Robson) 209-215  
 The effect of neotergan and of benadryl on serum-induced myocarditis in rabbits. (A. G. Macgregor & D. R. Wood) 216-218

## British Journal of Physical Medicine

12 : May-June 1949

- Physical medicine in the treatment of varicose veins and indolent varicose ulcers. (M. Fisher) 58-61  
 Joint manipulation in rehabilitation. (R. J. Talbot) 62-68  
 A walking aid for spastic children. (P. Wriston) 69-73  
 Hydrotherapy. Part II. (M. B. Ray) 69-73

12 : July-August 1949

- Impressions of physical medicine in the United States and Canada. (B. Kierlander) 86-88  
 Impressions of physical medicine in the United States of America. (J. Shulman) 89-92  
 Posture. (J. T. Aitken) 92-95  
 Hydrotherapy. Part III. (M. B. Ray) 95-100

## British Journal of Plastic Surgery

2 : July 1949

- Sir H. D. Gillies, C.B.E., F.R.C.S. (A. H. McIndoe) 75-77  
 Bilateral hypertrophy of the masseter muscle: an operation for correction. Case report. (W. M. Adams) 78-81  
 Regeneration of sensation in grafted skin. (J. Hutchison, J. S. Tough & G. M. Wyburn) 82-94  
 Plasma and blood transfusions in the treatment of burned patients. (F. Braithwaite) 95-103  
 The local treatment of burns by dibromopropamide (M & B 1270). (G. P. Arden) 109-115  
 Infant plastic surgery and mother nursing. (C. Pickerill) 116-124  
 The "Marsupial" skin flap. (J. B. Cuthbert) 125-131  
 Rhinoplastic flap design in the narrow forehead. (J. Penn) 132-133  
 Fractures of the malar: a method for maintaining position in cases in which reduction is delayed. (S. D. Gordon) 134-135  
 A new type of knife for cutting skin grafts, using replaceable blades. (D. C. Bodenham) 136-137  
 Plaster of paris head cages in the fixation of free skin grafts to the head and face. (C. R. McCash) 139-144

## British Journal of Radiology

22 : May 1949

- Observations on the ionization produced by high-voltage radiation in moulded ionization chambers with walls of various effective atomic numbers. (S. M. Aly & C. W. Wilson) 243-254  
 A dynamic electrometer for small condenser chambers. (W. H. Sutherland) 255-260  
 Analysis of radio-iodine uptake and excretion curves. (T. H. Oddie) 261-267  
 Demonstration of iron in cells: a preliminary note. (A. E. Barclay) 268-269  
 The significance of congenital lumbosacral abnormalities. (H. W. Gillespie) 270-275  
 Yaws. (S. F. Oosthuizen) 276-279  
 Radiological studies of the abdominal aorta in individuals over 50 as an aid to the differential diagnosis between benign and malignant ulceration of the stomach. (A. Elkeles) 280-283  
 Gastric adenomyosis. A report of a case. (R. J. C. Campbell) 284-285  
 A case of fissura sterni congenita completa. (M. G. Magan) 286-287  
 A calcified aneurysm of the descending thoracic aorta. (F. L. Ingram) 287

22 : June 1949

- Dr. A. E. Barclay: a personal tribute. (D. B. McGrigor) 298-299  
 The old order changes. (A. E. Barclay) 300-303  
 A roentgen-ray microspectrographic investigation of the inflammatory destruction of the mastoid bone. (A. Engström, C. A. Hamberger & S. Welin) 309-324  
 Some observations upon the radiology of the small intestine in old age. (H. J. Jungmann & L. Cosin) 325-330  
 The natural history of malignant disease. (S. Cade) 331-341  
 A note on back-scatter and depth doses for elongated rectangular X-ray fields. (D. E. A. Jones) 342-345  
 Note on an improvised simultaneous bi-plane fluoroscopy. (N. Klein) 346

22 : July 1949

- The structure of biological tissues as revealed by X-ray diffraction analysis and electron microscopy. The Silvanus Thompson Memorial Lecture, 1948. (W. T. Astbury) 355-365  
 The lateral distribution of ions across the track of an ionizing particle. Part I: The present picture and its implications. (J. Read) 366-374  
 Erythema nodosum. (J. H. Middlemiss) 375-383  
 A sesamoid at the elbow analogous to the patella. (G. L. Hardman) 384-385  
 Studies of the effect of the protraction of X radiation by 12 fractionations on the erythema reactions. (H. Schötenlender) 386-392  
 Symposium—carcinoma of the bladder:  
 1. The treatment of cancer of the bladder by radium. (A. Jacobs) 393-398  
 11. Some further aspects of treatment. (E. W. Riches) 398-402  
 111. Treatment by radon seed implantation and deep X-ray therapy. (J. L. E. Millen) 402-405

22 : August 1949

- Symposium—diverticula of the alimentary tract:  
 I. Diverticula of the oesophagus. (A. S. Johnstone) 415-422  
 11. Diverticula of the oesophagus. (A. L. d'Abreu) 423-426  
 111. The radiological aspects of diverticula of the stomach and small bowel. (R. Fawcitt) 427-436  
 IV. Diverticula of the small intestine. (H. C. Edwards) 437-442  
 V. Diverticulosis and diverticulitis of the large intestine. (A radiological commentary.) (J. L. A. Groult) 442-448  
 VI. Diverticula of the colon. (C. Wells) 449-453  
 Angiocardigraphy: a new cassette changer. (M. McGregor) 459-461

- The synchrotron accelerator—its potentialities as a generator of X rays and electrons of 10-50 MeV energies for medical use. (D. W. Fry) 462-472  
 The microwave linear electron accelerator. (G. R. Newbery) 473-496  
 The indirect effect of X rays on the synthesis of nucleic acid *in vivo*. (B. E. Holmes) 497-491

## British Journal of Social Medicine

3 : April 1949

- Milk-borne infections in Great Britain. (W. Savage) 45-55  
 A study on birthweight and intelligence. (C. Asber & J. A. F. Roberts) 56-68  
 Control charts for the standard mortality ratio. (G. Herdan) 69-76  
 Social medicine—a study of the first hundred patients of a university department of industrial health. (R. C. Browne, I. F. Beck & R. I. McCallum) 77-84  
 Mortality amongst babies from injury at birth. (W. T. Russell & I. Sutherland) 85-94

## British Journal of Surgery

36 : April 1949

- A simple experimental method of evaluation for the bassini and allied types of herniorrhaphy. (F. S. A. Doran & W. H. Lonsdale) 339-345  
 The treatment of cavernous haemangiomas and cirrroid aneurysms by the injection of boiling water. (P. P. Cole & A. H. Hunt) 346-352  
 Spontaneous paralytic ileus. (W. B. Roanthe) 352-359  
 Mesothelioma of the peritoneum: report of a case and review of the literature. (J. A. Rhind & C. J. E. Wright) 359-363  
 Missile injuries of the urethra. (D. S. Poole-Wilson) 364-376  
 Carcinoma of the rectum and anal canal. Treatment with very high voltage X-ray therapy. (I. G. Williams) 376-381  
 The surgical-pathological aspects of myasthenia gravis. (H. Reid) 381-386  
 Post-operative biliary fistula. Description of a new reconstructive operation. (S. O. Aylet) 387-390  
 Urinary incontinence due to ectopic ureter. (G. F. Langley) 391-396  
 Partial hepatectomy. (R. W. Raven) 397-401  
 Immediate skin-graft in radical mastectomy. A plea for a more frequent adoption of this method. (C. Wells & D. Annis) 401-404  
 Athletes' blemish of the tibialis anticus muscles. (M. C. Oldfield) 405-408  
 Trichobezoar. (A. M. Nussey & A. R. Leask) 408-410  
 Mediastinal cysts of gastric origin. Report of a case. (B. J. Bickford) 410-413  
 Observations on bone lesions in Hodgkin's disease. (P. J. Moir & J. G. Brockis) 414-417  
 Bilateral aplasia of the vas deferens. (D. Young) 417-418  
 Further report on the operation of oesophagectomy with pre-sternal oesophagostomy. (H. Taylor) 419-421  
 A method of defunctioning the bladder and rectum in advanced pelvic carcinoma. (K. Powell) 421-423  
 Meningiomas in Pharaoh's people. Hyperostosis in ancient Egyptian skulls. (L. Rogers) 423-424  
 A case of benign hepatoma. (W. R. Hunter) 425-428  
 A case of bilharzia of the appendix, with strangulation of ileum. (M. Hughes) 428-429  
 Sudden death at operation due to tumour embolus. (T. W. Mimspriss & St. J. M. C. Birt) 429-430  
 A case of gastric neuroinoma with haematemesis. (L. J. Temple) 430-431  
 Diffuse sarcoma of the peritoneum. (K. C. Greer) 432-433  
 Spigelian hernia simulating acute appendicitis. (D. R. K. Reid) 433-434  
 Subcutaneous rupture of the muscles of the abdomen. (R. A. Jamieson) 434  
 Perforation of carcinoma of the stomach into the general peritoneal cavity. (J. P. Herdman) 435-436  
 A case of carcinoma of the duodenum. (W. M. Beattie & J. D. Muir) 436-437  
 Persistent haematuria from a minute papilloma of the renal pelvis. (M. Silverstone) 438-439  
 Fatal haemorrhage into a perirenal liposarcoma. (R. Burkitt) 439  
 Coincidental strictures of oesophagus and stomach. (R. H. F. Brain) 440-441

37 : July 1949

- The treatment of malignant obstruction of the cardia. (P. R. Allison & J. Borrie) 1-21  
 Leiomyosarcoma of stomach. (K. Watson) 21-25  
 The diagnosis and treatment of vascular diseases, with special consideration of clinical plethysmography and the surgical physiology of the autonomic nervous system. (R. H. Goetz) 25-40  
 A case of gastric carcinoma with spread exclusively to the remainder of the bowel and perianal skin. (G. Lumb) 41-45  
 Pulmonary embolism arising from the great saphenous vein. (E. T. McCartney & A. S. Lewis) 45-47  
 Primary carcinoma of the trachea. (J. F. Pantridge) 49-49  
 Fat necrosis of the breast, with report of a case in a male. (M. Silverstone) 49-52  
 A rare case of bone dystrophy. (J. Halliday) 52-63  
 Masked steatorrhea revealed by pseudo-fractures (Looser's zones) with some observations on calcium excretion in convalescence. (J. R. Nassim & N. H. Martin) 63-68  
 Non-specific (eosinophilic) granuloma of bone. (R. M. Hill) 69-76  
 Arteriovenous aneurysm of the great vein of Galen. (H. R. I. Wolfe & N. E. France) 76-78  
 A new method of venography with particular reference to its use in varicose veins. (H. D. Moore) 78-82  
 Duodenal diverticula. (D. Chamberlain) 83-85  
 Rupture of a splenic arterial aneurysm as a fatal complication of pregnancy. (J. A. Chalmers) 86-90  
 A new uretero-enterostomy. (G. C. Thomson) 90-91  
 David Fleming and the operation for ligation of the carotid artery. (J. J. Keevil) 92-95  
 Sarcoma of the urachus. Report of a case and brief review of the subject. (R. E. Shaw) 95-98  
 Pancreatic cysts. (M. Paul) 99-104  
 Polythene tubing in the experimental surgery of the ureter. (J. P. Herdman) 105-106  
 Large sacular aneurysm of the intracranial part of the vertebral artery. (A. N. Guthkelch) 107-108  
 A case of compound intrasuspension of a mucocele of the appendix. (J. N. Ward-McQuaid) 109-110

- Intestinal obstruction due to ascaris. (S. Skapinker) 110-111  
 An advanced case of mega-oesophagus due to cardiospasm. (S. O. Aylett) 111-112  
 A case of gastroliths. (R. C. Alexander) 113-114  
 Secondary haemangioma of bone. Report of a case. (J. A. White) 114-116  
 Neurinoma of cervical sympathetic chain. (E. N. Callum) 117  
 Endometrioma of the caecum causing mucocele of the appendix. (P. Shemilt) 118-120  
 Crushed chest syndrome with mediastinal emphysema the result of compressed air. (W. M. Toone) 120-121

### British Journal of Tuberculosis and Diseases of the Chest

43 : April 1949

- Tuberculous lobar atelectasis and thoracoplasty. (A. J. Coello) 23-31  
 Miliary carcinomatosis of the lungs: report of a case simulating miliary tuberculosis. (J. Lister) 31-36  
 Mass radiography and after. A plea for a mobile chest service. (E. G. W. Hoffstaedt) 36-40  
 Traumatic rupture of the left main bronchus. (B. W. Anderson) 40-41

### British Journal of Urology

21 : June 1949

- Master surgeons in urology: James Syme (1799-1870). (J. M. Graham) 102-107  
 Total cystectomy. A consideration of the technique. (T. Millin & F. Masina) 108-127  
 Parenchymal carcinoma of the kidney. (I. H. Griffiths & A. C. Thackray) 128-151  
 Unusual examples of urethrocele and ureterocele: operative cure. (A. W. Adams) 152-156  
 A case of ureterocele complicated by renal and ureteric calculi. (A. N. McCrea) 157-160  
 Uterovesical calculus. (J. K. Monro) 161-162

### British Journal of Venereal Diseases

25 : June 1949

- United Nations World Health Organization, Interim Commission. Expert Committee on Venereal Diseases. 45-55  
 The medical conduct of a brothel. (F. R. Bettley) 56-66  
 Modern interpretations of serum tests. (I. N. O. Price) 67-77  
 Syphilis antigen from the soya bean. (J. S. Stevenson) 78-80  
 Gonorrhoea and the sulphonamides. (E. M. C. Dunlop) 81-83  
 Advertisements on the treatment of venereal disease and the social history of venereal disease. (A. Fessler) 84-87

### British Medical Journal

1 : 7/5/49

- Pathogenesis of essential hypertension. (F. H. Smirk) 791-799  
 The role of infection in granulopenia. (K. Robertson) 799-801  
 Instruction of the medical student in paediatrics. An insight into family practice. (W. S. Craig, F. C. Naish & M. F. G. Buchanan) 801-803  
 Intermenstrual pain (the "mittelschmerz") and the time of ovulation. (P. L. Krohn) 803-805  
 Syndrome of diaphragmatic hernia and anaemia. (A. D. Codounis) 805-807  
 Amoebic vaginitis. (N. C. Sen) 808

1 : 14/5/49

- Extrathoracic pain in cardiovascular disease. (J. L. Lovibond) 833-837  
 Vioform in the treatment of skin diseases. (I. Martin-Scott) 837-840  
 The topical use of vioform in dermatology. (J. Overton) 840-842  
 Disseminated sclerosis in South Africa: its relationship to swayback disease and suggested treatment. (G. Dean) 842-845  
 The use of procaine penicillin in children. (J. L. Emery, S. M. Stewart & D. G. H. Stone) 845-846  
 Acute porphyria and associated electrolyte changes. (D. Davies) 846-848  
 Retained placenta and post-partum haemorrhage. (H. L. Sheehan) 849-851  
 Typhoid treated with chloromycetin. (F. Murgatroyd) 851-852

1 : 21/5/49

- Edward Jenner: the man and his work. (E. A. Underwood) 881-884  
 Ehrlich's aldehyde test for urobilinogen. (T. M. Wilson & L. S. P. Davidson) 884-887  
 Retention of urine. (E. W. Riches) 887-890  
 Ogilvie's syndrome of false colonic obstruction. A case with post-mortem findings. (J. A. Dunlop) 890-891  
 Chronic ileus caused by malignant invasion of the posterior abdominal wall. (R. S. Handley) 891-892  
 Thiouracil in thyrotoxicosis. (D. Vérel) 892-895  
 Thyrotoxic aortic fibrillation treated with thiouracil. (J. F. Goodwin) 895-897  
 Phenology of British hay-fever plants and its significance to allergists. (H. A. Hyde) 897-898  
 A simple colorimetric method for estimating sugar in urine or milk. (S. El-Dewi) 899-900

1 : 28/5/49

- Jenner and his impact on medical science. (E. Mellanby) 921-926  
 Tuberculosis in industry: an epidemiological study. Preliminary report. (A. Stewart, J. P. W. Hughes, W. E. C. Brooksbank & D. Coulthard) 926-929  
 Some aspects of partial gastrectomy. (J. Hosford) 929-932  
 Perforation of the rectum. (J. D. T. Jones) 933-935  
 Treatment of perforations of the oesophagus. Report of three cases. (L. J. Temple) 935-937

- Simulated amnesia for identity treated by electrically induced epilepsy. (R. E. Hemphill & J. R. Stuart) 938-940  
 An unusual case of chronic myeloid leukaemia. (R. A. R. Taylor) 940-941  
 Rupture of the liver associated with parturition. (J. R. C. Burton-Brown & J. A. Shepherd) 941-943

1 : 4/6/49

- Surgical aspects of meningitis. (H. Cairns) 969-976  
 Ayerza's disease, silicosis, and pulmonary bilharziasis. (H. Tidy) 977-978  
 The incidence of cancer of the uterine cervix. (R. G. Maliphant) 978-982  
 Psychiatric patients and the Disabled Persons (Employment) Act. (A. Harris & M. A. Lane) 982-983  
 Phyto-photo-dermatitis. (H. E. Bellringer) 984-986  
 The prognosis and treatment of sprue in India. (K. D. Kecle) 986-989

1 : 11/6/49

- Lumbo-dorsal sympathectomy in severe hypertension. An interim survey. (J. C. Harland & F. d'Abreu) 1019-1024  
 Painful amputation stumps and phantom limbs. Treatment by repeated percussion to the stump neuromata. (W. R. Russell) 1024-1026  
 Chemical sympathectomy. (H. A. Haxton) 1026-1028  
 Eosinophilic xanthomatous granuloma with honeycomb lungs. (T. Parkinson) 1029-1030  
 Acute pneumonitis in a beryllium-worker. (G. R. Royston) 1030-1032  
 Infective hepatitis and portal cirrhosis. (K. Damodaran) 1032-1035  
 Treatment of abortus fever with sulphonamides and blood transfusion. (C. Romer) 1035-1036  
 Treatment of herpes zoster with liver extract. (H. S. Gaskell) 1037

1 : 18/6/49

- The spleen and splenectomy. (R. B. Scott) 1063-1070  
 An operation for the treatment of stress incontinence. (W. Shaw) 1070-1073  
 Steatorrhoea and glossitis after ileocolostomy. Effect of synthetic vitamins of B complex, autolysed yeast, and liver extract. (A. Brown) 1073-1076  
 The prognosis of certain hysterical symptoms. (A. B. Carter) 1076-1079  
 Nutritional macrocytic anaemia in temperate zones. (J. Rubie & C. D. Calnan) 1079-1081  
 Streptomycin in finger infections. (J. B. Watson, E. R. Griffiths & L. W. Plewes) 1081-1082

1 : 25/6/49

- The mind of mechanical man. (G. Jefferson) 1105-1110  
 The use in children of procaine penicillin with aluminium monostearate. (J. L. Emery, L. M. Rose, S. M. Stewart & E. J. Wayne) 1110-1112  
 Injuries to the superior longitudinal sinus. (G. B. Barker) 1113-1116  
 A case of bilateral phaeochromocytoma. (T. M. Reid & R. Salm) 1116-1117  
 Spontaneous circumrenal haematoma. A review and a report of two cases. (K. W. Martin) 1118-1120  
 Aplastic anaemia following neoarsphenamine. (F. D. Hart & J. G. Humble) 1120-1121  
 Histamine headache. (M. Eszenyi-Halasy) 1121-1123  
 A note on electric automatic computing machines. (M. H. A. Newman) 1133

2 : 2/7/49

- Man and the machine. (C. W. C. Bain) 1-6  
 Tuberculous empyema. (D. A. Anderson) 6-11  
 Penicillin in the treatment of influenzal meningitis. (F. Braid & R. B. Meyer) 11-14  
 A study of the post-war incidence of breast-feeding. (F. H. M. Dummer) 14-16  
 Aschheim-Zondek and Hogben pregnancy tests modified and compared. (F. W. Landgrebe & B. M. Hobson) 17-18  
 A simple weight-reducing diet. (H. L. Marriott) 18

2 : 9/7/49

- Sir William Osler. (A. S. MacNalty) 41-43  
 Osler at Oxford. (C. Sherrington) 43-45  
 The Osler family. (W. W. Francis) 45-46  
 Osler: some personal recollections. (C. Singer) 46-47  
 My association with Osler. (Horder) 47  
 Grace Revere, Lady Osler. (K. J. Franklin) 47-48  
 Treatment of 160 cases of erythroblastosis foetalis with replacement transfusion. (J. J. van Loghem, J. H. van Bolhuis, J. M. Soeters & G. M. H. Veeneklaas) 49-53  
 A case of anamnestic reaction with Rh agglutinins. (D. A. Osborn) 53-54  
 Carcinoma of the breast in castrated women. (M. Dargent) 54-56  
 Congenital hemiatrophy associated with other congenital defects. (W. L. Calnan) 56-58

2 : 16/7/49

- The association of certain ovarian cells with endometrial cancer. (W. Shaw & B. Dastur) 113-117  
 Infantile diarrhoea and vomiting. A clinical and bacteriological investigation. (J. Taylor, B. W. Powell & J. Wright) 117-125  
 What is social medicine? (W. Hobson) 125-130  
 The age of the menarche. (D. C. Wilson & I. Sutherland) 130-132  
 Observations on the treatment of infantile gastro-enteritis. (C. Z. Neumann) 132-134  
 Experience with a syringe unit. (A. G. Rickards) 135-136  
 Amocbiasis in England as a household disease. (A. R. D. Adams & D. R. Seaton) 136

2 : 23/7/49

- Fibro-fatty tissue and its relation to certain "rheumatic" syndromes. (W. S. C. Copeman) 191-197  
 Rheumatoid arthritis in the young. (B. Schlesinger) 197-201  
 Psychogenic rheumatism. (W. Tegner, D. O'Neill & A. Kaldegg) 201-204  
 A case of rheumatoid arthritis simulating pyogenic infection. (D. S. Short) 204-206  
 Fibrocystic disease of the pancreas. (W. J. Matheson) 206-210  
 Fatal case of polio-encephalitis due to poliomyelitis virus. (G. H. Jennings, J. L. Hamilton-Paterson & F. O. MacCallum) 210-213  
 Fatal case of acute encephalomyelitis due to poliomyelitis virus. (W. H. Kelleher, A. B. Bratton & F. O. MacCallum) 213-214

Streptomycin in development of hydrocephalus in tuberculous meningitis. (S. N. De) 214-216  
High flying and decompression treatment of whooping-cough. (H. S. Banks) 226-227

## 2 : 30/7/49

Problems of ageing and chronic sickness. (A. P. Thomson) 243-250  
Effect of low temperatures on the Bittner virus of mouse carcinoma. (I. Mann) 251-253  
Effect of repeated freezing and thawing on mouse carcinoma tissue. (I. Mann) 253-255  
Preparation of mouse carcinoma by dried tumour tissue. (I. Mann & W. J. Dunn) 255-257  
Urethritis, gonococcal and non-specific, treated by aureomycin. (R. R. Willcox & G. M. Findlay) 257-259  
Neurological complications of mumps. (J. Macrae & A. M. G. Campbell) 259-261  
Leucocyte counts in the prevention of drug agranulocytosis. (C. J. Young) 261-263  
Torsion of normal Fallopian tube. (R. de Solderhoff) 263-264  
An outbreak of food-poisoning in Bromyard district. (M. J. Pleydell) 264-265

## 2 : 6/8/49

Tuberculosis: certain unexplained mortality figures. (W. Elliott) 297-299  
Problems of ageing and chronic sickness. (A. P. Thomson) 300-305  
The return to work of elderly male hospital in-patients. (J. Pemberton & J. C. Smith) 306-308  
Broncho-pulmonary segments of the lung and their terminology. (J. Hardie-Neil & W. Gilmour) 309-311  
"Tridione" in the treatment of epilepsy. (C. W. M. Whitty) 311-315  
The use of "tridione" in petit mal. (F. C. Haward) 315-316  
Case of *Salmonella enteritidis* septicaemia with lung abscess. (I. M. Baird & L. Capper) 316-317  
Health regulations for air travel. 111. (R. H. Barrett) 329

## 2 : 13/8/49

Thomas Addison: pioneer of endocrinology. (H. Dale) 347-352  
Some principles underlying determination of sex hormones. (H. de Wateville, S. Salinger & R. Borth) 352-356  
Poliomyelitis and social environment. (A. B. Hill & W. J. Martin) 357-358  
Production of dental caries. A new hypothesis. (P. Pincus) 358-362  
A case of psittacosis treated with penicillin. (J. R. Tasker) 362-363  
A case of monocytic leukaemia treated with aminopterin. (P. L. de V. Hart) 363-364  
Isolated unilateral spinal accessory nerve palsy of obscure origin. A report of three cases. (J. D. Spillane) 365-366  
A case of diaphragmatic hernia of congenital origin with perforation of stomach. (S. B. Radley & H. P. Goldsmith) 366-367  
The World Health Organization and tuberculosis. (J. B. McDougall) 379-380

## 2 : 20/8/49

Surgery of pulmonary stenosis. (R. C. Brock) 399-406  
Some aspects of poliomyelitis in New Zealand. (J. E. Caughey) 406-410  
Failure of aureomycin in experimental melioidosis. (J. C. Cruickshank) 410-411  
Intractable pain. (E. B. Strauss) 411-413  
Banti's disease. Possible relationship to Rh factor. (A. M. Nussey) 414-416  
Mikulicz's syndrome. (A. J. Hird) 416-418  
A simple emergency method for estimation of blood sugar. (A. L. Latner & G. B. Pendleton) 418-419  
Methyl n-propyl ether. (C. E. Sykes) 420  
Significance of convulsions in infancy. (P. W. Nathan & P. M. Ransford) 421

## 2 : 27/8/49

Goethe, an appreciation. (C. Sherrington) 449-450  
Streptomycin treatment of septicaemia and meningitis due to intestinal organisms in infants. (R. Debré & P. Mozziconacci, with the collaboration of R. Grumbach, P. Boulard, L. Costil & J. Meyer) 451-454  
Streptomycin treatment of infantile diarrhoea and vomiting. (A. Holzell, G. Martyn & L. Apter) 454-457  
The aetiology of gravitational ulcers of the leg. (S. T. Anning) 458-464  
A new neonatal syndrome. (W. G. Mills) 464-466  
Tetraethylthiuramdisulphide in the treatment of alcoholics. (A. E. Carver) 466-468  
Incidence of physical disorders among psychiatric in-patients. A study of 175 cases. (H. E. S. Marshall) 468-470  
Familial periodic paralysis: report of a case. (E. Soysa) 470-471

## Bulletin of Hygiene \*

24 : February 1949

Perspectives in venereology, 1948. (R. R. Willcox) 99-111

## Clinical Science

8 : July 1949

The mechanism of the vicious circle in chronic hypertension. (F. B. Byrom & L. F. Dobson) 1-10  
The circulatory effects of mercurial diuretics in congestive heart failure. (L. G. C. Pugh & C. L. Wyndham) 11-19  
A new method of clinical spirometry. (K. W. Donald & R. V. Christie) 21-31  
The respiratory response to carbon dioxide and anoxia in emphysema. (K. W. Donald & R. V. Christie) 33-44  
Reaction of carbon dioxide in pneumokoniosis of coalminers. (K. W. Donald) 45-52  
Oedema and potassium loss in combined sodium *p*-aminohippurate and penicillin therapy. A metabolic study. (J. E. Cates) 53-63

\* Journals marked with an asterisk in this Guide consist mainly of abstracts and are listed only when they include original articles.—Ed.

The effect of trauma on the chemical composition of the blood tissues of man. (H. N. Green, H. B. Stoner, H. J. Whiteley & D. Eglin) 65-87  
Deposition of adipose tissue between ocular muscle fibres in thyrotoxicosis. (E. E. Pochin & F. F. Rundle) 89-95  
Local deposition of adipose tissue, experimentally induced. (E. E. Pochin) 97-107  
The plasma iodide clearance rate of the human thyroid. (N. B. Myant, E. E. Pochin & E. A. G. Goldie) 109-133  
The estimation of radiotiodine in the thyroid gland of living subjects. (N. B. Myant, A. J. Honour & E. E. Pochin) 135-144

## Dental Record

69 : April 1949

Preparation of the mouth for dentures. (R. S. Taylor) 89-97  
Dental cysts. (T. T. Read) 98-106  
Buried teeth and roots. (S. A. Riddett) 106-109  
Some original methods in the performance of apicectomy. (A. R. Thompson) 110-114  
A note on anaesthesia for apicectomy. (W. S. McConnell) 115-116

69 : May 1949

Mulum in parvo. (L. R. Marsb) 120-128  
Some observations on the growth of the alveolus in man. (W. R. Logan) 129-133  
Case of spontaneous fracture of the mandible caused by an unerupted premolar. (B. St. J. Steadman) 134-135  
Serial models of a case treated by the extraction of the four first permanent molars. (K. E. Pringle) 135-138

69 : June 1949

The problem of child management in dental practice. (F. Allott) 150-163  
An investigation of the facial profile and new diagnostic methods. (E. Muzi) 164-173

69 : July 1949

Applications of the teachings of Johnson and the twin wire appliance. (C. K. Madden) 180-213  
The use of acrylic splints in the treatment of fractures of the jaws. (E. K. Tratman & G. H. Stephens) 214-218

69 : August-September 1949

Prevention of malocclusion. (C. M. Seipel) 224-232  
Sedation in paedodontics. (S. Robinson) 233-234  
Teeth and denture in a pituitary dwarf. (P. Adler) 235-241

## Guy's Hospital Reports

97 : 1948

The relation of idiopathic pleurisy and pleural effusion to tuberculosis. (K. S. Maclean) 133-184  
The applied anatomy of the lumbrical and interosseous muscles of the hand. (F. Braithwaite, G. D. Channell, F. T. Moore & J. Whillis) 185-195  
Studies in lung abscess. VII. The treatment of lung abscess. (R. C. Brock) 196-229  
Speech therapy at Guy's Hospital. (H. St. J. Rumsey) 230-234  
Combined renal and genital anomalies. (E. D. Y. Grasby) 235-241  
A case of pulsating exophthalmos treated by common carotid ligation. (C. Nicholas) 242-253  
Addison's disease: a clinical review of thirty-four cases, with reports of three cases showing associated thyrotoxicosis. (J. C. Houston & T. M. L. Price) 254-267

## Journal of Anatomy

83 : April 1949

Histochemical changes in the suprarenal gland of the adult male rat. (J. M. Yoffey & J. S. Baxter) 89-98  
An injection apparatus incorporating a maximum pressure safety device. (R. W. Weeks & V. C. Tindley) 99-100  
The use of safranin-O for the demonstration of cytoplasmic nucleoproteins. (C. L. Foster) 101-108  
Dendritic cells in pigmented human skin. (R. E. Billingham) 109-115  
Observations on the snout of *Varanus*, and a comparison with that of other lizards and snakes. (A. d'A. Bellairs) 116-146  
A cytoarchitectural investigation into the boundaries of cortical areas 13 and 14 in the human brain. (E. Beck) 147-157  
Bones, muscles and vitamin C. 1. The effect of a partial deficiency of vitamin C on the repair of bone and muscle in guinea-pigs. (P. D. F. Murray & E. Kodicek) 158-174  
Anatomical note. The lower limit of the spinal cord in south Indian foetuses. (V. S. Rao) 175

83 : July 1949

Age changes revealed by carbonyl reagents in tissue sections. (S. Albert & C. P. Leblond) 183-194  
A comparison of endocranial cast and brain of an Australian aborigine. (A. D. Packer) 195-204  
Bones, muscles and vitamin C. II. Partial deficiencies of vitamin C and mid-diaphyseal thickenings of the tibia and fibula in guinea-pigs. (P. D. F. Murray & E. Kodicek) 205-223  
An unusual anomaly of m. flexor digitorum longus. (T. E. Barlow) 224-226  
Alkaline phosphatase activity in normal and degenerated peripheral nerves of the rabbit. (J. Marchant) 227-237  
Observations on the female reproductive organs of the Ca'ing whale *Globiocephala melaena* Trall. (R. J. Harrison) 238-253  
A preliminary study of the distribution of cell size in the lateral geniculate body. (L. W. Chacko) 254-266  
The distribution of the vasa and cremasteric arteries to the testis and their functional importance. (R. G. Harrison) 267-282

## Journal of Bone and Joint Surgery

31B : May 1949

- Scoliosis with paraplegia. (K. G. McKenzie & F. P. Dewar) 162-174  
 Polyostotic fibrous dysplasia—Albright's syndrome. A review of the literature and report of four male cases, two of which were associated with precocious puberty. (C. K. Warrick) 175-183  
 Types of displacement in fractures of the femoral neck and observations on impaction of fractures. (P. Linton) 184-189  
 The treatment of trochanteric fractures of the femur. (E. M. Evans) 190-203  
 Trochanteric fractures of the femur. A plea for conservative treatment. (R. C. Murray & J. F. M. Frew) 204-219  
 Bone concavity caused by a ganglion. (G. R. Fisk) 220-221  
 Ischio-femoral arthrodesis of the hip by posterior open approach. (W. B. Foley) 222-226  
 Neurofibroma of the sole in a case of von Recklinghausen's disease. (E. G. Herzog) 227  
 Skin grafting by cross-leg flaps. (F. Braithwaite & F. T. Moore) 228-235  
 The pathology of osteoclastoma or giant-cell tumour of bone. (R. A. Willis) 236-240  
 Treatment of giant-cell tumours of bone: with a review of twenty-five cases. (T. M. Prosser) 241-251  
 Osteoclastoma: a study of thirty-eight cases. (B. W. Windeyer & P. B. Woodyatt) 252-267  
 Treatment of osteoclastoma by radiation. (F. Ellis) 268-280  
 Malignant osteoclastoma, and the association of malignant osteoclastoma with Paget's osteitis deformans. (D. S. Russell) 281-290  
 From an atlas of general affections of the skeleton. 9. Chondro-osteodystrophy, Morquio-Brailsford type. (H. A. T. Fairbank) 291-299.  
 10. Gargoylism. Synonyms—Hurler's syndrome, dysostosis multiplex. (H. A. T. Fairbank) 300-308  
 An ancient Egyptian treatise on traumatology 2800 B.C. (M. K. Hussein) 309-312

31B : August 1949

- Intermittent claudication. A clinical study. (A. M. Boyd, A. H. Ratcliffe, R. P. Jepson & G. W. H. James) 323-355  
 The fate of voluntary muscle after vascular injury in man. (R. E. M. Bowden & E. Gutmann) 356-368  
 Solitary plasmacytoma of the spine. (R. W. Raven & R. A. Willis) 369-375  
 Fractures of the dorso-lumbar spine. (E. A. Nicol) 376-394  
 Atlanto-axial fracture-dislocation. (K. Colson) 395-398  
 Surgical aspects of the treatment of traumatic paraplegia. (L. Guttmann) 399-403  
 Hindquarter amputation. (H. A. Brittain) 404-409  
 Pulsating angio-endothelioma of the innominate bone treated by hindquarter amputation. (G. Gordon-Taylor & P. Wiles) 410-413  
 The painful shoulder: review of one hundred personal cases with remarks on the pathology. (R. J. W. Withers) 414-417  
 The painful shoulder: significance of radiographic changes in the upper end of the humerus. (S. H. Harrison) 418-422  
 Early assessment of supraspinatus tears: procaine infiltration as a guide to treatment. (J. T. Brown) 423-425  
 Shoulder pain, with particular reference to the "frozen" shoulder. (F. A. Simmonds) 426-432  
 Painful shoulder: calcification of the supraspinatus tendon. (G. B. Jones) 433-435  
 Excision of the acromion in treatment of the supraspinatus syndrome: report of ninety-five excisions. (J. R. Armstrong) 436-442  
 Vitamin E therapy in Dupuytren's contracture. Examination of the claim that vitamin therapy is successful. (R. A. King) 443  
 The strength and elasticity of bone in rats on a rachitogenic diet. (J. B. de V. Weir, G. H. Bell & J. W. Chambers) 444-451  
 Innervation of the limbs. (R. J. Last) 452-464  
 Percivall Port. (A. R. Jones) 465-470  
 Otto Kahler (1849-1893). A centennial note. (W. R. Bett) 471  
 Orthopaedic surgery in the sixteenth and seventeenth centuries. Dismembering. (W. Brockbank & D. L. Griffiths) 472-475

## Journal of Clinical Pathology

2 : May 1949

- The nature of Russell bodies and Kurloff bodies: observations on the cytochemistry of plasma cells and reticulum cells. (A. G. E. Pearce) 81-88  
 Cystic pneumatosis of the large intestine. (I. Friedmann) 91-94  
 The surgical pathology of rectal cancer. (C. E. Dukes) 95-98  
 The iron reserve of a normal man. (M. Hynes) 99-102  
 Elution of an incomplete type of antibody from the erythrocytes in acquired haemolytic anaemia. (P. Kidd) 103-108  
 Survival after transfusion of Rh-positive erythrocytes previously incubated with Rh antibody. (P. L. Mollison & J. C. S. Paterson) 109-113  
 Acquired haemolytic anaemia: survival of transfused erythrocytes in patients and normal recipients. (J. G. Selwyn & W. E. R. Hackett) 114-120  
 The microbiological assay of riboflavin and nicotinic acid in urine. (J. Fitzpatrick & S. L. Tompsett) 121-125  
 The determination of the total neutral 17-ketosteroids in urine. (S. L. Tompsett) 126-128  
 The value of diluted antigen in the Wassermann reaction. (R. F. Jennison, J. B. Penfold & J. A. F. Roberts) 129-133  
 Coliform infection of the urinary tract. (P. N. Coleman & S. Taylor) 134-137  
 A simplified procedure for blood cell counts and haemoglobin determination. (F. Wroblewski, M. Weiner & S. Shapiro) 138-140  
 Rapid determination of the sickle cell trait by the use of a reducing agent. (A. W. Williams & J. P. Mackey) 141-142  
 The photochemical production of gold sols using artificial light. (F. S. Fowweather) 143-144  
 Orthotolidine hydrochloride test for blood in urine. (H. Zwarenstein) 145-146  
 The mass staining of paraffin sections before the removal of wax. (C. F. A. Culling) 147-148  
 An improved swab for the detection of threadworm ova. (J. A. Boycott) 149

2 : August 1949

- Serum proteins: a review. (J. R. Marrack & H. Hoch) 161-192  
 Serum copper levels in pregnancy and in pre-eclampsia. (R. H. S. Thompson & D. Watson) 193-196  
 Latent carcinoma of the prostate. (G. S. Andrews) 197-208  
 The use of pancreatic extract as a growth stimulant for *C. diphtheriae*. (M. Gordon & K. Zinnemann) 209-211  
 Errors in the estimation of streptomycin in serum. (D. A. Mitchison, H. D. Holt & S. H. Moore) 213-216  
 Studies *in vitro* on the maturation of erythroblasts in normal and pathological conditions. (G. Astaldi & P. Tolentino) 217-222  
 Dextran as a medium for the demonstration of incomplete anti-Rh-agglutinins. (Preliminary report.) (R. Grubb) 223-224  
 Haemolytic anaemia. (M. Gatman & L. Hamilton) 225-229  
 Estimation of *p*-aminosalicylic acid in blood. (H. V. Street) 230-231  
 Concentration of megaloblasts: an aid in the diagnosis of pernicious anaemia. (K. S. Rodan) 232

## Journal of Endocrinology

6 : April 1949

- Effects of the administration of thiouracil to dogs. (G. E. Glock) 6-13  
 Goitrogenic effect of aminothiazole and reactions of thymus and lymphoid tissue. (C. Grégoire) 14-22  
 Depigmentation in *Rana temporaria* tadpoles as a result of methylthiouracil treatment. (T. W. Blackstad) 23-27  
 The metabolic response to thyroid depressant drugs in animals maintained in a cold environment. (R. A. Macbeth & R. L. Noble) 28-40  
 Urinary pregnandiol estimation as a test for pregnancy. (J. Henderson, N. F. MacLennan, V. R. Whately & J. H. Wilkinson) 41-53  
 Effect of oestrogen treatment on the gonadotrophic content of the pituitary gland. (J. M. R. Hay) 54-62  
 Fertilization and the transport of gametes in the pseudopregnant rabbit. (C. R. Austin) 63-70  
 The 'diabetogenic' activity of growth-promoting pituitary extracts in rats. (J. H. Gaarenstroom, J. Hublé & S. E. De Jongh) 71-74  
 Fructose and citric acid assay in the secretions of the accessory glands of reproduction as indicator tests of male sex hormone activity. (T. Mann, D. V. Davies & G. F. Humphrey) 75-85  
 Influence of methyl-testosterone upon the 'endocrine kidney.' (H. Selye & H. Stone) 86-93  
 The influence of age and sex on the life span of adrenalectomized rats. (A. T. Cowie) 94-98  
 The influence of adrenal cortical hormones upon immunity in cold-blooded vertebrates. (K. A. Bisset) 99-103  
 The fragmentation of eggs following induced ovulation in immature rats. (C. R. Austin) 104-110  
 The urinary excretion of neutral 17-ketosteroids in childhood. (M. E. Wood & C. H. Gray) 111-119

## Journal of the Faculty of Radiologists

1 : July 1949

- Cerebral tumours. (M. H. Jupe) 2-14  
 Cerebral tumours. (D. S. Russell) 15-18  
 Cerebral tumours. (B. Hughes) 19-22  
 Cerebral tumours. (J. J. Richmond) 23-27  
 A comparison of the radiological and pathological changes in coalworkers' pneumoconiosis. (J. Gough, W. R. L. James & J. E. Wentworth) 28-39  
 The classification of radiographic appearances in coalminers' pneumoconiosis. (C. M. Fletcher, K. J. Mann, I. Davies, A. L. Cochrane, J. C. Gilson & P. Hugh-Jones) 40-60  
 The place of radiotherapy in the treatment of chronic lymphoid leukaemia. (R. B. Scott) 61-66  
 Radiotherapeutic treatment of leukaemia. (J. S. Fulton) 67-69  
 The doctor-patient relationship in the treatment of cancer. (E. A. Bennet) 70-72  
 The doctor-patient relationship in the treatment of cancer. (A. J. D. Smith) 73-74

## Journal of General Microbiology

3 : May 1949

- The phenomenon of lysogenicity in staphylococci. (P. M. Rountree) 153-163  
 The serological differentiation of staphylococcal bacteriophages. (P. M. Rountree) 164-173  
 The isolation in eggs of a new filtrable agent which may be the cause of bovine lumpy skin disease. (M. van den Ende, P. A. Don & A. Kipps) 174-183  
 A method of estimating streptomycin in serum and other body fluids by diffusion through agar enclosed in glass tubes. (D. A. Mitchison & C. C. Spicer) 184-203  
 The effect of artificial fertilizers and dung on the numbers of amoebae in Rothamsted soils. (B. N. Singh) 204-210  
 The assimilation of glutamic acid by yeast. (E. S. Taylor) 211-223  
 Adaptation of *Sporocytophaga myxococcoides* to sugars. (A. K. Sijpesteijn & G. Fähræus) 224-235  
 The relationship between micro-organisms and soil aggregation. (R. J. Swaby) 236-254  
 The lecithinase of *Bacillus cereus* and its comparison with *Clostridium welchii*  $\alpha$ -toxin. (H. P. Chu) 255-273  
 The incidence of penicillin-sensitive variant colonies in penicillinase-producing strains of *Staphylococcus pyogenes*. (M. Barber) 274-281  
 The fermentation of trehalose by yeasts and its taxonomic implications. (R. J. Bouthilet, N. E. Neilson, E. M. Mraak & H. J. Phaff) 282-289  
 The susceptibility of viruses to ethyl ether. (C. H. Andrewes & D. M. Horstmann) 290-297  
 The investigation of influenza and related viruses in the electron microscope, by a new technique. (I. M. Dawson & W. J. Elford) 298-311  
 A technique of examining large numbers of bacterial culture filtrates by partition chromatography. (A. J. Woitwod) 312-318  
 The examination, by partition paper chromatography, of the nitrogen metabolism of bacteria. (H. Proom & A. J. Woitwod) 319-327

## Journal of Hygiene

46 : December 1948

- Smallpox in Tripolitania, 1946: an epidemiological and clinical study of 500 cases, including trials of penicillin treatment. (C. W. Dixon) 351-377
- The serological relationship between vaccinia and ectromelia viruses. (L. Dickinson) 378-382
- The epizootic behaviour of mousepox (infectious ectromelia of mice). II. The course of events in long-continued epidemics. (F. Fenner) 383-393
- The survival of foot-and-mouth disease virus in meat and offal. (W. M. Henderson & J. B. Brooksby) 394-402
- Haemolytic disease of newborn foals due to iso-immunization of pregnancy. (R. A. Coombs, R. C. Crowhurst, F. T. Day, D. H. Heard, I. T. Hinde, J. Hoogstraten & H. B. Parry) 403-415
- A first record of *Brucella abortus* (Bang) in the cattle of Mauritius; and data on the possible occurrence locally of undulant fever in man. (J. L. Webb & A. M. L. Webb) 419-421
- A simple method for the determination of bacterial sensitivity to sulphonamides by the use of blotting-paper discs. (R. J. Evans) 422-425
- The counting of surface colonies of bacteria. (P. B. Crone) 426-430
- The retention of methallyl chloride and methyl bromide by fumigated grain. (N. van Tiel) 431-433
- Feeding and breeding of laboratory animals. VIII. Breeding of guinea pigs. (H. M. Bruce & A. S. Parkes) 434-437
- Electron-microscope studies on relapsing fever spirochaetes. (B. Babudieri & D. Bocciarelli) 438-439
- The problem of diabetes mellitus in school medical administration. (H. Sainsbury) 440-444
- The warmth of floors—a physical study. (N. S. Billington) 445-450
- The effects of air temperature and velocity and of various flooring materials on the thermal sensations and skin temperature of the feet. (A. F. Munro & F. A. Chrenko) 451-465

47 : March 1949

- The measurement of domestic ventilation: an experimental and theoretical investigation with particular reference to the use of carbon dioxide as a tracer substance. (E. T. Renbourn, T. C. Angus, J. M. Ellison, L. M. Croton & M. S. Jones) 1-38
- Studies on the vaccination of cattle as a measure against infection with tuberculosis with the living vole acid-fast bacillus. (J. A. Young & J. S. Paterson) 39-78
- A contribution to the epidemiology of poliomyelitis in New Zealand. (A. W. S. Thompson) 79-101
- A tellurite medium for the identification and isolation of *Corynebacterium diphtheriae*. (W. R. C. Handley) 102-106

## Journal of Laryngology and Otology

63 : May 1949

- Methods of audiometry in a modern deafness clinic. (P. Denes & R. F. Naunton) 251-275
- A clinical survey into the effects of turbo-jet engine noise on Service personnel: some preliminary remarks. (E. D. D. Dieksen & N. P. Watson) 276-285
- Experiences of penicillin treatment in acute otitis media. (N. Grebelius & A. Sjöberg) 286-298
- The turning test with small regulable stimuli. V. Is Ewald's law valid in men? (A. A. J. Van Egmond, J. J. Groen & L. B. W. Jongkees) 299-305
- The turning test with small regulable stimuli. VI. Deviations in the cupulogram. Preliminary note on the pathology of cupulometry. (A. A. J. Van Egmond, J. J. Groen, J. H. H. H. & L. B. W. Jongkees) 306-310
- An unusual case of Ménière's disease. (J. Evans) 311-313

63 : June 1949

- Histopathological investigations on the localization, number, activity and extent of otosclerotic foci. (B. Nylen) 321-327
- Chronic otitis media. (F. McGuckin) 328-336
- Some points in the pathology, diagnosis and treatment of chronic maxillary sinusitis. (J. C. Ballantyne & A. R. Rowe) 337-341
- Nasopharyngeal tumours. (J. I. M. Black) 342-349
- A case of persistent otorhœdo due to chronic infection in a large infra tympanic cavity. (P. R. B. Grimaldi, S. R. Mawson & G. H. Bateman) 350-351

63 : July 1949

- Otogenic intracranial hypertension. (S. Horowitz) 363-381
- On the technique of the fenestration operation. (I. S. Hall) 382-389
- The fenestration operation: early experience. (R. B. Lumsden) 390-394
- On the nature of a dual function in the cochlear nerve. (With reference to features of middle-ear deafness in cases of cochlear lesions.) (F. Kobrak) 395-410
- A case of acute laryngo-tracheo-bronchitis. (I. S. Thomson) 411-412
- Haemangioma of the trachea in an infant. Successful removal. (H. S. Sharp) 413-414

63 : August 1949

- Foreign bodies in the oesophagus. A review of six hundred and two cases. (I. Matheson) 435-445
- On prognosis and therapy in oto-rhinogenous meningitis. (R. Rudberg & A. Sjöberg) 446-452
- Fractures involving air sinuses. (A. Radcliffe) 453-456
- Two unusual cases of stridor. (J. Gerrie & W. R. Gauld) 457-461
- Simple objective test for paracusis. (A. S. Davidson) 462-463
- Determination of the difference limen and the latest illustration thereof in audiometry. (T. Halm) 464-466

## Journal of Mental Science

95 : April 1949

- The twenty-second Maudsley lecture: Psychiatry in the criminal courts. (C. Mullins) 263-274
- The effects of convulsive therapy on the excretion of cortins and ketosteroids. (W. R. Ashby) 275-324

- The tasks of psychiatry. (J. R. Rees) 325-335
- The long-term results of injuries of the head. (A medical, economical and sociological survey.) (G. F. Rowbotham) 336-354
- The psychosomatic diseases: a hypothetical formulation. (H. Stalker) 355-368
- The test performance of the encephalopathic. (R. M. Allen & J. C. Krato) 369-372
- Birth injury as a cause of mental defect: the statistical problem. (L. S. Penrose) 373-379
- Electronarcosis at the Homewood Sanitarium, Guelph, Ontario. (J. J. Geoghegan) 380-387
- A case of hystero-epilepsy successfully treated by deep analytic psychotherapy. (H. Edleston) 388-402
- Clinico-anatomical studies of frontal lobe function based on leucotomy material. (A. Meyer & T. McLardy) 403-417
- The effect of leucotomy on creative ability. (W. R. Ashby & M. Bassett) 418-430
- The results of prefrontal leucotomy in 68 patients not discharged from hospital. (J. M. Rosic) 431-448
- Preliminary report of changes after prefrontal leucotomy. (A. Penrie) 449-455
- The dual personality of Philip Heseltine. (S. M. Coleman) 456-466
- A Rorschach study in folie à deux of mother and son. (E. Wellisch) 467-476

95 : July 1949

- The results of a clinical study of war-damaged children who attended the Child Guidance Clinic, the Hospital for Sick Children, Great Ormond Street, London. (C. J. Carey-Trefzer) 535-559
- A psychiatric in-patient department for children. (K. Cameron) 560-566
- The interpretation of some disorders of speech. (W. W. Roberts) 567-588
- Abnormal behaviour and mental breakdown in adolescence. (W. Warren) 589-624
- Electronarcosis in the treatment of schizophrenia. (L. Rees) 625-637
- Observations in electrically-produced epileptic convulsions. Part III. The post-convulsive decerebrate state. (R. Klein & D. F. Early) 638-650
- Convulsive treatment in 56 tuberculous mental patients. (B. Jentoft) 651-654
- Some observations on leucotomy and investigations by pneumoencephalography. (J. F. Donovan, A. J. Galbraith & H. Jackson) 655-666
- Auditory, olfactory-gustatory and thermic Rorschach responses. (E. Wellisch) 667-672
- Legislation and mental health in Northern Ireland. (T. W. H. Weir) 673-684
- The incidence of mongolism in the general population. (L. S. Penrose) 685-688
- The differential leucocyte count in mongols. (A. Shapiro) 689-692
- Addiction under the Mental Treatment Act, Eire, 1945. (H. J. Eustace) 693-695
- Re-testing of the intelligence quotient and the social age. (G. de M. Rudolf) 696-702
- Comparison of the intelligence quotient with behaviour. (G. de M. Rudolf) 703-705
- Paranoid reaction during the phase of recovery from subarachnoid haemorrhage. (M. Silverman) 706-708
- Porencephaly and cerebral abscess simulating internal hydrocephalus. (B. H. Kirman) 709-715

## Journal of Neurology, Neurosurgery and Psychiatry

12 : May 1949

- "Integration, then and now." (E. G. T. Liddell) 81-85
- The fate of an intraneural injection as demonstrated by the use of radio-active phosphorus. (J. B. Brierley & E. J. Field) 86-99
- Metachromatic bodies in the brain. (M. C. Smith) 100-110
- Electrical activity of the neostriatum, paleostriatum, and neighbouring structures in Parkinsonism and hemiballismus. (R. Meyers, R. Hayne & J. Knott) 111-123
- Duration and form of action potential in the normal human muscle. (I. Petersin & E. Kugelberg) 124-128
- Electromyography in muscular dystrophies. Differentiation between dystrophies and chronic lower motor neurone lesions. (E. Kugelberg) 129-136
- The anterior inferior cerebellar artery. Its variations, pontine distribution, and significance in the surgery of cerebello-pontine angle tumours. (W. J. Atkinson) 137-151
- Some unusual complications of herpes zoster. (C. W. M. Whitty & A. M. Cooke) 152-154
- Pinealoma with a solitary spinal metastasis. (F. R. Magarey & H. R. I. Wolfe) 155-159
- Hysteria in one of a pair of identical twins. (J. H. Paterson) 160-164

12 : August 1949

- Rapid serial angiography: preliminary report. (J. B. Curtis) 167-182
- Percutaneous carotid angiography. A team technique, with a report of the results in seventy cases. (M. Wilkinson, J. B. Stanton, D. P. Jones & J. M. K. Spalding) 183-186
- Experimental radio-necrosis of the brain in rabbits. (D. S. Russell, C. W. Wilson & K. Tansley) 187-195
- After-imagery in defective fields of vision. (M. H. Bender & R. L. Kahn) 196-204
- Visual scotomata with intracranial lesions affecting the optic nerve. (A. J. Mooney & A. A. McConnell) 205-218
- The tonic pupil. (G. S. Graveson) 219-230
- Clinical and pathological observations on relapse after successful leucotomy. (T. McLardy & D. L. Davies) 231-238
- Observations on the wave and spike complex in the electro-encephalogram. (E. C. O. Jonesbury & M. J. Parsonage) 239-245
- Psychiatric changes associated with Friedreich's ataxia. (D. L. Davies) 246-250
- Cramp in cases of prolapsed intervertebral disc. (L. Wolman) 251-257

## Journal of Obstetrics and Gynaecology of the British Empire

56 : April 1949

- The period of gestation. (H. H. Knaus) 181-188
- Measuring the obstetric value of the pelvis. (The use of the "graph method" for the interpretation of radiological findings.) (J. C. Moir) 189-204
- Traumatic neuritis of the puerperium. (J. A. Chalmers) 205-216

- A nutritional survey in pregnancy with particular reference to certain haematological and biochemical findings. (W. Hobson, F. J. W. Lewis & D. Woodman) 217-225
- Excision of the round ligaments in corporeal and ovarian carcinoma. (P. Malpas) 226-227
- Roentgenography of vaginal cysts. (F. Szellö) 228
- The obstetric capacity of the undilated cervix. (T. B. FitzGerald) 229-236
- Ruptured pyometra as a surgical emergency. (W. J. C. Crisp & A. Clain) 237-239
- Combined full-time intra- and extra-uterine pregnancy with survival of mother and both children. (E. A. I. Fejer & G. H. Henry) 240-241
- Unilateral acute hydramnios in uniovular twin pregnancy. (F. A. Wurzbach & I. A. Bunkin) 242-245
- Fibroadenoma of the cervix with adenomyosis of the uterine body. (J. P. Maxwell & J. P. S. Whitehead) 246
- The significance of *Clostridium welchii* in the cervical swab and blood-stream in postpartum and postabortion sepsis. (A. M. Ramsay) 247-248
- A rotating disc calculator. (A. M. Thomson) 259
- Treatment of secondary amenorrhoea with low dosage irradiation of ovaries and pituitary gland. (P. L. Playfair & A. Booth) 260-268
- A false vagina formed by coitus. (G. P. Charlewood) 269

## 56 : June 1949

- Rubella in pregnancy as an aetiological factor in congenital malformation, still-birth, miscarriage and abortion. (C. Swan) 341-363
- The haemangiomas of pregnancy. (T. F. Rose) 364-366
- Schistosomiasis in gynaecology. (G. P. Charlewood, S. Shippel & H. Renton) 367-385
- Foetal mortality in postmaturity. (J. M. McKiddie) 386-392
- The establishment of extra-uterine respiration. (J. E. Morison) 393-403
- Observations on human leucocytes during the menstrual cycle. (L. L. MacKinnon) 404-407
- Tuberculous ulceration of the vulva. (With report of one case successfully treated with streptomycin.) (A. G. Mathew) 408-412
- Foetal mortality in toxæmia of late pregnancy according to mode of delivery. (J. Hamilton, T. N. A. Jeffcoat & U. M. Lister) 413-429
- Torsion of an ovarian cyst in a young child. (J. Cook) 430
- Surgical induction of labour. (H. J. D. Smythe) 431-438
- Virilism and theca-cell hyperplasia of the ovary: a syndrome. (A. Culiner & S. Shippel) 439-445
- Vaginal dilators. (W. M. H. McCullagh) 446
- The relief and prevention of referred pain. (G. W. Theobald) 447-460

## 56 : August 1949

- A case of transplacental metastasis of malignant melanoma from mother to foetus. (E. Holland) 529-536
- The maternal circulation in normal pregnancy. (A. J. Palmer & A. H. C. Walker) 537-547
- The cardiac output in normal pregnancy as determined by the Courmand right heart catheterization technique. (H. F. H. Hamilton) 548-552
- Further radiological studies in the investigation of obstetric disproportion with special reference to the contracted pelvic outlet. (E. R. Williams & H. G. E. Arthur) 553-575
- Symphysiotomy and pubiotomy. An apologia based on the study of 41 cases. (A. W. Spain) 576-585
- Endometriosis and intussusception of the appendix. (A. L. Deacon) 586-590
- Rubella in pregnancy as an aetiological factor in congenital malformation, still-birth, miscarriage and abortion. (C. Swan) 591-605
- Pregnancy and coarctation of the aorta. (G. H. H. Benham) 606-618
- Pathological changes in blighted twins. (W. G. Mills) 619-624
- Oestrogenic therapy with prolonged action. Report on water suspensions of oestradiol monobenzoate. (H. K. Topozada) 625-631
- Anaesthesia in Caesarean section with special reference to the use of d-tubocurarine chloride. (H. V. Corbett & J. P. Thomas) 632-635
- Postabortal infection with *Clostridium welchii*. Report of two cases with special reference to oliguria and to penicillin treatment. (M. A. M. Bigby & F. A. Jones) 636-647
- The treatment of functional bleeding in the last decade of reproductive life. (J. F. Foulkes) 648-649
- Primary brow presentation. (K. Vartan) 650-651
- Subacute bacterial endocarditis in pregnancy. (J. Mair & M. M. O'Hare) 652-656

## Journal of Pathology and Bacteriology

## 60 : October 1948

- The clinical features and pathogenesis of mouse-pox (infectious ectromelia of mice). (F. Fenner) 529-552
- A selective medium for isolating staphylococcus based on the differential inhibiting effect of increased concentrations of sodium chloride. (H. B. Maitland & G. Martyn) 553-561
- Actinomycosis in dogs. (A. Ginsberg & A. C. W. Little) 563-572
- The glycogen content of rats' livers after poisoning with large doses of *p*-dimethylaminoazobenzene. (J. W. Orr, D. E. Price & L. H. Stickland) 573-581
- Tuberculosis in a wild sparrow-hawk (*Accipiter nisus nisus*). (J. M. Harrison) 583-586
- Toxic effects of salicylate on the foetus and mother. (A. V. Jackson) 587-593
- Bacterial variation and toxin production by *Corynebacterium diphtheriae*. (C. R. Amies) 595-608
- Redistribution of body fluids in dysenteric toxæmia. (R. D. Seneviratne) 609-620
- Acute parietal endocarditis in a case of status asthmaticus: a possible early stage of Löffler's endocarditis parietalis fibroplastica with eosinophilia. (B. Lennox) 621-628
- The bone marrow in glandular fever. (A. C. P. Campbell) 629-632
- The histological preparation of bone-marrow particles, uterine curettings and other small tissue fragments. (A. C. P. Campbell) 633-634

## 61 : January 1949

- Tumours of the epiphysis cerebri. (V. J. McGovern) 1-9
- Teratomas of the pineal region and their relationship to pinealomas. (K. Walton) 11-21

- An experimental study of the relationship between plasma proteins and liver disturbance. (Kwok-Kew Cheng) 23-47
- Malignant haemangio-endothelioma (haemangioblastoma) of the liver. (R. Hastings-James) 49-53
- Studies of the pathogenesis of a case of influenza-A pneumonia of three days' duration. (J. Mulder & G. J. Verdonk) 55-61
- A serological investigation of the paracolon group of organisms. (H. Schwabacher) 63-74
- The pathology of subacute cor pulmonale in diffuse carcinomatosis of the lungs. (A. D. Morgan) 75-84
- The role of test toxins and the need for standards in the determination of avidity of antitoxins. (M. Barr) 85-91
- Lipomatous pseudohypertrophy of the pancreas with complete absence of exocrine tissue. (A. Hoyer) 93-100
- The effect of trauma on the pentose content of the plasma in animals. (H. N. Green, H. B. Stoner & M. Bielschowsky) 101-109
- The effect of limb ischaemia on the magnesium content of plasma. (H. B. Stoner & H. N. Green) 111-113
- The effect of fatal cutaneous burns on the adenosine equivalent of the blood of rabbits. (H. B. Stoner & H. N. Green) 114-116
- The yeast-like form of *Cryptococcus farcinosus* (Rivolta): (*Histoplasma farcinosum*). (J. J. Bullen) 117-120
- Shallow-layer fluid enrichment method for intestinal pathogens. (J. Brodie) 120-121
- Two independent foci of intraduct carcinoma of the breast, one within a fibroadenoma. (G. H. Smith) 121-124
- A suggested explanation of the alleged phenomenon of symbiotic (bacterial) nitrogen fixation in whales. (R. A. M. Case) 124-127
- Morphological changes in bacteriophage-infected organisms as revealed by phase-contrast illumination. (J. S. K. Boyd) 127-131

## Journal of Pharmacy and Pharmacology

## 1 : May 1949

- The pharmacology of curare and curarising substances. (W. D. M. Paton) 273-286
- The chemistry of anti-pernicious anaemia factors. Part I. The liberation of phosphorus as phosphate from vitamin B<sub>12</sub> by acid hydrolysis. (B. Ellis, V. Petrov & G. F. Snook) 287-291
- The pharmacognosy of rauwolfia. (T. E. Wallis & S. Rohatgi) 292-305
- The structure of  $\gamma$ -sugars. Part VI. The synthesis of a furanose, a 6-methylketohexose. (Y. M. Abouzaid & W. H. Linnell) 306-313
- A chlorohydroxy-triphenylmethane dye. (W. H. Linnell & J. B. Stenlake) 314-322
- The spectrophotometric determination of rutin and quercetin in mixtures. (R. V. Swann) 323-329
- The colorimetric determination of aneurine by Auerbach's method. (C. W. Ballard & E. J. Ballard) 330-333

## 1 : June 1949

- Anticoagulants. (F. C. MacIntosh) 353-367
- The identification of the clinically-important sulphonamides. (E. Hueknull & G. E. Turfitt) 368-376
- The isolation of the toxic principle of *Oenanthe crocata*. (E. G. C. Clarke, D. E. Kidder & W. D. Robertson) 377-381
- The absorption spectra and ionic dissociation of thiouracil derivatives with reference to their anti-thyroid activity. (R. E. Stuckey) 382-390
- The determination of proganil. (H. E. Stage) 391-394
- A note on the conversion of  $\omega$ -tribromoquinoline to  $\omega$ -dibromoquinoline and the production of quinaldic aldehyde. (L. K. Sharp) 395
- A preliminary investigation on the growth of *Cephaelis Ipecacuanha* (Brot) A. Rich, under tropical conditions at Calcutta. (G. C. Mitra & D. Chakraborty) 396-400
- The preparation of indones. (D. Dalev) 401-403

## 1 : July 1949

- Materials used in Great Britain for the active immunization of man against diphtheria. (P. Hartley) 425-435
- An examination of factors affecting the precision of the assay of oxytocic hormone in posterior pituitary lobe preparations. (G. A. Stewart) 436-453
- The isolation of bases from urine concentrates. (M. F. Lockett) 454-461
- The identification of local anaesthetic drugs of the benzoic ester group. (E. Hucknull & G. E. Turfitt) 462-469
- The evaluation of the bactericidal activity of ethylene glycol and some of its monoalkyl ethers against *Bacterium coli*. Part VI. (H. Berry & I. Michaels) 470-487

## 1 : August 1949

- Sclerenchyma in the diagnosis and analysis of vegetable powders. (T. E. Wallis) 505-513
- A titration method for the determination of procaine in procaine penicillin and its oily suspensions. (W. H. C. Shaw) 514-520
- A new method for measuring diffusion of antiseptics from ointment bases. (G. H. Clark & G. E. Davies) 521-525
- The bromination of *p*-aminosalicylic acid, sodium *p*-aminosalicylate and *m*-aminophenol. (D. Simmonite) 526-528
- A photoelectric colorimetric method for the estimation of khellin. (I. R. Fahmy, N. Badran & M. F. Messeld) 529-534
- Khellin and its assay in injections and tablets. (I. R. Fahmy, N. Badran & M. F. Messeld) 535-537
- The response of the heart to visamin and to khellinin. (K. Samaan, A. M. Hossein & I. Fahim) 538-544

## Journal of Physiology

## 108 : May 1949

- Cation control in human erythrocytes. (M. Maizels) 247-263
- The effect of breathing oxygen at atmospheric pressure on tissue oxygen and carbon dioxide tensions. (H. J. Taylor) 264-269
- Activity and drug responses of the sheep uterus in relation to reproductive condition. (N. Ambache & J. Hammond) 270-277
- Opacity changes in stimulated nerve. (D. K. Hill & R. D. Keynes) 278-281

- Observations on the action of prostigmine on the spinal cord of the cat. (I. Calma) 282-291  
 Changes in transparency of muscle during a twitch. (D. K. Hill) 292-302  
 Effects of dehydration on adult and newborn rats. (H. Heller) 303-314  
 Evidence for saltatory conduction in peripheral myelinated nerve fibres. (A. F. Huxley & R. Stämpfli) 315-339  
 The effect of postural and exercise components on the heart rate during a brief step test. (J. A. C. Knox) 340-344  
 The effect of the posterior pituitary hormones on the inorganic phosphorus and sugar of the blood. (A. M. Fraser) 345-352  
 The metabolic cost of passive cycling movements. (J. A. Saunders) 353-358  
 Observation of the hypophyso-portal vessels of the living rat. (J. D. Green & G. W. Harris) 359-361  
 The causes of serum bradycardia. (G. S. Dawes & W. Feldberg) 362-364  
 The influence of magnesium on respiration, glycolysis and cholinesterase activity in rat brain. (C. N. Peiss, V. E. Hall & J. Field) 365-373

## 108 : June 1949

- Action of condensed alkyl phosphates on the nerve-muscle preparation and the central nervous system of the cat. (M. Chennells, W. F. Floyd & S. Wright) 375-397  
 Method for the frequent estimation of forearm blood flow under conditions of decreased atmospheric pressure. (D. M. Kerslake) 398-404  
 The determination of blood volume by the carbon monoxide and dye (T-1824) methods in rabbits. (F. C. Courtice & R. W. Guntton) 405-417  
 Effect of nembutal anaesthesia on restoration of plasma volume after haemorrhage in dogs, cats and rabbits. (F. C. Courtice & R. W. Guntton) 418-426  
 Enzymic formation of pressor amines. (H. Blaschko, P. Holton & G. H. S. Stanley) 427-439  
 The changes in water and chloride distribution during heavy sweating. (W. S. S. Ladell) 440-450  
 The effect of the application of an arterial occlusion cuff to the wrist on the blood flow in the human forearm. (D. M. Kerslake) 451-457  
 The timing of certain circulatory events in man. (W. Schlapp & A. G. Walker) 458-466  
 The estimation of adrenalinic and allied substances in blood. (J. H. Gaddum, W. S. Peart & M. Vogt) 467-481  
 The effect of nicotine on the diuresis induced by ethyl alcohol. (M. G. Eggleston) 482-490  
 The nature of splenic sympathin. (W. S. Peart) 491-501  
 The dependence of neuromuscular transmission on glucose. (I. Hajdu & R. J. S. McDowall) 502-507  
 Action of acetylcholine on rabbit auricles in relation to acetylcholine synthesis. (E. Bülbring & J. H. Burn) 508-524  
 Noradrenaline in tumours of the adrenal medulla. (P. Holton) 525-529

## 109 : August 1949

- New methods for calculating metabolic rate with special reference to protein metabolism. (J. B. de V. Weir) 1-9  
 The action of botulinum toxin on the neuro-muscular junction. (A. S. V. Burgin, F. Dickens & L. J. Zatman) 10-24  
 The development of sensitivity to acetylcholine in denervated muscle. (G. Reid & E. M. V. Williams) 25-31  
 Changes in ionic distribution following dialysis of aqueous humour against plasma. (H. Davson, W. S. Duke-Elder & D. M. Maurice) 32-40  
 A method for the determination of heparin in blood. (L. B. Jaques, F. C. Monkhouse & M. Stewart) 41-48  
 The role of the adrenal cortex in the maintenance of the sciatic pressor reflex. (J. Secker) 49-52  
 Reactions of the peripheral circulation to external heat. (J. Grayson) 53-63  
 Effect of voluntary hyperpnoea on pulmonary blood flow. (G. H. Armitage & W. M. Arnott) 64-69  
 Air distribution in lungs during hyperventilation. (G. H. Armitage & W. M. Arnott) 70-80  
 The renal responses of infants and adults to the administration of hypertonic solutions of sodium chloride and urea. (R. F. A. Dean & R. A. McCance) 81-97  
 The sugar of the foetal blood, the amniotic and allantoic fluids. (H. Barklay, P. Haas, A. St. G. Huggett, G. King & D. Rowley) 98-102  
 Absorption from the lungs. (F. C. Courtice & W. J. Simmonds) 103-116  
 Absorption of fluids from the pleural cavities of rabbits and cats. (F. Courtice & W. J. Simmonds) 117-130  
 Healing of artificial defects in embryonic bone grafts. (N. M. Hancox) 131-133  
 The simultaneous estimation of the absorption of water and sulphaguanidine from the stomach of man. (J. N. Hunt) 134-141  
 Response of a frog's muscle spindle. (S. Van Leeuwen) 142-145  
 Explanation of the right kidney in the dog. (M. F. Lockett) 146-149  
 The inhibition of water diuresis in man by ischaemic muscle pain. (A. R. Kelsall) 150-161  
 The antidiuretic and oxytocic hormones in the posterior pituitary glands of newborn infants and adults. (H. Heller & E. J. Zaimis) 162-169  
 A method for testing the purity of commercial samples of T1824 with observations on the amounts of coloured impurities present and the errors in plasma volume estimation caused by them. (D. Leeson & E. B. Reeve) 170-176  
 The nervous pathway of the psycho-galvanic reflex. (K. W. Goadby & H. K. Goadby) 177-184  
 Multi-sensitization of the guinea-pig uterus by serum proteins. (L. B. Winter) 185-189  
 The liberation of histamine by certain organic bases. (F. C. Macintosh & W. D. M. Paton) 190-219  
 The effect of pressure on nerve conduction and nerve-fibre size. (G. Causey & E. Palmer) 220-231  
 The effects of intra-arterial adrenaline on carbohydrate metabolism in man. (J. A. Hildes, S. H. Purser & S. Sherlock) 232-239  
 The effect of temperature on the electrical activity of the giant axon of the squid. (A. L. Hodgkin & B. Katz) 240-249  
 The influence of suprarenal deficiency and of sympathectomy on creatinine clearance in conscious dogs. (M. F. Lockett) 250-257

## Journal of the Royal Army Medical Corps

92 : March 1949

- The purification of water supplies on field service: a retrospect. (S. Elliott) 111-120  
 The acute abdomen in military surgical practice. (D. C. M. Ertles) 121-129  
 Disposal of the sick and wounded of the English Army during the sixteenth century. (D. Stewart) 130-138  
 Radiotherapy and malignant disease. (W. A. D. Drummond) 139-146

92 : April 1949

- Pedunculated growth of the faecal tonsil. (D. W. Bell & W. A. D. Drummond) 164-167  
 Venereal disease and the West African in London. (R. R. Willcox) 168-172  
 Improvisations. (W. R. Martine) 173-182  
 Streptomycin in the treatment of cases of tuberculous meningitis in the Army. (E. S. Clarke) 183-201  
 Some pathological aspects of tuberculous meningitis treated with streptomycin. (G. B. S. Roberts) 202-211

92 : May 1949

- Military surgery in the sixteenth century. (D. Stewart) 229-237  
 The role of the consulting services in war time. (J. A. Macfarlane) 238-243  
 Some observations on, and methods of, dealing with medical problems when a prisoner of war of the Japanese 1942-1945. (C. W. Maisey) 244-264

92 : June 1949

- Rodents in relation to disease and their control. (L. J. Harrison) 273-283  
 Common skin disorders of the Army in the tropics. (K. Greenwood) 284-289  
 A hundred years of insecticides and repellents in the Army: a historical summary. (A. F. H. Keatinge) 290-312

## Journal of the Royal Institute of Public Health and Hygiene

12 : May 1949

- The nurse in industry. (F. C. Sykes) 150-153  
 Judicial welfare services and institutions. No. I. The probation services in the adult court. 160-166

12 : June 1949

- The psychological significance of geriatric rehabilitation. (L. Z. Cosin) 187-194

12 : July 1949

- The hygiene of the scalp and hair. (F. S. Law) 221-230  
 The prevention of accidents in the home. 231-238

12 : August 1949

- Occupational eye diseases and injuries. (J. Minton) 257-262

## Journal of the Royal Naval Medical Service

35 : July 1949

- Comparisons of the naval, military, R.A.F. and civil medical services with private practice. (R. C. Munday) 151-152  
 Two important naval contributions to the practice of vascular surgery. (L. Rogers) 152-154  
 The Royal Naval Blood Transfusion Service. (S. G. Rainsford) 155-186  
 The surgical thoracic unit at R.N. Hospital, Chatham. (W. V. Beach) 187-192  
 Some reminiscences of a hospital ship. (J. C. Gent) 192-218

## Journal of Tropical Medicine and Hygiene

52 : May 1949

- The treatment of amoebic liver abscess with chloroquine. (P. Manson-Bahr) 91-93  
 Mass suppression with chloroquine; chloroquine and pentaquine; and neopremaline. (R. B. Wallace) 93-106

52 : June 1949

- Diagnosis and treatment in latent amoebiasis, with special reference to cases presenting with pyrexia alone. (N. Broughton, A. C. F. Ogilvie & W. D. Wyllie) 112-120  
 The eradication of schistosomiasis: a plea for a rational approach to the problem. (W. H. Jopling) 121-126

52 : July 1949

- Splenic abscess in the tropics. (D. B. Jellicoe) 134-140  
 On pernicious attacks of malaria in childhood. (E. Stransky) 140-144  
 Dental defects observed on the Pacific coast of South America. (K. V. Earle) 144-146

52 : August 1949

- Typhus fevers in the Anglo-Egyptian Sudan. (E. P. Pratt, A. D. Drysdale & R. Kirk) 157-160  
 The parasite rate in high altitude malaria. (J. I. Roberts) 160-169

## Lancet

1 : 7/5/49

- An epidemic of acute nephritis. (J. Fleming) 763-766  
 Streptomycin and promizole in military tuberculosis and tuberculous meningitis in children. (E. M. Lincoln & T. W. Kirmse) 767-773  
 Decamethonium iodide (bistrimethylammonium decane diiodide) in anaesthesia. (G. Organe) 773-774

Effects of decamethonium iodide (C10) on respiration and on induced convulsions in man. (D. L. Davies & A. Lewis) 775-777  
 Handkerchiefs in the transfer of respiratory infection. (K. R. Dumbell & J. E. Lovelock) 777-780  
 Is insulin antigenic? (H. Hult & E. Jorpes) 780-781  
 Use of conducting rubber to eliminate electrostatic hazards in operating-theatres. (D. Bulgin, F. J. Llewellyn & G. Thomas) 789-790

## 1 : 14/5/49

The origin of placental trophoblast and the function of placental gonadotrophin. (I. Gordon) 807-814  
 Spontaneous hypoglycaemia. (R. Hastings-James) 814-817  
 Decamethonium iodide as a muscle relaxant in anaesthesia. (A. J. H. Hcwer, B. G. B. Lucas, F. Prescott & E. S. Rowbotham) 817-819  
 Comparison of decamethonium iodide with *d*-tubocurarine in controlling electrically induced convulsions. (J. A. Hobson & F. Prescott) 819-820  
 Carcinoma of the parathyroid gland with hyperparathyroidism. (O. L. V. de Wesselow & H. E. de Wardener) 820-823  
 Abdominal injury from lightning. (R. J. Alcock & H. C. Fletcher-Jones) 823-825  
 Treatment of seasickness aboard ocean-going ships. (M. B. McEvedy) 825  
 Psychiatric beds in a general ward. A year's experience. (J. Carson & E. H. Kitching) 833-835

## 1 : 21/5/49

The natural history of poliomyelitis. (B. W. Lacey) 849-859  
 Antipeptic and antacid therapy, with special reference to adsorbent complexes of calcium and magnesium phosphates. (N. Mutch) 859-863  
 Procaine penicillin. (M. Y. Young, G. W. S. Andrews & D. M. Montgomery) 863-865  
 Procaine penicillin in infants and children. (W. M. Wilson, J. W. Farquhar & I. C. Lewis) 866-868  
 Chloromycetin in typhoid fever. (W. H. Bradley) 869  
 Some factors affecting the results of treatment of peripheral nerve injuries. (D. R. Davis) 877-880

## 1 : 28/5/49

The radiology of rheumatic heart disease. (J. Parkinson) 895-902  
 Spontaneous pneumomediastinum in pregnancy. (D. J. MacRae) 902-904  
 Acute mediastinal and subcutaneous emphysema. (L. Fridjohn & P. G. Azzopardi) 904-905  
 Fatal human case of canicola fever. (R. S. Weetch, J. Colquhoun & J. C. Broom) 906-907  
 Canicola fever in Germany: report of six cases. (J. Mackay-Dick & R. W. E. Watts) 907-910  
 Surgery in Parkinson's disease. Division of lateral pyramidal tract for tremor: report on forty-eight operations. (L. C. Oliver) 910-913  
 Para-aminosalicylic acid (P.A.S.) in pulmonary tuberculosis. (M. M. Nagley & M. H. Legg) 913-916  
 Megaloblastic anaemia in an infant. (J. H. Hutchison & P. MacArthur) 916-917  
 Speech therapy. (H. St. J. Rumsey) 925

## 1 : 4/6/49

Deep pain sensibility. (J. H. Kellgren) 943-949  
 Ligation of the common carotid artery: report of 19 personal cases. (L. Rogers) 949-950  
 Serological diagnosis of human toxoplasmosis. (A. Macdonald) 950-953  
 Replacement transfusion: technique in the newborn. (J. W. Farquhar & I. C. Lewis) 953-955  
 Sensitisation of penicillin-resistant pathogens. (M. George & K. M. Pandalai) 955-957  
 Anuria following ischaemia of the renal cortex. (A. Solymoss) 957-959  
 Thyrotoxicosis with ophthalmoplegia, myopathy, Wolff-Parkinson-White syndrome, and pericardial friction. (J. A. Strong) 959-961  
 Epidemiology of poliomyelitis. (E. R. Hargreaves) 969-972

## 1 : 11/6/49

Feeding of premature babies. (F. J. Ford) 987-994  
 Testicular pain. Its significance and localization. (F. R. Brown) 994-999  
 The effect of tetraethylammonium bromide on the kidneys. (K. Aas & E. Blegen) 999-1001  
 Sudden death from tetraethylammonium bromide. (M. Schwartz) 1001-1002  
 Factors affecting the response of immunized guinea pigs to antigenic stimulus. Further observations. (P. Hartley & O. M. Hartley) 1003-1005  
 Acute jejunitis. Report of a case. (A. G. Young) 1005-1006  
 Hormone treatment of the sexual offender. (F. L. Golla & R. S. Hodge) 1006-1007  
 The chronic sick under new management. Experiences in starting a geriatric unit. (A. N. Exton-Smith & G. S. Crockett) 1016-1018  
 Social medicine in the universities. (T. McKeown) 1020-1021

## 1 : 18/6/49

The menstrual cycle. (S. Zuckerman) 1031-1035  
 Return of tone in blood-vessels of the upper limb after sympathectomy. (H. Barcroft & A. J. Walker) 1035-1039  
 Temporal arteritis. Report of seven cases. (S. L. Kaye) 1039-1042  
 Partition chromatography on paper. Identification of reducing substances in urine. (R. H. Horrocks & G. B. Manning) 1042-1045  
 A new type of encephalopathy after general anaesthesia. (A. R. Hunter) 1045-1048  
 Injection treatment of hydrocele. (W. W. Wilson) 1048-1049  
 Retarded growth of limbs as a sequel of encephalitis lethargica. (R. T. Gaunt) 1049-1051  
 Abdominal relaxation with decamethonium iodide (C10) during caesarean section. (I. M. Young) 1052  
 Progynon prophylaxis and intercurrent infection. (D. B. Jelliffe) 1052-1053  
 Food in hospital: basic and special diets. (R. Simmonds) 1061-1063  
 Aerial, preventorium, and sanatorium. (D. MacCarthy & T. Stapleton) 1067

## 1 : 25/6/49

Social factors in obstetrics. (D. Baird) 1079-1083  
 Some therapeutic and neurological aspects of peripheral nerve injuries. (W. R. Henderson & D. Taverner) 1084-1088  
 Haemolytic disease of the newborn due to anti-A antibodies. (K. E. Boorman, B. E. Dodd & R. H. Trinick) 1088-1091  
 Streptomycin in the treatment of actinomycosis. Report on three cases. (J. A. Torrens & M. W. Wood) 1091-1094  
 Intestinal actinomycosis treated with streptomycin. (H. S. Pemberton & W. R. Hunter) 1094-1095  
 Retinitis pigmentosa associated with cystinuria. Two uncommon inherited conditions occurring in a family. (W. D. W. Brooks, M. A. Heasman & R. R. H. Lovell) 1096-1098  
 Treatment of hay-fever by injection of nasal mucosa with alcohol. (B. Russell) 1098-1099  
 Diphtheria prophylaxis in very young infants. (G. Bousfield) 1100-1101  
 Greek peasant remedies. (T. Stephanides) 1115-1117

## 2 : 2/7/49

The metabolism of glutamic acid. (H. Waelsch) 1-4  
 Ileostomy and ulcerative colitis. (T. L. Hardy, B. N. Brooke & C. F. Hawkins) 5-9  
 The use of English male toads in pregnancy tests. (A. Klopfer & H. Frank) 9-11  
 Myxoma of the heart. (D. R. Allison & W. Susman) 11-12  
 Plasma-protein levels in West Africans. (M. R. Barakat & D. A. Smith) 12-13  
 Tonic fits and glycosuria due to fat-embolism. (C. A. Rumball) 13  
 Commemoration of the science and art of healing in Canterbury Cathedral. (Moran) 22-23

## 2 : 9/7/49

The rôle of the cerebral cortex in the apperception of pain. (G. W. Theobald) 41-47  
 Comparison of antihistamine (mepyramine maleate) and phenergan as histamine antagonists. (W. A. Bain, J. L. Broadbent & R. P. Warin) 47-52  
 Malleolar fractures. An inquiry into their mechanism. (E. G. Herzog) 52-53  
 Vaccination with the murine type of tubercle bacillus (*vole bacillus*). (A. Q. Wells) 53-55  
 Atypical pneumonia treated with chloromycetin. (E. J. Wood) 55-56  
 Active constriction of hepatic venous tree in anaphylactic shock. Relation to centrilobular lesions. (B. G. Macgrath, W. H. H. Andrews & C. E. M. Wenyon) 56-57  
 Anti-anaemia activity of faecal extract from pernicious anaemia patient. (S. T. E. Callender, B. J. Mallett, G. H. Spray & G. E. Shaw) 57  
 The ointment bases of the British Pharmacopoeia. (J. W. Hadgraft & R. T. Brain) 78-81

## 2 : 16/7/49

Obstruction of the gastro-oesophageal junction. (P. R. Allison) 91-94  
 The rôle of the cerebral cortex in the apperception of pain. (G. W. Theobald) 94-96  
 Treatment of kala-azar with hydroxystilbamidine. (P. C. S. Gupta) 97-99  
 Mechanical respiration. (U. Blackwell) 99-102  
 Haemolytic transfusion reaction due to anti-S. (M. Cutbush & P. L. Mollison) 102-103  
 Avian tuberculosis in man. (I. Dragsted) 103-105  
 Typhoid fever treated with chloromycetin. (A. D. M. Douglas) 105

## 2 : 23/7/49

Gleanings in the field of thyroid surgery. (J. W. Linnell & J. E. Piercy) 141-146  
 Action of hetrazan on filariasis and onchocerciasis. (F. Hawking & W. Laurie) 146-147  
 Loiasis treated with hetrazan (banocide). (F. Murgatroyd & A. W. Woodruff) 147-149  
 Sequelae of meningococcal meningitis in children. (J. D. Matthews) 149-150  
 Isolation of the Karpstrain of *Rickettsia tsutsugamushi*. (E. H. Derrick & H. E. Brown) 150-151  
 A new contrast medium for hysterosalpingography. (B. Williams) 151-152  
 Complete heart-block associated with amoebic hepatitis: normal rhythm restored with emetine. (M. D. Rawlins & G. L. S. Konstam) 152-153  
 Apparatus for intermittent venous occlusion. (J. P. Shillingford) 154-155  
 Osler centenary celebration at Oxford. 168-169

## 2 : 30/7/49

The prevention of burns and scalds. Review of 1000 cases. (L. Colebrook & V. Colebrook) 181-188  
 Excision-suture technique in infections of the hand. (G. P. Arden, A. P. Kitchin & H. D. W. Powell) 188-190  
 Some recent applications of nisin. (A. Hirsch & A. T. R. Martick) 190-193  
 Intramedullary abscess of the spinal cord. (J. Foley) 193-195  
 Fulminating pyrexial postpartum streptococcal peritonitis. (L. N. Jackson & M. H. Jackson) 195-196  
 Ankylosing spondylitis in all three children of one family. (W. Tegner & K. Lloyd) 196-197  
 Mercaptopan in the breath of patients with severe liver disease. (L. S. P. Davidson) 197-198  
 Inheritance of nodular goitre. Report of a family. (W. P. U. Jackson) 198-199  
 Non-medical care of chronically ill children in hospital. (B. W. MacLennan) 209-210  
 Costing for hospitals. (J. E. Stone) 212-213

## 2 : 6/8/49

Chronic and unexplained oedema. (A. G. W. Whitfield & W. M. Arnott) 225-228  
 Conservative treatment of anuric uraemia. (G. M. Bull, A. M. Joecks, K. G. Lowe & B. Evans) 229-234  
 Removal of simple univesicular pulmonary hydatid cyst. (N. R. Barrett) 234  
 Diurnal variation in the fat content of breast-milk. (M. Gunther & J. E. Stanier) 235-237  
 Sloughs of the tracheal mucosa. (F. L. Turner) 237-238

Megaloblastic anaemia in coeliac disease treated with folic acid. (M. L. Thomson, H. W. Dalton & V. K. Wilson) 238-240  
 Volvulus of the caecum presenting as a strangulated inguinal hernia. (H. D. Moore) 240-241  
 Fatal coronary occlusion in a girl aged 16. (W. G. MacDougall) 241

2 : 13/8/49

Twenty-five years of biliary surgery. (W. Walters) 265-268  
 A simple radiological aid to gasserian injection. (J. Penman) 268-274  
 The mortality of primary tuberculosis in childhood. (F. J. W. Miller) 274-276  
 The internal mammary lymph chain in carcinoma of the breast. Study of 50 cases. (R. S. Handley & A. C. Thackray) 276-278  
 The effect of water and salt intake on prickly heat. (G. O. Horne & R. H. Mole) 279-281  
 Recurring pneumococcal meningitis. (A. P. Norman) 281-282  
 Anti-pernicious-anaemia factor and white-cell count. (J. Dedichen & P. Laland) 282-283  
 Total serum-fat in hypertony. (I. Harris, C. E. Vernon, N. Jacob & M. E. Roberts) 283-285  
 Human serum containing anti-N agglutinin. (S. Phansomboon, E. W. Ikin & A. E. Mourant) 285  
 Units in hospital costing. (J. E. Stone) 297-298

2 : 20/8/49

Prophylactic sulphanilamide in rheumatic fever. Review of 548 cases. (S. D. Rubbo, M. C. Holmes & H. L. Stokes) 311-316  
 Carcinoma of the kidney. (E. D. H. Cowen) 316-320  
 Effect of pentamethonium iodide on normal and hypertensive persons. (P. Arnold & M. L. Rosenheim) 321-323  
 Acquired resistance to proguanil in *Plasmodium falciparum*. (D. R. Seaton & A. R. D. Adams) 323-324  
 Concentration of diphtheria antitoxin in cord blood and rate of loss in babies. (M. Barr, A. T. Glenny & K. J. Randall) 324-326  
 Aureomycin in undulant fever. (J. E. Debono) 326-329  
 Responsibilities of finance committees and their officers. (J. E. Stone) 342-343

2 : 27/8/49

Opportunity for adventure. (F. A. E. Crew) 357-358  
 The seven sins of medicine. (R. Asher) 358-360  
 Contribution of the employment history to clinical diagnosis. (A. Meikiejohn) 360-362  
 Function of the M.D. degree. (R. Whitehead) 362-365  
 Teaching of pharmacology in the U.S.A. (D. B. Taylor) 365-366

### Medical Officer

81 : 7/5/49

Informing the public: V. The written word. (M. Hastings) 193-194. VI. The approach to film making. (K. L. Smith) 195-196  
 Ministry of Health return of infectious diseases. 199

81 : 14/5/49

A study of asthma in schoolchildren. (R. I. Mackay) 205-206  
 Ministry of Health return of infectious diseases. 211

81 : 21/5/49

Provision of specialist services by local health authorities under the National Health Service Act, 1946. 217-218  
 Ministry of Health return of infectious diseases. 220

81 : 28/5/49

Bacteria on bank notes. (B. R. Nisbet & T. Skeoch) 225-226  
 Doctor Fosse of Leicester. (A. Hutchison) 226  
 Ministry of Health return of infectious diseases. 229

81 : 4/6/49

Food ways of the young worker. (F. Le G. Clark) 235-237  
 Ministry of Health return of infectious diseases. 239

81 : 11/6/49

Food ways of the young worker. (Concluded.) (F. Le G. Clark) 245-247  
 Ministry of Health return of infectious diseases. 250

81 : 18/6/49

The epidemiology of poliomyelitis with particular reference to the County of Dorset and the 1947 epidemic. (J. L. Gilloran) 255-258  
 Ministry of Health return of infectious diseases. 259

81 : 25/6/49

A field experiment in whooping-cough prophylaxis. (H. M. Holt) 265-269  
 Ministry of Health return of infectious diseases. 272

82 : 2/7/49

A field experiment in whooping-cough prophylaxis. (Concluded.) (H. M. Holt) 5-7  
 The training of the health visitor in the balance. (C. W. Dixon) 7-8  
 Ministry of Health return of infectious diseases. 11

82 : 9/7/49

Smallpox control under difficulties. (J. A. Kerr) 17-18  
 Ministry of Health return of infectious diseases. 21

82 : 16/7/49

Light and shade in the Colonial Medical Service. By a serving officer. 27-28  
 Ministry of Health return of infectious diseases. 32

82 : 23/7/49

The shoes of school children. 37-38  
 Ministry of Health return of infectious diseases. 40

82 : 30/7/49

Confinement—doctor and midwife. (S. Left) 45-47  
 Ministry of Health return of infectious diseases. 50

82 : 6/8/49

Confinement—doctor and midwife. (Concluded.) (S. Left) 55-57  
 Ministry of Health return of infectious diseases. 60

82 : 13/8/49

The care of the nursery school child. (J. Maddison) 65-68  
 Ministry of Health return of infectious diseases. 73

82 : 20/8/49

C.D. ambulance depot to L. A. health centre. (T. E. Roberts) 79-80  
 Ministry of Health return of infectious diseases. 83

82 : 27/8/49

The diphtheria epidemic in Amsterdam. (A. C. Ruys & A. L. Noordam) 89-93  
 Ministry of Health return of infectious diseases. 97

### Medical Press

221 : 4/5/49

The country health centre. (J. D. Kershaw & W. Radcliffe) 429-432  
 Pulmonary tuberculosis in pregnancy. (F. E. S. Willis) 433-435  
 Renal tumours. (J. B. Baird) 436-439  
 Treatment of mental depression. (A. M. Wylie) 439-443

221 : 11/5/49

The diagnosis and modern treatment of early ankylosing spondylitis. (E. Fletcher) 451-453  
 The treatment of schizophrenia. (E. B. Strauss) 454-457  
 The artificial feeding of infants. (J. V. Braithwaite) 457-462  
 Modern trends in physiotherapy. (L. J. Barford) 462-464

221 : 18/5/49

Chronic valvular disease of the heart. (C. T. Andrews) 473-476  
 Acute poliomyelitis: early diagnosis. (H. L. W. Beech) 477-480  
 Emphysema: the radiological aspects. (E. Samuel) 480-483  
 The management of the diabetic in general practice. (W. P. Brinckman) 484-487  
 An unusual case of intussusception. (A. M. Robertson) 487-488

221 : 25/5/49

A modern survey of alopecia areata and its treatment. (A. Biggam) 497-500  
 Radiation therapy. (I. G. Williams) 501-504  
 Multidimensional treatment of mental illness. (D. Blair) 504-507  
 Tumours of the testes. (M. J. Bennett-Jones) 507-509  
 Ophthalmic herpes zoster with contralateral pontine lesions. (C. Worster-Drought & F. Sargent) 510-512

221 : 1/6/49

Health centres. Four and twenty blackbirds. (K. E. Barlow) 519-522  
 The nutrition of children in England. (C. F. Brockington) 522-524  
 Tumours of the naso-pharynx. (J. I. M. Black) 524-527  
 Psychiatric reflections. (H. Baird) 527-531

221 : 8/6/49

The modern treatment of lupus vulgaris. (W. G. Annan) 541-545  
 Differential diagnosis of diseases of the hip in children. (R. Broomhead) 545-548  
 Mass miniature chest radiography (Part 1). (A. E. Beynon) 548-550  
 Hypnotism, retrospect and prospect. (W. P. Berrington) 550-553

221 : 15/6/49

The modern treatment of depression. (D. W. Abse) 563-565  
 Meningocele and myelomeningocele. (W. Gordon) 566-569  
 Some dermatological hazards in the mining industry. (J. L. Boyd) 569-573  
 Common fractures of the foot. (E. J. Bilcliffe) 574-577  
 Chest radiography: the clinical aspect (Part 2). (A. E. Beynon) 577-583

221 : 22/6/49

Modern trends in the treatment of venereal diseases. (J. A. Burgess) 589-592  
 Duties of a port medical officer: a brief survey. (W. P. Cargill) 592-596  
 Functional nervous disorders in children. (C. Burns) 597-599  
 The value of physiotherapy in general practice: a talk on electrical treatments. (L. D. Bailey & G. Norris) 599-601  
 Chest radiography: the clinical aspect (Part 3). (A. E. Beynon) 602-604

221 : 29/6/49

Rheumatism research. (G. N. Myers) 611-615  
 Rheumatoid arthritis. (W. Tegner) 615-618  
 The treatment of osteoarthritis. (J. C. R. Hindemach) 619-623  
 The frozen shoulder. (O. Savage) 623-626  
 Gout. (R. M. Mason) 626-634  
 Non-articular rheumatism. (T. C. Highton) 635-641  
 Drugs in the treatment of rheumatic diseases. (F. Wrigley) 642-646

## 222 : 6/7/49

Health centres in the county of London. (A. Daley) 5-11  
The principles of spa treatment and its place in modern medical practice. (C. W. Buckley) 11-14  
Confusional mental states. (J. C. Batt) 15-18

## 222 : 13/7/49

Some reminiscences of Osler. (A. S. MacNalty) 27-29  
Osler's love for obscure diseases. (F. P. Weber) 29-32  
The Osler Club of London. (A. W. Franklin) 32-34  
Osler, the medical historian. (W. R. Bett) 35-37  
Osler and tuberculosis. (W. Stobie) 37-40  
Some Osler eponyms. (T. H. Bishop) 40-41

## 222 : 20/7/49

Modern trends in the treatment of alcoholism. (A. E. Carver) 49-53  
Anaemia in infancy. (G. M. Komrower) 53-59  
Modern trends in intravenous anaesthesia. (A. Barnsley) 59-63  
Visual education—7. (P. Hansell) 64

## 222 : 27/7/49

Diagnosis and treatment of tuberculosis of the hip joint in children. (E. S. Brentnall) 71-75  
Epilepsy. (R. M. Cairns) 76-79  
Indications for caesarean section with a note on the most suitable type of operation. (C. W. F. Burnett) 79-82  
A fragment of the vast subject of multiple developmental abnormalities. (F. P. Weber) 82-83

## 222 : 3/8/49

Modern treatment of acute rheumatism in childhood. (M. D. Baber) 93-95  
The "Lily-white" appendix. (P. Childs) 95-98  
Intravenous transfusion technique. (K. Lawrence & D. S. Hewett) 99-107

## 222 : 10/8/49

The diagnosis and modern treatment of bronchiectasis. (F. P. L. Lander) 115-117  
Abdominal paracentesis: a new method. (W. J. Moore) 117-127  
Some basic principles in the treatment of flexion deformity of the knee. (B. Lush) 127-129

## 222 : 17/8/49

The modern trend of treatment of deafness. (H. N. Barnett) 137-140  
Hypnotism and its therapeutic value in medicine. (S. J. Van Pelt) 140-146  
Peptic ulcer of the lower end of a congenital short oesophagus associated with diaphragmatic hernia. Report of a case. (J. Almeyda) 147-150

## 222 : 24/8/49

The modern treatment of acute dermatitis. (R. M. Bolam) 159-162  
Third stage. (J. W. Burns) 162-166  
Precise examination of the voluntary motility of the tongue and of the lips. (G. de Morsier) 167-169  
The value of ascorbic acid and its complexes. (B. A. Meyer & I. S. Orgel) 170-172

## 222 : 31/8/49

Torticollis. (D. Brown) 183-187  
Anxiety states. (R. F. Barbour) 187-190  
Criteria of physical fitness. (T. P. Edwards) 190-193  
Voice without a larynx. (J. Sawkins) 193-197

# Monthly Bulletin of the Ministry of Health and the Public Health Laboratory Service

## 8 : May 1949

Accidents in the home. (C. A. Boucher) 90-92  
Recommendations on the use of paludrine (proguanil) in prophylaxis and treatment of malaria. 92-94  
The home help service. (M. L. Richey) 94-98  
The place of the dietitian in the National Health Service. (D. F. Hollingsworth & B. R. Stanton) 98-101  
Notification of infectious disease in England and Wales, March, 1949. 102  
A simple method for determining the streptomycin sensitivity of *Mycobacterium tuberculosis*. (H. D. Holt & R. Cruickshank) 103-106

## 8 : June 1949

The care of the aged sick. (T. H. Howell) 108-112  
Head louse infestation in school children: a comparative trial of insecticides. (C. B. Huss) 112-115  
Notification of infectious disease in England and Wales, April, 1949. 115  
Diphtheria experience in the Public Health Laboratory Service during 1945-1946, 1947 and 1948. 116-131

## 8 : July 1949

Mortality during infancy from some common infectious diseases, 1911-47. (W. P. D. Logan) 134-137  
The enigma of notified dysentery. II. (S. A. Glover) 138-146  
Anaesthesia and analgesia in hospital confinements. (A. L. Winner) 146-148  
Survey of sickness prevalence: December quarter, 1948. 148-152  
Notification of infectious disease in England and Wales, May, 1949. 154  
The bacteriological examination and grading of ice-cream. 155-163

## 8 : August 1949

Disinsectisation of aircraft. (W. A. L. David & R. P. Tew) 166-172  
The Schick reaction of London children, 1936-48: annual and seasonal variation. (I. Taylor) 172-175

Notification of infectious disease in England and Wales, June, 1949. 176  
The virus of lymphocytic choriomeningitis (L.C.M.) as a cause of benign aseptic meningitis. Laboratory diagnosis of five cases. (F. O. MacCallum) 177-183

## Nutrition Abstracts and Reviews\*

## 18 : April 1949

Effects of milling upon the nutritive value of wheat flour and bread. (M. C. Dawbarn) 691-706

## 19 : July 1949

The calorie requirement of adult man. (A. Keys) 1-10

## Overseas Post Graduate Medical Journal

## 3 : July 1949

Sir William Osler: a retrospect. (A. J. Hall) 385-386  
Freedom in medicine. (M. Davidson) 386-387  
Surgical treatment of asthma. (D. Barlow) 388-391  
Use of radioactive dye in localization of brain tumours. (I. Doniach) 391-392  
The surgery of cardiospasm. (R. Maingot) 393-398  
Cardiospasm. (A. S. Johnstone & G. H. Wooler) 399-410  
Substances for use in the diagnosis and treatment of vascular disease. (J. H. Burn) 411-415  
Electroencephalography. (S. L. Last) 415-416  
Hydatid disease. (J. A. Jenkins) 417-434  
Surgical treatment of hydatid disease of the lung. (W. Phillips) 435-445  
'Compound E.' (G. R. Fearnley) 445-446, 466  
An introduction to unipolar lead cardiography. (S. Oram) 447-466  
The place of artificial pneumothorax in the treatment of pulmonary tuberculosis. (P. Ellman) 467-475  
Case for diagnosis. (R. S. B. Pearson) 475-476  
The results of partial gastrectomy. A review of the follow-up of 180 cases of partial gastrectomy for peptic ulcer. (J. C. Ross & A. Walsh) 477-480  
The clinical value of X-ray pelvimetry. (H. G. E. Arthur) 481-486

## Parasitology

## 39 : February 1949

The effect of physical agents on hydatid scolex viability. (L. B. Faltier) 157-163  
Studies on some parasites of fishes. (J. Weiser) 164-166  
The ecology of the sheep tick, *Ixodes ricinus* L. Host relationships of the tick. Part 1. Review of previous work in Britain. (A. Milne) 167-172  
The ecology of the sheep tick, *Ixodes ricinus* L. Host relationships of the tick. Part 2. Observations on hill and moorland grazings in northern England. (A. Milne) 173-197  
*Trypanosoma uniforme*-*Trypanosoma vivax* infections in bovines and *Trypanosoma uniforme* infections in goats and sheep at Entebbe, Uganda. (S. G. Wilson) 198-208  
A new copepod parasite, *Lernanthropus dussumieria* N.S.P., from the gills of a Madras fish. (C. P. Gnanamuthu) 209-213  
*Pseudoperrhorchis teliger*, a new species of Acanthocephala from Java. (J. H. van Cleave) 214-217  
A list of the trichostrongylid lungworms (Phylum Nematoda) and a key to the six genera. (E. C. Dougherty) 218-221  
The phylogeny of the nematode family Metastrongylidae Leiper, [1909]: a correlation of host and symbiotic evolution. (E. C. Dougherty) 222-234  
The scutum of the tick, *Ixodes ricinus* L. (D. R. Arthur) 235-240  
Reactions of *Cyphomandra betacea* to strains of potato virus X. (R. E. F. Matthews) 241-244  
The uptake of radioactive phosphorus from host tissues and fluids by nematode parasites. (W. P. Rogers & M. Lazarus) 245-250  
Studies on the nematodes parasitic in the lungs of Felidae in Palestine. (C. B. Gerichter) 251-262  
The differentiation and nomenclature of Leishmania. (R. Kirk) 263-273  
The ecology of immature phases of trichostrongyle nematodes. III. Larval populations on hill pastures. (H. D. Crofton) 274-280  
The kinetics of the penetration of some representative anthelmintics and related compounds into *Ascaris lumbricoides* var. *suus*. (A. R. Trim) 281-290  
On the gregarine *Lankesteria culicis* (Ross), 1898, from the mosquito *Aedes (Finlaya) gemiculatus* (Olivier). (P. N. Ganapati & P. Tate) 291-294  
The distribution of Cimicidae (Hemiptera) in the Anglo-Egyptian Sudan. (D. J. Lewis) 295-299  
The water-soluble vitamins of parasitic worms. (M. R. A. Chance & P. Dimhuber) 300-301  
Glycolysis and related phosphorus metabolism in parasitic nematodes. (W. P. Rogers & M. Lazarus) 302-314  
Host-parasite relationship between the American Streblidae and the bats, with a new key to the American genera and a record of the Streblidae from Trinidad, British West Indies (Diptera). (B. Jobling) 315-329  
Studies on the virus of turnip yellow mosaic. (R. Marlsham & K. M. Smith) 330-342

## Practitioner

## 162 : May 1949

The treatment of syphilis. (V. E. Lloyd) 349-357  
The treatment of syphilis in the United States. (J. F. Mahoney) 358-360  
The treatment of neurosyphilis. (J. P. Martin) 361-368  
The treatment of congenital syphilis. (R. C. L. Batchelor) 369-376  
Modern views on diagnostic tests in syphilis. (I. N. O. Price) 377-382  
The treatment of gonorrhoea. (A. O. F. Ross) 383-389  
The venereal disease problem in tropical Africa with special reference to British East Africa. (G. L. M. McElligott) 390-395  
The medical hazards of camping. (C. G. Learoyd) 396-404  
Medical services in the small factory. (C. Swanson & R. Passmore) 405-413  
Current therapeutics. XVII. Streptomycin. (N. B. Capon & R. M. Todd) 414-422

\* Journals marked with an asterisk in this Guide consist mainly of abstracts and are listed only when they include original articles.—Ed.

Revision corner: Present trends in protection against childhood infections. (W. P. Phillips) 423-425. The care of the nails. (H. R. Vickers) 425-427

## 162 : June 1949

Food poisoning: a national problem. (E. T. Conybeare) 437-444  
The bacteriology of food poisoning. (G. S. Wilson) 445-451  
Food preservation in relation to food poisoning. (T. N. Morris) 452-456  
Investigation of an outbreak of food poisoning. (E. H. R. Smithard) 457-460  
Food hygiene in shops and restaurants. (R. Cruickshank) 461-468  
The treatment of food poisoning. (S. J. Hartfall) 469-476  
The domestic food poisoning problem. (A. B. Stewart) 477-480  
Headache. (C. Symonds) 481-485  
The present status of the treatment of thyrotoxicosis. (W. H. Beierwaltes & C. C. Sturges) 486-495  
Cricketing injuries. (W. E. Tucker) 496-501  
Early recognition of cancer of the rectum. (S. O. Aylett) 502-507  
Penicillin by the subcutaneous route. (D. Wheatley) 508-511  
Current therapeutics. XVIII. Androgens. (R. Greene) 512-519  
Revision corner: Penicillin in the treatment of infections of the nose and sinuses. (I. S. Hall) 520-521. Jaundice in the new-born baby. (M. J. Wilmers) 522-523

## 163 : July 1949

Examination of the blood. (J. Innes) 1-6  
Biopsy. (C. E. Dukes) 7-12  
Examination of the stools. (H. B. May) 13-16  
Throat swabs. (R. D. Stuart) 17-19  
The bacteriological investigation of pulmonary tuberculosis from the aspect of clinical pathology. (D. B. Cruickshank) 20-24  
Glycosuria. (A. Lyall) 25-30  
The investigation of tinea infestations. (C. H. Whittle) 31-33  
Blood cultures. (R. W. Fairbrother) 33-35  
Blood agglutination tests. (J. Bamford) 36-42  
Tests of renal function. (H. E. Archer) 43-45  
Examination of the cerebrospinal fluid. (D. P. King) 49-53  
Beauchamp Street and Marylebone. A historical causerie. (I. Geikie-Cobb) 54-62  
Freckles. (E. W. P. Thomas) 63-66

The present status of dilatation and curettage. (K. Bowes) 118-122  
The treatment of "athlete's foot." (G. B. Mitchell-Heggs) 123-129  
Asthma in childhood. Experiences in a Liverpool play clinic. (C. A. Clarke) 130-133  
A note on asthma. (A. V. Magee) 134-135  
Care of the perineum during labour. (W. Hunter) 136-140  
Thermal comfort in temperature climates. (W. S. Laddell) 141-150  
Current therapeutics. XX. Aureomycin and chloromycetin. (W. H. Hargreaves) 151-159  
Revision corner: The differential diagnosis of palpitation. (S. Oram) 160-162. The treatment of boils. (R. S. Handley) 162-163. Enemas. (M. Loudon) 163-165

## Proceedings of the Royal Society, B

## 136 : May 1949

The stimulant involved in the germination of *Striga hermonthica*. (R. Brown, A. W. Johnson, E. Robinson & A. R. Todd) 1-12  
Metabolic changes which form the basis of a microbiological assay of nicotinic acid. (H. Mellvain) 12-29  
Contractile tissues in the mammary gland, with special reference to myoepithelium in the goat. (K. C. Richardson) 30-45  
Some antigenic properties of mammalian spermatozoa. (A. U. Smith) 46-66  
The theory of genetical recombination. I. Long-chromosome arms. (A. R. G. Owen) 67-94  
Weissmann's ring and the control of tyrosinase activity in the larva of *Calliphora erythrocephala*. (R. Dennell) 94-109  
A new method for the study of cell division and cell extension with some preliminary observations on the effect of temperature and of nutrients. (R. Brown & P. Rickless) 110-125  
The mechanics of crossing-over. (K. V. Srinath) 126-130  
The route of antibodies passing from the maternal to the foetal circulation in rabbits. (F. W. R. Brambell, W. A. Hemmings, M. Henderson, H. J. Parry & W. T. Rowlands) 131-144

## 136 : June 1949

A discussion on antibiotic activity of growth factor analogues. 145-181  
Fatigue and neuromuscular block in mammalian skeletal muscle. (G. L. Brown & B. D. Burns) 182-195  
The heat of activation and the heat of shortening in a muscle twitch. (A. V. Hill) 195-211  
The energetics of relaxation in a muscle twitch. (A. V. Hill) 211-228  
Myothermic methods. (A. V. Hill) 228-241  
The onset of contraction. (A. V. Hill) 242-254  
The haemoglobins of *Ascaris lumbricoides*. (H. E. Davenport) 255-270  
The haemoglobins of *Nippostrongylus muris* (Yokagawa) and *Strongylus* spp. (H. E. Davenport) 271-280  
*Ascaris* haemoglobin as an indicator of the oxygen produced by isolated chloroplasts. (H. E. Davenport) 281-290  
Upper Ordovician trilobites of zonal value in south-east Shropshire. (B. B. Bancroft) 291-315

## Proceedings of the Royal Society of Medicine

## 42 : April 1949

Discussion: liver damage of metabolic origin. 201-206  
Discussion on the prevention of accidents. 207-214  
Discussion on food poisoning. 214-220  
Discussion on Hirschsprung's disease. 221-228  
The place of the experimental method in medicine. (G. W. Pickering) 229-234  
Discussion on chronic diarrhoea, excluding tropical causes. 235-244  
Discussion on the place of artificial pneumothorax in the treatment of pulmonary tuberculosis. 244-248  
Dental caries in Norwegian children during and after the last World War. A preliminary report. (G. Toverud) 249-258

## 42 : May 1949

Anaesthesia for the surgical treatment of hypertension. (J. Gillies) 293-298  
Anaesthesia for the surgical treatment of hypertension. (L. Morris) 298-300  
Detection of foetal abnormalities. (J. B. Hartley) 301-310  
Discussion on the artificial menopause, indications, technique and complications. 311-320  
Discussion on the cause of diabetes. 321-330  
The heart in endocrine disease. (W. Evans) 331-342  
Discussion on peripheral vascular diseases. [Abridged] 349-354  
Discussion on diagnostic radiology in rheumatic disease. 354-364  
Discussion on the development of psychiatry within the National Health Service. [Summary] 365-366  
Some cultural group abreactive techniques and their relation to modern treatments. (W. Sargant) 367-374

## 42 : June 1949

Discussion on the pathological features of cortical necrosis of the kidney and allied conditions associated with pregnancy. 375-387  
Vault-suspension. (H. G. E. Arthure) 388-390  
Some aspects of non-gonococcal infections of the genital tract. [Abridged] (A. H. Harkness) 390-392  
The hypotheses concerning the aetiology of dental caries. (G. J. Parfitt) 393-399  
Birth conditions and dental deformities. (L. M. Clinch) 399-400  
Discussion: how to write a report. [Abstract] 401-402  
Discussion on immunity responses in the young with special reference to diphtheria. 402-406  
Antonio de Gimbernat, 1734-1816. (N. M. Mathieson) 407-410  
Eighteenth century medical care: study of Roxburghshire. (I. E. McCracken) 410-416  
Discussion on manipulative treatment. 417-420  
Extensions of the tympanic cavity. [Summary] (V. Lambert) 421-424  
The aetiology of swimmers' exostoses of the external auditory canals and of associated changes in hearing. [Résumé] (W. S. Adams) 424-425  
Demonstration of the human labyrinth and its related structures in perspex. (O. Gray) 425-426  
The practical value of peripheral nerve repair. (H. J. Seddon) 427-436  
Discussion on the surgery of portal hypertension. 437-446  
The retro-orbital tissues as a site of outflow of cerebrospinal fluid. (E. J. Field & J. B. Brierley) 447-450  
Discussion on ophthalmic photography. 451-458

## 42 : July 1949

Persistent painful states after digital nerve injury. (R. P. Jepson) 459-465  
Flossilk dam for inguinal hernia. (R. Mainoot) 466-468  
An operation for hypospadias. (D. Browne) 466-468  
The use of irradiation, surgery and hormones in breast cancer. (F. E. Adair) 468-474  
Discussion: evaluation of renal clearances. 475-480  
The treatment of prostatic secondary deposits in bone. (E. W. Riches) 481-483  
Electrical reactions of muscle in poliomyelitis. (I. G. MacKenzie) 488-490  
Pharmacological explorations of the personality: narco-analysis and methedrine shock. (J. Delay) 491-496  
Discussion on periarthritis nodosa. 497-506  
Three children successfully operated upon for congenital atresia of the oesophagus with oesophago-tracheal fistula. (R. H. Franklin) 507-512  
Healed miliary tuberculosis of liver and spleen. Hepatomegaly, splenomegaly. (G. Konstam) 512-513  
Discussion: the significance of strain differences in virus prophylaxis. [Abridged] 517-522  
Discussion: the pharmacological basis of modern anaesthesia. 522-526  
"Nerve" deafness: its clinical criteria, old and new. (M. R. Dix, C. S. Hallpike & J. D. Hood) 527-536  
The causes of perceptive deafness. (R. R. Simpson) 536-540  
Pituitrin therapy in hydronephrosis. (J. G. Y. Bell) 541-546  
The operative treatment of urinary incontinence in the male. (G. M. Lewis) 547-548  
Vesical diverticula. [Abridged] (H. G. Hanley) 548-555

## Neurophysiology

The communications which are presented here by physiologists and neurologists represent such a wide range of research and offer so much of interest that they may fittingly be introduced by a short review of the more important stages in the development of neurophysiology, a field to which British workers had early made many noteworthy contributions.

In the later years of the last century, attention was particularly focused on the localization of function on the surface of the forebrain, of which there had been no indication till Broca showed that certain functions of speech depend on integrity of a portion of its cortex. It was not, however, till 1870, when Fritsch and Hitzig succeeded in evoking movements of the limbs by stimulation of the cerebral cortex by an electrical current, that the important part which this plays in the higher mammals, and especially in man, was recognized. These observations excited the interest of Ferrier in Great Britain, who, by his early training in physiology and psychology and by his exceptional manual dexterity, was particularly fitted to extend and elaborate them. He succeeded in demonstrating that not only initiation of movement, but also sensation, vision and hearing, are represented in, or related to, separate circumscribed areas of the surface of the forebrain. Confirmation, and in some respects modification, of Ferrier's observations came from his fellow countrymen Horsley, Schäfer, Beever and others ; in fact, during the succeeding twenty years, the chief contributions to this subject by experimental methods were made by the British school.

But even before it had been shown that restricted areas of the cortex are related to certain functions, Hughlings Jackson, whose teaching has had a profound influence on the development of this branch of neurology, had with remarkable insight discussed at length not where functions can be localized, but the more essential problem of how they are represented in the higher levels of the nervous system.

The next milestone in this chapter of neurology was the series of investigations by Grünbaum and Sherrington on the excitable cortex of anthropoid apes. In addition to providing a more precise scheme of localization of motor functions, these investigations showed that the response of any point to electrical stimulation is not constant and unalterable, but varies with varying conditions of stimulation; in other words, the motor cortex is a plastic organ. All subsequent investigations have confirmed Sherrington's conclusions, but as Jefferson in this number points out in his review of recent work, the conviction has been gaining ground that the exclusive role in initiation and direction of movement hitherto generally assigned to the cortical motor area can be no longer admitted. In fact, clinicians as well as physiologists have come gradually to the belief that even the simplest movement, whether it be voluntary, so-called, or evoked by a stimulus, requires the co-operation of cortical and subcortical mechanisms.

Clinical studies have thrown further light on these and other problems, and especially on those for which a co-operative human subject is essential. Noteworthy among these studies are: the distribution and organization of the sensory receiving areas in the cortex; the mode of synthesis of elementary movements into complex purposeful acts; the recognition and identification of happenings in the outer world or in the subject's own body by integration of messages supplied to the brain, and the use of the conventional symbols of speech for communication with one's fellows. But unfortunately conclusions from clinical observations depend mainly on the study of functions that are disordered by disease and their interpretation is frequently difficult, for the symptoms exhibited by a patient, especially when they are due to injury of the higher and less organized levels of the nervous system, are partly the result of adjustment of intact parts to the specific defect; they rarely give a true and simple picture of the function that is lost.

Though less spectacular, studies of the lower levels of the nervous system have been equally essential to an understanding of how the system works as a whole. Earlier investigations on reflexes mediated through the spinal cord

and brain-stem threw much light on the nature of nervous activity of these parts, but it is largely to Sherrington's classical work on the integration of their activities that modern neurology owes its present orientation.

The papers included in this symposium have been contributed by those actively engaged in the study of the subjects on which they write. They deal with almost every branch of neurophysiology, from such fundamental matters as conduction through individual nerve fibres to sensory discrimination at higher levels of the nervous system; from nervous control of the endocrine glands to localization of function in the cerebral cortex.

Much of this has been acquired by the use of new methods which have enabled physiologists to trace and analyze at different levels of the nervous system messages that arrive from the periphery or originate within it. This is well brought out in Eccles' interesting paper on the responses of motoneurons; and Hodgkin's researches on the conduction of impulses, for instance, necessitated the insertion of a fine electrode into a single nerve fibre for the purpose of studying action and resting potentials developed across the membrane on its surface. To observe the effects of stimulation of different parts of the hypothalamus, Harris employed electrodes permanently fixed within it; these could be excited, without interfering with the routine of the experimental animal's life, simply by bringing the animal's head into an electromagnetic field.

All the communications presented here contain matter of special or general interest. The story of the hypothalamus is told from the anatomical side by Le Gros Clark & M. Meyer, and from the physiological side by Harris. The significance of the hypothalamus was for long overlooked, though the fact that its development has scarcely varied in the vertebrate series was suggestive. Now it is recognized as the highest level of the autonomic system. Its intimate reciprocal relations with the cortex enable it, on the one hand, to influence cortical activity itself, and on the other hand to determine the reactions of the ductless glands and other organs to emotional and other higher-level activities.

Another function of the autonomic system is regulation of the flow of blood through different organs. Carmichael, who has already studied it in the distal segments of the limbs, reviews the subject in the light of further observations. In addition to the generally recognized vasoconstrictor reflexes, he finds evidence of vasodilator fibres to arteries, and even that veins, in the peripheries of the limbs at least, may also be under sympathetic control.

Feldberg in a particularly interesting article records experiments which at least suggest that passage of impulses across synapses in the central nervous system may be effected by a chemical transmitter, such as acetylcholine, which Dale has shown to be essential in the autonomic system.

Another noteworthy contribution is Adrian's paper on the basis of sensory discrimination. In addition to a critical review of the subject, he refers to the results of his further studies on the distance receptors, in this instance by experiments on the olfactory system. These show that, as in the case of vision and hearing, recognition and differentiation of a stimulus depends on the characteristic pattern of excitation it forms on the receptor surface.

As facts accumulate it often happens that cherished

theories and assumptions must be disenthroned from positions long accorded them, or at least that they must be greatly modified. Jefferson, for example, here brings forward evidence which, though still scanty, suggests that consciousness, in the sense of awareness of surroundings, which has been almost universally regarded as a function of only the highest levels of the nervous system, may be dependent on integrity of certain structures in the brain-stem. If this evidence becomes generally accepted, it will provide yet another instance of a change of outlook brought about with the help of experimental research.

This symposium shows what a wide range of work of this kind is being carried out now in Britain; future developments in this subject should be equally impressive.

*Gordon Holmes*

# Notes on Contributors

PROFESSOR E. D. ADRIAN has occupied the chair of physiology at Cambridge since 1937, and in 1942 was awarded the Order of Merit. Much of his work has been on the function of neurones and on the use of the electroencephalograph. His most recent book, *The physical background of perception*, was published in 1947; other works include *The basis of sensation* (1928) and *The mechanism of nervous action* (1932). In 1945 Professor Adrian contributed to the Neurology number of the Bulletin an article entitled "Physiological Mechanisms in the Brain" (*Brit. med. Bull.* 1945, 3, 1). Further details of his career may be found in the Notes on Contributors in that number.

DR E. A. CARMICHAEL is Director of the Medical Research Council's Neurological Research Unit at the National Hospital, Queen Square, London. During the Second World War he was Secretary of the Council's Military Personnel Research Committee, and a member of various other committees, among them, the Flying Personnel Research Committee. In 1942, Dr Carmichael, with Dr J. S. Weiner, Dr B. McArdle, and others, began a series of investigations into the effects of high temperatures on the comfort and efficiency of fighting personnel. Research activities on tropical clothing of the wartime Climatic Unit—of which Dr Carmichael was Director—have been described in Dr J. S. Weiner's article in the Personnel Research number of the Bulletin (*Brit. med. Bull.* 1947, 5, 20). Dr Carmichael's published work includes *On hereditary ataxia and spastic paraplegia*, written jointly with Dr Julia Bell, and published in 1939.

PROFESSOR W. E. LE GROS CLARK is Professor of Anatomy in the University of Oxford. His main interest for many years has been the study of the interconnexions of different parts of the central nervous system by experimental methods. In the past he has concentrated attention mainly on the sensory mechanisms of the brain—in particular the thalamus and the visual system. His earlier studies on the anatomy of the hypothalamus are now assuming a more obvious practical significance, for recent evidence indicates an important functional relationship between this primitive part of the cerebrum and the frontal areas of the cerebral cortex.

DR G. D. DAWSON was educated at Manchester University and carried out research there on recording nerve action potentials, gaining his M.Sc. in 1933. In 1936 he became medically qualified, and after holding various clinical appointments he began work on electroencephalography in 1938 at the Manchester Royal Infirmary. From 1941 to 1944 Dr Dawson was Assistant Director of the David Lewis Epileptic Colony and since then has been on the staff of the Medical Research Council, working in the Neurological Research Unit at the National Hospital, Queen Square, London. In collaboration with Dr W. Grey Walter, he has contributed papers on electroencephalography to the *Journal of Neurology, Neurosurgery and Psychiatry*.

DR JOHN C. ECCLES is Professor of Physiology in the University of Otago, Dunedin, New Zealand. He graduated in medicine in Melbourne in 1925 and came to Oxford, as a Rhodes Scholar, in order to be a pupil of Sir Charles Sherrington. He was a Fellow of Exeter College and later of Magdalen College, and a University lecturer in physiology until he left England in 1937. Professor Eccles, who was elected a Fellow of the Royal Society in 1941, has worked on many aspects of the transmission across the junctional regions between nerve cell and nerve cell (synapses) and between nerve cell and muscle (striated, cardiac and smooth). His recently developed electrical theories of synaptic excitatory and inhibitory processes have aroused much interest and are effectively stimulating research. He is part author of a book, *Reflex activity of the spinal cord* (1932), and the author of over ninety papers in the *Journal of Neurophysiology, Journal of Physiology, Proceedings of the Royal Society B, Nature*, etc.

DR WILHELM FELDBERG's main work has been on the physiology and pharmacology of histamine and acetylcholine. Until 1933 he was lecturer in physiology at Berlin University, which he was forced to leave in that year. He then worked at the National Institute for Medical Research, London, and later at the Walter Eliza Hall Institute, Melbourne, Australia; afterwards he became Reader in Physiology at Cambridge University. Dr Feldberg is now again at the

National Institute for Medical Research. In the years after 1933, he demonstrated, with Sir Henry Dale, Professor J. H. Gaddum and, later, with Professor G. L. Brown, the role of acetylcholine as a chemical transmitter across a synapse in the autonomic nervous system and from motor nerve endings to motor end-plates of striped muscle fibres. He was one of the first to demonstrate the release of histamine during the antigen-antibody reaction of anaphylaxis, and with Dr Charles Kellaway, in Australia, showed the release of histamine during poisoning by various snake venoms and by bee venom. With Dr N. Emmelin, Dr Feldberg has recently demonstrated that histamine occurs in high concentrations in the hair fluid of the nettle plant and, with acetylcholine, accounts for the reactions and sensations produced by the nettle sting in the human skin. He has written, with E. Schilf, *Histamin: seine Pharmakologie und Bedeutung für die Humoralphysiologie* (Berlin, 1930), and has translated into German books by Barcroft, Gaddum, and Krogh.

DR G. W. HARRIS obtained his M.D. degree at Cambridge in 1944, and is a lecturer in physiology at that University. He is a member of the Physiological Society, Anatomical Society and Endocrinological Society. He has contributed to various scientific journals papers on such subjects as the innervation and actions of the neurohypophysis and the induction by electrical stimulation of pseudo-pregnancy and ovulation in experimental animals.

MR A. L. HODGKIN is an assistant director of research in the Physiological Laboratory, Cambridge. He has worked on the mechanism of nervous conduction and his experiments throw much light on the processes underlying the phenomenon. With A. F. Huxley he developed a method of inserting micro-electrodes into the interior of nerve fibre and showed that activity involved a reversal of membrane potential. The present article deals with recent developments in this field. Before the war Mr Hodgkin worked under Barcroft and Professor E. D. Adrian at Cambridge and also spent a year with Dr H. S. Gasser and Dr K. S. Cole in the USA. From 1940 to 1945 he worked on the design of radar in aircraft and was concerned with early applications of the microwave technique. He was elected a Fellow of the Royal Society in 1948, and is the author of numerous articles in scientific journals.

PROFESSOR GEOFFREY JEFFERSON was appointed Hunterian professor of the Royal College of Surgeons in 1942, and in June last year delivered the Lister Oration at the College. He now occupies the chair of neurosurgery at the University of Manchester. Professor Jefferson has gained world-wide recognition in the field of neurosurgery and has published many important papers on the subject. Fuller details of his career appeared in the Neurology number of the Bulletin, to which he contributed an article on head injuries (*Brit. med. Bull.* 1945, 3, 5).

DR HENRY McILWAIN previously worked in the Medical Research Council's Unit for Research in Cell Metabolism at Sheffield University, and afterwards carried out investigations of bacterial nutrition with the Council's Department of Bacterial Chemistry at the Middlesex Hospital, London. In 1948 he was appointed to the posts of Senior Biochemist to the Teaching and Research Laboratories, and Senior Lecturer in Charge of Biochemical Laboratories, at the Institute of Psychiatry, Maudsley Hospital, London. Various biochemical studies in connexion with the central nervous system are in progress in the laboratories of the Institute. Dr McIlwain contributed to a previous number of the Bulletin an article entitled "Analysis of Antibacterial Action" (*Brit. med. Bull.* 1946, 4, 259), with which a more detailed note on his early career was published.

MRS MARGARET MEYER is a research worker who, with the aid of a grant from the Medical Research Council, is engaged in a study of the connexions of the cerebral cortex by the use of silver techniques. For some time she worked in the Institute of Psychiatry at the Maudsley Hospital, London, investigating the anatomical changes in brains of patients who had undergone the operation of leucotomy. More recently, she has been amplifying the results of her observations on the human brain by making parallel studies in the Department of Anatomy at the University of Oxford on the brains of animals which have been subjected to localized lesions of the cerebral cortex.

## BRAIN METABOLISM AND ACTIVITY

H. McILWAIN D.Sc. Ph.D.

London

- 1 Changes in blood during its passage through the brain
  - 2 Changes in brain constituents
  - 3 Metabolic potentialities of brain tissues
  - 4 Balance between physiological and biochemical events in brain
  - 5 Utilization of energy-rich compounds
- References

In higher animals the main exchange of materials between the brain and the rest of the body is by the blood-stream; exchange by the cerebrospinal fluid is relatively sluggish. The blood supply to the brain is a large one, and if it is interrupted even for only short periods mental activities and the electrical activities of the brain are first disturbed and then cease. Analysis of the blood before and after its passage through the brain shows that changes have taken place in some of its constituents during the passage, and other experiments indicate that the magnitude and type of these changes vary with the activity of the brain. Accurate study of the major exchange occurring during such experiments is relatively recent, and has been chosen as the starting-point of this account, after which some concomitant changes in brain tissue and their relation to the activity of the brain are then considered. Many antecedent studies have of necessity not been described.

## 1. Changes in Blood during its Passage through the Brain

To determine the over-all metabolism of the whole brain *in situ*, representative samples of all blood entering and leaving the brain are analyzed; surgical techniques may be required in such experiments (Ferris *et al.* 1946; Gibbs, Maxwell & Gibbs, 1947). Simultaneously, the rate at which blood is flowing through the brain is determined; in normal adults this rate is about 600 ml./min. but under varying physiological conditions it can range between 300 and 1,300 ml./min. In a group of normal people the oxygen content of the blood fell from an average of about 20 volumes per cent to about 13 volumes per cent (Gibbs *et al.* 1942). This is a somewhat greater loss of oxygen than the average which is sustained by the blood in passing through the body. The loss of oxygen in the brain is accompanied by an almost exactly equivalent gain in carbon dioxide, that is, the brain's respiratory quotient is close to unity. This suggests that carbohydrate is the main substrate oxidized, and determination of arterial and venous levels of glucose confirms this. Thus one set of experiments showed that of the glucose which was lost on passing through

the brains of dogs, 87 per cent could be accounted for by the  $\text{CO}_2$  formed, 11.5 per cent by lactic acid, and some 2 per cent by pyruvic acid (Himwich & Himwich, 1946). It is thus unlikely that the brain ordinarily oxidizes any other substrate at a rate approaching that of its oxidation of glucose. Also, if the glucose level of the blood is lowered by insulin, the oxygen consumption of the brain falls, even though the blood contains other oxidizable substrates (Himwich & Fazekas, 1937; Wortis, Bowman & Goldfarb, 1940). The muscles of animals in which this was taking place maintained almost their normal respiratory rate by oxidizing fat or amino-acids; but the brain did not do so. It is presumably such metabolic characteristics which make the functioning of the brain particularly susceptible to hypoglycaemia.

The brain's oxygen consumption corresponds to a respiratory rate of about 2 ml.  $\text{O}_2$ /g. of brain/hr., or about 3 l.  $\text{O}_2$ /hr. in the whole brain of a normal adult. Its magnitude can be appreciated by comparing it with the oxygen consumption of the body as a whole, when it is found that in adults at rest the brain takes about one-quarter of the total oxygen used by the body. In infants, whose brain is much larger in proportion to the whole body, the corresponding value is about one-half (Folch, 1947). Brain metabolism is thus not only continuous, but at a relatively high level.

## 2. Changes in Brain Constituents

The very active exchange of materials which occurs between blood and brain makes it understandable that interruption of the blood-stream should disturb the functioning of the brain. The problem of how this functioning is maintained or disturbed has prompted investigations by other techniques. One technique has involved analysis of the brain itself, in order to discover what changes in its constituents are associated with changes in the materials supplied by the blood, or with changes in brain functioning induced by other means.

Post-mortem changes in brain constituents can be extremely rapid, and the most satisfactory techniques for obtaining the specimens needed in such work are to drop small animals or their heads into liquid air, or to freeze the exposed brain *in situ*. The necessity for such techniques was first shown in 1935 (Kerr, 1935; Avery, Kerr & Ghantus, 1935), when they were devised in order to obtain satisfactory values for the lactic acid, glycogen and phosphocreatine content of brain. Thus values of some 12–30 mg./100 g. brain for the normal lactic acid content of the brains of dogs or cats rose to 65 mg./100 g. brain if cooling was delayed for 2 to 3 seconds, while values for phosphocreatine fell. Such connexion between changes in carbohydrate and labile phosphoric acid derivatives has been the subject of many investigations which have aimed at finding chemical correlates of changed physiological activity, as will be seen in the account which follows.

When dogs were caused to breathe air low in oxygen content, the concentration of inorganic phosphate in the brain rose, while that of phosphocreatine fell (Gurdjian, Stone & Webster, 1944). Cyanides caused the same changes in cats (Olsen & Klein, 1947). Increasing the electrical activity of the brain by means of a variety of convulsants led also to a fall in phosphocreatine, adenosine triphosphate, glucose and glycogen, and to an increase in inorganic phosphate (Klein & Olsen, 1947; Stone, Webster & Gurdjian, 1945). Electrical stimulation produced a 50 per cent fall in phosphocreatine within one second; hexose phosphates and then inorganic

phosphates were formed (Richter & Dawson, 1949). Re-synthesis of the phosphocreatine took place within 15 to 45 seconds.

These data can be summarized by saying that respiration maintains, and activity depletes, the labile energy-rich phosphoric esters of the brain. Other changes also are consistent with this general observation. Increased activity or decreased oxygen led to a much greater utilization of glucose and to the formation of more lactic acid than would otherwise have been the case. Decreased activity in anaesthesia or sleep reduced the lactic acid content of the brain (Stone, 1938; Richter & Dawson, 1948a). Increased activity led to increase in free ammonia in the brain (Richter & Dawson, 1948b). The assessing of these various changes is greatly assisted by observations on intermediary metabolisms which are next described.

### 3. Metabolic Potentialities of Brain Tissues

Independently of the evidence described above, studies with separated tissues and tissue preparations from brain have shown that a major part of their enzymic make-up is related to the metabolism of carbohydrate and labile phosphoric esters. Thus the conversion of glucose to lactic acid is brought about by extracts from brain, and probably proceeds through hexose diphosphate as this compound is converted to lactic acid even more rapidly than is glucose (Ochoa, 1941b). Adenosine triphosphate, cozymase and magnesium ions are required for the reaction to proceed at its optimal rate (Uttér, Wood & Reiner, 1945). If fluorides are present to prevent break-down of adenosine triphosphate, esterified phosphate accumulates. Glycolysis is more rapid in the presence of a phosphate acceptor such as creatine (Ochoa, 1941b). Many of the individual stages of phosphorylating glycolysis, observed in other tissues, have also been shown to take place in brain. Hexokinase, phosphorylase and phosphoglucomutase are present (Shapiro & Wertheimer, 1943); phosphoglyceric acid was found to be converted to phosphopyruvic acid, which phosphorylated adenylic acid (Ochoa, 1941a). Dismutations involving fumarate, malate and pyruvate were shown to be dependent on the presence of inorganic phosphate (Long, 1945).

Many enzymes of the oxidative reactions of general schemes of carbohydrate metabolism also occur in brain and result in the formation of energy-rich phosphoric esters. Thus inorganic phosphate, an acid of the tricarboxylic cycle, and an adenosine phosphate and cocarboxylase are required for oxidation of pyruvate by pigeon brain dispersions (Banga, Ochoa & Peters, 1939; Ochoa, 1941b); cozymase, magnesium and cytochrome are also needed (Larner, Jandorf & Summerson, 1949). Such oxidation can yield energy-rich phosphates, esterifying initially some 600  $\mu\text{mol.}$  of phosphate/g. fresh tissue/hr. with a molar ratio of phosphate esterified/oxygen utilized, of about 4 (Ochoa, 1941a). Quantitative data are available on the tissue content of malic dehydrogenase (Potter, 1946), succinic dehydrogenase (Howe & Flexner, 1947) and cytochrome oxidase (Schneider & Potter, 1943).

### 4. Balance between Physiological and Biochemical Events in Brain

It is immediately understandable that chemical events in the brain should limit physiological ones. But it is observed also that physiological events limit chemical ones: that the

normal rate of brain metabolism is below its potential rate; that in sleep it is still further lowered, but that with increased physiological activity it is increased.

The rate of glycolysis is an excellent example of this phenomenon. Rates have been observed for this reaction in carefully prepared homogenates and extracts of brain which give indications of the metabolic potentialities of the tissue in this respect. Rates of glycolysis of 300–450  $\mu\text{mol.}/\text{g.}$  of brain/hr. are found (Ochoa, 1941b; Utter *et al.* 1945; Elliott & Henry, 1946; Meyerhof & Geliazkova, 1947). In normal brain the values quoted in a preceding section correspond to the much lower value of 36  $\mu\text{mol.}/\text{g.}/\text{hr.}$ , but this is very greatly increased in convulsions (Klein & Olsen, 1947).

There is not such a large difference between the potential rates of respiration and those ordinarily realized; homogenates have given rates of approximately 160  $\mu\text{mol.}/\text{g.}/\text{hr.}$  (Reiner, 1947; glucose or hexosediphosphate as substrates), or 135–225  $\mu\text{mol.}/\text{g.}/\text{hr.}$  (Larner *et al.* 1949; pyruvate as substrate). The normal rate by arteriovenous differences corresponds to 90  $\mu\text{mol.}/\text{g.}/\text{hr.}$ , and again is increased in convulsions.

The restraint normally imposed on glycolysis operates in separated tissues. The aerobic rate of formation of lactic acid from glucose by slices is normally low—some 15  $\mu\text{mol.}/\text{g.}$  fresh brain/hr. It can, however, be greatly increased by anaerobiosis, or aerobically by certain reagents of which phenosafranine is an outstanding one. Low concentrations of this substance accelerate glycolysis to values of some 250  $\mu\text{mol.}/\text{g.}/\text{hr.}$  (Dickens, 1936). Phenosafranine has now been found to affect a particular metabolic process which the preceding account suggests to be intimately connected with the level of metabolism in brain: this is the formation of energy-rich phosphates from inorganic phosphates during oxidation of pyruvate (Case & McIlwain, unpublished; for analogous observations in kidney preparations, see Judah & Williams-Ashman, 1949). The action of phenosafranine appears to be through its effect on cozymase metabolism (McIlwain, 1949); cozymase is needed for the oxidation. In the presence of phenosafranine, inorganic phosphate and phosphate acceptors remain uncombined, even though oxidation of carbohydrate is in progress. Now inorganic phosphate or phosphate acceptors are reactants in stages of carbohydrate degradation: at hexokinase, which constitutes the point of entry of glucose to glycolysis or oxidation, and again in reacting with glyceraldehyde phosphate. For these reactions, which cannot proceed without inorganic phosphate, phenosafranine provides, or prevents the removal of, phosphate and phosphate acceptors, which would otherwise have been combined. It is therefore understandable that the degradation of carbohydrate should be accelerated.

There is a close analogy in chemical events between the action of phenosafranine and of the convulsive agents discussed above. In those cases the increased physiological activity led to break-down of phosphocreatine and formation of inorganic phosphate and phosphate acceptors. Here also it is evident that these products can themselves stimulate the reactions which lead to their re-formation. A mechanism for controlling carbohydrate break-down by physiological need is thus provided through the balance between energy-rich phosphates and their break-down products.

A further aspect of the stimulated metabolism may be noted. This concerns the balance between the end-products of glucose metabolism, lactic acid and carbon dioxide. It

appears almost certain that in brain, as in general schemes for carbohydrate degradation, these two end-products are the result of two series of reactions which proceed in common from glucose to pyruvic acid. The pyruvic acid may then be oxidized if oxygen is available, or if not, it may form lactic acid. The number of energy-rich phosphate groups which can be generated during catabolism of glucose by these two routes differs widely, varying from 3 to 40 mol./mol. glucose. Thus the situation, observed physiologically, in which most of the glucose catabolized is oxidized completely, could be described as providing the most efficient means of deriving phosphate esters from glucose. In the absence of oxygen this cannot take place, and glycolysis is observed to increase. Aerobically, glycolysis is inhibited in some way; but it can, as was noted above, be released by agents such as phenosafranines. The aerobic inhibition may be mediated also through the availability of phosphate and phosphate acceptors; this and other possibilities have been much debated (cf. Burk, 1939; Lipmann, 1942). Both oxidation and glycolysis require phosphate, but the differential effect—the inhibition of glycolysis aerobically—may be explained in terms of the varying phosphate concentrations required (see Long, 1945) for the different reactions in which it participates.

### 5. Utilization of Energy-Rich Compounds

Knowledge is very limited of how, in any organ or tissue, the energy derived from metabolic processes is utilized in physiological functioning. In nervous tissues the following findings may be recorded, but at present they can be said to be no more than suggestive. The passage of a nerve impulse is associated with migration of ions. The magnitude of the electric disturbance is related to the magnitude of the ionic change in a way which would be expected were the ion difference responsible for the potential of the discharge (cf. Hodgkin & Katz, 1949). Differential ion gradients can be built up and maintained in separated nervous tissue (Rothenberg & Feld, 1948) and here they are found to require energy-yielding metabolic processes, including glucose break-down

(Krebs & Eggleston, 1949). Changes in specific organic constituents are also associated with propagation of nerve impulses. Among these is acetylcholine, and the re-synthesis of acetylcholine by systems from nervous tissue requires an energy-yielding reaction (Mann, Tennenbaum & Quastel, 1938, or the presence of adenosine triphosphate (Nachmansohn & Machado, 1943).

A major limitation in present knowledge of metabolic events in the brain is that the majority of biochemical investigations have been carried out with the organ as a whole of with preparations from relatively large portions of it. The physiologically important events in brain are extremely localized as well as being very rapid. They are undoubtedly dependent on maintenance of general metabolism which it has first been necessary to understand, and much remains yet to be discovered concerning the effects of various agents and conditions on the brain as a whole. But still less is known of the detailed connexions between metabolism and functioning in separated neurones; and relatively little is known of the biochemical peculiarities of different cell types and of different areas in the brain (see, however, Dixon & Meyer, 1936; Elliott, 1948). Feldberg & Vogt (1948) have shown the value of such studies in relation to the organization of the central nervous system. The results of orthodox histological studies also give hints of structural complexities for which the metabolic basis and significance have yet to be found.

It has been necessary, in preparing this account, to select a particular theme which is basic to neurophysiology, and which has recently attracted metabolic investigation. In doing so, many chemical, biochemical, endocrinological and pathological observations with metabolic findings or implications have been omitted. Ultimately the general subject of the utilization of chemically derived energy can be expected to bring an understanding of many observations in these categories. At present, it can be seen that very much more is known about the formation of the energy-rich compounds utilized in brain functioning, and about the control of their formation, than was known a decade ago.

# THE RESPONSES OF MOTONEURONES

J. C. ECCLES D.Phil. F.R.S.

Professor of Physiology  
University of Otago, Dunedin, New Zealand

- A Antidromic activation of motoneurones
  - 1 Antidromic propagation of impulses
  - 2 After-potential and excitability following antidromic activation
- B Monosynaptic orthodromic activation of motoneurones
  - 3 The electrical hypothesis of synaptic transmission
  - 4 Reflexly subliminal activation
  - 5 Reflex discharge of impulses
  - 6 After-potentials and excitability following orthodromic activation of motoneurones
  - 7 Action of repetitive orthodromic volleys on motoneurones
  - 8 Rhythmic discharge of motoneurones
- References

It may be claimed that virtually all precise investigations on the fundamental responses of the central nervous system have been performed on motoneurones either of spinal or of cranial nerves. Presumably this is attributable to the ease of selective excitation and recording. In particular these neurones can be subjected to monosynaptic excitation by impulses (orthodromic) from the large proprioceptor fibres of muscle and to activation by impulses propagated antidromically up the motor axons. The following account of recent investigations, largely carried out in this laboratory, is restricted to the responses of spinal motoneurones activated thus orthodromically or antidromically. However, this restricted account has some general interest, because, in the absence of precise investigations on other neurones, it has been customary to explain their reactions in terms of the known properties of motoneurones. Since the orthodromic volleys have been elicited from muscle nerves by stimuli not stronger than twice threshold, they have been virtually restricted to the largest proprioceptor fibres, and tests with graduated stimuli have established that all the synaptic excitatory actions described in Section B of this paper are attributable to these large fibres.

Since motoneurones are buried in the central nervous system, their electrical responses may conveniently be led off by a fine (50  $\mu$  diameter) needle electrode insulated except at its tip. Such a micro-electrode can be inserted close to a motoneurone or group of similar motoneurones (a motor nucleus), the other leading electrode being an indifferently placed large metal plate. Alternatively, the more prolonged electrical responses of motoneurones may be recorded from the ventral root, whither they have spread electrotonically. Both methods of recording inevitably introduce distortions. The interpretation of the "focal potentials" recorded with a micro-electrode in nerve tissue is now well understood (Barakan, Downman & Eccles, 1949; Brooks & Eccles, 1947; Lorente de N6, 1947a). A positive focal potential (micro-electrode positive to the indifferent) indicates that to a preponderating extent current is flowing outwards across those nerve cell membranes (of axon, soma or dendrites) in close proximity to the micro-electrode, i.e., that they are "sources" for extrinsic current flow. Conversely a negative focal potential indicates the preponderance of "sinks".<sup>1</sup> Since under the basal conditions for an experiment extrinsic currents may be flowing (e.g. due to injury), the positive or negative focal potentials recorded on activation do not signify absolute levels of "source" or "sink" respectively, but merely the change from the basal level.

There has been good agreement between the three methods that have been used to test the excitability of motoneurones: direct electrical stimulation through a buried micro-electrode; excitation by a monosynaptic orthodromic volley; and excitation by an antidromic volley fired up the motor axons. In the two former, the excitability is judged by the size of the spike discharged along the motor axons, in the latter by the size of the "soma spike" focally recorded close to the motor nucleus (see Section A1 below).

It is not possible in this brief summary to give a comprehensive treatment of the experimental investigations. Each section gives the explanations or hypotheses that have been developed and the simpler experimental tests that have been applied. In developing these hypotheses it has been assumed that the surface membrane of the nerve cell body (soma) and of its dendrites has electrical and excitatory properties essentially similar to that of a nerve fibre (non-medullated), and that the special features are mainly geometrical. However, it has been necessary to postulate some quantitative modifications of properties, e.g., that the soma and dendrites have slower electrical responses than the motor axon, and also larger positive after-potentials. This treatment is sound methodologically, for it ensures that additional postulates are introduced only when all attempts at an explanation have

<sup>1</sup> The term "source" refers merely to the flow of electrical current outwardly from the cell membranes into the external conducting medium, i.e., the cell membrane in such an area is regarded as a "source" for current flow; conversely it is a "sink" when electrical current is flowing from the external medium inwardly across it.

FIG. 1a. Diagram of external lines of current-flow generated by an antidromic impulse that has reached the axon hillock of a motoneurone. On the right the lines are drawn from the soma only, but on the left dendrites are drawn and lines are shown running from them

FIG. 1b. Continuous line shows a record of potential set up by a maximal antidromic volley in quadriceps nerve and recorded by micro-electrode just ventrolateral to quadriceps nucleus. Broken line and line of circles show, respectively, antidromic potential after conditioning depression by a preceding antidromic volley, and after conditioning facilitation by an orthodromic volley. For significance of dotted line see text. Time-scale in msec, with zero at time of stimulus

failed without them. The danger of development of unnecessary *ad hoc* hypotheses is thereby minimized.

## A. ANTIDROMIC ACTIVATION OF MOTONEURONES

### 1. Antidromic Propagation of Impulses

As an impulse propagates antidromically up a motor axon to its motoneurone, the positive focal potential recorded by an adjacent micro-electrode shows that the soma and dendrites of the neurone form a source for currents flowing back into the sink on the axon (fig. 1a), just as occurs from regions ahead of a propagating impulse in a nerve fibre (Barakan *et al.* 1949; Brooks & Eccles, 1947; Lorente de Nó, 1947a). A special feature, however, is introduced by the enormous expansion of surface membrane that begins at the axon hillock as the axon flares out to the soma and dendrites. This geometrical feature provides a satisfactory explanation for the blockage of antidromic axon-soma transmission that occurs with a large proportion of motoneurones (Barakan *et al.* 1949; Brooks & Eccles, 1947; Lloyd, 1943; Lorente de Nó, 1947a); for the area of the source of the soma and dendrites may be so large that the local circuits of current flowing to the axonal sink (fig. 1a) fail to depolarize the soma to that critical degree at which invasion of the impulse occurs. Even when the antidromic impulse does invade the soma and dendrites, the low safety factor in this invasion is evidenced by a brief delay (cf. fig. 2b) of about 0.1 to 0.3 msec. (Barakan *et al.* 1949), which presumably is attributable to slowed propagation into the expanding surface.

As would be predicted, antidromic axon-soma propagation is facilitated (figs. 1b, 2a) by the partial depolarization of soma and dendrites produced by subliminal orthodromic activation (Barakan *et al.* 1949; Brooks & Eccles, 1947; Lloyd, 1943; Renshaw, 1942), and is depressed (fig. 1b, broken line) during the increased polarization (positive after-potential, see

Section A2) following the propagation of one or more impulses over the soma and dendrites (Barakan *et al.* 1949; Brooks, Downman & Eccles, 1950a; Lloyd, 1943; Renshaw, 1942, 1946). The facilitation of antidromic transmission not only shortens the delay in axon-soma transmission (cf. the earlier origin of the negative spike, line of circles, in fig. 1b), but also relieves the blockage at many axon-soma junctions. Conversely the depression causes antidromic blockage at many junctions and increases the delay at those junctions still traversed. Thus the focal spike potential set up by an antidromic volley is divisible into a labile component generated by impulse propagation over the soma and dendrites and

FIG. 2a. Records at top and second from bottom show focal potential set up in quadriceps nucleus by a maximum antidromic volley. Main series from below upwards shows progressively increasing facilitation of the negative (soma) spike as antidromic volley is moved earlier, relative to quadriceps afferent volley. Lowest record shows, at higher amplification, response to quadriceps afferent volley alone (subliminal reflexly)

FIG. 2b. Records i and ii show part of a series of antidromic focal potentials in which an antidromic volley set up by a slightly (1%) stronger stimulus always generated a larger potential, ii, which was not present with a weaker, i. It is concluded from this all-or-nothing behaviour that this additional potential is generated by the antidromic invasion of a single motoneurone. Record iii shows a small terminal change invariably produced by the conditioning depression of a preceding antidromic volley, while with records iv and v are seen two stages in lengthening of axon-soma delay before the final failure of antidromic transmission into the soma of that motoneurone, seen in record vi. Time in msec.

FIG. 2c. Antidromic focal potentials from single motoneurones as with records of fig. 2b, but showing the more usually observed positive potential (records i and iv). Antidromic stimuli for records ii and iii 1.1% weaker. Time in msec.

a non-labile component (approximately shown by dotted line of fig. 1b) due to the initial axonal component (Barakan *et al.* 1949).

The spread of the antidromic impulse over the soma and dendrites presumably is by "local circuit" action, but the fine dendritic terminals are apparently not invaded because the focal potentials recorded in the field around the motor nucleus indicate that the dendritic terminals continue to act as "sources" throughout the whole invasion process (Barakan *et al.* 1949). Possibly the profuse branching and diminishing calibre of the dendritic branches cause the invading impulse to slow and die out before reaching the terminals. It may be doubted (cf. Barakan *et al.* 1949) if much significance can be attached to the dendritic propagation velocity of 2 metres per second given by Lorente de N  (1947a).

It is usually possible to find a position of the micro-electrode such that it records the electrical response of one motoneurone, to the relative exclusion of all others. The records so obtained give the simplest illustration of the above propositions concerning antidromic propagation. Figure 2b shows the brief initial positive wave (soma and dendrites as source) followed by the negative wave due to invasion of the soma and dendrites. The spike so generated is about 1 msec. in duration, which is much longer than the axonal spike. During the depression set up by a conditioning antidromic volley antidromic axon-soma transmission is not blocked but is slightly delayed and the terminal phase of the soma spike potential is altered, possibly owing to an increased failure of propagation into dendritic terminals. In fig. 2b, after the records i to iii, a progressive axon-soma blockage developed (presumably due to mechanical damage by the micro-electrode), as is revealed by a lengthening of axon-soma delay. The longest delay (0.6 msec.) is shown in fig. 2b, v, and thereafter permanent blockage supervened. It is to be noted that, even after such a long delay, there is a normal soma spike potential (cf. v with ii), i.e., once the antidromic invasion has surmounted the critical region of low safety factor at the axon-soma junction, it proceeds at least as far as the dendritic terminals with a much higher safety factor, as would be expected on the local-circuit theory of propagation.

Usually (Barakan *et al.* 1949) single motoneurones have given a positive soma spike potential (fig. 2c), i.e., the inverse of that in fig. 2b. This is attributable to the micro-electrode lying close to an injured area of the neurone. Antidromic invasion of the remainder of the neurone diminishes the flow of injury currents into the region of the micro-electrode and hence will be recorded as a transient positivity, much as occurs with peripheral nerve in a like situation (Lorente de N , 1947b).

## 2. After-Potential and Excitability Following Antidromic Activation

Following antidromic activation, motoneurones show a large positive after-potential and an associated depression of excitability (Brooks *et al.* 1950a; Gasser, 1939); these are analogues of the positive after-potential and the subnormal state of peripheral nerve. The potential and the depression run virtually identical time-courses (fig. 3a; and Brooks *et al.*

FIG. 3a. Inset diagram shows approximate position of electrodes, E being on the gastrocnemius-soleus nerve, while antidromic stimulating electrodes A are on isolated 1st sacral ventral root. Earth- and grid-leads to amplifier pick up the reflexly discharged spike responses more distally along that root. The testing stimulus through E is applied at various intervals after the conditioning stimulus through A, and its reflex spike response is plotted as a percentage of its mean reflex spike. Abscissae give stimulus intervals.

FIG. 3b. Plotting as in fig. 3a, but abscissae are the calculated intervals at the axon-soma junctions between arrival of the antidromic volley and emergence of the testing reflex discharge. Inset diagram gives basis of this calculation (see Brooks, Downman & Eccles, 1950a, for details).

1950a; Gasser, 1939), decaying from a maximum at about 20 msec. so as to disappear just beyond 100 msec. This time-course is somewhat slower than in peripheral nerve, but the greater size of the two effects provides a more striking difference.

It appears that two distinct processes are responsible for the decrementing after-negativity that immediately follows the soma spike potential and passes over into the after-positivity (Brooks *et al.* 1950a).

(i) In those neurones invaded antidromically there is evidence of a negative after-potential and associated phase of relative supernormality, i.e., of lessened subnormality, thus differing from peripheral nerve in that the excitability is always lower than normal, being supernormal merely to the subsequent depression.

(ii) Those neurones not invaded antidromically pass immediately into a phase of supernormal excitability, which decays rapidly and largely disappears in 10 msec. (fig. 3b). Any such neurone will have been depolarized to a subliminal extent by its antidromic impulse, i.e., it will be in a catelectrotonic state and hence will be supernormally excitable, the decay of this supernormality presumably indicating the time course of decay of the catelectrotonus. Thus the after-negativity would be compounded of a negative after-potential of the invaded motoneurones and a catelectrotonus of the uninvaded.

As shown in fig. 3b the uninvaded motoneurones show their maximum reflex excitability in less than 1 msec. after the arrival of the antidromic impulse at the site of its blockage

(Brooks *et al.* 1950a; Lloyd, 1943). A value as low as 0.7 msec. has been recorded. Thus the facilitated reflex discharge is propagated outwards almost as soon as the axon has recovered from its absolutely refractory period. On the other hand, when the motoneurones are invaded antidromically, they appear to be inexcitable by any test for at least 1.3 msec. and do not recover from their relative refractoriness until about 5 msec. The overlapping supernormal and subnormal states make these determinations inaccurate, but such complications are inherent in any method of determining neuronal refractory periods. Other methods of testing for refractoriness have to contend with additional complications.

## B. MONOSYNAPTIC ORTHODROMIC ACTIVATION OF MOTONEURONES

### 3. The Electrical Hypothesis of Synaptic Transmission

Almost all the experimental data in the sections that follow are satisfactorily explained by the electrical hypothesis of synaptic transmission (Eccles, 1946b, 1949); hence a brief preliminary account is desirable.

As a presynaptic impulse propagates up to a synaptic knob, this knob will be first a source (fig. 4a) and then a sink (fig. 4b) for currents flowing in extrinsic circuits to that presynaptic fibre upstream. It is postulated that a significant fraction of these currents loops through the post-synaptic membrane and hence will in the second phase (fig. 4b) exert a catelectrotonic action on the post-synaptic membrane immediately subjacent to the knob. It is further postulated

that this catelectrotonus (C.) is intense enough to set up an active response of that membrane—presumably by activation of the sodium carrier mechanism (Hodgkin & Katz, 1949). A synaptic knob is so small (about  $2\mu$  in diameter) that this post-synaptic activated area is far below the size at which a self-regenerative action would ensure its growth to a full-sized propagating impulse. Hence there will be merely a local response (L.R.) persisting for about the duration of a spike potential (about 1 msec., see Sections A1 and B5), during which time the synaptic knob will act as a sink (figs. 4c, 4d) through which other regions of the post-synaptic membrane discharge, and thus develop a 'catelectrotonus.' When the sink is no more, this catelectrotonic surround passively decays with the electric time constant of the post-synaptic membrane, being responsible meanwhile for the facilitation phenomena; hence it may be called the facilitation potential (F.P.). Alternatively, if many closely adjacent knobs are activated at the same time, then the flow of local current from the interposed areas of the membrane into the mosaic of sinks (post-synaptic L.R.'s) may be adequate to cause activation of these areas, i.e., these L.R.'s will spread and fuse, thus growing up to an impulse propagating over the surface of the motoneurone and down its axon. In this way a reflex discharge is generated.

### 4. Reflexly Subliminal Activation

A single orthodromic volley sets up in the motoneurones two closely related events—an increased excitability and a negative potential. The increased excitability is shown (by means of the three standard testing stimuli, direct, antidromic (fig. 2a), and monosynaptic orthodromic) to reach a maximum in little more than 1 msec. after the arrival of the orthodromic volley in the motor nucleus (Brooks & Eccles, 1947), and thereafter it decays with a half-time of about 3 msec. (Brooks & Eccles, 1947; Eccles, 1946a; Lloyd, 1946).

The negative potential, recorded after electrotonic spread along the motor axons to the emerging ventral root, has a rather slower time-course, rising to its summit in about 2 msec., and decaying with a half-time of about 5 msec. if care is taken to record from the root close to the spinal cord (fig. 5a) (Brooks, Downman & Eccles, 1950b; Brooks & Eccles, 1947; Eccles, 1946a). On the other hand, although having an identical latent period, the negative focal potential recorded with the micro-electrode placed just ventrolateral to the quadriceps nucleus has a faster time-course, attaining its summit in about 1 msec. and decaying with a half-time of about 1.5 msec. (fig. 5b). There is evidence that, on account of the asymmetry of quadriceps motoneurones, a micro-electrode in this position is favourably placed for recording currents flowing from the dendritic terminals and axon into the soma and proximal dendrites (Barakan *et al.* 1949), i.e., a negative potential there signifies a sink on the soma and dendrites. The discrepancy between the time-courses of the potentials recorded in these two ways can plausibly be attributed (cf. Brooks & Eccles, 1947) to distortion of the actual potential change of the motoneurone, which would run an intermediate time-course, and so be comparable with the facilitation curve (cf. fig. 10b in Brooks & Eccles, 1947). Thus, on this interpretation, the potentials recorded either focally or from the ventral root have a common origin in the depolarization process (L.R. plus F.P.) which is generated in motoneurones by synaptic stimulation and which decays with

FIG. 4. Schematic representations of presynaptic fibre and motoneurone with lines of current-flow generated during synaptic transmission (see text)

FIG. 5. Synaptic potentials set up by single orthodromic volleys and recorded as follows:

- a: after electrotonic spread to the emerging ventral root
- b: by a micro-electrode just ventrolateral to motor nucleus (quadriceps)
- c: recorded as in a and b for identical orthodromic volleys in same preparation. Note identical latent periods for the two synaptic potentials (lower one begins at second arrow, first arrow showing time of arrival of sink of orthodromic volley at presynaptic terminals)
- d: as in b, but with synaptic potential generating reflex discharge of a volley at arrow. Record of volley in ventral root is shown by inverted spike
- e: synaptic potentials recorded as in a, but for progressively larger orthodromic volleys in quadriceps nerve, the upper record being a pure synaptic potential and the two lower having reflex spikes superimposed. Note the later after-positivity

a half-time of about 3 msec. This rate of decay is much slower than is observed with catelectrotonus of the motor axons, but such observations are complicated by the myelin sheath and the nodes of Ranvier. As yet the rate of decay of a catelectrotonus set up directly by an electrical pulse has not been determined for motoneurons, but it is to be noted that the facilitation process (attributable to a catelectrotonus) generated by a blocked antidromic impulse (see Section A2) decays at a rate comparable with the above facilitation process. Recently it has been suggested (Lloyd & McIntyre, 1949) that the "focal synaptic potential" is generated presynaptically. However, it has been pointed out that there is much evidence against this interpretation (Eccles,

1949), and that the only supporting evidence may be otherwise interpreted (Brooks *et al.* 1950b).

As the presynaptic volley propagates up to the motor nucleus, it generates the initial diphasic wave (positive-negative) of the focal potential, and hence gives opportunity for precise determination of the synaptic delay. If this is measured between the arrival of the "sink" phase of the presynaptic volley at the motor nucleus and the onset of the "sink" phase in the motoneuron, i.e., of the negative potentials recorded either focally or from the ventral root, it has a duration of only 0.3 to 0.45 msec. (figs. 5c, 8b).

When the testing orthodromic volley is in a nerve synergic with one carrying a conditioning volley which alone evokes a large reflex response, it has been found that, with very short volley intervals, the facilitated spike may be discharged as a double wave (Brooks & Eccles, 1948). It appears that two distinct facilitation processes are involved, an initial  $\alpha$  process which decays so rapidly that it disappears at a volley interval of about 1 msec., and a  $\beta$  process characterized by a longer synaptic delay and the much slower rate of decay already described. An explanation of these two facilitation processes is provided by the electrical hypothesis of synaptic transmission, for the  $\alpha$  process has precisely the characteristics that would be given by the initial excitatory effects, C. and L.R., while the  $\beta$  process is attributable to the F.P. (Brooks & Eccles, 1948; Eccles, 1949). The  $\alpha$  process of facilitation has previously been known as the detonator action.

### 5. Reflex Discharge of Impulses

Focal recording (figs. 5d, 8b) shows how the reflexly discharged impulse arises as a sudden upward inflection in the negative (synaptic) potential (Brooks & Eccles, 1947), and a comparable observation may be made with the synaptic potential recorded from the ventral root (Brooks *et al.* 1950b; Eccles, 1946a). There is a delay of from 0.2 to 1 msec. between the onset of the synaptic potential and the initiation of the impulse. This value, when added to the synaptic delay determined for the synaptic potential (see Section B4), gives the delay in initiating the reflex discharge of an impulse, which would thus have a minimum value of about 0.6 msec., and a maximum of about 1.5 msec. Such a range of values would be expected if the reflex discharge arises by the spread and fusion of initially discrete L.R.'s having a duration of about 1 msec. If allowance be made for the asynchronism of the individual units, the focally recorded spike potential of discharging motoneurons has a duration of about 1 msec. (fig. 5d), which agrees well with the antidromic spike duration (figs. 1b, 2b). According to the local circuit theory of propagation, an impulse generated in the soma by synaptic excitatory action would readily propagate on to the axon and would not have the low safety factor characterizing transmission in the reverse direction (see Section A1).

### 6. After-Potentials and Excitability Following Orthodromic Activation of Motoneurons

When monosynaptic orthodromic activation has generated the discharge of impulses from motoneurons, it would be expected that a positive after-potential of the motoneurons would ensue, just as occurred after invasion by an antidromic volley. This is shown in fig. 5e, but a smaller positive after-potential running the same time-course is seen to follow a

FIG. 6a. Plotting of testing reflex spike response as in fig. 3a, but the conditioning volley is a similar orthodromic volley. The broken line shows the curve of fig. 3a (same experiment)

FIG. 6b. As in fig. 6a—same experiment, but conditioning orthodromic volley so small that it evoked little or no reflex response. Filled circles show the sizes of these conditioning spikes also calculated as percentages of the mean control value for the testing reflex spikes and placed at abscissa values for corresponding testing responses

FIG. 6c. As in fig. 6b—same experiment, but with conditioning orthodromic volley in an afferent nerve (lateral gastrocnemius) synergic with that conveying the testing volley (medial gastrocnemius). Open circles give conditioning spike responses as in fig. 6b

synaptic potential on which no reflex discharge is superimposed. The superimposition of a reflex discharge merely adds to the positive after-potential.

The excitability of motoneurones during these positive after-potentials has been tested with monosynaptic orthodromic volleys (Brooks *et al.* 1950b; cf. Bernhard, 1947). When the testing volley was in the same afferent nerve as the conditioning, there was a very deep depression at 10 to 30 msec. (complete suppression of reflex discharge), and, initially, recovery occurred along much the same time-course as after antidromic activation of these motoneurones (fig. 6a). However, unlike the latter, this phase of recovery was always incomplete and was followed by a prolonged slow recovery of excitability persisting for at least one second. A similar, but usually less intense, depression with two-stage recovery was observed after a conditioning volley which was so small that it evoked little or no reflex discharge (fig. 6b). Presumably the initial phase of depression (i.e., up to about 100 msec.) is attributable to a subnormal state of the motoneurones associated with the positive after-potential, and is identical with that induced by antidromic invasion. When the conditioning volley sets up no reflex discharge, it will still, according to the electrical hypothesis (see Sections B3 and B4), set up local responses (L.R.'s) under the activated synaptic knobs and these areas would be expected to develop positive after-potentials and the associated depression. In accordance with this explanation little or no reflex depression was observed when the "reflexly subliminal" conditioning volley

was in a different, but synergic, nerve from the testing volley (fig. 6c). The small depression then sometimes observed (Brooks *et al.* 1950b) presumably is attributable to a spreading anelectrotonus from the localized areas of positive after-potential. On the available evidence the prolonged phase of depression is located presynaptically, for it is never observed when testing by a synergic orthodromic volley.

#### 7. Action of Repetitive Orthodromic Volleys on Motoneurones

The response to repetitive synaptic bombardment is of great interest because it would normally be produced by receptor organ discharges, and, if intense enough, it gives rise to rhythmic discharges of motoneurones. Repetitive orthodromic volleys are relatively ineffective in building up synaptic potentials by summation whether recorded focally or from the ventral root.<sup>2</sup> Even at frequencies as high as 500 per second, summation gives a transient maximum which at most is little more than

<sup>2</sup> Eccles & Rall, unpublished observations

FIG. 7a. Synaptic potentials recorded from the 1st sacral ventral root and set up by repetitive orthodromic volleys in gastrocnemius nerve; the frequencies from above downwards are 200, 150, 75 and 35 per second

FIG. 7b. As in fig. 7a, but at a lower depth of anaesthesia, so that a single orthodromic volley sets up a small reflex spike discharge and a larger spike is evoked by the second volley at high frequencies of stimulation; the frequencies from above downwards are 350, 500, 150, 100 and 50 per second

double the single potential, and which, during continuance of the stimulation, rapidly declines to a plateau at about the level of the initial base-line (fig. 7a). On cessation of stimulation a large positive after-potential supervenes, which presumably explains the ineffectiveness of the summation. Analysis further reveals that this ineffectiveness is dependent on three factors: (i) the cumulative positive after-potentials of the preceding responses provide a positively deflected base-line on which the summed synaptic potentials are superimposed; (ii) at high frequencies the sizes of the successive synaptic potentials are greatly diminished relatively to the initial response (fig. 7a)—presumably owing to the depressant action exerted by the positive after-potential (located *ex hypothesi* in the subsynaptic membrane) on the generation of the L.R.'s by the successive C. responses of the subsynaptic membrane; (iii) at high frequencies the relatively and absolutely refractory periods both of the presynaptic fibres and of the motoneurones would also exert a depressant action.

The reflex discharges evoked during repetitive stimulation conform with the synaptic potential picture, for discharges may be evoked by the first, second and even the third volleys at high frequencies (200 up to 500 per second), but not as a rule thereafter, as would be expected from the falling level of synaptic potential at this stage (fig. 7b). A frequency as high as 75 per second is required before any summation occurs, and then it is restricted to the second volley. Since even 75 per second would be an unusually high frequency for discharges from the proprioceptors of muscle, it may be concluded that temporal summation under synaptic knobs is by itself virtually ineffective in evoking reflex discharges. As an apparent exception to the above statements, the motoneurones of some muscles give reflex discharges throughout repetitive stimulation of the large proprioceptor fibres, but there is evidence that this is attributable to additional activation through interneuronal pathways.<sup>3</sup>

On cessation of the repetitive train of orthodromic volleys, testing by a single similar orthodromic volley reveals a deep depression for 10 to 20 msec., resembling that following a single volley (see Section B4), and then a rapid recovery to a phase of supernormal reflex excitability (fig. 8a), which slowly decays over several minutes. Our experiments confirm the recent systematic study by Lloyd (1949) in showing that this supernormality is dependent on some change whereby a pre-synaptic impulse becomes a more effective excitor of motoneurones which themselves have unchanged excitability. Furthermore this change is restricted to those presynaptic fibres which were repetitively stimulated. Focal recording may reveal no change in the size of the presynaptic volley in the motor nucleus, the first sign of the supernormality being seen in the steeper rise of the synaptic potential right from its origin (fig. 8b). Lloyd (1949) suggests in explanation that the repetitive stimulation sets up a positive after-potential (P2 component) of the presynaptic fibres, which, by increasing the size of the presynaptic impulses, causes them to be more effective synaptic exciters. If such an increase were as much as 2 per cent it would be detectable in records of the presynaptic spike in the motor nucleus (fig. 8b), and yet at the same time there is an increase in the focal synaptic potential of as much as 100 per cent and a reflex spike discharge often several times the normal control. Furthermore a large facilitation

FIG. 8a. Curve drawn as in fig. 6a, but with conditioning by repetitive orthodromic volleys (300 per second for 0.17 sec.). Zero time is at last volley of conditioning series.

FIG. 8b. Dotted line is the mean of six closely similar records of focal potentials set up by an orthodromic volley in quadriceps nerve and recorded just ventrolateral to the quadriceps nucleus (see fig. 5b). Continuous line shows the focal potential (mean of two closely similar records) recorded at 220 msec. after conditioning by repetitive orthodromic volleys (300 per second for 0.3 sec.). First arrow marks the first detectable sign of the increased response, which would coincide with start of the "focal synaptic potential" (cf. fig. 5c). Second arrow marks the inflection that signals the initial of the reflex spike discharge in the facilitated record (confirmed by timing of spike in ventral root, cf. fig. 5d). Note that slight difference between two records prior to first arrow is attributable to a slight shift in base-line. Stimulus to quadriceps nerve at zero of time-scale.

effect, prolonged for minutes, is obtained after as few as 20 volleys, which makes the positive after-potential explanation unlikely. With the severe conditioning tetani of some thousands of volleys employed by Lloyd (1949) we have observed at long test intervals (seconds) the approximate parallelism that he reported between increased presynaptic spike and potentiated synaptic excitatory action (reflex discharge or synaptic potential). But it would appear that this correlation is merely fortuitous, because with shorter test intervals and with shorter conditioning tetani the presynaptic spike of the testing volley is diminished in size and yet there is a large potentiation of its synaptic excitatory action. It would appear that Lloyd's explanation of potentiation is inadequate.

<sup>3</sup> Eccles & Rall, unpublished observations

Since it has been shown that an acetylcholine mechanism is not significantly concerned in synaptic transmission in the spinal cord (Eccles, 1947), the most probable alternative postulate is that the presynaptic impulse becomes a more effective synaptic excitator because repetitive stimulation temporarily alters the spatial relationship of the synaptic knobs to the post-synaptic membrane, e.g., the knobs may become larger and/or in closer apposition thereto. It is to be noted that this facilitation process is approximately 30,000 times longer in duration than the process due to the facilitation potential (F.P.) and thus is more likely to provide a basis for an explanation of those prolonged functional changes in the nervous system that occur in conditioned reflexes, and which presumably depend on some change in the form or structure of the synapse (Konorski, 1948).

### 8. Rhythmic Discharge of Motoneurones

The foregoing concepts of the excitatory properties of motoneurones may be used in outlining a hypothesis to account for the rhythmic discharges, usually at 10 to 50 per second, of motoneurones that are subjected to a continuous synaptic bombardment of sufficient intensity. The temporal summation of the excitatory effects produced by repetitive bombardment of synaptic knobs has usually been assumed to explain the build-up of an excitatory state, but it has been shown that this is ineffective at the repetitive frequencies that normally obtain (see Section B7). However, spatial summation between the excitatory effects set up under different synaptic knobs on a motoneurone is effective for the duration of the individual facilitation potential (about 15 msec.). The normal randomly distributed bombardment of the various knobs on the surface of a motoneurone is therefore likely to

give rise to combinations of excitatory foci sufficiently close together in time and space to generate a propagated impulse in the way described above (see Sections B3 and B5). Following such an impulse there will be a positive after-potential and associated subnormal state (see Sections A2 and B6) from which complete recovery will take 100 msec. or more. As this recovery becomes progressively further advanced, i.e., from 20 msec. to beyond 100 msec., there is an increasing probability that the continuous random synaptic bombardment will give once more some combination of excitatory foci that will be adequate to initiate the discharge of an impulse; and so on for each successive discharge. Thus the frequency of the rhythm would be higher the more intense the bombardment; and there is in addition a random factor depending on the chance activation of contiguous knobs in close temporal sequences. The recovery from the positive after-potential would account for the fairly regular frequencies observed at any adequate intensity of bombardment; but, if the bombardment falls to such a low intensity that it rarely gives a threshold combination of excitatory foci even for the fully recovered motoneurone, the discharges will be conditioned only by the random factor and will lose all semblance of regularity. Thus the properties of motoneurones as described in the foregoing sections give a satisfactory explanation of the observed discharges of motoneurones under continuous synaptic stimulation.

### ACKNOWLEDGEMENTS

The author wishes to thank the Medical Research Council of New Zealand for defraying the expenses of these investigations, his collaborators Dr A. K. McIntyre and Mr W. Rall for permission to quote unpublished work, and Charles C. Thomas, publisher of the *Journal of Neurophysiology*, for permission to reproduce figs. 1-6.

It is easy to show that acetylcholine is a substance occurring naturally in the central nervous system. Properly prepared brain extracts when tested on a variety of organs show all the typical reactions of acetylcholine, and acetylcholine has, in fact, been chemically identified in brain extracts (Stedman & Stedman, 1937). The following questions then arise: is acetylcholine a central synaptic transmitter? if so, is it the universal central transmitter, or does it exert this function at certain synapses only? or is it perhaps merely a by-product of some metabolic process in brain?

The possible function of acetylcholine as a central synaptic transmitter was first envisaged by Dale (1935) and was the natural outcome of experiments which suggested that acetylcholine was responsible for neuromuscular transmission in skeletal muscle and for synaptic transmission in sympathetic ganglia.

## 1. Continuous Activity in the Central Nervous System and in Sympathetic Ganglia

We may, however, question the extent to which we are justified in comparing a central synapse with that in a sympathetic ganglion, where a preganglionic impulse gives rise to a single impulse in the postganglionic fibre and a 1 to 1 correspondence exists. This is in sharp contrast to the continuous activity in the central nervous system. For its explanation, the well-known theories of delayed pathways through interneurons and of re-exciting circuits in closed chains of neurones have been postulated. According to these theories continuous activity is dependent on internuncial neurones and should therefore be absent in sympathetic ganglia. But when impulses are sent into a sympathetic ganglion at a sufficiently high frequency, it continues to discharge after stimulation has come to an end (Larrabee & Bronk, 1938;

Bronk, 1939; Eccles, 1944). It is true that the required frequencies are higher than any observed *in vivo* coming from sympathetic centres, but the results show that there is no fundamental difference between the two transmission processes. Continuous nervous activity may, in fact, depend not mainly upon the anatomical arrangement of pathways but upon some kind of ionic instability. Even nerve and muscle fibres may discharge spontaneously and "oscillate" when deprived of their calcium.

The transmission process in a sympathetic ganglion can thus still be regarded as a likely representation of what is happening at the central synapse.

## 2. Acetylcholine as Transmitter in Sympathetic Ganglia

Most of the evidence of the role of acetylcholine in the transmission process has been obtained on the superior cervical ganglion of the cat. This organ weighs about 20 mg. and contains, closely packed, about 100,000 cells. It can be perfused from its artery. All preganglionic fibres impinging on the cells run in the cervical sympathetic nerve, which can easily be stimulated. The theory that acetylcholine transmits the impulses from the preganglionic endings to the ganglion cells is based, in the main, on the following findings (Dale, 1914; Feldberg & Gaddum, 1934; Feldberg & Vartiainen, 1935; Brown & Feldberg, 1936a, 1936b; von Brücke, 1937; MacIntosh, 1938a, 1938b; Bronk *et al.* 1938; Bronk, 1939; Kahlson & MacIntosh, 1939; Feldberg, 1943; Sawyer & Hollingshead, 1945):

(i) Acetylcholine stimulates the ganglion cells to discharge impulses into the postganglionic fibres. The frequency of the discharge depends on the concentration of acetylcholine in the perfusion fluid. With a high concentration, stimulation is followed by paralysis. In this condition the ganglion cells no longer discharge on renewed application of acetylcholine or on stimulation of the cervical sympathetic nerve.

(ii) Acetylcholine appears in the venous effluent from a ganglion during preganglionic nerve stimulation, provided eserine is present in the perfusion fluid. The former difficulty of detecting the acetylcholine released from a ganglion perfused with whole blood has recently been cleared up by Emmelin & MacIntosh (*in press*). They have shown that the same amounts of acetylcholine are released per nerve impulse, whether the ganglion is perfused with eserinated saline solution or undiluted eserinated plasma. In order to obtain this result with whole blood, however, eserine had to be given in much higher concentrations, otherwise the true cholinesterase of the red cells, which is the enzyme in blood responsible for the destruction of the released acetylcholine, remains active. This had not been realized in the earlier experiments because, at that time, Mendel and Rudney's distinction between true and pseudo-cholinesterase was not known (Mendel & Rudney, 1942).

(iii) Acetylcholine is released on preganglionic nerve stimulation, even when the ganglion cells have been paralysed by curare or nicotine, but not on antidromic stimulation of the postganglionic trunk, which backfires impulses into the ganglion cells. Degeneration of the preganglionic nerve fibres entails the disappearance of acetylcholine, of choline acetylase and of true cholinesterase in a sympathetic ganglion, but its cells remain sensitive to acetylcholine. Thus, the acetylcholine metabolism in a sympathetic ganglion is located entirely in the preganglionic nerve endings. Here the

acetylcholine is stored, formed and released, and here, too, the enzyme for its destruction, the true cholinesterase, is located. The ganglion cells themselves are not involved in acetylcholine metabolism, but are merely the effector structures on which the released acetylcholine acts.

The methods used for the sympathetic ganglion are only to a limited extent applicable to the central nervous system. Synapses are not confined to one place, perfusion methods are difficult and, in addition, the transmission at the various synapses may involve different transmitter substances. Nevertheless, attempts have been made to apply the methods used on sympathetic ganglia, or modifications of these methods, to the central nervous system. We shall confine ourselves to a discussion of the results obtained by the following lines of research: the central actions of acetylcholine; the central actions of anticholinesterases; the release of acetylcholine; changes in the acetylcholine content; and synthesis of acetylcholine.

### 3. Electrophysiological Considerations

The problem of central synaptic transmission by acetylcholine has also been taken up by electrophysiologists, and many have stated that acetylcholine cannot be the central synaptic transmitter. They have certain ideas of how the acetylcholine released at the synapse should influence their electrical recordings, but these expected changes have not been observed. The following example, however, may illustrate the difficulty of deciding the acetylcholine theory of central synaptic transmission on electrophysiological data alone. Measurements have been made of the synaptic delay in the central nervous system and at some synapses the delay was found to be about 0.5 msec. (Lorente de Nó, 1939), an extremely short time interval indeed, so short that it appeared to exclude the possibility of release and action of acetylcholine. What it actually excluded was the possibility that a process of diffusion of a substance from the site of liberation to a distant site of action could be involved in the transmission process.

Far too much emphasis has been laid on the brevity of the time intervals as an argument in favour of or against the acetylcholine theory. These measurements give us a time limit in which the process has to occur, but they do not provide evidence of its nature. The corresponding time values for neuromuscular transmission or for synaptic transmission in a sympathetic ganglion are of the order of 2 to 3 msec. If we can imagine a process happening within 2 msec., there are no insurmountable difficulties in envisaging it happening in a quarter of that time. We should remember that the role of acetylcholine in the transmission from motor ending to motor end-plate, or from sympathetic ending to the cell of a sympathetic ganglion, was not determined electrophysiologically, and it is doubtful whether the issue of a transmission process can be decided by this approach. If other methods prove that acetylcholine has a function as a central synaptic transmitter, the electrophysiological facts must be interpreted accordingly; if proof for a different mechanism should be found, they would have to be explained in terms of this other mechanism. To use an analogy: the thermometer measures the temperature of a patient, but the finest analysis of a temperature curve is insufficient to decide which bacterium or virus is responsible for the infectious disease, though it may provide suggestive evidence.

### 4. Central Effects of Acetylcholine

Acetylcholine applied locally, or injected through the vertebral or carotid artery, or intrathecally, has both stimulating and depressant central effects. These are enumerated in Table I, which is not meant to give a complete list of all central effects so far found, but to illustrate the fact that the action of acetylcholine on many sections of the neuro-axis, from the cerebral cortex to the spinal cord, has been described.

In some instances, particularly when acetylcholine is applied locally, it is advisable to give eserine beforehand. For example, the local application of acetylcholine to the cortex of the cat's brain appears to produce its full characteristic effect only when this is done. Then, however, it induces large 10 per second spikes in the electrocortigram, together with motor activity on the contralateral side. The "acetylcholine spikes" suggest synchronous firing of several cortical neurones under the influence of cells with short axons, each of which controls a number of pyramidal cells (British Association, 1948). The electrical discharges of the cortex produced by acetylcholine are similar to seizure discharges, and several authors take the view that a disturbance in the acetylcholine metabolism may be an important factor in the causation or mechanism of the convulsive seizures in epilepsy (Brenner & Merritt, 1942; Forster, 1945; Richter & Crossland, 1949).

The question has often been asked whether the central actions of acetylcholine should be classed as muscarine or as nicotine actions. This classification of the peripheral actions of acetylcholine was suggested by Dale in 1914. It is not possible to extend the nomenclature to the central actions without encountering certain difficulties. If atropine sensitivity were taken as the decisive factor in classification, many of the central actions of acetylcholine would have to be grouped with the muscarine actions. But the subdivision emphasizes also the structures on which the acetylcholine acts. Its effect on gland cells, smooth muscle, heart and the capillary endothelium falls within the domain of muscarine action, whereas the nicotine action is exhibited on the cells of the suprarenal medulla, the motor end-plates of skeletal muscle and on the nerve cells of sympathetic and parasympathetic ganglia. The structures involved in muscarine action have nothing in common with the cells of the central nervous system, but the properties of the motor end-plates and of the cells of the autonomic ganglia resemble those of the cells of the central nervous system. Therefore it is probably better to associate the central actions of acetylcholine with its nicotine actions but to confine the rigorous classification of muscarine and nicotine action strictly to its peripheral effects.

### 5. Central Effects of Eserine and other Anticholinesterases

It may be argued that we are not justified in regarding the effects of acetylcholine as anything more than interesting pharmacological phenomena; after all, there are many substances affecting central nervous activity, often in an even more striking manner. Against this argument, we can state that acetylcholine is a substance occurring naturally in the central nervous system and that we can obtain similar effects when, instead of applying acetylcholine artificially, we create conditions in which acetylcholine released at the synapse is prevented from being destroyed and thus allowed to

TABLE I. SUMMARY OF THE CENTRAL EFFECTS OF ACETYLCHOLINE

Site	Method of application	Effects	References
Cerebral cortex (man, cat, rabbit)	Local application ; arterial and intracisternal injection	On local application : motor effects on contralateral side. On intracisternal injection : general convulsions. Typical changes in cortical electrogram. Increased amplitude and frequency of Berger waves on arterial injections of 0.1–0.2 $\mu$ g. Increased electrical activity and after-discharge to stimuli in acoustic region (awakening reaction) and in area for mastication. Stimulation of suppressor areas	Sjöstrand, 1937; Bonnet & Bremer, 1937a, 1937b; Bremer, 1938; Moruzzi, 1939; Miller, Stavraky & Woonton, 1940; Gerard, 1941; Chatfield & Dempsey, 1942; Brenner & Merritt, 1942; Forster & McCarter, 1945; Forster, 1945; British Association, 1948; Beckett & Gellhorn, 1948; Hyde, Beckett & Gellhorn, 1949
Hypothalamus	Intraventricular injections	Sleep and drowsiness obtained regularly in cats, irregularly in man Apnoea ; inhibition of motor activity of intestine	Dikshit, 1935; Silver & Morton, 1936; Henderson & Wilson, 1936 Emmelin & Jacobsohn, 1945
Supra-optic nucleus (dog)	Local application	Release of posterior pituitary hormone	Pickford, 1939, 1947
Respiratory centre	Local application. Injections with chemo-receptors excluded	Stimulation preceded or followed by depression	Dikshit, 1934; Heymans <i>et al.</i> 1935; Shuh, Wang & Lim, 1936; Schweitzer & Wright, 1938a, 1938b; Gesell, Hansen & Worzniak, 1942; Gesell & Hansen, 1943; Miller, 1943
Trigonum hypoglossi	Local application	Tongue contractions. Deglutition	Miller, 1943; British Association, 1948
Cardiac centres	Arterial injection	Irregularities of heart action, as on central vagus stimulation	Dikshit, 1934; Heymans <i>et al.</i> 1935; Silver & Morton, 1936; Henderson & Wilson, 1936
Pressor centre	Iontophoresis	Rise in arterial blood-pressure	Shuh, Wang & Lim, 1936
Spinal cord	Perfusion experiments. Arterial and intrathecal injections	Discharge of motor impulses  Reflex activity altered	Feldberg & Minz, 1932; Lefebvre & Minz, 1936; Bülbring & Burn, 1941; Calma & Wright, 1944  Schweitzer & Wright, 1937; Bonvallet & Minz, 1937, 1938a, 1938b; McKail, Obrador & Wilson, 1941; Martini & Torda, 1938; Torda, 1940; Bülbring & Burn, 1941; Kremer, 1941

accumulate. Such a condition is brought about by the action of anticholinesterases.

The cardinal problem of the action of these substances is the extent to which we are justified in attributing their effects to the accumulation of undestroyed acetylcholine. If this were indeed the whole explanation of the mechanism, then the effects of anticholinesterases would represent the strongest evidence for the acetylcholine theory of central synaptic transmission. The problem is not an easy one. The cholinesterase-inhibiting action of eserine, for instance, is explained on the assumption that it competes with acetylcholine for the same receptor of the enzyme. But if they compete for the same receptor, they may also do so at the respective functional receptors of the nerve cells. Thus the possibility exists of acetylcholine-like actions of anticholinesterases independent of the inhibition of true cholinesterase. In fact, such actions do occur in the case of prostigmine. For instance, Ricker & Westcoc (1948) have recently shown that

prostigmine produces muscular contractions when injected into the muscle artery of a cat whose cholinesterase has been completely inhibited by previous treatment with another anticholinesterase such as di-isopropylfluorophosphonate (DFP).

Concerning the *peripheral* actions of eserine, there are many observations which provide strong proof that they are fully accounted for by inhibition of the enzyme. The following three instances show that an acetylcholine-sensitive structure reacts to eserine only when acetylcholine is present and released.

i. The isolated intestine and uterus of the guinea-pig: both contract to acetylcholine, but the intestine alone to eserine. The intestinal wall produces and releases acetylcholine continuously; this is not true of the uterus.

ii. Acetylcholine and eserine both constrict the pupil. But after degeneration of the parasympathetic nerve supply, the pupil no longer contracts to eserine, whereas it still contracts to acetylcholine. The normal iris contains acetylcholine;

the denervated iris is free from it. Thus, eserine cannot act.

iii. Eserine injected into an anaesthetized cat causes fascicular twitchings and fibrillation of skeletal muscles even after severance of the motor nerves, but two to three days after nerve section eserine is inactive. Within this time the nerve fibre and its ending have lost their acetylcholine, their ability to form it and consequently to release it. Thus eserine has become inactive. This instance is of particular interest because the processes at the motor end-plate have always been regarded as furnishing a kind of analogy to those at the central synapse.

If the peripheral actions of eserine can be accounted for by accumulation of released acetylcholine, the same mode of action may apply at least to some of the central actions of eserine. This appears to be the only convincing explanation of the effects of small doses of eserine. Larger doses, however, may have additional "direct" effects as well. In particular, the paralyzing effects so easily obtained with larger doses of eserine and of other anticholinesterases may not always be due solely to accumulation of acetylcholine. Some ideas about this paralyzing action will be given later.

There is no need to enumerate the central actions of eserine and other anticholinesterases. They resemble those of acetylcholine with the following main differences: (i) the onset and the disappearance of the effect is usually more gradual than with acetylcholine and (ii) compared with acetylcholine, depression is even more pronounced and more easily obtained than stimulation.

From among the great number of observations which show that eserine causes discharge of motor impulses in the central nervous system, followed by depression, I would like to mention one observation on the isolated cat's head perfused with diluted blood (Chute, Feldberg & Smyth, 1940). This observation was not the first, nor even an important one, but it is particularly impressive. The fully isolated head was mounted on a stand and connected with the perfusion arrangement by rubber tubing. On the addition of eserine to the perfusion fluid, there occurred a spontaneous blinking reflex at a rate of about 80 per minute and jerky movements of the head. A striking picture indeed! The muscular contractions were of central origin and disappeared after motor nerve section. How can they be explained if not by accumulation of released acetylcholine; and, if this is so, then—at least for some of the synapses involved in the central pathways of these reflexes—acetylcholine must be the central transmitter.

Schweitzer, Stedman & Wright (1939) have tried to explain the variety of effects obtained with various anticholinesterases. Tertiary bases such as eserine are lipid-soluble and were thought to penetrate the cells and act as convulsants, whereas quaternary bases, such as prostigmine, are lipid-insoluble and were thought to remain outside the cells and act as depressants. This theory, attractive as it may appear, does not, however, explain all the known facts; there are sufficient observations, such as those by Merlis & Lawson (1939), McKail, Obrador & Wilson (1941), Bülbring & Burn (1941) and Calma (1949), which show that eserine and prostigmine influence reflex activity in the same way.

Recently, another anticholinesterase, DFP, has been widely examined. Its anticholinesterase activity was discovered during the war, independently by Adrian, Feldberg & Kilby (1947) and by Mackworth & Webb (1948). It differs from eserine in its much more prolonged action, which is due to the fact that it forms an irreversible combination with the enzyme.

Another recently discovered inhibitor of cholinesterases (DuBois & Mangun, 1947), probably acting like DFP, is tetraethylpyrophosphate (TEP). But both substances also inhibit respiration of brain tissue and, in this respect, differ from eserine. Some of their depressant actions may therefore result not from inhibition of cholinesterase but from interference with the cell metabolism (Brooks, Ransmeier & Gerard, 1949).

When DFP was given to human patients over long periods, they complained of disturbed sleep and nightmares (Grob *et al.* 1947; Rowntree, Nevin & Wilson, 1950). In this connexion it is interesting to note that, in one of the first papers written on the pharmacological action of eserine, in 1876, Harnack & Witkowski describe how eserine injected into an epileptic idiot caused convulsions and, in addition, the idiot behaved as if he had had hallucinations. It is interesting to speculate, although we cannot do more at present, if these effects are the results of inhibition of cholinesterase and are brought about by accumulation of acetylcholine on the sensory side of the brain.

Duke, Pickford & Watt (1950) injected small amounts of DFP into the region of the supra-optic nucleus in dogs, and observed a profound and long-lasting inhibition of the rate of urine flow, followed by a diabetes insipidus lasting for a few weeks. We have seen that an injection of acetylcholine into this region causes the release of the antidiuretic hormone, and the delayed effect of DFP could be explained by its paralyzing action. The acetylcholine released by cholinergic nerve endings impinging on the supra-optic nucleus would no longer be destroyed and, by its persistence, would give rise to the paralyzing action. But we cannot discard the alternative explanation that paralysis is due to direct interference with the cell metabolism.

## 6. Mode of Action of Acetylcholine at the Central Synapse. Central Depressant Effects of Acetylcholine and Anticholinesterases

We may form an idea of how acetylcholine acts on the central nervous system from an analogy with its effect on motor end-plates of striated muscles or on cells of sympathetic ganglia. Acetylcholine depolarizes these structures. The depolarization can be recorded and is known as the motor end-plate potential (Göpfert & Schaefer, 1937; Schaefer & Haass, 1939; Eccles & O'Connor, 1939; Eccles & Kuffler, 1941; Eccles, Katz & Kuffler, 1941a, 1941b, 1942; Kuffler, 1943). Depolarization of the ganglion on preganglionic nerve stimulation has been recorded by Eccles (1943, 1944) and termed "synaptic potential"; a better name would be "ganglion potential". These potentials then give rise to the impulse or excitation wave along the fibre of the postganglionic nerve or muscle. Evidence in support of this view has been obtained from quite a different source (Beutner & Barnes, 1941, 1942). A model of a polarized surface with a lipid layer in contact with saline solution can be connected to an amplifier by leads applied to the two surfaces of the interface. A positive electromotive force may then be recorded. This quickly declines when minute amounts of acetylcholine are added to the saline solution.

Probably acetylcholine also depolarizes some surface of the nerve cell in the central nervous system and this depolarization then provides the appropriate stimulus for initiating the nerve impulse in the axon. This view enables us to understand why

stimulation is so often followed by depression, and why the latter is often observed more easily than stimulation. When acetylcholine acts as the physiological stimulus at central synapses, it is destroyed by the true cholinesterase the moment the acetylcholine is released; the surface thus becomes repolarized and ready for depolarization by a renewed charge of acetylcholine. With most of the methods of artificial application of acetylcholine, however, depolarization will persist for some time, because the large amounts of acetylcholine are no longer dealt with quickly enough by the normal protective mechanism of enzymatic destruction; in addition, depolarization will no longer be restricted to those relevant points where the nerve endings impinge on the cell; on the contrary, the whole cell may be "flooded" with acetylcholine. In order to understand how this can cause depression we may follow Sherrington's earlier suggestion and look upon transmission at the motor end-plates as furnishing a pattern or paradigm of what happens at the central synapse.

Acetylcholine may cause either contraction, depression or contracture of the skeletal muscle and all three effects can be explained by the depolarizing action of acetylcholine.

When released from the motor nerve-ending under physiological conditions, the only region which becomes depolarized by the acetylcholine is the motor end-plate. This depolarization furnishes the appropriate stimulus for the excitation wave along the muscle fibre and its subsequent contraction. This action of acetylcholine is represented diagrammatically in fig. 1a. But when a large dose of acetylcholine is injected into a muscle artery, contraction is often followed by depression. The same occurs with smaller doses of acetylcholine when its destruction is prevented by eserine or another anticholinesterase, as shown in fig. 2. Depression is seen also when the nerve to the muscle is frequently stimulated in the presence of eserine. Figures 2 and 3 illustrate the fact that eserine has two actions on the muscle contraction elicited by nerve stimulation; it potentiates the single twitch, but depresses the

tetanus. The depression of the muscle responses is explained either by prolonged persistence of acetylcholine at the end-plate region or, more likely, by depolarization extending beyond this region to the muscle fibre. In the diagrammatic representation (fig. 1), depolarization beyond the end-plate region is indicated in b and c. It makes no difference for the purpose of interpretation whether this depolarization affects only a small region beyond the end-plate or the whole muscle fibre. In both conditions depression would result, because depolarization of the fibre, unlike that of the end-plate, does not give rise to an excitation wave but, on the contrary, forms an inexcitable region which blocks transmission. Thus, even depolarization of a minute part of the muscle fibre adjacent to the end-plate acts as a block, and would fully explain the phenomenon of the depressant action. Two facts support the view that, during the condition of acetylcholine depression, parts at least of the muscle fibre are depolarized: first, the finding that the reduced excitability applies not only to nerve stimulation but also, although to a lesser degree, to direct muscle stimulation (Brown, Dale & Feldberg, 1936); and second, the acetylcholine contracture. This phenomenon has not been sufficiently considered in the interpretation of the mode of action of acetylcholine. By a contracture we mean a form of contraction which develops more slowly than a twitch or tetanus; tension is not as high as that of a summated contraction; heat and lactic acid are produced; and that part of the muscle which is in a state of contracture becomes negative to the resting part, i.e., it is depolarized. Where it differs from the picture of normal contraction is in the conduction of the mechanical response and the propagation of excitation. In the state of contracture the muscle fibre is depolarized and electrically inexcitable; the contracture thus prevents propagation along the muscle fibre of excitation waves arising from the motor end-plate. This accounts for the depression of the response to nerve stimuli, a characteristic of muscles in contracture. When the contracture is localized in a muscle fibre it forms a region of neuromuscular block. Contractures and depression of response are therefore both signs of a depolarization of the muscle fibres.

FIG. 3

Reproduced from Bacq & Brown (1937) by kind permission of the Editors of the *Journal of Physiology*

Fig. 3. Cat, under chloralose anaesthesia

Contractions of tibialis anticus in response to maximal shocks to nerve at frequency of either 6 or 180 per min. At arrow, intravenous eserine 0.5 mg. per kg. bodyweight. The white patches are caused by overlapping of the individual contractions during high frequency stimulation

In denervated mammalian muscle, as well as in normal avian or amphibian muscle, acetylcholine causes typical contractures; in other words, depolarization of the muscle fibre beyond the end-plate region occurs. Similarly, Feng & Shen (1937) have shown that, for frog muscle, repeated nerve stimulation after eserine leads to a contracture restricted to the region near the end-plate, i.e. there is again depolarization beyond the plate region.

There is thus sufficient evidence to show that acetylcholine depolarizes at least part of the muscle fibre and that the depressant action is thereby explained. Nevertheless, prolonged persistence of acetylcholine at the end-plate region might itself produce depression. On this assumption, the persistence of acetylcholine would result in a derangement of the finely adjusted mechanism of depolarization and repolarization, which apparently is required for the proper functioning of the end-plate region. The condition is represented diagrammatically in fig. 1d. The phenomenon of depression can certainly be obtained in the absence of any muscle fibres as, for instance, in the electric organ of the torpedo fish. This organ consists of exaggerated electric plates, which are modified motor end-plates lacking the contractile fibre. The release of acetylcholine by the nerve impulse leads to depolarization of the ventral surfaces of the plates, which are quickly repolarized when the acetylcholine is destroyed by the true cholinesterase (Feldberg & Fessard, 1942). After eserine, however, the effect of repeated nerve stimulation becomes more and more reduced and may disappear. This "depression" is explained either by continued depolarization of the ventral surface of the plates, or by the fact that the released acetylcholine "floods" parts of the plate, perhaps even the dorsal surface which is normally not reached by the acetylcholine. The sequence of events at the electric organ thus provides no proof for the view that prolonged persistence of acetylcholine at the points of its physiological action is sufficient to produce a condition of depression.

The depressant actions of acetylcholine and anticholinesterases on the central synapses may be explained in a similar fashion; prolonged depolarization or "poisoning" by acetylcholine of parts normally depolarized for an extremely short period, or depolarization of regions of the cell which are normally not reached by the released acetylcholine and which may even extend to the beginning of the axon, may account

for the depression. We can now understand not only why the depressant actions are so prevalent with anticholinesterases but also why stimulant effects are so much more difficult to obtain than in skeletal muscle. In the latter, only the response to single nerve impulses is potentiated by eserine; the tetanic contraction obtained with repeated nerve stimulation is depressed, as seen in fig. 3. The continuous activity in the central nervous system, however, resembles not the single impulse but the repeated stimulation. It is thus not surprising that the anticholinesterases are central depressants; what is surprising is that they often exert central excitatory effects.

The central depressant actions of acetylcholine, and of anticholinesterases like eserine, thus present strong evidence for the acetylcholine theory of central synaptic transmission. This has not always been fully recognized.

The above considerations do not necessarily apply to the effects obtained with high concentrations of DFP, TEP or even of eserine. In these conditions we may be dealing, in part at least, with direct depressant actions not accounted for, or not wholly accounted for, by released acetylcholine.

## 7. Release of Acetylcholine

The release of acetylcholine on stimulation of the nerve has always provided the first and most important part of the evidence for the cholinergic nature of a peripheral nerve. The method has not had a wide application in the central nervous system. This is not surprising when we consider the difficulties inherent in perfusion experiments of this part of the body. But the few results so far obtained (for references see Feldberg, 1945b) support the acetylcholine theory of central synaptic transmission.

The central nervous system exhibits continuous activity; therefore acetylcholine should be released continuously in the absence of special external stimuli. It has, in fact, been found by all workers on this subject, that after eserine, acetylcholine appears "spontaneously" in the cerebrospinal fluid as well as in the venous effluent from the central system. In certain conditions, this spontaneous output increases, as for instance after central vagus stimulation, or stimulation of the sinus nerve, after asphyxia and, strangely enough, after administration of adrenaline. By far the most convincing evidence regarding increased release of acetylcholine as a result of increased central activity is given by Bülbring & Burn (1941). They perfused the lower half of the spinal cord of dogs with eserinated saline solution. Reflex activity persisted for eight minutes; during this period they stimulated the central end of the cut sciatic nerve and obtained an increased output of acetylcholine in the venous effluent. Figure 4, taken from their paper, shows the effect of effluent, collected before and during stimulation, on leech muscle.

## 8. Changes in the Acetylcholine Content

The problem of the acetylcholine content of the central nervous system has to take into account the following facts: (i) acetylcholine is present in the tissues in a bound form in which it is inactive and protected against enzymatic destruction; (ii) as soon as it is set free it is at once destroyed by true cholinesterase; (iii) the released acetylcholine is rapidly replaced by synthesis, the new acetylcholine being synthesized in the bound form.

FIG. 4

Reproduced from Bülbring & Burn (1941) by kind permission of the Editors of the *Journal of Physiology*

Fig. 4. Leech muscle

- a : effect of a control sample of venous effluent from spinal cord taken 3 min. after Ringer perfusion was started
- b : contraction produced by a sample collected after 2 min. stimulation of the central end of the sciatic nerve
- c : contraction produced by acetylcholine (1 in 50 million)

If destruction of the released acetylcholine and its replacement by synthesis were to proceed at the same rate, variations in the functional activity of the brain would produce no change in the acetylcholine content—even if these variations were associated with increased and decreased release of acetylcholine. The acetylcholine content of a given part of the central nervous system would have a constant value, determined probably by the number of available tissue constituents to which acetylcholine is bound. This view is correct to a limited extent only.

Most of the earlier experiments (for references see Feldberg, 1945b) which dealt with variations in the acetylcholine content of the central nervous system were undertaken without taking into consideration or making allowance for the fact that release, destruction and synthesis of acetylcholine take place very rapidly. It is therefore not surprising that the results were contradictory and anything but convincing.

However, recent experiments on rats carried out in the Neuropsychiatric Research Centre in Cardiff have shown that, if brain tissue is rapidly fixed, the level of its acetylcholine content shows variations dependent on the state of functional activity of the brain prevailing during the time of fixation (Richter & Crossland, 1949). Replacement by synthesis apparently does not keep pace with the release and destruction of acetylcholine.

In the experiments of Richter & Crossland the method of rapid fixation was that formerly used by von Murlt (1937) on peripheral nerves; i.e., the animals were killed by immersion in liquid air. The brains of rats killed during anaesthesia or sleep showed an increased acetylcholine content, those killed in emotional excitement or convulsions a decreased acetylcholine content. The changes were large but transient. The values for the convulsed animal were only 25–30% of those obtained in anaesthesia; when the animals were killed only a few seconds after electrically induced convulsions, the acetylcholine level had returned to its normal level. Even with the method of immersion in liquid air it took approximately 4 sec. for the brain to cool to 0° C.; with quicker methods of

fixation, still greater variations in the acetylcholine content might have been obtained.

## 9. Synthesis of Acetylcholine

There are different methods available for studying the synthesis of acetylcholine. When we incubate tissue slices or minced tissue, the enzyme is not in solution; the synthesis occurs in the slices or cell debris, and the acetylcholine is released from them and diffuses into the solution (Mann, Tennenbaum & Quastel, 1938, 1939). The method actually does not distinguish between synthesis and release. Glucose must be present in the incubation medium when this method is used, but the concentration necessary for optimal synthesis is only about 10% of that existing in blood. The normal concentration in the blood actually depresses synthesis or release.

If similar conditions prevail in the body, it means that the blood-glucose exerts normally a restraining effect on the continuous synthesis or release of acetylcholine in the central nervous system. Lowering the blood-glucose would remove the "glucose brake" and allow synthesis and release to proceed at an abnormal rate. The result would be the same as if acetylcholine had been applied to the motor cortex, i.e., convulsions would occur. Insulin convulsions might thus be explained on the acetylcholine theory of central synaptic transmission (Feldberg, 1945a, 1945b).

The hunger contractions of the stomach associated with a lowering of the blood-glucose might be interpreted as being due to a similar mechanism, i.e., removal of the glucose brake—partly in the stomach wall but mainly in the central nervous system—on the acetylcholine release, and synthesis at the nerve endings impinging on the vagal centres or at neurones situated higher up in the neural axis.

A great advance was made when it became possible to bring the enzyme for synthesis of acetylcholine into solution. This we owe to Nachmansohn & Machado (1943). They showed that the enzyme acts by acetylation of choline and that adenosinetriphosphate is necessary for the reaction. They termed the enzyme: choline acetylase. The experiments were performed on homogenized brain; later Feldberg & Mann (1944, 1945) used extracts from acetone-dried brain. The biochemical reactions involved in the synthesis are rather complicated and not yet fully understood (for references see Feldberg, 1950). For optimal synthesis of acetylcholine to take place in saline extracts prepared from acetone-dried brain, the following substances have to be added to the incubation medium: choline, adenosinetriphosphate, magnesium, potassium, cysteine, citrate, and activator or co-enzyme A. Eserine and sodium fluoride are added as well, as a precaution, in case traces of cholinesterase or phosphatase are still present in the extract. Cysteine is necessary in aerobic conditions in order to keep the SH groups of the enzyme reduced and active. The action of citrate is not clear; it may act as a source of acetate. The activator or co-enzyme A is a heat-stable, dialyzable substance present in extracts of brain and of many other tissues. According to Lipmann *et al.* (1947), it is a derivative of pantothenic acid; it appears to be the co-enzyme for acetylation in general and not for choline alone.

The great advantage of the use of acetone-dried tissue is that the amount of tissue required is small, so that determinations can be made with a few milligrams of tissue. Making

FIG. 5

Fig. 5. Four possible arrangements (a, b, c, d) of cholinergic and non-cholinergic neurones at the synapse

● ——— cholinergic  
○ - - - - non-cholinergic

use of this fact, the synthesis of acetylcholine has been studied in various relatively well-defined areas of the central nervous system with the idea of mapping out the distribution of the enzyme, and on the assumption that acetylcholine is perhaps not the universal central synaptic transmitter, but that the central nervous system is built up of cholinergic and non-cholinergic neurones (Feldberg & Vogt, 1948). So far, these experiments have been confined to dogs. The acetylcholine-synthesizing power of a number of regions and tracts of the central nervous system was studied, but the results obtained seemed at first sight confusing. High and low values occurred in regions belonging to the same efferent or afferent pathway. However, by applying our knowledge of the properties of cholinergic neurones in the peripheral nervous system to the results, some interpretation became possible.

Assuming there are two kinds of neurones, then four connections are possible at the synapse, as indicated in fig. 5, and the following conclusions and approaches appear justified:

i. A cholinergic neurone is characterized by the fact that it synthesizes acetylcholine not only at its ending but along the whole course of its axon. Thus, a tract composed of cholinergic fibres will be identified by a high concentration of choline acetylase.

ii. On the other hand, a bundle of non-cholinergic fibres will be identified by the nearly complete absence of choline acetylase.

iii. Since the enzyme is apparently located in the axon and not in the myelin sheath, the thickness of the latter may affect the result. Thus, an intermediate value may not necessarily mean a mixture of cholinergic and non-cholinergic neurones. This introduces a difficulty, and interpretation depends largely on those less frequent regions with either high or low values.

iv. Concerning the grey matter, we must realize that the greyness is not so much determined by the nerve cell as by the abundance of non-myelinated fibres. The myelin sheath does not start at the very beginning of an axon, nor extend right to the end, as indicated diagrammatically in fig. 5. A

high value for synthesis of acetylcholine may thus indicate one of three possibilities: (i) the neurones of which the nerve cells form a part are cholinergic; (ii) only the fibres terminating at these cells are cholinergic; (iii) both are cholinergic. Therefore, a high concentration of enzyme in a region of grey matter does not necessarily imply that the enzyme is produced by the cell body or its axon. In the peripheral nervous system this fact is illustrated by the sympathetic ganglia, which contain cells of non-cholinergic neurones. More information can, therefore, be obtained if, in addition to the synthesizing power of the region of a nucleus, that of the tracts passing to and from the nucleus is known as well.

v. Occasionally, use can be made of our knowledge of the central actions of acetylcholine in the interpretation of the results. It is necessary to emphasize that the sensitivity of a nerve cell does not depend on whether or not it gives rise to a cholinergic axon; for instance, the sympathetic ganglion cells, which are the cell bodies of adrenergic neurones, are sensitive to acetylcholine. The reverse conclusion—that cells which respond to acetylcholine are cells upon which cholinergic neurones impinge—is more likely to be generally true.

With these facts in mind, an interpretation was attempted and it was found that often, although by no means always, the arrangement of neurones in the efferent and afferent nervous pathways was such that cholinergic and non-cholinergic neurones alternated with each other. For example, in the voluntary motor pathway, the finding of a high choline acetylase concentration in the anterior horns, in the motor nuclei of the cranial nerves and in the anterior roots suggests the cholinergic nature of the lower motor neurone. On the other hand, low values were encountered in the pyramidal tracts, indicating that the upper motor neurone is non-cholinergic. The fibres of the pyramidal tracts are not the only ones to impinge on the anterior horn cells. Fibres from other systems, some of which may be cholinergic, terminate at these cells. The same cell may, therefore, be impinged upon by cholinergic and non-cholinergic fibres. In the motor area of the cerebral cortex an intermediate value was found, which might suggest that cholinergic neurones converge on the pyramidal cells. This suggestion is strengthened by the fact mentioned earlier that both eserine and acetylcholine, when locally applied to the motor cortex, initiate impulses in the pyramidal tracts.

Evidence for a succession of alternating non-cholinergic and cholinergic neurones is also found in afferent pathways. Low values found for the posterior roots and their central continuation, the funiculi gracilis and cuneatus, are in agreement with the conception that the first neurone of the afferent sensory pathway is non-cholinergic. However, relatively high values were obtained for the nuclear masses in which these sensory fibres end; this was taken to indicate the cholinergic nature of the second neurone in the sensory pathway. More recently, in 1949, Feldberg, Harris and Lin examined tracts of secondary sensory neurones (unpublished work). Whereas the eighth cranial nerve itself lacked the enzyme, the trapezoid bodies and the lateral filament which contain the fibres of the second ascending neurone gave intermediate values. Similarly, the region of the spinal cord which contains, amongst other fibres, those from the spino-cerebellar tract, i.e., of the second ascending neurone, also gave intermediate values. The third sensory neurone, originating in the thalamus and leading to the cortex, is probably again non-cholinergic, as suggested by

the low values found for the fibres in the posterior part of the internal capsule which, at least in man, is said to contain the thalamic radiation.

Another example is provided by the optic pathway. The retina contains large amounts of choline acetylase, whereas the optic nerve is free from it. This suggests that acetylcholine is the chemical transmitter at one or more of the synaptic junctions in the retina, but that the optic nerve is non-cholinergic. Observations made in 1949 on *Sepia* by Feldberg, Harris and Lin (unpublished work) suggest that, in the squid at least, the first neurone originating in the retina is also non-cholinergic. In *Sepia*, the retina consists of one kind of visual element only, which may correspond to the rods, and the nerve fibres originating from these pass, without synaptic interruption, as retinal nerves out of the eye and into the optic ganglion. It was found that in *Sepia*, the retina and the retinal nerves lack choline acetylase, which is highly concentrated in the optic ganglion. It is tempting, but dangerous, to use these results for interpretation of results obtained on the mammalian retina. But it may well be that the high concentration of choline acetylase in the mammalian retina is solely accounted for by the presence of the short second neurones. In that case, the first neurone originating in the rods and cones would be non-cholinergic and the second neurone cholinergic. This neurone then impinges in the ganglionic layer on the cell bodies of the non-cholinergic third neurone, the optic nerve. The fourth neurone in the optic pathway may again be cholinergic, as indicated by the high values found for the lateral geniculate bodies, where this fourth neurone begins.

Very low values for choline acetylase were found in the tissue of the anterior and posterior pituitary gland, but the region of the supra-optic nucleus gave a high value. This suggests that the last neurone by which nerve impulses are conveyed to the posterior pituitary is non-cholinergic, but that the fibres impinging on the supra-optic nucleus are cholinergic; the fact that the cells of this nucleus are sensitive to acetylcholine (Pickford, 1947) is in agreement with this concept.

However attractive such a pattern of a succession of alternating non-cholinergic and cholinergic neurones may be, it would be dangerous to have a conception which is too simplified and diagrammatic. We must realize that, if there are two different kinds of neurones, then on purely statistical grounds there must be considerable alternation.

About the nature of the non-cholinergic neurones nothing definite is known. As Sir Henry Dale said at the 1948 meeting of the British Association: "It is difficult to suppose that synapses in the central nervous system can differ among themselves so fundamentally in function, that transmission at some should be cholinergic and at others involve no kind of chemical agent." (British Association, 1948).

Naturally one thinks of the transmitter for adrenergic nerves in the peripheral nervous system: adrenaline or nor-adrenaline. Another substance has recently been suggested by Hellauer & Umrath (1948). According to their results, the transmitter is an unknown vasodilator substance which is also responsible for antidromic vasodilatation, a possibility which had already been foreseen by Dale (1935). Destruction of this transmitter is thought to be an enzymatic process which can be prevented by strychnine in the same way as eserine inhibits cholinesterase. Strychnine convulsions would thus be explained; confirmation of these results is essential before it is possible to speculate on these startling results. Holton and Perry (personal communication, 1950), for instance, have recently shown that strychnine has no detectable effect on antidromic vasodilatation produced in the external ear of the rabbit.

Summarizing, it may be said that whatever conclusion we draw from each single finding, it is impossible to deny the fact that there is a great number of observations which can be accounted for convincingly and satisfactorily only by the acetylcholine theory, even if we agree that acetylcholine is probably not the universal central synaptic transmitter.

I find it difficult to understand the position taken up by several authors who discard all findings in favour of the acetylcholine theory as being irrelevant, but perhaps my difficulty is the result of bias and prejudice.

- References

The centenary of the discovery of the action current by Du Bois-Reymond and Matteucci<sup>1</sup> has passed almost unnoticed by the majority of physiologists and biophysicists. But formal recognition of this event is hardly necessary, for the discovery forms the basis of most modern work on the nervous system and its importance is as clear today as it was a hundred years ago. For a long time progress was limited by the lack of suitable recording instruments, and precise information could be obtained only by the use of ingenious but indirect methods such as those employed by Bernstein (1868) or Lucas (1912).

In recent times the development of valve amplifiers and cathode-ray tubes has provided an almost perfect method of measuring rapid electrical changes. With these instruments, an observer can be sure that the electrical variations which reach his recording system are reproduced without appreciable distortion. But this is not by any means the end of the story, for it does not follow that the changes at the recording electrodes are the same as those at the active surface of a nerve or muscle fibre. Excitable cells are always surrounded by a certain amount of external fluid and the potential difference observed with external electrodes depends to a large extent upon the shunt provided by the external fluid. Another complication is introduced by the interesting phenomenon of dispersion. A mixed nerve trunk consists of many thousands of nerve fibres with diameters varying over a wide range. The conduction velocity of a nerve fibre increases with its diameter so that the action potential of a mixed nerve trunk is a compound wave which is built up from the asynchronous activity of large numbers of different fibres (Erlanger & Gasser, 1937). It is therefore a matter of some difficulty to make quantitative deductions about the behaviour of a single nerve fibre from observations with large nerve trunks.

<sup>1</sup> According to Biedermann (1896) the discovery was made independently by Du Bois-Reymond and Matteucci between the years 1840 and 1843. Full references to the literature of this period are given in Du Bois-Reymond's *Untersuchungen über thierische Elektrizität* (1848).

Errors may also be introduced by irregularities in the nerve trunk or by the presence of an external connective-tissue sheath. The position can be improved by using an isolated nerve fibre, but it is still necessary to allow for the shunting effect of the external fluid and this can be done only by making complicated electrical measurements.

### 1. Experiments with Internal Electrodes

The most satisfactory method of determining the absolute magnitude of the action potential depends upon the use of an internal electrode which measures the potential difference across the cell surface. This technique has been used to measure the resting potential and action potential in the giant axon of the squid (Curtis & Cole, 1940, 1942; Hodgkin & Huxley, 1939, 1945). The methods employed by American and British investigators differ in certain minor respects, but the general principle is the same. A micro-electrode consisting of a long glass capillary is inserted at one end of the fibre and is pushed in for a distance of 10–30 mm. During this process it is important to keep the micro-electrode in the centre of the axon. If the electrode scrapes against the surface membrane it damages the fibre and the experiment is at an end; but if kept in the centre it appears to do no harm and the axon remains excitable for many hours.

The small size of most nerve and muscle fibres makes it difficult to use the technique employed for the giant axon, but another method has now been developed by a group of physiologists in Chicago (Graham & Gerard, 1946; Ling, 1948; Ling & Gerard, 1949a, b, c, d). These workers showed that a very small electrode can be inserted transversely into a muscle fibre without causing appreciable damage or twitching. The surface membrane appears to form an effective seal round the electrode, provided that the dimensions of the latter are sufficiently small. In order to obtain successful results it is desirable that electrodes should have an external tip diameter of not more than 0.5  $\mu$ . This small diameter means that the electrodes have a high electrical resistance and special precautions must be taken with the recording system. Gerard and his collaborators were primarily interested in the resting potential and made no direct measurements of the action potential. Further developments in technique have made it possible to record both action potential and resting potential with this type of electrode (Hodgkin & Nastuk, 1949; Nastuk & Hodgkin, 1949, 1950). Other investigators are now extending the method to different preparations (e.g. Coraboeuf & Weidmann, 1949) and it may prove to be an important way of investigating cells and tissues which are not amenable to more conventional methods of attack.

Two general conclusions may be drawn from the experiments with internal electrodes. In the first place, it is clear that both action potential and resting potential are developed across a thin membrane at the surface of the fibre. There was already much evidence for this conclusion, but the experiments with internal electrodes put it on a firmer basis. In this respect modern work substantiates the assumptions made in the classical form of the membrane theory, but in another respect it comes into sharp conflict with the predictions of the theory. For it is found that activity does not consist of a simple membrane break-down, but involves a substantial reversal of the membrane potential. Thus the resting potential of squid nerve is about 50 mV., while the action potential may be 100 mV. or more (Curtis & Cole, 1942;

FIG. 1. RESTING POTENTIAL AND ACTION POTENTIAL OF FROG MUSCLE FIBRE

(From Nastuk & Hodgkin (1950), by permission of the Editors of the *Journal of Cellular and Comparative Physiology*)

Temperature 6° C.

Ordinate scale : 10 mV. steps (from voltage calibrator)

Record A : obtained at beginning of experiment, with micro-electrode outside fibre

Record B : obtained in the resting condition, with micro-electrode inside fibre

Record C : obtained in stimulated condition, with micro-electrode inside fibre

Record D : obtained at end of experiment, with micro-electrode outside fibre

Hodgkin & Huxley, 1945; Hodgkin & Katz, 1949). The average resting potential in frog's muscle is about 90 mV., while the action potential is about 120 mV. (Hodgkin & Nastuk, 1949). A typical record which illustrates the reversal of potential difference in frog muscle is shown in fig. 1. There is evidence for a similar reversal in crustacean nerve (Hodgkin & Huxley, 1945) and it appears to be a fairly general property of excitable cells. Recent experiments suggest that the effect may have an interesting explanation in terms of permeability and ionic concentrations.

## 2. The Basis of the Action Potential : a Hypothesis

Table I gives approximate figures for the ionic concentrations in the interior of a frog's muscle fibre and in the surrounding Ringer's fluid. The figures illustrate the well-known result that inside the cell potassium is present in

TABLE I. APPROXIMATE IONIC CONCENTRATIONS IN FROG MUSCLE

Myoplasm	Ringer's Fluid
(K) <sub>i</sub> = 125	(K) <sub>o</sub> = 2.5
(Cl) <sub>i</sub> = 1-5	(Cl) <sub>o</sub> = 117
(Na) <sub>i</sub> = 15	(Na) <sub>o</sub> = 117
Internal Anions = 135	
Membrane	

Concentrations are given in milliequivalents per litre and are based on information provided by Boyle & Conway (1941). The figures given for Ringer's fluid are those used in the experiment illustrated by fig. 1 (see Nastuk & Hodgkin, 1950).

high concentrations, while sodium and chloride are present in low concentrations. We shall assume that the resting mem-

brane is permeable to potassium and to chloride but is sparingly permeable to sodium and to the internal anions (cf. Boyle & Conway, 1941). Under these conditions a potential difference of the same sign and order of magnitude as the resting potential is to be expected. Owing to the direction of the concentration gradients, potassium ions tend to leave and chloride ions to enter the fibre. In this way a potential difference is built up which opposes further motion of ions. If the membrane were permeable to potassium ions alone we should have :

$$E_K = 58 \text{ mV. } \log_{10} \frac{(K)_i}{(K)_o} \quad (1)$$

where  $E_K$  is the equilibrium potential for potassium;  $(K)_i$  and  $(K)_o$  are activities inside and outside the fibre. On the assumption that the activity coefficient inside the fibre is the same as that outside we find  $E'_K = 99 \text{ mV.}$  for the system considered in Table I. If the membrane were permeable to chloride ions alone we should have :

$$E_{Cl} = 58 \text{ mV. } \log_{10} \frac{(Cl)_o}{(Cl)_i} \quad (2)$$

$$E'_{Cl} = 80 \text{ to } 120 \text{ mV.}$$

The combined effect of potassium and chloride would therefore be to give a potential difference of about 100 mV., which is of the same order as that observed in isolated muscle. It is clear that maintenance of the resting potential ultimately depends on metabolism, but we know very little about the intervening links in this process. Recent work suggests that a fraction of the metabolic energy may be directed towards an active extrusion of sodium (Krogh, 1946; Ussing, 1949). A process of this kind would prevent equalization of ionic concentrations and might also have the temporary effect of raising the membrane potential above that required by equations (1) and (2). There must be many other ways in which metabolism might contribute to the resting potential, but this does not reduce the importance of the potassium and chloride systems, which may be conveniently regarded as a storage battery in parallel with a metabolic source of energy.

In the classical form of the membrane theory it is assumed that excitation leads to a loss of the normal, selectively permeable, character of the membrane. If this is so the membrane potential would fall towards zero during activity and there would be no reversal of membrane potential. In order to account for the reversal it will be assumed that the membrane becomes highly and specifically permeable to sodium. In this case sodium ions would tend to enter the fibre faster than potassium ions could leave it and a reversed potential difference would be established. If the membrane became infinitely permeable to sodium its potential should approach the equilibrium potential for a sodium electrode :

$$E_{Na} = 58 \text{ mV. } \log_{10} \frac{(Na)_i}{(Na)_o} \quad (3)$$

$$E'_{Na} = -52 \text{ mV.}$$

We should not expect to find such a large reversal of membrane potential unless the degree of selective permeability were very great. It is therefore reassuring to find that the average values in muscle and squid nerve appear to be less than the maximum predicted by equation (3) (Nastuk & Hodgkin, 1950; Hodgkin & Katz, 1949).

### 3. Tests of the Hypothesis

One advantage of this hypothesis is that it can be tested experimentally in a number of different ways. If the active depolarization of a nerve or muscle fibre is due to entry of sodium, it follows that conduction of impulses should be impossible in sodium-free media.

#### a. Action of Sodium-free Solutions

The action of sodium-free solutions was studied by Overton (1902) and has been the subject of recent investigations by Lorente de N  (1944, 1947, 1948, 1949a, b) and others (Kato, 1936; Erlanger & Blair, 1938; Webb & Young, 1940; Katz, 1947; Hodgkin & Katz, 1949; Nastuk & Hodgkin, 1950; Huxley & St mpfli, 1949). There appears to be general agreement that most excitable tissues become reversibly inexcitable when immersed in solutions which do not contain sodium, lithium or certain quaternary ammonium ions. Single nerve fibres from amphibia and crustacea become inexcitable within a few seconds of application of an isotonic sodium-free solution; excitability can be restored by solutions containing sodium in a similar space of time (Hodgkin & Katz, 1949; Kato, 1936). In other preparations, such as frog muscle or the giant axon of the squid, the time required for excitability to disappear may be somewhat longer, but is still of the same order as that predicted on a diffusion basis (Hodgkin & Katz, 1949; Nastuk & Hodgkin, 1950). A frog's sciatic nerve retains its excitability for many hours in a sodium-free solution and there is some difference of opinion about the reason for this. One possibility is that appreciable quantities of salt may be retained in the interstitial spaces as a result of slow diffusion through the epineurium (see Rashbass & Rushton, 1949a, b), but this view is not universally accepted (see Lorente de N , 1947). In general, it may be said that the experiments with isolated nerve fibres support the sodium hypothesis while those with multifibre preparations are still the subject of controversy.

#### b. Effects of Changes in the External Concentration of Sodium

Another consequence of the hypothesis is that the relative magnitudes of the action potential and resting potential should depend upon the concentration of sodium in the external fluid. Thus the active membrane should be unable to give a reversed potential difference if the concentration of sodium in the external fluid were made equal to the internal concentration. The effect of alterations in sodium concentration has now been studied in the giant axon of the squid (Hodgkin & Katz, 1949) and in frog's muscle (Nastuk & Hodgkin, 1949, 1950). In both cases it was found that the magnitude of the reversed potential difference varied with the sodium concentration, in the general manner demanded by the hypothesis. It was also shown that the difference between the action potential and resting potential was increased by solutions containing an excess of sodium. Another interesting point is that the rate of rise of the action potential could be varied over a wide range by changing the external concentration of sodium. This result is clearly consistent with the idea that the active depolarization of a nerve fibre is due to entry of sodium.

#### c. Ionic Exchange during Activity

A more direct test of the hypothesis has recently been made by Keynes (1949), who has studied the penetration of  $\text{Na}^{24}$

into *Sepia* axons. He found that stimulation at 100/sec. caused a fifteenfold increase in the rate of uptake of  $\text{Na}^{24}$ . There was also a considerable increase in the outward passage of  $\text{Na}^{24}$ , so that it was difficult to decide whether or not activity was associated with a net uptake of sodium. But it seems clear that activity must involve a substantial increase in the permeability to sodium.

The experiments with sodium are closely linked with recent experiments on potassium leakage. Earlier work indicated that activity is associated with a loss of potassium (Cowan, 1934; Fenn & Cobb, 1936; Young, 1938; Arnett & Wilde, 1941) and this finding has now been put on a more quantitative basis. Using an indirect method, Hodgkin & Huxley (1947) estimated that about  $1.7 \times 10^{-12}$  mol. of potassium pass through 1 cm.<sup>2</sup> of membrane in one impulse in *Carcinus* axons. Using radioactive tracers, Keynes (1948, 1949) reports a potassium loss of  $2.1 \times 10^{-12}$  mol. per cm.<sup>2</sup> per impulse in *Carcinus* and  $4.5 \times 10^{-12}$  in *Sepia* axons. It is possible that most of the potassium is lost during the falling phase of the action potential and that this loss balances a corresponding entry of sodium during the rising phase. (There is also likely to be some simultaneous exchange of Na and K.) If this view is correct, it follows that the immediate source of energy for the nervous impulse is the exchange of a minute amount of sodium and potassium ions. It is important to remember that the quantities involved are extremely small. Thus the amount of potassium which leaves a 200  $\mu$  *Sepia* axon during one impulse is of the order of  $\frac{1}{100,000}$  of the total internal potassium. A large nerve fibre should therefore be able to live on its ion store for some time. However, sooner or later the axon must pump out the sodium which leaks in and reabsorb the potassium which it has lost. In this connexion it is interesting to recall that the human erythrocyte appears to be able to extrude sodium (Harris, 1941) and that here there is some evidence to show that sodium extrusion is the active process and potassium absorption is a passive counterpart (Maizels, 1949). If this idea is correct it may simplify the position, since only one secretory system need be considered. But the problem is still a formidable one and no satisfactory hypothesis has yet been put forward.

### 4. Saltatory Conduction in Medullated Nerve

It would be inappropriate to close this article without referring to recent work on conduction in medullated nerve. There is now a considerable body of evidence to show that conduction in all excitable fibres is brought about by local electric circuits (e.g., Osterhout, 1931; Auger, 1933; Hodgkin, 1937a, b, 1939; Tasaki, 1939b). In muscle and in non-medullated nerve these local circuits spread in a continuous manner and conduction appears to be a perfectly uniform process. On the other hand, medullated nerve fibres show characteristic discontinuities at the nodes of Ranvier, and Lillie (1925) suggested that the high conduction velocity of these fibres might be due to the fact that they conduct in a saltatory manner. On this view the thickly myelinated internodes act as segments of inert cable which allow the impulse to skip from one node to the next with relatively small delay. In recent years much evidence has accumulated in favour of the hypothesis. On the one hand, there are a number of experiments which show that agents block most easily at the nodes of Ranvier (Erlanger & Blair, 1934, 1938; Kato,

1936; Tasaki, Amikura & Mizushima, 1936); on the other, there are experiments which indicate that electric currents stimulate at the nodes of Ranvier (Kubo, Ono & Toyoda, 1934; Kato, 1934, 1936; Tasaki, 1939a; see also von Muralt, 1945). Huxley & Stämpfli (1949) have now subjected the hypothesis to a rigorous test by analyzing the distribution of current in an active fibre. They find that the internodes act as passive, cable-like structures, while the inward current associated with activity is confined to the nodes of Ranvier. This constitutes strong evidence for the saltatory theory; but there remains the difficulty that the myelinated fibres of the central nervous system are commonly supposed to possess no nodes of Ranvier. If this were true, saltatory conduction would be impossible in central fibres and unlikely in the periphery. However, both Cajal (1899) and Bielschowski (1928) described nodes in the central nervous system and their existence has recently been demonstrated by a variety of methods (Hess & Young, 1949; Feindel, Allison & Weddell, 1948; Allison & Feindel, 1949).

The somatic sensory receiving areas in the brains of animals have been mapped by Marshall, Woolsey & Bard (1941) and by Adrian (1941), with particular attention to the results of stimulating cutaneous sensory receptors. Less attention was given to the effects of stimulating proprioceptors, though Adrian mentioned that a prolonged stretching of a muscle caused only a brief discharge in the white matter deep to the sensory cortex. Woolsey, Chang & Bard (1947) stimulated posterior nerve roots electrically, which presumably excited proprioceptive as well as cutaneous sensory afferent fibres, and then found potential changes in the motor cortex precentrally as well as in the postcentral sensory areas. They reported that "the distribution of the precentral responses for various roots supplying the leg suggest that the afferent impulses terminate in a definite way in relation to the pattern of representation in the motor area." Localized modification of the spontaneous activity in the cortex of monkeys was reported by Gay & Gellhorn (1949), who stimulated proprioceptors on the opposite side of the body, and found that the effect was greatest in the particular area of the precentral region related to the part in which muscles were stretched.

### 1. Cerebral Responses to Electrical Stimulation

#### a. Responses in a Patient with Myoclonus

Investigations on a patient subject to severe myoclonic seizures (Dawson, 1947b) showed that a large cerebral electrical response could be detected on the scalp after a tap on a tendon or after electrical stimulation of a peripheral nerve. In this patient the responses to stimulation of the arm or leg showed the same distribution in a lateral direction as would be expected in the sensory or motor areas, but in an anteroposterior direction the electrical maximum lay on a line approximately 3 cm. in front of the surface marking of the central sulcus. At post-mortem examination Dr. Greenfield confirmed that this line lay in front of the central sulcus. The question then arose as to whether the response in this

subject indicated the normal site of arrival at the cortex of proprioceptive impulses, and was abnormal only in being so large as to be easily detectable, or whether the position in which the activity was greatest was also abnormal. An investigation was therefore begun to see if similar stimuli would produce detectable responses in healthy people.

#### b. Detection of Small Responses

During the investigations on the patient with myoclonus some difficulty was experienced in measuring the latency of the responses after the stimuli. This difficulty was caused by irregularities in the base-line of the records, due largely to spontaneous brain activity or activity of scalp muscles and to a small extent to random fluctuations in the amplifiers. When a number of records were superimposed with the stimulus artefacts coincident, features occurring at a constant time after the stimulus appeared more clearly, whilst those not regularly related to it produced only a general thickening of the base-line. The start of the response could then be identified more easily and timed more accurately. In the same way it was found that regular deflections in the records, previously too small in relation to the background to be considered significant, could now be detected with certainty. A similar technique was used in radar for detecting signals which were small in relation to random disturbances or interference, and an example of its use is given by Bradfield, Bartlett & Watson (1946). The principle of the method is essentially the same as that used by Francis Galton in 1875 (Galton, 1883), to bring out the features which were common to a number of portraits and to suppress the irregularities which were present only in individual pictures. The value of applying the method to the present work was realized as a result of discussion with Dr J. A. V. Bates, who has also used it for investigations to which reference will be made later.

#### c. Responses in Healthy Subjects

By the use of the technique described above, it was found that responses to electrical stimulation of peripheral nerve were detectable on the scalps of healthy people (Dawson, 1947a). These responses had the same distribution in a lateral direction as those produced by the same type of stimulation in the patient with myoclonus, but they were only one-fifth to one-tenth as large; they seemed also to be centred, in an anteroposterior direction, nearer to the surface markings of the central sulcus than the responses in the subject with myoclonus. The centre of the disturbance was taken as being deep to the place on the scalp where the potential gradients, plotted with a row of electrodes separated by 3 cm., changed in sign. This is the method described by Adrian & Yamagiwa (1935) and, so long as the potential gradients are symmetrical about the point of reversal, it gives a reliable indication of the position of the centre of the underlying electrical disturbance. In the coronal plane this condition was approximately fulfilled, and it is probable that the location of the area active in the responses, both in the patient with myoclonus and in healthy people, was accurate to within 2 cm. in either direction in this plane. In a sagittal plane the location in healthy people was less satisfactory as, although there was a maximum over the surface marking of the central sulcus, the potential gradients in front of this and behind it were not at all symmetrical. Up to the marking of the sulcus, from a point 6 cm. in front, the gradient was steep,

whilst behind the sulcus it fell only slowly; so the centre of the disturbance was probably not under the marking of the sulcus, although this was where the gradient reversed. An asymmetrical distribution of potential such as this may be accounted for in a number of ways. Of the possible hypothetical arrangements some are not physiologically unreasonable, and these include disturbances either behind or in front of the marking of the central sulcus. Hence it seems that the present methods will not allow accurate location in the sagittal plane of the site of arrival of the afferent volleys in the healthy subject. Although it was not found possible to determine where the activity was centred in the sagittal plane in healthy people, it was clearly differently distributed from that in the subject with myoclonus. It therefore remained important to determine whether or not the nerve fibres which were being stimulated in the two cases, and which were mediating the responses, were the same.

## 2. Afferent Nerve Fibres Concerned in the Responses

Clinical examination of the patient with myoclonus showed that the adequate stimulus for evoking the jerks was stretching of muscle and that light touch and pin-prick were ineffective in doing so. Electrical stimulation of a mixed nerve in this patient would evoke the cerebral responses, almost unreduced in size, when the shocks were so weak that few motor fibres were being excited. It seemed that the fibres concerned had a lower mean threshold to this form of stimulation than had the motor fibres, and that therefore they probably conducted more rapidly and were of larger diameter than the motor fibres. The group of nerve fibres which conduct most rapidly and have the lowest threshold to electrical stimulation contains fibres carrying impulses from stretched muscle and also, as has been shown by Kugelberg (1944), fibres mediating the sensation of touch. The peculiar power of stretching muscle for producing the responses in the patient with myoclonus, and also the fact that no responses were detected after stimulation of a purely cutaneous nerve, suggested that impulses in proprioceptive fibres from muscle were chiefly concerned. In healthy people on the other hand there was no clinical evidence that proprioceptive stimuli were more potent than any other kind, and the cerebral responses in them to stimulation of a mixed nerve might have been produced by volleys in cutaneous fibres as well as those from muscle. The experiments to be described, designed to test this point, were carried out with Dr J. W. Scott of Toronto. A comparison was made between the effects of stimulating the skin of the thumb and fingers and stimulating the trunk of the median or ulnar nerve through the skin at the wrist. The stimuli were applied to the skin of the hand by placing the thumb in one beaker of saline and the four fingers in another, with the stimulating current passed between the two beakers. It was found that a strength of shock which produced a just perceptible sensation and no sign of muscular twitching in the hand would produce a detectable cerebral response. In this experiment stimulation of some afferent fibres from muscles by spread of the stimulating current might still be occurring. However, the great increase in the shock—enough for it to become very unpleasant in the thumb and fingers—which had to be made before any twitching occurred in the small muscles of the hand suggested that the amount of such spread was probably insignificant with the weaker shocks. Since stimulation of the skin in healthy

people produces a cerebral response it seems likely that the response to stimulation of a mixed nerve is also in part due to a volley in cutaneous afferent nerve fibres. In the patient with myoclonus the responses to stimulation of proprioceptors were large and relatively smaller amplifications were used; this may perhaps explain the failure to find responses when cutaneous nerves were stimulated.

In the healthy subject, when the strength of the shock to the thumb and fingers was increased until it was very uncomfortable, and when the small muscles of the hand were twitching slightly as a result of spread of the current, the cerebral response remained smaller in many of its phases than the response which could be produced by stimulating the median, or even the ulnar nerve, at the wrist. This was so when the shock to the nerve was only just maximal for the motor fibres and was not at all uncomfortable. Figure 2 shows in A the cerebral responses to fifty stimuli applied at one-second intervals to the ulnar nerve at the wrist and just strong enough to be maximal for motor fibres. The records in B show the responses to fifty stimuli applied to the thumb and fingers with the shock as strong as the subject could bear. In C are shown the responses to 50 stimuli, applied to the thumb and fingers, which were only just above the threshold for producing sensation. The initial phases of the responses in records A and B are little different in size, but the later phases in A, where the stimulus was applied to the ulnar nerve, are significantly larger than those in B, where the stimulus was to the skin. A strong shock to the skin of the thumb and fingers would be expected to excite a greater area of cortex than would stimulation of the ulnar nerve at the wrist. If the area of active cortex was greater and it was excited synchronously, the change of potential picked up on the scalp with relatively widely spaced electrodes should also be increased; but any such difference in the area of cortex active was not apparent from records such as those shown in fig. 2, A and B.

## 3. Recording of Action Potentials in Afferent Nerve Fibres

In interpreting the findings described above, little importance may be attached to the size of the cerebral response unless something is known about the characters of the volley of impulses produced by each type of stimulation. It was found that, when the median or ulnar nerve was stimulated at the wrist, the action potential which resulted could be recorded from surface electrodes on the skin over the nerve above the elbow; similarly the action potential which followed the stimulus to the thumb and fingers could also be recorded. The methods used for making these records have been described elsewhere (Dawson & Scott, 1949) and by using them it was possible to obtain some information about the nerve volleys produced by stimulation at the different sites. (Similar methods, which were described by Eichler (1937), had not come to the authors' attention when this work was done.) When the shock to the nerve at the wrist is strong enough to stimulate motor fibres, the centripetal volley will contain antidromic impulses in these fibres, in addition to impulses in sensory fibres of the same and lower threshold. Therefore, when the action potentials are used to compare the activity in sensory fibres produced by different stimuli, allowance must be made for this antidromic volley whenever the stimulus may also be exciting motor fibres. With a stimulus which was

maximal for motor fibres it was shown (Dawson & Scott, 1949) that 70 per cent of the amplitude of the action potential in the nerve was due to impulses in sensory afferent fibres with a lower threshold than that of motor fibres. The remaining 30 per cent was due partly to antidromic impulses in motor fibres and partly to impulses in sensory fibres with the same threshold as motor fibres. Thus when the effects of stimuli to the hand and at the wrist are to be compared, not more than 30 per cent need be deducted from the amplitude of the volley caused by the stimulus to the nerve at the wrist, if the stimulus is exciting motor fibres. After such an allowance had been made the nerve action potential produced by stimulating the thumb and fingers was found to be half the amplitude of that which occurred after stimulating the nerve at the wrist. The action potential from the stimulus to the hand was also 30 per cent longer in duration and had a flatter top than that due to the nerve stimulus. The difference in the size of these two nerve action potentials may have been due to the fact that the stimulus to the hand was exciting only cutaneous afferent fibres, whilst the stimulus to the nerve was also exciting afferent fibres from muscles. But another possible cause of the difference may have been the temporal dispersion of the impulses in the volley, which is indicated by the greater duration and flatter top of the action potential following the skin stimulus. Either or both of these peripheral differences in the results of stimulation of skin or nerve trunk might account for the differences in the appropriate cerebral response.

#### 4. Excitability of Afferent Nerve Fibres Concerned

Experiments have been made to investigate the threshold to electrical stimulation of the nerve fibres chiefly concerned in producing the cerebral responses under consideration. In fig. 1, where one such experiment is illustrated, trace 1 is a time-scale showing 1, 5 and 20 msec. intervals, trace 2 is a record of the cerebral response made from electrodes placed as shown in the diagram, and trace 3 is a record of the action potentials in the left median nerve above the elbow. Trace 4 is a time-scale for trace 3 in 0.1 and 1 msec. intervals and the relative timing and duration of traces 3 and 4 to that of traces 1 and 2 is shown by the notch in trace 1. In A, 50 records have been superimposed without any stimulus being applied to the nerve. In B, an electrical stimulus, strong enough to be maximal for motor fibres, was applied to the median nerve at the wrist once a second, and again 50 records were superimposed. From C to H the shock strength was progressively reduced and it can be seen that the nerve action potential decreases in size more rapidly than the cerebral response. Allowing for the falling out of the action potentials due to antidromic impulses in motor fibres, which would be complete at the shock strength used in record D, these records suggest that the cerebral responses which are being considered are produced mainly by the fibres of lowest threshold in the nerves being stimulated. Of these low-threshold fibres some at least are cutaneous in origin. This is suggested by the fact that with the strength of stimulus used for the records in fig. 1G, and even with the weaker stimulus used in H, which did not produce a detectable cerebral response, the subject reported sensations referred to the peripheral distribution of the median nerve. From the present experiments it is not clear how much of the cerebral response

is due to stimulation of these low-threshold cutaneous afferent fibres and how much to stimulation of proprioceptive afferents from muscle. The small size of the cerebral response in record G, when the subject could detect some sensation which was diffusely scattered in the median nerve distribution, suggests that these methods are not likely to be useful for the study in man of the responses to localized tactile or other stimuli.

#### 5. Variations in Cerebral Responses

The use of the technique of superimposing many records of the cerebral response gives a mean form, which would otherwise be difficult to obtain on account of the irregularities in the records. But the method has the disadvantage of masking variations in the size or form of the responses to successive stimuli. A series of records, shown in fig. 3, made during the same experiment as those in fig. 1, but recorded individually instead of being superimposed, shows great apparent variations in the size of the cerebral response. The stimulus, which was of the same strength as that used for the records shown in fig. 1B, was applied to the median nerve at one-second intervals. From the records shown in fig. 1 it was known that when the nerve action potential was reduced by 20 per cent below maximal the mean amplitude of the cerebral responses changed by less than the differences between the individual responses in fig. 3. Since the nerve action potentials in fig. 3 were maximal and varied by less than 10 per cent it seems likely that the variations in size of the cerebral responses recorded in that figure were therefore not caused by any variations in the size of the afferent volleys. Much of the apparent variation of the cerebral responses in fig. 3 was probably due to inadequate relaxation of the subject in this experiment, which produced some irregularity of the base-line. This seems less likely to have been the cause of the variations between the responses in the series of records shown in fig. 4, since the subject was more relaxed in this experiment. In these records the shocks used were applied at one-second intervals and it appears that either the first or the later waves may vary in size or be completely absent. Variations of this kind in the responses to sensory stimuli have been shown to occur in animals (Marshall *et al.* 1941) as a result of cortical activity evoked by a preceding stimulus; but no regular relation between the spontaneous brain activity and the size of the responses to the stimuli was observed. On the other hand, Adrian & Moruzzi (1939) have shown in animals that the activity of the cortical cells discharging into the pyramidal tract is modulated in time with the spontaneous cerebral rhythms in the motor area during dial anaesthesia. In the subject from whom the record in fig. 4 was made, a pair of electrodes 3 cm. apart on the scalp over the sensorimotor area picked up—when the eyes were closed—a considerable amount of activity at 11 cyc./sec., which was apparently spread of occipital alpha rhythm. Whether this spread was a purely passive one, or an active neuronal spread more likely to modulate the activity of the cells concerned in the cerebral responses to stimulation, was not clear, but it seemed worth while to study the effects of applying the electrical stimuli at fixed times in relation to the phases of the alpha rhythm. When this was done the records failed to show any consistent differences between the responses to stimuli at different parts of the alpha cycle, and

# CEREBRAL RESPONSES TO PERIPHERAL NERVE STIMULATION

(FIGS. 1—3)

G. D. Dawson

FIG. 1. The 8 records, each of 50 sweeps superimposed, illustrate the relation between the sizes of the action potentials in the median nerve after electrical stimulation at the wrist (trace 3) and the resulting cerebral responses (trace 2). The nerve action potentials were recorded from electrodes on the skin over the nerve above the elbow and the cerebral responses from a pair of electrodes on the scalp 6 cm. apart in the position indicated in H, with the back electrode 8 cm. from the mid-line. The amplifiers were connected in such a way that when the back electrode (dotted line) became positive with respect to the front one (continuous line) an upward deflection was recorded. The stimuli were applied at 1-sec. intervals. The dots above the time-scales indicate the time of stimulation. The short vertical lines in D over trace 1 show 20 msec. for trace 2; those below trace 4 indicate 1 msec. for trace 3. The relative duration and timing of traces 3 and 4 to traces 1 and 2 is shown by the notch in trace 1. The vertical lines after traces 2 and 3 in B show the deflection caused by 10  $\mu$ V. in 2 and 20  $\mu$ V. in 3

In A, no stimulus was applied to the nerve

In B, a stimulus was applied which was maximal for motor fibres

From C to H, the stimulus strength was progressively reduced, being below threshold for motor fibres in D and just above threshold for sensation in H

The records suggest that the greater part of the cerebral response is produced by afferent impulses in fibres with a lower threshold to electrical stimulation than that of motor fibres

FIG. 2. The 3 records, each of 50 sweeps superimposed, show the cerebral responses to stimulation as follows :

In A, stimulation of the left ulnar nerve at the wrist with a shock just maximal for motor fibres

In B, stimulation of the thumb and fingers with the strongest shock the subject could bear

In C, stimulation of the thumb and fingers with a shock the subject could just detect

The stimuli were applied at 1-sec. intervals. The time-scales show intervals of 1, 5 and 20 msec. and the vertical lines between them show a time-interval of 30 msec. after the stimulus. The dots above and below the time-scales indicate the time of stimulation. The deflection produced by a potential difference of  $10 \mu V$ . at the amplifier input is shown by the vertical lines at the ends of the traces in A. The scalp electrodes were on a line 7 cm. lateral to the mid-line on the right side and were separated from each other by 4 cm., with the back electrode over the surface marking of the central sulcus. The amplifier was connected as described in fig. 1

FIG. 3. The 10 records shown were made during the same experiment and under the same conditions as those in fig. 1B, except that they were recorded individually instead of being superimposed. The records show large apparent variations in the cerebral responses in trace 2, without significant alterations in the size of the nerve action potentials in trace 3. The notch in trace 1 indicates the relative timing and duration of traces 3 and 4 to that of traces 1 and 2, as shown in record 10. The short vertical lines above trace 1 and below trace 4 in record 10 show 20 msec. and 1 msec. respectively. The vertical lines at the ends of traces 2 and 3 in record 5 show  $10 \mu V$ . and  $20 \mu V$ . respectively

FIG. 4. The records are of 20 consecutive cerebral responses to stimulation of the ulnar nerve. The records were made from a pair of electrodes on the scalp, one over the surface marking of the central sulcus and 7 cm. from the mid-line and the second 4 cm. anterior to it. The cerebral responses are less irregular than those in fig. 3, but they show that either the first or later phases of the response may vary in size or be absent. The vertical line after trace 19 shows 20  $\mu$ V. and the horizontal line below it 20 msec.

the variations between the responses to successive stimuli seemed to be as great as when they were applied at random, or with the eyes open and little or no alpha rhythm present. There was thus no evidence that the cells responding to the afferent volley were occupied at all by cortical activity at the frequency of the alpha rhythm. This finding is of interest in view of the work of Bates (communication to Second International Congress of Electroencephalography, 1949, unpublished) and of Boreham, Kibbler & Richter (1949), who have shown independently, in the first case by a modification of the superimposition technique and in the second case by a statistical examination of measurements from many single records, that the time of initiation of voluntary movements in man

tends to be related to the phase of the alpha rhythm. One explanation of this finding is that a similar relation may exist, in man, between the motor cells and the alpha rhythm mechanism, as Adrian & Moruzzi (1939) showed to exist between the pyramidal discharges and the spontaneous cortical activity in animals. In another sensory field the variations which may occur in both normal and abnormal subjects in the response to visual stimulation with flashes of light, when the rate or phase of the stimulus was altered in relation to the spontaneous rhythms, have been described by Walter & Walter (1949). More recently Cobb (communication to Second International Congress of Electroencephalography, 1949, unpublished) has described in detail regular alterations which have been found to occur in the occipital responses to flash stimuli in conditions of concentration and relaxation of attention. So far no factors which would produce similar repeatable variations in the responses to tactile or proprioceptive stimuli have been found.

## 6. Conclusions

The experiments described suggest that the cerebral responses which may be detected in healthy man, after electrical stimulation of nerve, are probably produced by excitation of at least two kinds of nerve fibre. One type of fibre is that which carries afferent impulses from cutaneous receptors and the other is probably that carrying impulses from proprioceptors in muscle. The records made through skin show that 70 per cent of the nerve action potential which can be detected is due to activity in fibres with a lower threshold than motor fibres; it is the volley in these low-threshold afferent fibres which produces the greater part of the cerebral response. The relative contributions of the cutaneous afferent fibres and of the afferent fibres from muscle to this group of low-threshold fibres is not clear from these experiments. The records of nerve action potentials also indicate that variation in the size of the afferent volley was not the cause of the variations in size of the cerebral responses to successive stimuli of the same kind; no cause for this variation has yet been found but it seems that, even with submaximal stimuli, it is not peripheral. On the other hand the same methods show that, with different types of stimuli, the peripheral differences in the resulting afferent volleys may alone be enough to account for the considerable differences in the cerebral responses produced.

## ACKNOWLEDGEMENTS

The author would like to express his gratitude to Dr E. A. Carmichael for his advice and encouragement, also to Dr J. W. Scott for his help in many of the experiments and in discussion.

The vertebrate nervous system receives its information about the outside world by means of signals transmitted by a large number of sensory nerve fibres. The number must be large, because the range of information which one fibre can transmit is small. The fibre signals the excitation of a sensory ending by transmitting a stream of impulses; the frequency of the impulses shows the intensity of excitation at each moment, but there is nothing else to indicate what sort of change has stimulated the receptor. This limitation comes from the nature of the conduction process in the fibre, for a single nerve fibre is a far less able transmitter of information than a single metallic wire, in which a fluctuating electric current can transmit all the inflections of speech or the pattern of a written message. The nerve fibre can send only brief pulses of activity which depend for their transmission on local stores of energy. They must be all alike and cannot bear the stamp of the event which set them in motion.

Ultimately the afferent messages transmitted in this way will modify the stream of efferent messages which are sent out from the nervous system to the muscles. These, too, are made up of impulses, all of the same form and distinguishable only when the fibres carrying them are of different size. Both on the sensory and motor sides, therefore, a large number of nerve fibres must be available if the efferent pattern is to be effectively harmonized with the afferent, i.e., if the animal is to react appropriately to its surroundings.

During the past 25 years the use of electronic amplifiers has made it possible to record the impulses in single nerve fibres, and we have gained new information about the activities of individual nerve cells and sensory end-organs. This led at first to a focusing of attention on the units rather than on the group, for the technique was more suitable for investigating the performance of the sensory nerve fibre than that of the receptor surface or the motor nucleus. Thus problems involving joint action by many units have had less consideration

than they deserve. But more recently the study of the large-distance receptors and of the sensory areas of the brain has begun to shift the emphasis back from the unit to the group and the purpose of this article is to deal with a general principle which it now seems possible to trace in the organization of the sensory system.

### 1. Identification of the Stimulus

Thinking of the individual nerve fibres, one might have supposed that a sensory surface could be regarded as a patchwork of areas, each of which was supplied by one sensory fibre and by that fibre only. The simplified diagrams in the textbooks of, for example, touch spots did nothing to contradict this impression, but it was soon obvious that it was false. Records of the electrical activity in the frog's cutaneous nerve fibres showed that each supplied an area of several square millimetres and that other fibres had endings in the same area, so that the most strictly localized touch could not avoid exciting endings belonging to a number of different fibres (Adrian, Cattell & Hoagland, 1931). The dispersion is often much greater than this in the mammal, as Weddell's histological studies have shown (Weddell, 1941). One nerve fibre to a rabbit's ear may innervate 300 hairs and each hair may be innervated by many fibres.

The wide dispersion and intermingling of the terminal branches of the sensory fibres means that a touch on the skin will send messages to the spinal cord by many paths. Where these terminate there will be a focus of activity corresponding to the point that is touched and a zone of declining activity round it. Thus the pattern of excitation of the skin will be reproduced more or less faithfully and if one or other of the sensory fibres were put out of action it would not seriously affect the reproduction of the pattern. The information will be supplied both by the spatial and by the temporal pattern of excitation, i.e., by the rate of rise and fall of the impulse frequencies in different fibres. And for recognizing the nature of the object which has touched the skin the temporal element may be the more important. Even if the sensory surface did no more than signal the stimulation of different regions the order in which the stimulation occurred would be significant, and in fact the important sensory surfaces never behave as a static receiving screen. In the intact animal a touch which differs from the expected range of contacts will immediately arouse exploratory movements by which the object can be "felt", as, for instance, when something put in the hand is moved about so that the pattern which is available to the brain is compounded of signals from the tactile receptors and from those which show the movement and position of the fingers. Such qualities as roughness and smoothness, softness and hardness, could be judged only by a combination of spatial and temporal analysis.

Contacts with the body surface are signalled to the sensory receiving area of the brain and we must suppose that the identification of the stimulus is dependent on certain events, some of which must take place in that area. But by the time the pattern arrives there the streams of impulses from the periphery will have lost their identity. They will have travelled the whole length of the sensory fibres, the excitation will have been passed on to other neurones, and wherever the transfer occurs some alteration may have taken place, possibly a sharpening of contrasts and usually a reduction in the number of units involved. Thus the effect of an individual sensory

ending on the final picture becomes even less than on the primary signal: it will not be much greater than that of a single voter in a parliamentary election.

## 2. Visual and Auditory Stimuli

It has been known for many years that an even greater condensation of signals must take place in the eye, for the number of receptors in the retina far exceeds the number of fibres in the optic nerve. But it was not until the impulses in the optic nerve were recorded that it became clear how much interaction could take place between the different pathways. Thus Adrian & Matthews (1928) found evidence of nervous interaction between two points 1 mm. apart on the eel's retina, and Hartline (1935, 1938), Granit (1930) and Granit & Therman (1937) have shown that in frogs and mammals it involves inhibition as well as facilitation. Again, therefore, the contribution of the individual receptor is likely to be submerged in the composite pattern.

With vision, as probably with touch, there are certain parts of the receptor surface where there is less intermingling of pathways. At the macula lutea some of the cones seem to have private pathways through the retina to single fibres in the optic nerve. This may be necessary to give the extreme detail with which the central visual pattern must be reproduced, but the insulation of the pathways from one another is an inference from retinal histology and may turn out to be incomplete.

Both with touch and vision we interpret the stimulus in spatial and temporal terms, and it is therefore not surprising to find the spatial and temporal patterns reproduced in the brain. With hearing, however, there is no spatial quality about the stimulus, yet there is already abundant evidence to show that auditory stimuli are distinguished, like tactile and visual stimuli, by differences in the spatial and temporal excitation pattern. The evidence is partly old and partly new. Helmholtz's resonance theory supposed that the cochlea was so arranged that each part of the basilar membrane would tend to resonate to a particular note. The various objections raised to the theory have now been set aside by the work of Galambos & Davis (1943) on the impulses in the auditory nerve fibres. They find that a pure tone of small intensity excites only a limited region of the basilar membrane—near the basal turn of the cochlea for high tones and near the apex for low. As the intensity of the sound is increased the extent of the excited area enlarges, but the region of maximum excitation remains where it was. Thus the distribution of excitation along the basilar membrane from moment to moment will give all the information needed to specify the sound.

As with tactile and visual signals, the pattern is passed on to the brain, condensed and possibly sharpened, but preserving its spatial arrangement. Tunturi (1944) has found that in the dog the different segments of the basilar membrane are connected with different points in the auditory area, just as the different parts of the body surface are connected with different points in the somatic sensory area. With a high note the cortical activity will be at the front, and with a low note at the rear, and as the sounds change in pitch the region of maximal activity will shift in the basilar membrane and in the auditory area of the brain. There the information is conveyed as before by the temporal as well as by the spatial pattern. A voice will give several peaks of activity, shifting to and fro along the

cortical strip in a characteristic fashion, and our recognition of the voice will depend on the particular sequences which occur.

These results bring hearing into line with vision. In both the eye and the ear the general plan seems to be that a large area closely packed with receptor endings is set in the organ, the structure of which ensures the analysis of the stimulus in spatial terms. The camera arrangement of the eye projects the visual scene on the retina: the resonating system of the cochlea projects different sound frequencies on to different parts of the basilar membrane. It is to be noted also that, in both, the information is transmitted to the brain in the same form, i.e., with the intensity indicated by the impulse frequency and the number of fibres in action. The earlier records from the auditory nerve suggested that the impulse frequency was fixed by the pitch of the sound, but we know now that it varies over the usual wide range and indicates loudness and not pitch.

As in the eye, so in the ear the contribution of any one fibre of the auditory nerve will be relatively unimportant, because even with the feeblest stimulus the message will be carried by a group of nerve fibres. With a loud note, more than half the basilar membrane may be excited. Thus the failure of a few of the receptors would make little difference to the general balance of the pattern. A larger failure might be detected by careful audiometry, just as a scotoma in the field of vision can be detected by careful perimetry, but the subject would be unaware that he was deaf to a particular tone or blind in a particular part of the visual field.

There is, however, one important difference between the signalling of visual and auditory stimuli. So far as we can tell, the most complex sound will be analyzed into a spatial and temporal pattern by the mechanism of the inner ear, but in a complex visual scene there will be differences of colour as well as of light intensity. The analysis of colour undoubtedly depends on the properties of the visual receptors rather than on the optical mechanism of the eye, and if the contours of objects are disclosed to us by the pattern of excitation in the striate area, the same pattern cannot also disclose the colour of the object. There are some grounds for thinking that the colour will affect the temporal pattern, but at present this is little more than a guess.

## 3. Olfactory Discrimination

The eye and the ear are the distance receptors most important to man, but to many animals the nose is the chief guide. In the last few years an attempt has been made in Cambridge to find out how smells are distinguished, and the results, though still very far from complete, point to a fundamental likeness between all three distance receptors (Adrian, 1948). When we consider the olfactory organ, we seem to be confronted with sensory experiences which have no spatial quality and no components like the scale of pure tones which we recognize as building up sounds. But an immense variety of smells can be distinguished and, like the eye and the ear, the olfactory organ has a large sheet of receptor endings and an elaborate structure to contain it.

The receptor sheet is spread out on folded partitions and is exposed to the air in the narrow spaces between them. This air is in free communication with that drawn into the lungs at each breath, for the olfactory organ is set above and behind the main airway through the nose, so that the pressure

gradients will cause some movement of air in the olfactory spaces. The area covered by olfactory receptors is comparable in size to the retina, but the nervous layers of the retina are represented in the olfactory system by the olfactory bulb, which receives the nerve fibres from the receptors. Here synaptic transmission takes place and the signals, greatly condensed, are passed on by the fibres of the olfactory tract in the same way as the signals from the retinal receptors are conveyed by the fibres of the optic nerve.

#### *a. Recording of Impulse Discharges in the Olfactory Tract*

To make clear records of the electrical activity in these fibres the animal must be under anaesthesia deep enough to suppress the spontaneous discharge from cells in the olfactory bulb. It is then found that impulse discharges occur in the tract fibres whenever air containing an odorous substance is drawn through the nose, and we can look for some characteristic difference in the discharges set up by different smells. What has been found is not that there are receptors with specific sensitivity uniformly distributed over the olfactory epithelium—such receptors may exist, though the impulse discharge technique is scarcely precise enough to reveal them—but what is revealed is that with different smells there may be large-scale differences in the level and evolution of the excitation in different parts of the receptor surface. This can be shown by making simultaneous records from different parts of the olfactory bulb. In the rabbit (the most convenient animal to use) an insulated wire electrode thrust deeply into the oral part of the olfactory bulb will record from the fibres which are in touch with receptors in the oral and more accessible part of the olfactory epithelium, and an electrode leading from the aboral part of the bulb will record from fibres in touch with the receptor surface at the back, furthest from the main air current through the nose. It is found that there are two classes of odorous substance which can be clearly distinguished by their relative effect in these two regions. Esters and compounds containing oxygen as well as carbon and hydrogen produce a greater excitation in the front areas, and hydrocarbons and oils generally produce a greater excitation at the back. Either class will stimulate in both regions if the smell is present in high enough concentration; but there is still a characteristic difference in the evolution of the discharge. With the esters it starts abruptly and is very soon over; with the oils it starts more slowly and usually outlasts the period of inspiration. Thus fruity and oily smells could certainly be distinguished by the distinctive spatial and temporal pattern of excitation in the receptor surface.

#### *b. Differential Analysis of Olfactory Stimuli*

On the analogy of the eye and the ear it would seem probable that in the olfactory system the analysis is brought about by the general arrangement of the olfactory organ rather than by a differential sensitivity of the receptors in different parts of it. The general arrangement will certainly lead to considerable differences in the stimulus to the front and back regions. The air current will be more rapid in the more accessible front passages. The air reaching the back will have already passed over much of the epithelium and may have lost some of the odorous molecules on the way. There may be more or less water vapour in the two places, and differences in the fluid covering the receptors. Such differences,

imposed by the structure of the olfactory organ, might well make stimulation by the esters more effective in front and by the oils more effective further back; but it is equally possible that the receptors in the two regions are not exactly alike in their sensitivity to different smells—there is not yet enough evidence to decide. What is clear, however, is that owing to this regional analysis there may be large-scale differences in the pattern of excitation set up by two kinds of smell.

What is not yet clear is the extent to which olfactory discrimination depends on such differences of pattern. They have been shown to exist for only two classes of odorous substance; it does not at all follow that there is a distinctive pattern for every smell that we can recognize. But certainly if there were other differential effects of the same kind, leading for instance to a different distribution of excitation with small and large molecules, the range of analysis would be much greater. And if, in addition, there are some regions where the receptors in general are more readily excited by a particular class of compound, the possibilities are immensely extended. It must be remembered that both the temporal and the spatial distribution of the excitation is probably significant and that the latency of the discharge may vary both with the velocity of the air current (which will differ from one part of the olfactory organ to another) and with the chemical and physical properties of the stimulating molecules. At all events, the evidence as far as it goes supports the view that large-scale differences of pattern can occur, and there has been no indication that the olfactory epithelium is a uniform mosaic of receptors, each with specific affinities for certain kinds of smell. Indeed, if it were, there would be no obvious reason for the large sensitive surface and the complex arrangement of the olfactory organ.

On this view the range of olfactory discrimination will depend partly on the size and complexity of the organ, which has to produce the characteristic pattern for each smell, and also very much on the ability of the central nervous system to discriminate between two olfactory patterns which are nearly alike. If we had the dog's much larger and more elaborate olfactory organ, it would not necessarily follow that we should distinguish many more smells than we do at present; and if the dog had ours he might still have a range of discrimination wider than we have though not as wide as that of a normal dog.

#### 4. Conclusion

It will be seen, then, that from the study of these three kinds of distance receptor organ the same general principle emerges. This is that the signals from them can be recognized or differentiated because the stimulus is analyzed not so much by a large number of receptors of different properties but by the sense organ itself, so that a characteristic pattern of excitation is formed on the receptor surface. The receptors may well differ in range and sensitivity, and the activity of a particular class will assist the recognition of the pattern, but the general balance of activity over the whole surface and the way in which it changes from moment to moment is determined by the structure of the organ in which the receptors are contained. In the eye they are contained in a camera, in the ear they are fixed to a system of tuned resonators, while the olfactory organ seems to act as an analyzer for molecules of different physical and chemical properties. Since recognition

A man who has the curiosity to look back at the physiological textbooks of about a hundred years ago cannot withhold admiration for the insight shown by the comparative anatomists of that time in deducing the probable uses of the different parts of the central nervous system. They had already firmly chosen the optic thalamus as the chief relay station for sensation, and if they erred in believing that the caudate nucleus and striatum were the chief motor ganglia they were wrong only in calling them "chief". The belated discovery of excitability of the cortex in 1870 (belated because it lagged more than 70 years behind Galvani's discovery of the excitability of peripheral nerve) found the scientific world in a mood of ready acceptance, so well had Hughlings Jackson prepared the way by clinical inference. Once the resistant crust had been broken progress was rapid, especially in the hands of Ferrier, Schäfer and Horsley. Topographical maps of the motor area must indeed have been exciting things to look at for generations who had been taught that the function of the cerebral mantle was to fabricate "the Will", the commands of which were carried out by lower "nervous hands" and principally by the spinal cord. Almost concurrent with the newer exploration of the cortex were the histological researches of Cajal. It was his ability to demonstrate the nerve cell in continuity with its axon and dendrites as a discrete unit that opened the way for intelligent experiment. Before Cajal's time the cortex had appeared to be a meaningless tangle of cells and fibres. So great was the illumination shed by the new histology that Cajal (as Sir Charles Sherrington has said) was the real begetter of the neurone theory commonly ascribed to Waldeyer (1891). The importance of the neurone conception went far beyond that

usually attributed to it, namely that it was a biological unit in which the survival of the axon depended on the cell and vice versa. The importance that others saw in it was that the nervous impulse passed in one direction only, i.e., dromically, so that revelatory experiment became possible by tracing the expected passage of impulses. Brilliant use of this property was made by Sherrington, who painstakingly built up a coherent story of integration in the spinal cord. The relatively simple structure of the cord made this project successful. Sherrington substantiated the claim that Marshall Hall had passionately held (but could not prove) 50 years before—that the spinal cord was an organ and not a large bundle of conducting fibres. By contrast, what we lack still and probably for very long will continue to lack is an equally clear insight into the integration of the brain as a whole.

### 1. Structure of the Cortex

The structure of the cortex naturally attracted many observers. It quickly became apparent that the cortex was not made in a homogeneous and identical pattern but that there were differences almost as one passed from one gyrus to the next. It was thought that these differences must be highly significant and before long several maps of cortical structure, now famous, made their appearance. The best-known maps were those of A. W. Campbell (1905), Grafton Elliot Smith (1907), K. Brodmann (1909), C. & O. Vogt (1919) and von Economo & Koskinas (1925) (for Brodmann's map, see fig. 1). The areal differences depended on cell size, cell shape and density of cell population, and on the position and thickness of interspersed fibre layers. Authority had been given to the view that the chequer-board cortex did in fact represent a pattern of significant functional differences by two discoveries. The unique pattern of the calcarine striate area was found to correspond accurately with the visual area; later O'Leary & Bishop (1938) demonstrated, by stimulating the rabbit's optic nerve and picking up potential-fluctuations in the occipital region, that the electroencephalographic relationships tally very closely with the extent of the anatomical striate area. A further point was that the motor area was found by the Russian biologist Betz (1874) to contain a number of strikingly large pyramidal cells, which caused the part immediately abutting on the fissure of Rolando inhabited by them to be later called "area giganto-pyramidalis". Much more recently it has been shown that the pyramidal tract, tentatively named "Pyramidenstrang" by Türck (1851) when he first ingeniously studied the descending degenerations in the spinal cord, originated from many cells besides the Betz cells (which are, in fact, calculated to contribute not more than 2-3% of the pyramidal fibres) and further that these cells were not, in anthropoids and men at least, the only

### SENSORY DISCRIMINATION

*Continued from page 332*

depends on the general excitation pattern, the interaction and concentration of pathways will not prevent the recognition of the

stimulus and, as happens with vision, the interaction may assist it by sharpening contrasts and emphasizing details.

FIG. 1. BRODMANN'S CORTICAL AREAS, DELIMITED BY HISTOLOGY

ones from which movement could be excited by cortical stimulation. It is not as generally appreciated as it should be that the pyramidal tract was so called not because its fibres originated in pyramidal cells but because it ran through the pyramid of the medulla oblongata. The pyramid had been thought to be the pathway of motor power for generations before its exact location in the cord was discovered by Türck, and even he did not know for certain whence it came. Ignorance of this piece of physiological history can even now lead to confusion.

It gradually became clear that the histologist had provided both physiologist and clinician with more facts about the cortex than they could use. The mind could easily grasp the plan of motor nuclei in brain-stem and spinal cord, whilst the spinal dermatomes and the afferent pathways presented no insuperable obstacles to exploration. But what could be the meaning of the six-layered cortex—this stratification of cell and fibre layers? It had to be admitted that although a single-layered cortex would have been more easy to understand, such a one could surely not have provided an adequate machinery for the limitless variety of human behaviour. Research today is no little concerned with an attack on the meaning of cortical structure, in the hope that it may have a simpler explanation than at present appears. It is possible that parallels may eventually be found in electronic "mock-ups", for certainly scrutiny with the microscope has so far failed to indicate a meaning. Possibly the new quantitative survey of cell population in different areas being undertaken by J. Z. Young at University College, London, may be suggestive. But it may be that the structural differences between various cortical areas are not so great or so important as was once forecast (see Lashley & Clark, 1946). By using micro-electrodes it has been shown that the production of the

potential-pattern of the electroencephalograph seems to be a function of the whole thickness of the cortex and not of any one single layer. It differs, so far as we yet know, not so much in kind as in intensity in different regions.

Perhaps we have been too "cortically minded", have thought too much of, and have searched too readily among, cortical structures during the last decades, to the detriment of our understanding of subcortical and brain-stem mechanisms. Have we not assumed too readily that these last were capable of only the crudest synthesis, and were we not wrong in thinking so? It seems to me that much of the immediate future of neurophysiology will centre on the correlations between the higher and lower levels of Jacksonian integration, and that the lower levels have already won greater respect than they used to have. Changing views about the supreme importance of the cortex might be illustrated by the motor area.

Some of the difficulties that beset the clinician in correlating his bedside observations with the laboratory findings of the neurophysiologist arise from the fact that the latter is much more concerned with, and much more interested in, the cortex of apes, monkeys and the lower animals than he is in man's. The physiologist appears to be more impressed by a chart such as the famous diagram of Grünbaum & Sherrington (1901) of the orang-utang's stimutable cortex than he is by Penfield's topographical charts from 200 human beings (see Penfield & Erickson, 1941). Perhaps I exaggerate if I say that since Penfield's charts are not identical with Grünbaum & Sherrington's in the matter of a separate discrete secondary pre-motor area for eye-turning, then so much the worse for Penfield! But the enquirer must be warned of the differences in outlook between the pure physiologist and the neurologist. Each studies the creatures which most readily lend themselves

to observation—sub-human on the one hand, human on the other. It is difficult to be unbiased in these matters, but it seems to be strikingly true that the clinician is more ready to learn from all sources than is the physiologist, who would do himself no harm by now and again checking his results against roughly comparable results due to disease in man. Much animal experiment is only roughly transferable to man; structures gain in importance as the scale is ascended—compare the crippling effect of total excisions of motor areas in the chimpanzee with similar removals in the cat. But the laboratory worker plays the laboratory game according to the conventions of his fellows and is instructed not to show interest in “applied physiology”, which is for some reason a debased activity (see Fulton, 1949a). But we may properly ask whether “pure” physiology exists and whether it is not always “applied.”

## 2. Motor Cortex

The motor cortex represents movements, fragments greater or smaller of a useful action, rather than muscles (as Walshe, upholding the doctrines of Jackson and Sherrington, has repeatedly said in his scholarly reviews of motor function). Some have thought that refinements in liminal stimulating currents elicited single muscle twitches; and there is no real reason why this should not be so. The suggestion would perhaps seem less shocking if the muscles had never been named and the experimenter saw a twitch in a portion of a complicated muscle mass. Certainly both animal and human behaviour is a matter of co-ordinated movement of large muscle masses, innervated presumably by hundreds or thousands of motor cells.

We are as far off as we were 300 years ago from knowing how the brain uses the motor cortex. The beautiful researches of Sherrington with Graham Brown, and with Leyton<sup>1</sup>, had established finally not only the topographical lay-out of the motor cortex but also its essentially pre-central situation (see Leyton & Sherrington, 1917; Grünbaum & Sherrington, 1901; Brown & Sherrington, 1912). But these researches showed that the motor cortex was not like a pianoforte where pressure on one key invariably produces the same note. It was a somewhat refractory piece of living nervous tissue which *on the whole* gave such and such a result at any given point but which was subject to slight variation—variations that became more apparent the longer the experiment lasted. The anterior edge of the excitable motor cortex seemed to wax and wane, becoming gradually more extended as “facilitation” developed. Every neurosurgeon knows how true this is of the human motor area. Sherrington had shown also that the responses might be reversed, that from a given stimulated spot extension might be replaced by flexion. By varying the parameters of stimulation, more recent explorations have carried knowledge of “reversal” and “deviation” of response much further. Fulton (1949b) has shown that a change of wave shape and intensity of the cortical stimulus alters the motor response in a limb even though the electrode is not moved. Innovations in the kinds of electrical stimuli applied to the cortex are opening up new fields because not only are the motor results different from those obtained by classical faradic methods but silent areas are not so unresponsive as they were to older techniques. This matter has been carried

further by Liddell & Phillips (Festschrift für C. & O. Vogt, in the press) who have obtained by square waves of excitation single ‘flick’ responses in the limbs that vary interestingly in their incidence with the intensity of the stimulus almost regardless of the position of the electrode. The importance of these newer stimulatory methods is that they permit of more intelligible surveys of the motor cortex than were possible in the days when increase in intensity of the faradic current then employed resulted inevitably in a violent epileptic fit that rendered further observation nugatory.

The recently published researches of Denny-Brown & Botterell (1948) bring emendations too, the most important being that partial excisions of Brodmann’s area 4 depress all motor behaviour in the contralateral limbs and that incomplete excisions, although affecting one body segment more severely than another, do in fact depress all the opposite side. This view is supported by Lashley’s observations. Lashley holds that the motor areas are “more concerned with the maintenance of excitability and the regulation of postural reflexes than with the excitation and control of finely integrated movements” (Lashley, 1924). Certainly excitation in man never, in my own experience or in the wider experience of Wilder Penfield, has caused anything more than a fragment of a recognizably useful movement, something that could be imagined as a bit of a skilled movement. But more often the abrupt twitches are no more than caricatures of anything that a man normally does with his limbs. Denny-Brown & Botterell (1948) found that stimulation of the motor cortex abutting on the central sulcus evoked more localized effects in distal joints than were obtained from stimulation of the anterior parts of that area, which seemed to be more concerned with postural movements of the proximal joints. The highest digital skills were most posterior. But the whole function of area 4 was less specific than has been so far taught. Spasticity developed after all excisions of the motor area. This vindicates the claims put forward by Walshe in several papers (Walshe, 1944, 1947), for he was unable to reconcile clinical observation with certain experimental findings of Fulton. The permanent flaccidity reported by Fulton & Kennard (1934) after excision of area 4, and spasticity after excision of area 6, was not confirmed by Denny-Brown & Botterell (1948). The flaccidity said by Tower (1944) to result from section of the pyramids remains for the moment a mystery. Flaccidity does actually occur for a time after complete motor excisions but Denny-Brown & Botterell (1948) attribute it to “pyramidal shock”, which does not persist indefinitely. It is prevented or shortened in duration if parcels of Betz cells are left behind during the excisions. Spasticity is held to be a disorder of the intimately associated neurones connecting the motor area to the mesencephalic and bulbar (tectal) mechanisms. It is this disturbance which induces the most characteristic features of hemiplegic spasticity. Denny-Brown & Botterell (1948) conclude that “. . . area 4 acts as a potentiator and integrator of movement more directly related to the thalamus and the pontospinal mechanism than to the remainder of the cortex.” When we read this conclusion we may recall Hughlings Jackson’s cautious belief that certain convolutions are only *more* concerned with movement than others—the monopoly was not absolute. And experiments clearly show that far more movements are obtainable from the motor area than elsewhere, but in some circumstances movements have in fact been evoked from most of the

<sup>1</sup> A. S. F. Leyton was earlier known as Grünbaum; earlier publications therefore appeared under the latter name.—Ed.

convolutions (see the work of Penfield, Dusser de Barenne, and others). Area 4 in man is said by Lassek (1948) to contain about 34,000 Betz cells; these are more numerous at the mesial end of the motor area, i.e., the leg area. The significance of this particular distribution is puzzling. In numerical contrast the pyramidal tract at the level of the medullary pyramid contains roughly 1 million fibres, of which some 40 % are non-medullated, and great numbers are very fine indeed. The number of large fibres such as would furnish a fast-conducting system is roughly the same as the number of cortical Betz cells. The origin and purpose of the slow-conducting fine fibres are not known; some may be autonomic. But it is quite certain that the pyramidal tract must contain great numbers of fibres from sources other than the Betz cells. At the moment all available evidence (e.g., cord degeneration studies after decortication in animals and after hemispherectomy in man) indicates that all the pyramidal fibres spring from the cortex. The histological sections of the cord after cortical excisions (Leyton & Sherrington, 1917) showed fewer degenerated axons than would have been expected and moreover that they were scattered in a random fashion in the tract. There seems to be no authority for Foerster's diagram (1927) of a neatly laminated pyramidal tract, with the short distance axons nearest the central grey matter for convenience of access. It was a pretty picture, but it was a piece of artistic imagination—but then Foerster was a highly imaginative man.

### 3. Physiological Neuronography and Suppressor Areas

The discovery by Dusser de Barenne that a piece of filter paper 3–4 mm. square soaked in a saturated solution of strychnine sulphate was a powerful and long-lasting stimulator of cell bodies, but not of axons, provided the experimental physiologist with a new laboratory tool (Dusser de Barenne, 1933). In fact the discovery of different kinds of both electrical and of chemical stimulation has caused some formerly "silent" areas to yield information. The results of strychnine stimulations such as these could be used in two ways. It could be a method of direct observation, such as by application to an animal's cortical sensory area in topographical sequence, with watch kept on the body segment in which the stimulatory effects (usually unpleasant) were evidently experienced. Or it could be used in combination with electronic pick-ups to discover the interrelationships of cortical areas. By this means many of the fibre connexions known by anatomical dissection were discovered to be what they seemed—bundles of functional association or perhaps inter-cortical projection fibres. It has proved its importance by verifying the direction in which the nervous impulses passed, a fact on which pure dissection could pronounce no judgement. It has been possible to do a good deal more than that by quickly identifying the relationships between cortex and thalamus and hypothalamus. In the main it verifies the painstaking and beautiful experimental anatomical studies of Le Gros Clark and of Earl Walker (see, for example, Le Gros Clark, 1932a, 1932b; Walker, 1938). This work lies along the lines already mentioned, a retreat from the study of areal differences in the cortex to that of cortical linkages with deeper structures. But the other point just mentioned stands out very clearly: the previously "silent" areas are now stimutable and the effects of stimulation can be picked up by electronic recorders.

Map indicates areas of sensory and adjacent cortex, distinguishable by physiological neuronography, in chimpanzee (*Pan sotyris*). Below are diagrams indicating maximal axonal field disclosed by repeated strychninizations in area marked  $\Delta$ . Horizontal dashes indicate suppression of electrical activity; Y indicates area fired; ce refers to central sulcus; double vertical lines indicate anterior and posterior borders of sensory cortex. (Reproduction of fig. 91b, in *The precentral motor cortex*. See McCulloch, 1944.)

Amongst the most interesting and unexpected of these results has been the discovery by Dusser de Barenne & McCulloch (1934) of suppressor areas, work extended by those observers, by Bailey and by Garol. Four suppressor strips are now known, two frontal and two parietal (see fig. 2), making five in all, including Brodmann's area 24 discussed below. Strychninization of these strips leads to the extinction of spontaneous electrical rhythms in the cortex and renders the motor area silent to stimulation; tendon reflexes may be temporarily abolished. The effects may not come about for 20 minutes and may last as long or longer. Garol & Bucy (1944) found that stimulation of strip 4S leads to motor relaxation in the contralateral limbs in man. The part played by

these contributory cortical areas in the normal synthesis of behaviour is neither known nor easily foreseen. Probably nothing exactly like the suppression that can be obtained experimentally actually occurs in health. But it is well enough known that brain activities must be a balance of activation and inhibitions. It is presumed that the suppressor strips must be part of the inhibitory system. Each suppressor area is associated with a major functional subdivision of the cortex (see fig. 2): area 8 with the associative activity of the frontal pole, area 4S with motor control, suppressor area 2 with sensation, and area 19 with vision. McCulloch (1944) has shown that all have connexions with the caudate nucleus and some parts of the corpus striatum, and these structures are supposed to block thalamic impulses from reaching the cortex. Ritchie Russell (1947) has suggested that cortical injuries that coincide with these strips are more likely to produce fits than those in other parts of the cortex.

#### 4. Cortex and Autonomic Functions

Another important suppressor area appears to be Brodmann's area 24 or the cingulate gyrus. Long considered to be part of the rhinencephalon and olfactory system, Le Gros Clark (1948) and von Economo & Koskinas (1925) see in it a highly important vegetative centre. Pupillary dilatation, pilo-erection, vagal slowing of the heart, and respiratory slowing and arrest for as long as 25 sec. have been observed on stimulation of different parts of the cingulate gyrus. It appears also to be a secondary motor area, since tonic bilateral movements of the limbs have also been observed to follow stimulation. Strychninization causes widespread and deep suppression of electrical activity in the rest of the cortex, a suppression mediated, according to McCulloch (1944), by the caudate nucleus. Ablation of the cingulate gyrus leads to considerable change in personality in monkeys—disappearance of shyness and hostility, and a concomitant lack of social sense so that the monkey will walk on its fellows or take food from them without expecting reprisals. How far any of these functions are applicable to man is not known but probably its dominance in all directions is less pronounced than in the macaque. Confirmation, however, is required.

Another important autonomic area lies on the orbital surface of the frontal lobe, lateral to the olfactory tract but close to its lateral root. This is Brodmann's area 13. Stimulation of this area was found long ago by W. G. Spencer (1894) to lead to respiratory arrest. Lately this area has been much studied by Bailey & Sweet (1940), and by Livingston *et al.* (1948). Stimulation of a corresponding area (which is perhaps area 47) has been observed to lead to respiratory arrest and a slow moderate rise in blood-pressure. Strychninization of this area has been shown to cause firing of certain of the hypothalamic nuclei, paraventricular and posterior (Warren McCulloch, Bailey and Ward) (see fig. 3). Another interesting observation has been that prolonged faradization of this area in the cat caused ischaemia of the renal cortex with a shunt of blood-flow similar to that discovered by Trueta *et al.* (1947) at Oxford. Vasodilatation of the extremities generally followed excision of these areas in monkeys but also rendered them restless and over-active (Livingston *et al.* 1948). Autonomic reactions such as pilo-erection were recorded by Fulton and his co-workers from the motor area or its immediate environs. Connexions with the hypothalamus are probably weakly and thinly sown in the cortex; the

main concentrations so far found have been those mentioned on the orbital surfaces and in the cingulate gyrus. Bucy & Pribram (1943) have recorded a case of localized sweating from a glioma affecting area 44.

#### 5. Parietal-Temporal Fields

It has been said that the anatomist of 40 years ago had high hopes that clinician and neuropathologist between them would be able to substantiate the functional individuality of a great number of histologically different areas. Electrical stimulation of the brain in animals and later in man, although it gave fascinating results, accounted when all was said and done for a surprisingly small portion of the total cortical area. Vast tracts remained which were silent to stimulation. It was in these regions that the clinician might hopefully be expected to discover a coherent description of function from human beings able to give an account of their subjective experiences. This proved to be true of certain regions, notably those concerned with language and sensation.

An example already existed from pre-stimulation days, namely, Broca's use of Dax's discovery that dysphasia required usually a left-sided lesion. Broca selected the posterior end of the third left frontal convolution as the area

FIG. 4. LOCALIZATION OF FUNCTION

By courtesy of Prof. Wilder Penfield

concerned with language. He chose this because Dax had shown that the lesion producing dysphasia must be left-sided; Broca chose the third frontal convolution because this lay nearest to the orbital surface of the frontal lobe, i.e., nearest to the area in which his passionate and vituperative senior colleague Bouillaud said that speech lay (on both sides); and he chose the posterior part because that area was softened in his famous case "Tan Tan". But in "Tan Tan" there was also softening in the whole middle cerebral territory, including the upper and middle temporal, pre-central and post-central, and lower parietal convolutions, as Souques (1928) pointed out. It is not surprising that every kind of observation has failed to discover the real relationship of Broca's area to speech or even to certify with finality what part in speech the cortex of that area plays. It is quite clear that Broca's area was originally taken much too seriously; Broca's own observations were trivial. It is little more than the oddest of chances that the third left frontal convolution has anything to do with language. Broca knew nothing of its proximity to the not yet discovered face-head motor area.

Despite the labours of Sir Henry Head, Pierre Marie, Henschen, Wernicke, and others it cannot be said that we are much nearer an understanding of the physiological and cortical anatomical substratum of speech than we were many years ago. Stimulation of Broca's area in man may cause movements of the larynx and Penfield often produced crude vocalization without words by stimulation in the cortical head area, i.e., roughly in the posterior end of Broca's area. Stimulation in the pre-central area, but especially in the superior temporal and angular gyri, may lead to arrest of speech (Jefferson, 1935; Robb, 1948). Penfield's and my own excisions of Broca's area, with care to avoid deep under-

cuts in the white matter, have led at most to nothing more than transient aphasia.

The means by which our wordless sensa are turned into speech completely eludes us. Some, like myself, feel sure that the precursors of speech must surely be present in species lower than man; there are broad hints of this in anthropoids. It seems that an entirely new approach is required if we are to advance further. So far a new way has not been found. We are left with the belief that destruction of the angular gyrus leads to much more profound disturbances of ideation and language than do lesions elsewhere, and that they wreck mental processes more subtly than do severe frontal lesions. But physiology has as yet no new clarification of the underlying mechanisms to offer.

On the other hand, the somatotopic plan of the human post-central sensory area has advanced far since the first stimulation under local anaesthesia by van Valkenburg (1914) and by Cushing (1909). Thermionic recording from the post-central gyrus of animals (Bard, 1938) when sensory stimuli were applied to body and limbs has brought information of that area in these animals almost up to the level of our knowledge of it in man. It is interesting to note that local injections of strychnine into parts of the optic thalamus cause pain and paraesthesia in the animal very suggestive of Déjerine & Roussy's thalamic syndrome (1906). A more important discovery, unparalleled in the laboratory, has been the illuminating demonstration of the linkage between spatial orientation and the parietal cortex of both sides. A number of first-rate observations have been made on this type of agnosia by Holmes, Riddoch, Russell Brain, Critchley and Purdon Martin. The latter in particular has considered that man's spatial orientation depends on the lower parietal field.

Lesions in the parietal area have been shown to produce not only a loss of the power to find one's way about, even in the familiar purlieu of one's own house, but a loss of power to conceive space in even two dimensions. It becomes impossible to draw a plan of a house; for instance, the kitchen may be depicted as a separate disconnected object in the garden. The same lack of orientation holds for dressing if the plan of articles of clothing can no longer be perceived. Concurrently may be seen a loss of recognition of half the body as a personal property, as Purdon Martin (1949) illustrated. It is in such ways as these, as in the visual field analysis of occipital lesions, that the clinician has made contributions that could not have come either from experiments on animals or from purely histological studies. The map of cerebral function recently devised by Penfield (fig. 4) lacks reference to man's recognition of his personal orientation but otherwise is interesting.

### 6. Levels of Consciousness

The concept, that awareness of surroundings is a primitive defence mechanism in a wide biological sense and has a brain-stem location rather than a purely cortical one, was put forward by the present writer (Jefferson, 1943) in relation to concussion. This was not a complete innovation because Fulton and Bailey, J. C. White, and Penfield had produced evidence of extinction of consciousness by lesions in the region of the third ventricle. Cairns *et al.* (1941) had also described a state of "akinetic mutism" in a girl with a congenital pituitary cyst. None the less the notion of low-level location for consciousness seemed to shock the too "cortically minded". Clinical observation has, however, done nothing but confirm the view and it is doubtful indeed whether any cortical lesion can cause unconsciousness except by driving down to at least thalamic levels, as Penfield and Jasper have contended. Again, no one who has watched a clot in the posterior fossa causing a patient to go through exactly the same stages of increasing stupor as that caused by middle meningeal bleeding can fail to be impressed by the sensitivity of the brain-stem. This sensitivity shows itself not so much by alteration in the medullary vasomotor centre and respiratory centres but in extinction of consciousness, and that with normal or atmospheric pressure in the ventricles (Jefferson & Johnson, in press). The relevant area seems to be the upper pons and lower mid-brain, presumably by some suppression of afferents or effect on the upper brain-stem. In going to sleep, alterations in electrical rhythms are first seen in the thalamus and below, last of all in the cortex.

Bound up with these functions must be the integrative action of the thalamic reticular system and its relations with the brain-stem reticular systems recently disclosed by Jasper (1949). It is well known that cortical responses can be picked up in very circumscribed areas on stimulation of the dorso-medial nucleus of the thalamus, thus verifying physiologically

the connecting fibres discovered by Le Gros Clark by anatomical methods of research. Exploration of the thalamus by stimulation along a fine insulated needle reveals a circumscribed point (which can be reached from several directions with the same result) at which control of the normal symmetrical cortical rhythms can be achieved. This area appears to be in the inter-laminar thalamic areas. It was known that the thalamus had a rhythm of its own of 8–12 per sec. waves, similar to the cortex, and some had thought that it was these thalamic rhythms which drove the cortex. Jasper, and Denis Williams working independently, did not accept this view; Williams' recent thalamograms confirm his belief (see Williams & Parsons-Smith, 1949). Jasper's experiments proved that the waves and, equally, bursts of activity, are not exactly synchronous in thalamus and cortex, though they could sometimes be in step. Stimulation of the thalamic reticular system caused a sudden stop of responsiveness in the freely moving conscious animal, suggesting an arrest of awareness as in petit mal. Powerful stimulation in the thalamus would cause a generalized fit. The important point is that stimulation of the thalamic reticular system had a wide-spread general effect on the animal's behaviour without affecting postural reflexes. After-discharge with slow spike and wave form was common. Magoun and his colleagues have brought forward evidence of the relationship between the reticular portion of the brain-stem and cerebral activity. Jasper (1949) concludes that there is in the thalamus a regulating mechanism "involving thalamic and other brain stem structures . . . controlling the form and rhythm of the background of cortical activity upon which afferent impulses must act, and regulating local and generalized excitatory states of the cortex as a whole." He believes that the thalamic reticular system is the most important item in these mechanisms. Whether these integrative actions will be confirmed by other writers and especially by thalamic stimulation in man remains to be seen.

These remarks on subcortical functions and their possible relationships to cortical control have been inserted in proof of something said in earlier passages: that we are in process of searching for some general scheme, however vague and uncertain its details might be, of the general plan of integration of the brain as an acting whole. My purpose has also been to show that the modern exploration of the cortex is deeply concerned with the physiological connexions of cortical areas to deeper structures. The search will be carried on in a vertical direction rather than on the plane surfaces of the cortical cartographers of 40 years ago. I do not intend to suggest that the cortical areas for long so well known are unimportant but that the integration is carried out not only by inter-cortical connexions but also by a multitude of "feed-backs" to the deeper structures of the brain, and that the physiological state of the cortex depends on the state of subcortical structures.

If the comparative anatomist were asked which parts of the cerebrum are to be regarded as the most primitive and archaic and which the most advanced and recently acquired (in the evolutionary sense), he would point to the hypothalamus and to the neopallial component of the cerebral cortex, respectively. The hypothalamus comprises a relatively well-developed part of the forebrain in all vertebrates, from the lowest to the highest and, indeed, shows but little change in its nuclear content and differentiation throughout an extensive comparative series which includes every level of mammalian development and even some of the submammalian vertebrates. The neopallial cortex, however, is commonly believed to have no representation in submammalian vertebrates, and, as is well recognized, undergoes a progressive elaboration in the evolutionary scale of the mammals until, in man, it achieves the acme of its development. This broad contrast, so apparent in comparative anatomical studies, is equally well reflected in physiological studies. On the one hand, the hypothalamus has been demonstrated to contain neural mechanisms intimately concerned with the regulation of autonomic functions and basic metabolic activities. On the other, the cortex provides the basis for such highly integrated functions as those concerned with sensory discrimination and the voluntary control of movement. It has, of course, been long accepted that these contrasting aspects of cerebral function are by no means wholly independent of each other. But it is probably fair to say that for many years neurologists have tended to assume that, within the organization of the cerebrum as a whole, these functions have become segregated to the extent that functional interrelationships between them occur predominantly at lower levels.

Undoubtedly one of the outstanding features of the study of brain functions during recent years is the demonstration

that the interaction of cortical and hypothalamic functions is much more direct than had been supposed. For example, impulses from important centres in the hypothalamus can be directly projected, through monosynaptic relays, to specific areas of the cortex, while electrical stimulation of these specific areas of the cortex can be shown to affect autonomic activities through the medium of the hypothalamus. Apart, however, from the evidence of specific relationships between hypothalamic nuclei and cortical areas, there is also evidence that the hypothalamus may profoundly influence the activity of the cortex as a whole. Thus the spontaneous rhythmic electrical activity of widespread areas of the cerebral cortex may be modified or abolished by appropriate lesions in the hypothalamus (Obrador, 1943), while electrical stimulation of the hypothalamus may accentuate cortical potentials (Grinker & Serota, 1938). It now appears certain that the hypothalamus influences the cerebral cortex through the intermediary of certain principal nuclei of the thalamus which project on to focal areas of the cortex. In recent years it has also been shown that other elements of the thalamus, represented by the intralaminar and mid-line nuclei, have a diffuse projection by means of which the rhythmic activity of extensive areas of the cortex may be controlled and integrated; this raises the interesting question whether these elements may perhaps also serve to relay hypothalamic impulses of a more generalized type.

In any case, it is clearly a matter of some importance to determine to what extent cortical functions, whether expressed in focal responses or in total patterns of rhythmic activity, may be ultimately determined, or at least influenced, by activation from primarily hypothalamic sources, and it is partly for this reason that more and more attention has been focused in recent years on the precise details of cortico-hypothalamic fibre connexions. In this short review, we are concerned to give a précis of our present knowledge of these connexions and to indicate the methods which may be used to elucidate them in still further detail.

### 1. Afferent Hypothalamo-Cortical Connexions

Apart from the possibility of diffuse and indirect ascending connexions, through which impulses from the hypothalamus may eventually be relayed to the neopallial cortex, there are now known to be two main relay centres in the thalamus whereby such impulses are focused directly on to specific cortical areas. These centres are the anterior nucleus and the dorsomedial nucleus.

#### *a. Anterior Nucleus*

The anterior nucleus of the thalamus in lower mammals can be readily subdivided into three quite distinct elements, the anterodorsal, anteroventral and anteromedial nuclei, and the earlier evidence that these three elements project on to specifically different areas of the so-called limbic cortex has now been confirmed in considerable detail by Rose & Woolsey (1948). In the higher primates, including man, the anteromedial element has undergone retrogression, and the main element is the anteroventral. This well-defined group of cells is sufficiently large in the human brain to form a conspicuous eminence—the “anterior tubercle”—on the upper surface of the thalamus, which every student sees for himself when he first dissects a brain.

The anteromedial element of the anterior nucleus is connected with the anterior limbic region (area 24),<sup>1</sup> the antero-ventral element sends its fibres to the posterior limbic region, at least mainly to area 23, while the smaller anterodorsal element projects still further back to the retrosplenial region of the cortex. In the human brain the main element of the anterior nucleus probably sends some fibres to area 24 (as well as to area 23), and it may be, therefore, that it represents a mergence of the anteroventral nucleus with remnants of the anteromedial element of lower mammals. Since the anterior nucleus of the thalamus is known to receive its afferent impulses by way of the mamillo-thalamic tract (bundle of Vicq D'Azyr) which, again, takes origin from the mamillary body (mainly the medial mamillary nucleus), it evidently serves as a simple relay whereby the mamillary component of the hypothalamus acquires a cortical representation. The significance of this very well-defined projection system is by no means certain. For many years it has been ignored and forgotten, on the assumption that it was an unimportant relic of the "rhinencephalon". Until quite recently, indeed, standard textbooks have mistakenly included the whole of the limbic cortex, as well as the mamillary body, the bundle of Vicq D'Azyr and the anterior thalamic nucleus, in the "rhinencephalon". It is clear that the term "rhinencephalon" has led to very serious misconceptions, and it should now be redefined. The reason for attributing olfactory functions to this system was simply that the mamillary body is the terminal station of the fornix system which has its main origin in the hippocampus, and the latter had come to be regarded as "olfactory cortex". In recent years, however, increasing doubt has been thrown on this traditional conception, and the critical review by Brodal (1947), as well as the more precise definition of the olfactory pathways and centres in the rabbit (Le Gros Clark & M. Meyer, 1947) and monkey (M. Meyer & Allison, 1949), has made it clear that this view can no longer be seriously maintained.

This being so, it now becomes a matter of the greatest importance to elucidate the real functional significance of the hippocampus. Unfortunately, little is known of the details of its afferent connexions, except that at least the majority of them come from the posterior piriform cortex and from the cortex of the limbic region (either directly or by way of the cingulum). This latter connexion provides anatomical evidence for the supposition that the hippocampus and the fornix system form part of a circuit which perhaps maintains a continuous cycle of functional relationship between the hypothalamus and the neopallial cortex. This circuit, it seems, would be made up as follows: hippocampus→fornix→mamillary body→anterior nucleus→limbic cortex→cingulum→hippocampus. It is by no means, however, a closed circuit. For example, although the mamillary body is mainly served in its afferent connexions by the fornix and hippocampus, its cells may also be influenced through ascending fibres which are present in the mamillary peduncle (Ibañez, 1938) and probably have their origin in the ventral tegmental nucleus of the midbrain (Fox, 1941); in addition the cells are almost certainly influenced by impulses from adjacent parts of the hypothalamus, and also by corticofugal fibres derived (at least in part) from area 6 of the frontal lobe (*vide infra*). Again, impulses from the

anterior nucleus of the thalamus which arrive at the limbic cortex may presumably be influenced there by the activity of other areas of the cortex. Nevertheless, the circuit appears to be exceedingly well defined anatomically and it is all the more remarkable, therefore, that its function should still remain so obscure. Possibly it plays a part in maintaining neopallial activity (either by activation or inhibition) at a level necessary for the manifestation of normal cortical functions during waking life. In this connexion, it is worth bearing in mind that the cingulate gyrus of the limbic cortex forms one of the "suppressor areas" and, like all the other suppressor areas of the cerebral cortex, pours efferent association fibres into the mysterious area 32 which A. Meyer & McLardy (1949) have referred to as a nodal point of considerable physiological activity between cortex and sub-cortical basal ganglia. That it has some concern with cortical activities underlying rather complex psychological processes is suggested by the few observations which have so far been made on the clinical effects of interference with some parts of the circuit (see, for example, Grünthal's report of a case with circumscribed destruction of the corpora mamillaria, 1939). On the other hand, so far as physiological responses of a simple type are concerned, experimental investigations involving the circuit in animals have so far led to little result, apart from the fact that stimulation of the anterior limbic area has been shown to lead to autonomic and motor phenomena (Smith, 1945; Ward, 1948). Sigrist (1945), who made a careful study in Hess's laboratory of the effect of stimulation of the mamillo-thalamic tract in the cat, was forced to conclude that there is no definite physiological response which can be related to it ("... derselbe muss daher für den Tierversuch als 'stumme Zone' angesehen werden").

It is of some interest to note that the hippocampal circuit referred to above is characteristic of the mammalian brain; it appears to have no representation in the reptilian brain. Thus, in spite of statements which have sometimes been made to the contrary, there is nothing in the reptilian brain which corresponds to the medial mamillary nucleus, the mamillo-thalamic tract, or the anterior nucleus of the thalamus (see Ariëns Kappers' study of the mammalian homologues of the dorsal thalamic nuclei of reptiles, 1942). It follows that the functions subserved by the circuit must have a relation to forms of cerebral activity which are not to be found in any vertebrates other than mammals. In other words, it is hardly likely to be concerned with physiological responses of an elementary character.

#### *b. Dorsomedial Nucleus*

We may now briefly refer to the other main element of the thalamus concerned with the relay to the neopallial cortex of impulses originating in the hypothalamus, viz., the dorsomedial nucleus (medial nucleus of human anatomical terminology). The fact that this nucleus projects mainly on to the granular areas of the frontal lobe has now been amply confirmed by many investigators, and the relation of different sectors of the nucleus to specific cortical areas has been studied in great detail in leucotomized human brains by A. Meyer, Beck & McLardy (1947). These authors have shown, *inter alia*, that the medial portion of the dorsomedial nucleus (which is in most immediate relation to the periventricular system of fibres in the wall of the third ventricle) projects on to the orbital cortex, while the main lateral part sends fibres

<sup>1</sup> Except where otherwise stated, the numbers refer to the areas of the cortex in Brodmann's notation (cf. fig. 1 in article by Jefferson, p. 334).—Ed.

to areas on the convexity of the frontal lobe. That these fibre connexions with the cortex serve to relay hypothalamic impulses was initially inferred from anatomical evidence (not entirely satisfactory) that the hypothalamus is linked with the dorsomedial nucleus by the periventricular system of fibres which ascend close to the wall of the third ventricle. This has now received confirmation from the electro-physiological studies of Murphy & Gellhorn (1945), who were able to demonstrate characteristic changes in electrical potentials in the dorsomedial nucleus following strychninization of the posterior hypothalamus. Incidentally, they adduced evidence that impulses may also pass in the opposite direction—from the dorsomedial nucleus to the hypothalamus. Thus, since it has been well established on anatomical evidence that cortico-thalamic fibres connect the frontal areas with the dorsomedial nucleus, it is evident that hypothalamic activities may be indirectly influenced by the cerebral cortex through this pathway.

The nature of the impulses which are conveyed from the hypothalamus to the frontal cortex is not known, but evidence has accrued from the study of leucotomy cases that interruption of the projection fibre system from the dorsomedial nucleus can be to some degree correlated with the personality changes observed after this operation (see, in particular, the careful studies of A. Meyer & McLardy, 1949). It has also been reported by Spiegel *et al.* (1947) that bilateral lesions made surgically in the dorsomedial nuclei of the thalamus (as a substitute for frontal leucotomy) produce personality changes of a similar type. These observations are in harmony with those made previously on the association of mental deterioration with pathological affections involving the dorsomedial nuclei and periventricular system (Smyth & Stern, 1938), and may also be related to the well-known correlation between hypothalamic lesions and gross disturbances of emotional behaviour (see A. Meyer, 1944).

The anatomical details of the conducting system represented by the hypothalamus—→dorsomedial nucleus—→frontal cortex connexions are now fairly well known so far as the thalamo-cortical relationships are concerned. But they are still far from complete in regard to the hypothalamo-thalamic relationships. As already noted, the work of Murphy and Gellhorn indicates that impulses reach the dorsomedial nucleus from the posterior hypothalamus, but we do not yet know from which particular nuclear elements in this region. This is a problem which urgently needs elucidation by experimental anatomical methods.

Like the anterior nucleus, the dorsomedial nucleus of the thalamus has no representation in vertebrates other than mammals, and on these grounds alone may be presumed to subserve some of the more elaborate mental processes which depend on cortical activity. It appears to be present in all grades of mammals, but in primitive mammals the cortical area at the frontal pole of the cerebral hemisphere to which it projects is relatively very small (see Rose & Woolsey, 1947).

## [2. Efferent Cortico-Hypothalamic Connexions

We now come to a consideration of the anatomical pathways whereby cortical activities are enabled directly to influence hypothalamic functions—a problem of particular interest, since such pathways presumably form (at least in part) the basis for the apparently causal relationship which

has been noted to exist between higher mental processes and autonomic activities. In recent years the increasing accumulation of evidence has tended to emphasize the association of autonomic functions with certain specific regions of the frontal cortex. A review of this evidence also makes it apparent that, apart from the cingulate gyrus, there are two focal regions of what may be termed “autonomic representation” in the frontal lobe, one lying between the motor cortex and the frontal granular areas (the “cortico-autonomic belt” of Kennard, 1944), and the other on the orbital surface of the frontal lobe. This experimental evidence finds some confirmation from the clinical study of leucotomized patients, for it has been demonstrated that the more-posteriorly situated cuts in leucotomy (that is to say, involving the pre-motor and posterior orbital regions) are likely to be followed by autonomic disturbances (A. Meyer & McLardy, 1949). On the other hand, very few of these undesirable effects occur after strictly “prefrontal cuts”.

### *a. Fronto-Hypothalamic Connexions*

It has been recognized for some time that indirect pathways exist in the brain whereby impulses from the frontal lobe can be indirectly relayed to the hypothalamus through the septal and pre-optic regions, or the subthalamus. The first demonstration of *direct* fronto-hypothalamic connexions was made by Ward & McCulloch (1947), using the method of physiological neuronography. These authors mapped out descending connexions from certain specific areas of the frontal cortex (in particular the pre-motor and orbital regions) to certain specific nuclei of the hypothalamus, suggesting an elaborately organized pattern of connexions between these two functionally contrasted levels of the brain. By their technique, they traced cortico-hypothalamic fibres to the lateral and posterior hypothalamic areas, the mamillary body, and the supra-optic and paraventricular nuclei. The further study of these connexions is now being undertaken by direct anatomical methods in the Department of Anatomy at the University of Oxford, in order to define with greater certainty their precise distribution. These methods involve the ablation of specific areas of the cortex in macaque monkeys, and the study of the resulting terminal degeneration of cortico-fugal fibre systems a few days later with Glee's silver technique. The detailed results of these studies will be published elsewhere, but it is appropriate to summarize here some of the observations in relation to their possible functional implications.

One of the most interesting results of the degeneration experiments which we have been carrying out in the monkey is the demonstration of quite a massive projection of direct cortico-hypothalamic fibres from the postorbital cortex (an area practically equivalent to Walker's area 13), and also from the pre-motor cortex (area 6), to the ventromedial hypothalamic nucleus. This connexion is bilateral, the heterolateral fibres crossing in the rostrum of the corpus callosum, and passing through the pre-optic region in close association with the descending column of the fornix. It also appears probable that on both sides the fibres are finally conveyed to their termination by way of the medial forebrain bundle. The ventromedial hypothalamic nucleus, it should be noted, lies in the pars tuberalis of the hypothalamus, and its topographical position (or, at any rate, that of the adjacent part of the medial forebrain bundle through which afferent

fibres reach it) appears to correspond fairly closely with Hess's "intermediate zone of the hypothalamus", which this authority showed to respond to electrical stimulation by a complex syndrome of sympathetic discharge (Hess, Brügger & Bucher, 1946). A similar effect was noted by Wheatley (1944), who correlated the development of a type of "sham rage" with injuries localized to the ventromedial nucleus. Also apposite to these observations are those of Sachs, Brendler & Fulton (1949) who reported that, following the application of strychnine to the posterior orbital cortex, pronounced potential changes could be recorded in the region of the medial forebrain bundle in the hypothalamus. It is interesting to note that some of the autonomic effects which follow stimulation of this region of the hypothalamus may also be elicited by stimulating those areas from which the ventromedial hypothalamic nucleus mainly receives its cortical connexions, i.e. the posterior orbital cortex and the pre-motor cortex (see, for example, Bailey & Sweet, 1940; Delgado & Livingston, 1948; Kennard, 1944). According to our experimental anatomical studies, these cortical areas also send fibres, either directly or by collaterals, to the anterior hypothalamic area, the dorsomedial hypothalamic nucleus, and the periventricular arcuate nucleus, but these connexions are by no means so numerous as those which reach the ventromedial hypothalamic nucleus.

The demonstration of rather abundant cortical connexions with the ventromedial nucleus of the hypothalamus, and the physiological evidence that autonomic responses of various kinds may be obtained by electrical stimulation in this region, suggest that this hypothalamic element represents an important focal area for a number of fibre systems concerned with the control of autonomic functions. It is therefore of some interest to note that, in the human foetal brain, the ventromedial nucleus develops precociously and for a time appears as a relatively large and very circumscribed group of cells (Le Gros Clark, 1938). Later on in foetal development its outline becomes more diffuse and thus not so easily definable, probably in relation to the increasing complexity of its fibre connexions with adjacent regions of the hypothalamus and with more distant parts of the brain by way of the medial forebrain bundle.

So far, we have not been able with certainty to demonstrate anatomically any direct cortical connexions with the paraventricular and supra-optic nuclei (though these must be presumed to be present from the electrophysiological studies of Ward and McCulloch). The importance of such connexions has reference to the fact that these nuclei are closely linked by efferent fibres with the neurohypophysis, and a pathway is thus provided whereby pituitary functions may be influenced rather directly by the cortical activities of the frontal lobe.

#### *b. Connexions between Frontal Cortex and Mamillary Body*

Anatomical evidence for a direct fibre path from the frontal cortex to the mamillary body has been provided by the detailed study of brains which have been subjected to leucotomy operations (M. Meyer, 1949). From this evidence it appears that these fibres are mainly derived from the pre-motor cortex (area 6), and no doubt correspond to the connexions inferred by Ward and McCulloch to have their origin in the corresponding area (6a) in the monkey's brain.

The cortico-mamillary fibres terminate mainly in the caudal part of the main or medial mamillary nucleus, and it seems probable that they reach their objective by passing through the internal capsule and traversing the subthalamic area. The function of this system is not known, for the reason, already noted, that nothing is really known of the functional significance of the mamillary body.

#### *c. Limbic Cortex and Hippocampus*

We have made mention of two main efferent systems linking the neopallial cortex directly with the hypothalamus. Another efferent system, less direct, is of course that represented by the limbic cortex and hippocampus to which reference has already been made. From our experiments on the monkey brain, using the method of terminal degeneration, it is clear that efferent fibres extend back from the gyrus cinguli (area 24) to the retrosplenial areas of cortex, and there is good reason to suppose that these areas in their turn supply afferent fibres to the hippocampus from which the fornix system mainly arises. But there is evidence that a small proportion of the fibres of the fornix take their origin directly from the limbic cortex, and the latter is thereby brought into much more direct relationship with the mamillary body. Further experimental studies in our laboratory (Sprague & M. Meyer, 1950) have recently made it evident that, in the rabbit, the fornix terminates mainly in the basal and intermediate parts of the medial mamillary nucleus. None appears to reach the lateral nucleus. It should be noted, also, that some fibres of the fornix definitely leave the main fascicle to end in the septal region (and possibly the anterior hypothalamus), while others extend back beyond the mamillary body towards the tegmental region of the midbrain. Lastly, contrary to the usual textbook description, it has not been found possible to detect any contribution from the fornix to the habenular region by way of the stria medullaris.

### 3. Conclusion

The more or less direct anatomical connexions between the neopallial cortex and the hypothalamus which we have briefly described in this review are those which have now been defined with considerable certainty by anatomical or electrophysiological methods. Taken by themselves, they evidently betoken a much closer functional relationship between these contrasting levels of cerebral organization than might have been supposed a few years ago. In conjunction with the evidence of physiological experimentation, they also make it clear that there are certain topographical regions of the cerebral cortex which are specifically concerned with this relationship, in the sense that they are more intimately connected than other areas with autonomic effector mechanisms in the hypothalamus. The importance of these relationships seems clear, for they evidently provide for the integration of primitive autonomic mechanisms (such as are associated, for example, with instinctive urges and emotional reactions) with neural activities taking place at the highest functional levels of the brain. It is not surprising, therefore, that interference with this system should lead to psychological disturbances affecting the very structure of what is usually termed "personality". No doubt it is still far from clear precisely what part is played in these high-level integrations by the anatomical connexions to which we have referred. But clinical and

The internal environment of the body is controlled by the autonomic nervous system and by humoral means. It seems likely that adjustments of the internal milieu mediated by these two mechanisms are integrated in the hypothalamus. Hypothalamic control of the autonomic nervous system has been the subject of intense study. Following the pioneer work of Karplus and Kriedl, many schools took up this field of investigation with particular regard to the quicker reactions concerned with the control of the blood-pressure, respiration, body temperature and similar functions. This aspect of hypothalamic physiology has been ably summarized in many reviews (Ranson & Magoun, 1939; Ranson, 1940; Miller,

1942; Hess, Brügger & Bucher, 1945-6). However, hypothalamic control of humoral mechanisms such as the slower metabolic and endocrine processes has received much less attention, and it may be said that little is known of the interrelation between the central nervous system and the ductless glands. Except for the adrenal medulla and the neurohypophysis (posterior pituitary gland), the position of endocrinology today may be likened to that of the vascular system if the function of vagus and sympathetic nerves were as yet undiscovered. That the reproductive and other endocrine functions are brought into harmony with the external environment and general somatic requirements is well established, but the investigation of the mechanism whereby such co-ordination is brought about is only in its opening phases. This review deals with such work.

### 1. Adrenal Medulla and Neurohypophysis

These two glands are exceptional in the endocrine series in that they are closely associated with the central nervous system in development, being derived from neural crest material and from the diencephalon, and both are dependent on a rich nerve supply for normal function throughout life.

#### a. Adrenal Medulla

The adrenal medulla is supplied by the splanchnic nerves and by the upper lumbar sympathetic chain (Swinyard, 1937; Young, 1939), and if these nerves are cut it is doubtful whether the gland continues secreting. It certainly becomes inexcitable to electrical stimuli that elicit secretion in the normal gland (Cannon & Rosenbleuth, 1937). Houssay & Molinelli (1925), using a crossed circulation technique, showed that stimulation of the infundibular region of the hypothalamus elicits secretion by the adrenal medulla in dogs, which is abolished by section of the great splanchnic nerve. Magoun, Ranson & Hetherington (1937) likewise found that stimulation of the hypothalamus resulted in release of adrenin into the circulation, the loci active to stimulation being situated

experimental enquiries are beginning to demonstrate how important they may be, and it seems to us that these enquiries may be considerably facilitated in the future if those who pursue them are

made familiar with the essential anatomical data concerned. This, indeed, is the main reason why we have prepared this short review.

in the anteroposterior extent of the lateral hypothalamic area and the adjacent perifornical region. It would seem clear from this and other evidence that the hypothalamus influences adrenaline secretion, as part of general sympathetic control, by means of a pathway through the brain stem, spinal cord and splanchnic nerves; and that in the hypothalamus the activity of the adrenal medulla is co-ordinated with the requirements of the organism under varying patterns of emotional excitement.

#### *b. Supraoptico-Hypophyseal Tract*

The neurohypophysis is innervated by a very rich tract of unmyelinated fibres descending to the gland in the neural stalk. These fibres originate mainly in the supraoptic nucleus, some in the paraventricular nucleus and possibly other hypothalamic nuclei (for discussion, see Harris, 1948a). Functionally, the most important tract appears to be the supraoptico-hypophyseal (SOH) tract, as first shown by the classical work of Ranson and his colleagues (Fisher, Ingram & Ranson, 1938). These workers found that bilateral lesions of this tract were followed by loss of secretory activity of the neurohypophysis with a resultant state of diabetes insipidus, by degeneration and atrophy of the neurohypophysis and of the supraoptic nucleus, and by a loss of active material (antidiuretic, oxytocic and pressor) extractable from the glands. For the first time the relationship between the hypothalamus and pituitary gland and the water balance of the body, and the analysis of clinical cases of diabetes insipidus, were on a sound basis. The effect of similar lesions on the oxytocic activity of the gland and the mechanism of parturition is not clear cut. Fisher, Magoun & Ranson (1938) and Dey, Fisher & Ranson (1941) found that lesions of the SOH tract in cats and guinea-pigs were followed by dystocia in a high proportion of cases, though some animals that exhibited a state of diabetes insipidus delivered their young normally. It has been reported that clinical cases of diabetes insipidus may suffer from dystocia (Marañón, 1947), and the position has been discussed (Harris, 1948b).

The converse experiments, electrical stimulation of the SOH tract with resultant positive responses from the neurohypophysis, have been technically difficult to perform, since anaesthesia itself tends to inhibit water diuresis, against the background of which the antidiuretic effect is observed. However, Haterius (1940), Haterius & Ferguson (1938) and Ferguson (1941) made the experiment in anaesthetized rabbits and cats and obtained evidence that electrical stimulation of the pituitary stalk causes secretion of the antidiuretic and oxytocic hormones. The experimental procedure was much simplified when remote control stimulation was applied to the hypothalamic region and it became possible to stimulate different regions without the use of an anaesthetic. In a preliminary operation a small coil was buried between the scalp and skull of a rabbit and an insulated electrode carried down through the skull, corpus callosum and other median structures into some part of the hypothalamus or pituitary gland. After recovery from the initial operation, stimulation could be performed in the conscious state by placing the animal with its head in an electro-magnetic field. Using this method it was found that localized stimulation of the SOH tract produced secretion by the neurohypophysis and, as a result, the following reactions occurred—inhibition of a water diuresis; an increase in the relative, and sometimes absolute, urinary chloride; a marked increase in uterine activity in the oestrous,

or oestrogenized rabbit, but no increase in the pseudopregnant animal or animal treated with progesterone; an increase in intestinal activity; only slight rises in blood-pressure of the same type as those produced by injection of posterior pituitary extract; no increase in blood-sugar; and the appearance of an antidiuretic substance in the urine (Harris, 1944 (thesis for M.D. degree, Cambridge University); 1947a, 1948d, 1948e). It is of interest that the secretion produced by stimulation of the SOH tract appears to possess relatively more oxytocic than pressor activity as compared with standard posterior pituitary extracts. For example, maximal stimulation of the tract for 1 min. causes the secretion of the equivalent of 200–500 mU oxytocic factor and less than 100 mU pressor factor. The fact that the rabbit possesses a mechanism for increasing the activity of the empty oestrous uterus may be significant in relation to sperm transportation during and after coitus (Harris, 1948f).

#### *c. Secretion of Antidiuretic Hormone*

The changes in the external environment and internal milieu which in the normal animal elicit secretion of the antidiuretic hormone, and the mechanism whereby such changes affect the neurohypophysis, have been the subject of a series of investigations by Verney and his colleagues. Their work has firmly established the posterior pituitary antidiuretic secretion as a true hormone. Rydin & Verney (1938) investigated the inhibition of a water diuresis produced by muscular exercise. They found the inhibiting factor was the emotional accompaniment of the exercise, and showed that the effect of emotion was not mediated by the nerve supply of the kidney, or by the participation of haemodynamic factors. They suggested that the antidiuretic effect of emotion was humorally conducted to the kidney, and they produced strong indirect evidence that the humoral agent was the pituitary antidiuretic hormone. O'Connor & Verney (1942) then found that removal of the posterior pituitary gland in dogs reduced the emotional inhibition of a water diuresis to 5 per cent of its original magnitude. Section of the SOH tract (O'Connor, 1946) also very largely abolished the emotional inhibition of a diuresis. Much of this work was performed on dogs in which the kidneys and adrenals had been denervated.

In further work, on dogs with intact sympathetic systems, O'Connor & Verney (1945) distinguished a second type of emotional inhibition of a diuresis. The inhibition of pituitary origin is slow and prolonged, but this second type was rapid in onset and evanescent in duration. After denervation of the adrenal glands and kidneys, a long slow inhibition was apparent in all cases. It did appear, then, that an intact sympathetic system may prevent the development of an inhibition of pituitary origin. It was then found that injection of adrenaline immediately prior to an emotional stress stimulus likewise prevented any pituitary-type inhibition of a water diuresis, although adrenaline did not prevent an inhibition following the injection of posterior pituitary extract. Further work (Verney, 1947) showed that tyramine acts in a similar manner to adrenaline, and it is thought that the most likely mode of action is through interference with the chemical reactions initiated in the nervous system by the emotional stress stimulus. Attention was then turned (Verney, 1946, 1947) to the effect of changing the osmotic pressure of the blood on the secretion of the antidiuretic hormone by the posterior pituitary gland. It was found that intracarotid injections of hypertonic sodium chloride over a 5–20 sec. period caused a

release of antidiuretic hormone with resultant inhibition of a water diuresis, the response being diminished by some 90 per cent after removal of the posterior lobe. This response was shown to be osmotically determined, the receptive elements being situated somewhere in the vascular bed of the internal carotid artery. The osmoreceptors were shown to be freely permeable to urea, less freely permeable to dextrose, and relatively impermeable to sodium chloride and sucrose. A local increase in osmotic pressure of only 2 per cent (in experiments involving intracarotid infusions lasting 40 min.) was found to cause an antidiuresis which had a postpituitary extract equivalence of  $1\mu\text{U/sec}$ . The change in blood-chlorides in these latter experiments is within the range of changes found physiologically in man. It would seem likely that the osmoreceptors postulated by Verney lie within the supraoptic nucleus of the hypothalamus. This nucleus possesses an exceedingly rich blood supply, which is a likely attribute of a chemoreceptor, but there is as yet no proof that it is the location of the receptive structure.

Since emotional stress excites the secretion of the antidiuretic hormone it would seem probable that the supraoptic nucleus is in turn excited by afferent nerve tracts from other regions. There is evidence that these tracts are cholinergic in nature. Pickford (1939) showed that intravenous injection of acetylcholine into the dog inhibited a water diuresis, but that the inhibitory effect could not be produced after removal of the posterior pituitary gland. Burn, Truelove & Burn (1945) found that nicotine had a similar action in man. These experiments did not definitely localize the site of action of acetylcholine or nicotine as being in the supraoptic nucleus, but Pickford (1947) has further shown that injections of  $0.004\text{ cm}^3$  (totalling from 2 to  $40\text{ }\mu\text{g}$ .) of acetylcholine solution directly into the supraoptic nucleus of chloralosed dogs interrupts the course of a water diuresis. Further interesting work by Pickford and her colleagues (personal communication, 1949) has disclosed that injection of di-isopropylfluorophosphonate (DFP), an inhibitor of cholinesterase, into the supraoptic nuclei of chloralosed diuretic dogs results in an immediate inhibition of the water diuresis, followed by a delayed effect in which marked polyuria and polydipsia occur and persist for 4–9 days.

Summarizing the evidence concerning hypothalamic control of the neurohypophysis, it may be said that anatomically the neurohypophysis has a rich innervation from the supraoptic nucleus; that lesions of the supraoptico-hypophyseal tract produce diabetes insipidus and atrophy of the neurohypophysis; that stimulation of the tract causes secretion of the antidiuretic (pressor) and oxytocic factors; that the supraoptic nucleus is stimulated (either directly or indirectly) by changes in the osmotic pressure of the blood, and by cholinergic nerve tracts from other regions of the brain subserving emotional and possibly other reactions.

## 2. Adenohypophysis and the Gonads, Thyroid and Adrenal Cortex

The crucial problem in endocrinology at the present time is the inter-relationship between the central nervous system and the anterior pituitary gland, gonads, thyroid and adrenal cortex. It is beyond doubt that neural processes influence the internal secretion of these glands, and that the hormones liberated react back on the nervous system, so producing

profound behaviour changes; but the mechanisms involved are largely conjectural.

There is much evidence that the anterior lobe of the pituitary gland is under the influence of the nervous system and that, through the eutrophic pituitary hormones, the gonads, thyroid and adrenal cortex are brought indirectly under neural control (see Harris, 1948a). As examples of such an influence may be quoted: (i) the important observations of Marshall (1922, 1936, 1942) on the effect of the external environment on reproductive processes; (ii) the fact that small localized tumours in the region of the tuber cinereum may produce precocious puberty in young children (Weinberger & Grant, 1941); (iii) the well-known disturbances that may occur in the menstrual rhythm or in the process of lactation due to psychological disturbances such as worry, fright, hypnosis; (iv) the effect of the environmental temperature on thyroid histology (Uotila, 1939; Brolin, 1945); and (v) the effect of emotional and other types of stress on the histology and activity of the adrenal cortex (Sayers & Sayers, 1948). It seems highly probable that these effects are produced by means of the hypothalamo-adenohypophyseal system.

### *a. Mode of Transmission of Stimuli*

The anatomical pathway by which the hypothalamus influences anterior pituitary secretion has been the subject of much debate. Most workers have found, on microscopic examination, that the anterior pituitary gland possesses a scanty nerve supply. These findings, and the fact that the anterior pituitary gland possesses a rich reticular fibre framework which may stain by silver methods to give the appearance of nerve fibres, put the onus of proof on those authorities who claim to have found many nerve fibres in the gland. Such claims now need the substantiation of two control procedures: firstly, to stain alternate sections for nerve fibres and reticular fibres and compare the fibre patterns disclosed; and secondly, to stain simultaneously sections from a normal gland and a "denervated" gland (after cervical sympathectomy and pituitary stalk section), in order to demonstrate the presence of nerve fibres in the normal gland, and the absence in the "denervated" gland. At the present time, it may be said that there is no convincing histological evidence of secretory nerves in the pars distalis of the adenohypophysis.

The same conclusion may be drawn from the experimental evidence available. Three nervous pathways have been suggested as possible routes for hypothalamic control of the anterior pituitary: the cervical sympathetic system, the parasympathetic fibres of the petrosal nerves, and the hypothalamo-hypophyseal tract in the pituitary stalk. Section of these various nerves, however, does not necessarily prevent neural processes from affecting anterior pituitary secretion.

Apart from the nerve tracts mentioned above, another anatomical pathway exists connecting the median eminence of the tuber cinereum and the anterior pituitary gland. Rainer of Bucharest noticed, in human autopsy material, blood-vessels running longitudinally along the pituitary stalk. One of Rainer's pupils, Popa, working in collaboration with Fielding, first described these vessels in detail (Popa & Fielding, 1930, 1933). On histological grounds they claimed that blood was collected from the sinusoids of both lobes of the pituitary, carried upwards in large vascular trunks along the pituitary stalk, and redistributed by a secondary net of capillaries in the hypothalamus. For this reason the authors

termed the vessels "hypothalamo-hypophysial portal vessels". Wislocki & King (1936) and Wislocki (1937, 1938) confirmed the presence of these vessels, but differed from Popa & Fielding in claiming that the vessels started in the median eminence of the tuber cinereum, that the direction of flow was from above downwards, and that the vessels ended entirely in the pars distalis of the pituitary. Since the median eminence is, strictly speaking, part of the neurohypophysis rather than of the hypothalamus, the vessels were renamed the "hypophysial portal vessels". Green & Harris (1947) re-investigated the region in a variety of mammals and largely confirmed the findings of Wislocki. They found that small arterial twigs, branches of the internal carotid or posterior communicating arteries, run to supply a large vascular plexus situated between the pars tuberalis and median eminence. From this plexus arises a multitude of wide capillary loops which penetrate into the tissue of the median eminence where they come into intimate relationship with the nerve fibres of the hypothalamo-hypophysial tract. The blood from these loops is drained by means of large portal trunks running in the pars tuberalis envelope of the neural stalk, these trunks breaking up and redistributing the blood into the sinusoids of the pars distalis. The exact pattern of these vessels varies in detail in different mammals. In animals with short pituitary stalks, such as the dog, the intermediate trunks of the portal vessels may be likewise short and the two terminal sets of capillaries approximated, but in forms where the stalk is elongated, as in man, the portal trunks are also long. Green (1947, 1948, 1949; personal communication, 1949) has recently made a thorough investigation of the portal vessels in many types of vertebrates and finds a similar system of vessels in all forms examined from the Salientia to the Primates. Even in the porpoise and the whale (forms in which the anterior and posterior lobes of the pituitary gland are separated by a septum of thick connective tissue) a well-marked portal system of vessels is present and connects the median eminence and pars distalis by passing anterior to the septum (Harris, 1947b; unpublished observations, 1949). It has been suggested that, embryologically, the portal vessels are related to the lateral lobes of Rathke's pouch; and the significance of the pars tuberalis, which is derived from the lateral lobes, lies in the fact that it forms a bed for the vascular pathway between the nervous system and pars distalis (Harris, 1947c). The direction of blood-flow in the portal vessels has been a subject of much controversy. Direct microscopic examination of the vessels in living amphibians (Green, 1947) and rats (Green & Harris, 1949) has established that the blood flows from the median eminence to the pars distalis of the pituitary. To complete this summary of the blood-vessels of the gland, it may be added that, besides a portal system of supply, the pituitary receives a systemic arterial supply by means of branches from the internal carotid artery, and that the venous drainage is by wide veins which pass laterally into the adjacent venous sinuses.

In view of the above anatomical facts it was suggested (Harris, thesis, 1944; Green & Harris, 1947) that the hypothalamus may influence the secretion of the adenohypophysis by means of a neurovascular link, viz., that hypothalamic nerve fibres end in close relation to the capillary loops in the median eminence and, on excitation, liberate some chemo-transmitter into these vessels, this substance being transported by the portal vessels to excite or inhibit the pars distalis of the gland. It may be said that the experimental evidence avail-

able lends strong indirect support to the theory of neuro-vascular transmission of stimuli.

#### *b. Effect of Sectioning Pituitary Stalk*

Very varied effects have been recorded by different workers after sectioning the pituitary stalk. To take one example, the effect of pituitary stalk section on the oestrous cycles and reproductive processes in rats has been studied in detail. Following this operation, Richter (1933) found that oestrous cycles were prolonged, Westman & Jacobsohn (1938a, 1938b), and Brolin (1945) reported gonadal atrophy, whilst, on the other hand, Dempsey & Uotila (1940) and Dempsey & Searles (1943) found that some animals showed normal reproductive processes. Similarly, diverse results have been reported by workers who have studied the effects of stalk section on other pituitary functions such as lactation, maintenance of the thyroid and adrenal glands, and carbohydrate metabolism. The conclusion that may be drawn from these results is that the nerve fibres of the stalk are not of importance to anterior pituitary activity, since some animals display normal pituitary functions after stalk section, and the nerve fibres involved have no power of regeneration.

In an attempt to discover whether the portal blood-vessels of the stalk regenerate after section, and whether any regeneration could be correlated with the postoperative return of pituitary activity, the above experiments on stalk section in rats have been repeated. Harris (1949; and unpublished observations, 1949) found that regeneration of the hypophysial portal vessels and the return of oestrous cycles occurred in a high proportion of rats following pituitary stalk section. A second series, of 32 rats, in which small foreign bodies (usually paper plates) were placed between the cut ends of the stalk in an attempt to prevent such regeneration, was also studied. Fifteen of these latter animals remained anoestrous, and serial sections showed that in these cases the foreign body had been accurately placed and that no vascular regeneration had occurred. Of the other 17 animals in this group, 11 showed the return of irregular, and 6 the return of regular, oestrous cycles; histological examination showed a good correlation between the amount of regeneration of the portal vessels (allowed by misplacement of the foreign body) and the return of cycles.

The questions of what areas of the hypothalamus are concerned with the control of anterior pituitary secretion, and of how such control is mediated, are important; electrical stimulation of different regions of the hypothalamus and pituitary gland was applied in an effort to obtain relevant data. It is well known that under normal conditions ovulation in the rabbit involves coital excitation of a nervous reflex followed by anterior pituitary secretion and so follicular rupture. Using the remote control method (described in Section 1b above), it was shown (Harris, 1948c) that electrical stimulation of the tuber cinereum for 3 min. may be followed by a full ovulatory response, whereas similar stimuli applied directly to the pars distalis, pars intermedia or infundibular stem for periods up to 7½ hr. were not followed by ovulation. These experiments were performed in conscious rabbits so that different levels of anaesthesia could not be concerned with variations in response to stimulation. The theory of neurovascular transmission of stimuli accords well with the facts that stimulation of nerve fibres in the tuber cinereum of the hypothalamus excites anterior pituitary secretion of the gonadotrophic hormone, whereas stimulation of the nerve

fibres in the pituitary stalk (infundibular stem) or stimulation of the anterior pituitary itself does not result in secretion. If the anterior pituitary gland lacks secretomotor nerve fibres and is humorally excited via the portal vessels, it seems likely that the gland would be inexcitable to electrical stimulation.

### *c. Secretion of Adrenocorticotrophic Hormone*

Since the mechanism of ovulation in the rabbit is rather exceptional among mammals, it appeared doubtful how far the above results could be applied to anterior pituitary secretion in general. That such application was valid appeared likely when it was found in a few rabbits that prolonged stimulation of the tuber cinereum resulted in a glycotropic response, that is, a marked decrease in sensitivity to the injection of small doses of insulin (Harris, unpublished observations, 1949). However, a more detailed study of the mechanism underlying the secretion of adrenocorticotrophic hormone (ACTH) by the anterior pituitary gland of the rabbit has been made. It is known that injection of ACTH in rabbits and other animals produces a temporary but marked fall in the absolute number of blood lymphocytes (Dougherty & White, 1943, 1944), and that emotional stress stimuli in mice and rats (Selye & Harlow, 1937) and in man (Pincus, 1947) produce a similar lymphopenia. It was found (Colfer, de Groot & Harris, unpublished observations, 1949) that emotional stress stimuli (restraint or subcutaneous faradism) constantly evoked a lymphopenic response in normal rabbits, but not in hypophysectomized animals, though injection of ACTH still produced a response after hypophysectomy. It was also shown that the adrenal medulla played no part in the lymphopenic response.

There was then available for investigation a reaction in the rabbit which could be indicated: emotional stress (neural excitation) → anterior pituitary gland → adrenal cortex → lymphopenia. To see whether the secretion of ACTH and a resultant lymphopenia could be evoked by hypothalamic stimulation, de Groot & Harris (unpublished observations, 1949) used the remote control method of stimulation with the primary coil enlarged to encircle the cage containing the rabbit. Thus the animal was in its usual surroundings and free to move, eat, groom the fur and so on during the period of stimulation and was not subject to concurrent emotional stress. It was found that the stimulation of the posterior region of the tuber cinereum and mamillary body resulted in a lymphopenia which was similar in time relations and magnitude to that following an emotional stress stimulus or injection of ACTH. Cervical sympathectomy did not abolish the response. Stimulation of other regions in the hypothalamus (including the supraoptico-hypophyseal tract) and pituitary (pars and zona tuberalis, pars distalis, pars intermedia and infundibular stem) did not elicit the response. Some further observations were made (de Groot & Harris, unpublished observations, 1949) on the effect of various hypothalamic and pituitary lesions on the lymphopenia which normally follows an emotional stress stimulus. In two rabbits in which the zona tuberalis (the part of the anterior pituitary gland of the rabbit traversed by the portal vessels) was destroyed, and in some

other animals in which the posterior part of the tuber cinereum or mamillary body was damaged, the lymphopenic response to stress was diminished or abolished. Thus, as in the case of the studies of gonadotrophic secretion, the theory of neurovascular transmission of stimuli is in accordance with the facts.

From the above, it appears that anterior pituitary secretion is influenced by nervous structures in the posterior wall of the tuber cinereum. Through this complex region passes the tubero-hypophyseal tract and, although there is no direct evidence implicating this tract, it seems likely that it is concerned with the activity of the adenohypophysis.

It is of interest that from a different approach, Markee and his colleagues in America (Markee, Sawyer & Hollinshead, 1948; Sawyer, Markee & Townsend, 1949; Sawyer, Everett & Markee, 1949; Everett, Sawyer & Markee, 1949) have reached the conclusion that hypothalamic control of gonadotrophic secretion by the anterior pituitary gland of the rat and rabbit is humorally mediated by an adrenergic mechanism.

### 3. Conclusion

There can be little doubt that the majority of endocrine glands are under the control of the nervous system. The adrenal medulla and neurohypophysis are controlled by a rich, direct secretomotor innervation, whereas the adenohypophysis (and thus indirectly the thyroid, adrenal cortex and gonads) is probably brought under neural control by a local vascular link, the hypophyseal portal blood-vessels. The hypothalamus forms an essential part of the neural mechanism influencing the endocrine series.

One of the striking facts emerging from recent work is the emphasis on emotional and psychological factors in the control of endocrine secretion. The relationship between emotional stimuli and the secretion of the adrenal medulla has long been known, but it is now apparent that the secretion of the antidiuretic, gonadotrophic and adrenocorticotrophic hormones from the pituitary gland may also be influenced by emotional states. It may be that the frontal cortex-hypothalamic relationship, which Fulton (1949) has recently emphasized in reference to the autonomic nervous system, is also of importance to the function of the endocrine glands. Eighteen years ago Le Gros Clark (1932) pointed out the importance of the fibre tracts uniting the cortex of the frontal lobe and the dorsomedial thalamic nucleus, and of the periventricular fibres which connect the dorsomedial thalamic nucleus and hypothalamus. Le Gros Clark suggested that this anatomical system links up a dualism of psychic life, the hypothalamus concerned with the internal environment (visceral activity and the pituitary gland) and the emotions, and the thalamus concerned more with stimuli arising in the external environment. The operation of frontal lobotomy has again focused attention on the fronto-thalamic connexions and it is of interest that there are many reports of cases, such as that of Hemphill (1944), in which lobotomy has resulted in a marked change in endocrine activity.

  - 2 Responses to various stimuli
  - 3 Blood-pressure changes in spinal man
  - 4 Responses in opposite limb and in veins
  - 5 Vasodilator function of the sympathetic nervous system
  - 6 Conclusions
- References

In man there are two main motor divisions of the nervous system. The first—the somatic efferent system—is concerned with the volitional control and reflex activity of skeletal muscle. The second—the autonomic nervous system—controls the activity of smooth muscle and glandular tissue. Anatomically the peripheral portions of these two systems are relatively distinct. The autonomic nervous system differs from the somatic in having an outflow to ganglia situated either along the side of the vertebral column or in close proximity to the tissues served by it. Like the somatic efferent system it has central connexions, which play a considerable part in governing its activities. The purpose of this communication is to discuss the recent work of several observers who have been concerned mainly with eliciting information regarding the nervous control over digital blood vessels and to place on record some further observations made in subjects with lesions of the spinal cord.

### 1. Vascular Changes Associated with Changes in Respiratory Rhythm

By the use of the finger plethysmograph, Goetz (1935) demonstrated that changes took place in the peripheral vascular bed following a deep breath. Using similar methods Bolton, Carmichael & Stürup (1936) made an especial study of the changes associated with alteration in the respiratory rhythm: they found that following a deep inspiration the volume of the finger decreased, and they noted that this response occurred nearly simultaneously in the digits of all four limbs; as this response was absent in the digits of a limb previously sympathectomized they considered that the response was mediated through activity of the peripheral sympathetic system and that therefore the response was in the

nature of a vasoconstrictor reflex. Carrying their studies further, they concluded that the reflex was initiated by a stimulus associated with expansion of the chest wall during the inspiratory phase of the deep breath, and that the afferent stimuli were mediated by the intercostal nerves. Gilliatt (1948) re-investigated this reflex. In trained subjects he was unable to detect any appreciable difference between the response to thoracic inspiration and that to abdominal inspiration; he also found that the response was not connected with the fall in blood-pressure occurring during inspiration. He was thus unable to substantiate the assumption of Bolton *et al.* (1936) that the reflex was mediated by the intercostal nerves; at the same time he offered no information as to the probable site of the afferent nerve-endings responsible for this response. It would appear, however, that the afferent pathway for the response must reach the cord through the upper thoracic spinal nerves. Gilliatt, Guttman & Whitteridge (1948) found in a series of patients with spinal injuries that, with lesions at the level of the lower cervical segments, deep inspiration caused constriction in the vessels of the fingers and often in the vessels of the toes; with lesions below the sixth thoracic segment no response in the toe occurred. Though there is considerable variability in the responses in the toes, the observations of these authors suggest that the entry for the afferent impulse is between the first and sixth thoracic roots.

### 2. Responses to Various Stimuli

Such responses, being constrictor in quality, were more readily observed when the digital vessels were in a state of dilatation. To obtain this state body-warming was essential, and the method used by Bolton *et al.* (1936) was that of immersion of indifferent limbs in water at 44–45° C. This method had been shown by Uprus, Gaylor & Carmichael (1936) as the most satisfactory for producing rapidly, and sustaining steadily, a state of vasodilatation of digital vessels. These authors demonstrated the difficulties in obtaining satisfactory vasodilatation of digital vessels by exposure to radiant heat and drew attention to the need for an adequate rise in blood temperature. It will be noted that, in a subject with a spinal lesion causing complete interruption of spinal pathways, vasodilatation of finger vessels could still be fully initiated by immersion of the insensitive legs in water at 44–45° C., but a greater rise of blood temperature was required than in healthy subjects. In subjects so warmed, Stürup *et al.* (1935) were able to obtain constrictor reflexes to a variety of stimuli—cutaneous and visceral pain, loud noise, cold, etc. In response to such stimuli the reflex occurred in all four limbs simultaneously. On occasions, without any known stimulus having been given, vasoconstriction could be noted as occurring, sometimes in the vessels of the toes alone and at other times in the vessels of the digits of all four limbs. These constrictions were examined by Doupe, Robertson & Carmichael (1937), who noted that they took place more frequently in the vessels of the toes and that when observed in the digits of all four limbs the degree of change was greater in the vessels of the lower limbs than in those of the upper limbs. As such spontaneous constrictions did not appear in the records obtained from the digits of a limb which had been previously sympathectomized, these authors believed that they were dependent upon the integrity of the sympathetic nervous system. They further observed that following a

variety of stimuli, such as cutaneous pain or sensation of cold induced by application of ice to an indifferent area of the body, digital vasoconstriction resulted, again more readily and to a greater extent in the vessels of the toes than of the fingers. This difference both in spontaneous and provoked responses was found to be absent in subjects with lesions of the cauda equina: the lesion had to be extensive enough to include the first sacral and lower lumbar roots, thereby producing sensory loss in the feet and calves. In such lesions, there was retention of the integrity of the peripheral sympathetic pathway, the outflow of which was above the level of the lesion: the vessels of the toes thus remained under active control of the sympathetic nervous system. In view of the absence of "spontaneous" vasoconstriction, combined with the greater response in the toe vessels in such patients, it was deduced that in the healthy subject the central nervous system was bombarded by afferent impulses from the leg area, which impulses tended to make it more easy to induce vasoconstriction in the vessels of the toes than elsewhere. Such a deduction might in part explain the observation of Lewis & Pickering (1931) and Pickering & Hess (1933) that vasodilatation was more easily obtained in the vessels of the fingers than of the toes. As far as is known to the present author, similar observations have not been made on animals. It may well be that, with the assumption of the erect posture, man has evolved an added means of controlling the blood supply, especially to the most dependent parts of the body.

As already noted, many forms of noxious stimuli, such as loud noise, flash of light, cutaneous pain, visceral pain and cold, produce vasoconstrictor responses. Carmichael *et al.* (1939) showed that distension of the duodenum also produced similar responses in the vessels of the fingers and toes; and not infrequently these responses followed a degree of distension which produced no conscious sensation. In later work (unpublished), these authors also found that similar results were obtainable in healthy subjects when the rectum was distended or the pressure within the bladder rapidly raised by injection of saline through a catheter.

### 3. Blood-Pressure Changes in Spinal Man

More recently, in patients with gun-shot wounds of the spinal cord, Guttmann & Whitteridge (1947) found marked changes in blood-pressure following distension of the bladder. As several of their subjects had lesions of the spinal cord at the level of the lower cervical segments; i.e. above the level of outflow of the sympathetic efferent fibres, the rise in blood-pressure resulted from activation of essentially spinal mechanisms. As they demonstrated a diminution in blood-flow in the fingers coincident with the rise in blood-pressure, it was taken that in spinal man digital vasoconstrictor reflexes could be elicited following a visceral stimulus.

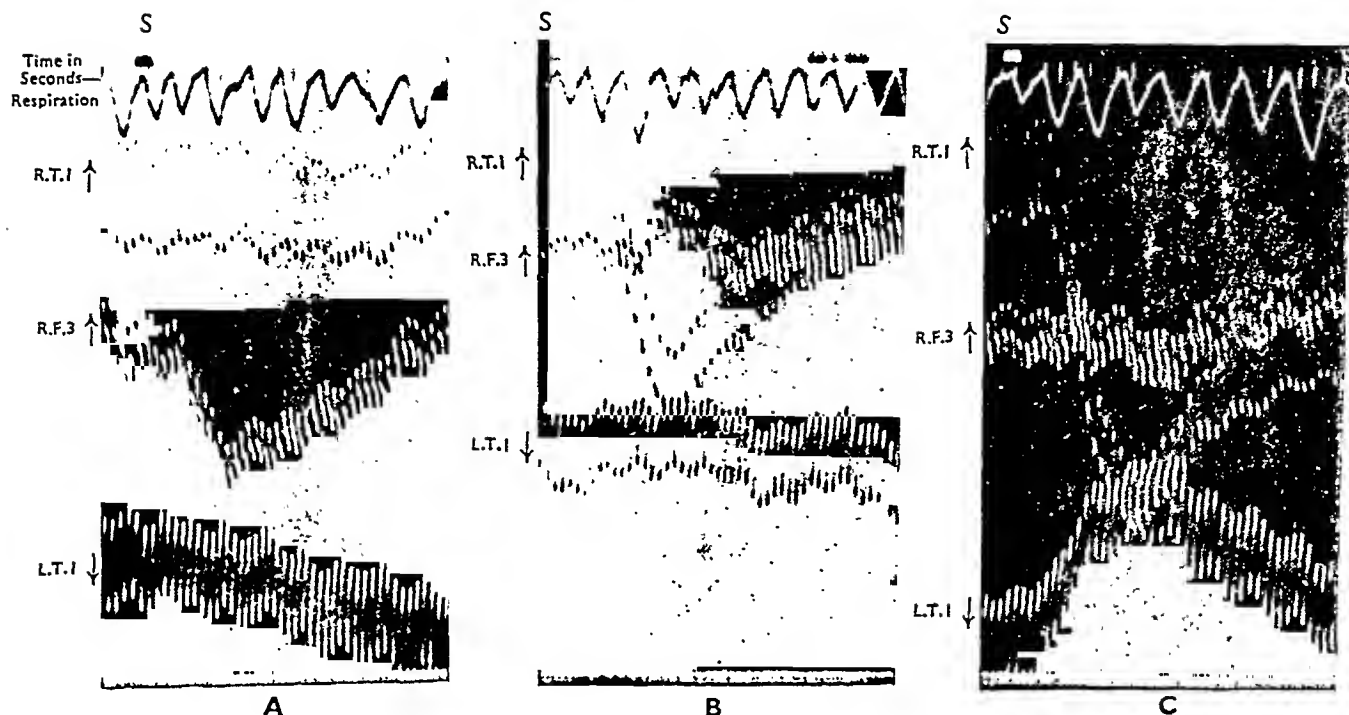

In a series of patients suffering from traumatic or vascular lesions of the spinal cord it has been possible to examine in further detail the vasomotor reflexes. After having assured a steady state of vasodilatation of the digital vessels by immersion of one arm in water at 44–45° C., the responses of the vessels of the other hand and both feet were studied. In one subject, in whom as the result of a traumatic lesion of the spinal cord at the 8th thoracic segment there was an absence

of sensation below that level, pin-prick or cold applied to the face or shoulders resulted in a ready vasoconstriction of the vessels of the fingers only. When a similar stimulus was applied to the lower abdomen or legs, vasoconstriction occurred only in the vessels of the toes; even when the stimulus was greatly increased, no response was observed in the vessels of the fingers. As already noted, vasomotor responses are more active in the toes than in the fingers in healthy subjects, irrespective of the site of the stimulus; hence the absence of vasoconstriction of the vessels of the toes in response to a stimulus applied to the upper half of the body may be taken as evidence that the descending pathways in the cord had been interrupted. Again, as even with severe stimuli to the lower half of the body nothing occurred in the finger vessels except, at most, a slight increase in volume probably due to the increase of blood-pressure, the ascending pathways in the spinal cord had also been interrupted. Thus vasoconstrictor responses in the toes were aroused by cutaneous stimuli when only spinal mechanisms were available. In another subject, again with a spinal lesion causing loss of voluntary control over movement of the legs and of sensation in the lower half of the trunk and legs, the application of a cold object to the front of one thigh resulted in a vasoconstrictor response limited to the vessels of the toe of the same side: if the area of stimulus was increased, then vasoconstriction appeared in the toes on both sides but never in those of the fingers (see fig. 1). In a third subject, with a vascular lesion at the level of the sixth thoracic segment, pin-prick above the level of the nipple resulted in vasoconstriction of the vessels of the fingers and no response in the vessels of the toes; when applied to the lower abdomen, pin-prick caused only a response in the vessels of the toes; however, when the stimulus was applied to a narrow zone above and below the upper level of maximum sensory loss in the trunk, vasoconstrictor responses occurred in the vessels of both the toes and fingers. This last observation is explicable on the assumption that, owing to the considerable overlap of sensory dermatomes on the trunk, the vasomotor centres in the cord, both above and below the level of the lesion, had received afferent impulses sufficient to initiate the mechanisms responsible for vasoconstriction in the digital vessels of both the upper and lower limbs.

### 4. Responses in Opposite Limb and in Veins

As in subjects with transverse lesions of the spinal cord it is possible to obtain responses in the vessels of the toes on the side stimulated, Elithorn and Crosskey have attempted to determine if in healthy subjects, following graded sensory stimuli, greater vasoconstrictor responses are obtainable in the limb stimulated than in the opposite limb. In a personal communication they have given information which shows that it is possible to obtain greater sudomotor responses in the arm stimulated. Using chiefly pain provoked by deep pressure, they noted that the skin resistance always altered more on the side stimulated. And as with vasoconstriction provoked reflexly by a painful stimulus a fall in skin resistance takes place at the same time, it is fair to deduce that, if the skin resistance alters more in the limb stimulated, the blood-vessels probably constrict more in that limb than in the opposite one. Absolute evidence of this, however, must await further investigation.

FIG. 1. PLETHYSMOGRAPH RECORD IN PARAPLEGIC SUBJECT

R.T.1 and L.T.1 refer to large toe of right and left foot respectively, R.F.3 refers to middle finger of right hand. Arrows point in direction of increase in volume. In A, at signal (S), pin-prick was applied to forehead, with resulting diminution in volume of finger only. In B, pin-prick was applied to right thigh, with diminution in right big toe volume only. In C, multiple pin-pricks to right thigh resulted in greater diminution in volume of right toe and also diminution in volume of left toe.

The observations recounted have been concerned with diminution in volume of a finger following a sensory stimulus. Wilkins, Doupe & Newman (1938) made a study of the changes in blood-flow associated with these changes and concluded that during the stage at which the finger diminished in volume there was a marked decrease in blood-flow to the fingers. Quite rightly then, these responses have been termed vasoconstrictor, and from the flow experiments it is apparent that the constriction at least takes place on the arterial side of the vascular tree. The literature contains few references to responses in veins to sensory stimuli. Doupe, Krynanuw & Snodgrass (1938) demonstrated clearly that in an isolated segment of a subcutaneous wrist vein the tension within the segment increased following a cold stimulus applied to another part of the body, and they interpreted this as favouring nervous control of veins. Lewis & Landis (1930) also observed an increase in the size of veins following sympathectomy. It would thus appear that the veins are in part under the control of the sympathetic nervous system and probably respond in a manner similar to arterial vessels.

##### 5. Vasodilator Function of the Sympathetic Nervous System

The possibility of the sympathetic nervous system having an active dilator function has also been the subject of study. Lewis & Pickering (1931) reported observations which, they

suggested, supported the existence of vasodilator fibres to the vessels of the hands. The interpretation of their results, however, received criticism from Uprus *et al.* (1936). Discussing the response to warming of the body, Grant & Holling (1935) postulated at least two mechanisms: relatively gentle heating resulted in dilatation of the digital arterioles with resulting increased flow to the skin of the hands and feet—this response was believed to be due to release of vasoconstrictor influences and not due to active vasodilatation. If, however, the heating was more intense, causing generalized sweating over the trunk and limbs, there was an increase in temperature of the skin in the proximal portion of the limbs. From the experiments they carried out, they postulated that this increase in skin temperature was the result of active vasodilatation, the product of vasodilator nerves to the vessels of the skin. It is to be noted that their observations were concerned more with skin vessels in the upper arm than with the digital vessels.

##### 6. Conclusions

There is adequate evidence to support the view that, in man, the peripheral sympathetic nervous system contains fibres whose function is to constrict the digital blood-vessels on the arterial side of the vascular bed. This constrictor function is initiated by both visceral and cutaneous sensations. The

reflexes are obtainable at spinal levels; with minimal cutaneous stimuli the reflex is an ipsilateral one, and with greater stimuli bilateral. There is less voluminous evidence that there are fibres whose function is to dilate digital blood-vessels; observations are available demonstrating the presence of

vasodilating fibres to the skin vessels, especially in the proximal zones of the limbs. The veins are also under nervous control which is constrictor; the possibility of vasodilator fibres acting on veins has not been adequately investigated.

IN this issue of the Bulletin the books reviewed have been classified into a number of main sections which are listed below. It is hoped that this plan will facilitate reference to Part II by specialist readers, and that continuity of interest in the various fields of medicine will be maintained. There are, as before, sections devoted to annotations and news, historical notes, shorter notices, and a guide to the contents of current British medical periodicals.

ANTIBIOTICS ... .. F. R. Selbie

## ANTIBIOTICS

F. R. SELBIE M.A. D.Sc. M.D. Ch.B. Ph.D.

*Professor of Bacteriology**Bland-Sutton Institute of Pathology, Middlesex Hospital, London*

*Antibiotics*<sup>1</sup>, by the Oxford workers to whom we owe the development of penicillin, has as sub-title "A survey of penicillin, streptomycin, and other antimicrobial substances from fungi, actinomycetes, bacteria, and plants". It is, however, more than a survey and could be described as "All about antibiotics" although, naturally, very recent developments have been too late for inclusion. In spite of this drawback, common to all books on growing subjects, *Antibiotics* surveys all aspects of this subject in sufficient detail to satisfy the requirements of all who want guidance in this branch of chemotherapy. That this is only a branch of chemotherapy can be gathered from the preface where it is stated:

The term antibiotic, which is now in general currency, has been defined by Waksman as a substance produced by one micro-organism which is antagonistic to the growth of others. In this book plant products with antimicrobial properties have been included; these are often referred to in the literature as antibiotics, though strictly speaking it is doubtful whether the term should be applied to them. No consideration has been given to antibacterial substances of animal origin, such as lysozyme, nor to the complex phenomena associated with bacteriophage.

In some ways it is a pity that antibiotics should be arbitrarily separated from other antibacterial substances for, on the one hand, some antibiotics can be synthesized and even produced commercially, as has recently been done with chloromycetin, while on the other, as Florey and his colleagues mention here, their mechanism of action may be similar to that of well-known synthetic drugs. It is therefore quite likely that this distinction will disappear although the study of antibiotics as now defined will continue as a method of finding ready-made antibacterial substances which may turn out, like penicillin, to be useful chemotherapeutic drugs as they are, or may, after the determination of their chemical structure, give a lead to new valuable substances. In any case it is as well that this book is confined to substances produced by living organisms, because it already comprises 1774 pages in these first two volumes, which deal with all aspects except clinical application.

From the general historical introduction it becomes apparent that the bacteriological techniques now in current use for the detection of antibiotics had all been thoroughly exploited many years ago. Most of this work, however, was abortive in that there was little co-operation between the biological worker and the chemist and indeed it is doubtful whether such co-operative work would have been fruitful because many of the biochemical procedures, which are so

essential for the separation and purification of antibiotics, were not then sufficiently developed. In this sense it may be said that the early work on antibiotics was ahead of its time in much the same way as the early experiments which eventually led to the isolation of insulin were frustrated because the methods of blood analysis had not then been sufficiently developed to control their application to man.

That the chemist plays a major role in the hunt for new antibiotics is evident from this book. Taking penicillin alone we find that it requires 13 chapters, comprising 284 pages, to outline its chemical aspects. But though the biologist owes much to the chemist for his help in developing these antibiotics, the chemist too is amply repaid by being introduced to chemical structures that have never before been encountered in nature. Thus the linking of these sciences is paying dividends on both sides—on the one hand increasing the number of new antibacterial substances, of which two, chloromycetin and aureomycin, have recently proved their worth in infections which have been unresponsive to other remedies, and on the other the widening of the range of the chemist's experience.

After the introduction the first volume describes the methods used for the detection and development of antibiotics, and gives details of a large number of these substances from fungi, actinomycetes and plants. The most satisfactory method of detecting antibiotics is the most familiar, namely, sowing the organism to be tested for antibiotic properties on a nutrient agar plate which is also sown with the micro-organism against which antibiotic action is sought. Florey and his colleagues find this a more suitable method than tests made in fluid media. The micro-organisms against which action has been sought have generally been *Staph. pyogenes* and *Bact. coli*, being representative of the gram-positive and gram-negative bacteria, the former of which are usually more sensitive to antibacterial substances. This has been a most useful procedure for screening micro-organisms for antibiotic activity and can also be used for testing extracts of larger organisms such as plants, in which case the extract is placed in a cylinder or in a hole in the agar, so allowing any active substance to diffuse into the medium. With this now classical technique, on the basis of which Sir Alexander Fleming discovered penicillin, much time has been saved in the rapid detection of possibly useful antibacterial substances, active not only against *Staph. pyogenes* and *Bact. coli* but against other micro-organisms. Of these there have now been described at least 80 well-defined antibiotics and many hundreds of active principles. There still, however, remains the possibility that valuable chemotherapeutic substances may be missed by this method, as for example substances like the sulphonamides which, being antagonized by some metabolite present in ordinary media, would not show any effect by cultural methods, but by an interference with some aspect of bacterial metabolism to which animal tissues are indifferent might prove to be of great therapeutic value.

The second volume, which comprises 1144 pages including appendix (65 pages), bibliography (84 pages), indexes (112 pages) to vols. I and II, deals with penicillin and streptomycin and has two final chapters, one on the action of antibiotics on bacteria and another giving conclusions. In the historical introduction to penicillin, Sir Alexander Fleming's discovery of penicillin is fully described and then there is a full account of the early work at Oxford which, owing to the Second World War, was greatly hampered by many difficulties, particularly as regards supplies of essential equipment.

<sup>1</sup> For particulars, see p. 394.

Though little is said here it is obvious that this must have been a heart-breaking time for Florey and his colleagues, who knew that they had a preparation which would revolutionize the treatment of infections, particularly in war wounds, and were not able to get on fast enough because of war-time restrictions. The later development of penicillin and its dramatic effect in clinical practice both in the battlefields and in the civilian population are now so well known and recognized that there is no need to say more here. It is, however, noticeable that the Oxford team do not claim for penicillin all the credit for the dramatic improvements in the surgical treatment of war wounds; they say:

Much of the success attending the use of penicillin for the treatment of the wounded is to be attributed to the increasingly high quality of war surgery, and this again received a great stimulus because surgeons armed with penicillin could, if their technique were sufficiently good, suture even the most severe wounds without the danger of spreading sepsis, and with great benefit to the patient.

In the light of their intense research on antibiotics and their application, the Oxford workers have formulated the properties desirable in a chemotherapeutic agent for systemic use. The agent should have little toxicity to the animal body in comparison with its toxicity to sensitive micro-organisms. It should be active in low concentrations for otherwise the doses would be impracticably high. It should be active in the presence of normal and pathological body fluids and should not be inactivated by tissue enzymes. It should not be anti-

genic because of the great danger of producing allergic phenomena. For most purposes it should be significantly soluble at the pH of body fluids. A great advantage in an antibiotic would be stability sufficient to allow of its administration by mouth.

So far penicillin, with the one single disadvantage of not being usefully administrable by mouth, is the exceptional antibiotic that fulfils these criteria, but recently chloromycetin and aureomycin, two antibiotics that can be given by mouth, have shown exceptional activity against a number of infections. How these new substances will compare with penicillin in clinical practice has yet to be seen. There is, however, no doubt that penicillin has come to stay and will be our main weapon in combating infections when properly used. The other antibiotics will have their place in supplementing penicillin in the treatment of infections in which penicillin is less applicable.

This book will be essential to all those who are interested in chemotherapy and should have a place in every hospital library and medical laboratory. All other works of a similar nature in this field fall far short of this reference book; and it is more than an exhaustive review because of the high standing of the authors who, beside their work on penicillin, have themselves isolated and studied many new antibiotic substances. Their critical evaluation of the subject will therefore command universal respect, and indeed we owe these busy workers a tremendous debt of gratitude for sparing their time to give us the benefit of their unique experience.

## MEDICAL CONGRESSES 1950

**Autonomic Nervous System.** The Austrian Medical Conference will be held in Salzburg from 7-9 September, 1950. The main subject of the Conference will be "The Autonomic Nervous System and its Influence upon the Course of Illness". Enquiries should be sent to the Sekretariat der Van Swietengesellschaft, Landesskrankenhaus, Salzburg.

**Cancer.** The Fifth International Congress on Cancer will be held in Paris at the Sorbonne, from 15-22 July, 1950. The Congress will coincide with the 50th anniversary of the discovery of radium by Pierre and Marie Curie, to the celebration of which members of the Congress are invited. Papers to be read will deal with the following branches of the subject: biology and experiment, pathology, clinical approach, therapy, social implications of the fight against cancer. Full details may be obtained from l'Union Internationale contre le Cancer, 6 Avenue Marceau, Paris VIII.

**Comparative Fertility.** The new Society for the Study of Comparative Fertility will hold its inaugural meeting at a conference to be held at the premises of the Zoological Society of London on 16-17 June, 1950. Further particulars may be obtained from Dr G. I. M. Swyer, Obstetric Hospital, University College Hospital, London, W.C.1.

**Diseases of the Chest.** The First International Congress on Diseases of the Chest will be held in Rome from 17-20 September, 1950. The Congress is to be held under the auspices of the council on international affairs of the American College of Chest Physicians and the Carlo Forlanini Institute. Further information may be obtained from Professor A. Omodei Zorini, Carlo Forlanini Institute, Rome, or from Dr Chevalier L. Jackson, 500 North Dearborn Street, Chicago 10, Illinois, USA.

**Haematology.** The International Society of Haematology will hold a Congress from 21-26 August, 1950, in Cambridge. The provisional programme includes the following subjects: (i) Therapy of Anaemias; (ii) Hyperpleurism; (iii) Leukaemia, Including Therapy of Leukaemia; (iv) Physiology and Pathology of Coagulation and (v) Immunohaematology. Further information may be obtained from Dr Martin Hynes, Department of Medicine, University of Cambridge.

**History of Medicine.** The Sixteenth Congress of l'Union Internationale d'Histoire de la Médecine will form part of the Sixth International Congress on the History of Science. This will be held in Amsterdam from 14-20 August, 1950. Further information may be obtained from Professor Ir R. J. Forbes, Haringvlietstraat 1, Amsterdam-Z, the Netherlands.

**Maternity and Child Welfare.** The Annual Conference of the National Association for Maternity and Child Welfare will be held in London from 28-30 June, 1950. The theme of the Conference will be "The Child and its Environment" and introductory papers by experts in the field will be followed by group discussions. Further information may be obtained from the Honorary Secretary, National Association for Maternity and Child Welfare, 5 Tavistock Place, London, W.C.1.

**Medical Photography.** An International Exhibition of Medical Photography will be held in London from 12-24 June, 1950, by the Medical Group of the Royal Photographic Society. It is hoped that medical photographers from all parts of the world will submit their work for selection. Entry forms may be obtained from the Honorary Secretary, Kenneth G. Moreman, 16 Princes Gate, London, S.W.7.

**Psychiatry.** The International Congress of Psychiatry will be held in Paris from 18-27 September, 1950, and will include an exhibition of psychopathological art. The secretary-general of the Congress is Dr Henri Ey, 1 Rue Cabanis, Paris XIV.

1541

## GALEN AND RHAZES: A SPANISH TRANSLATION

The last twenty years have seen the growth of a widespread interest in the history of medicine in most of the countries of Latin America. It is by no means the interest of the dilettante, but a genuine scholarly discipline fostered and maintained by numerous university chairs in the subject and a number of flourishing specialist institutes. The Institute of the History of Medicine of the University of Buenos Aires has long been known for its journal, the *Publicaciones*, which is distributed throughout the world. Formerly edited by Professor Juan Ramon Beltran, it is now under the able direction of his successor in the chair, Professor Anibal Ruiz Moreno. Volume 12,<sup>1</sup> for the year 1948, was published a few months ago and has recently arrived in this country.

The first part of this volume is a most important contribution to Galenic literature, for it is devoted entirely to a Spanish translation of two of Galen's treatises on the pulse. Working in collaboration with the distinguished Spanish philologist Dr Antonio Tovar, Professor Moreno has based his version on Kühn's edition which, if not perfect from a philological standpoint, is the best available, since Galen's writings on the pulse have not yet found their way into the modern critical edition of his works which began in the *Corpus medicorum graecorum* in 1914. There is no complete translation of Galen's works into any modern language, and Professor Singer's appeal for a complete English translation has not shown any obvious results, although I believe that such an undertaking has been started in the United States of America.

Galen wrote seven distinct treatises on the pulse, viz., (i) *De usu pulsuum*; (ii) *De pulsibus od tirones*; (iii) *De pulsuum differentis libri IV*; (iv) *De dignoscendis pulsibus libri IV*; (v) *De consis pulsuum libri IV*; (vi) *De praesagitione pulsibus libri IV*; (vii) *Synopsis librorum suorum de pulsibus*. These were published in their entirety in the *Opera de pulsibus* in 1532, but the only modern work on any of them is Johann Gossen's critical discussion of the *Synopsis* (Berlin, 1907).

It is clear then that Professor Moreno, in undertaking the translation into Spanish of all seven treatises, has found a neglected corner in the field of Galenic studies, and one which is most important for the influence and strength of the Galenic tradition, so that his work will be of value to scholars not only in the Spanish-speaking countries but throughout the world.

He has wisely chosen to begin the series with (ii), the compendium on the pulse for students, a short tract of only twelve chapters, and to proceed to (iii) the four books on the differences of pulses. The chapter headings throughout are taken from the sixth Giunta edition (Venice, 1586); footnotes are sparse, but there is an excellent index of subjects, an index of authors cited in the text, and another of references to Galen's other works. A most useful feature is the glossary of technical terms used by Galen, with their modern Spanish equivalents.

To judge the translation itself one would need to be expert not only in Greek and Spanish philology but also in Galenic physiology and medicine; for those who do not possess this rare combination of attainments the authority and reputation of the two translators is sufficient recommendation.

The second part of the volume under discussion is also devoted almost entirely to the Spanish translation of a classic text, the book on smallpox and measles by Rhazes. The indefatigable Professor Moreno is entirely responsible for this version. As he confesses in his preface, there is no Spanish orientalist with sufficient knowledge of medicine to undertake a direct translation from the Arabic text, and he decided to make a Spanish version of the English translation by W. A. Greenhill which was published by the Sydenham Society in 1848. He could not have made a better choice, and it must be of particular pleasure to English historians of medicine to find the work of one of their greatest predecessors reappearing in this guise more than a century after it was written.

Rhazes' work on the smallpox and measles is too well known to warrant any detailed account here. It is of course the first classic account of both diseases, and for nearly a thousand years there have been few writers on the subject who have not been indebted to it or referred to it in some way or other. The present text is preceded by a useful introduction on the author's life and work.

<sup>1</sup> For particulars, see p. 394.

Concluding the volume is an interesting account of the organization of military hygiene in the Brazilian war of 1827. Written by Professor Moreno in collaboration with Vicente A. Risolla and Rómulo D'Onofrio, this paper was read at the seventh National Medical Congress.

After perusing this very impressive volume I cannot resist the temptation to revive the perennial complaint of the singular lack of a scholarly British journal devoted to the history of medicine. With some of the finest medical libraries in the world and a wealth of material for study, we are still without one; nor is there in any of our universities an institute or even a chair in medical history. The superiority of North America in this respect is already acknowledged. The astonishing activity in South America since 1939, of which this volume is one further proof, should do something to stimulate the responsible authorities in Great Britain.

F. N. L. Poynter

1542

## JOURNALS NEWLY RECEIVED

The *Bulletin of the Hong Kong Chinese Medical Association* entered its second year of publication with the first number to reach us (vol. 2, no. 1, April 1949). The Editorial Board at that time felt assured of its continuance "... as a medium of communication and information for the medical fraternity in Hong Kong as well as a means of union among the members of our Association," and invited contributions, which should be addressed to the Editor-in-Chief, Dr H. C. Chan, Bank of Canton Building, 4th Floor, Hong Kong. The editorial discusses the question of administration of intravenous injections by nurses, which had been raised in the correspondence columns of the previous number, and requests the co-operation of the Association's members in the current anti-tuberculosis campaign. Original articles and case reports are published, and a few abstracts. The Association's annual report is incorporated in the *Bulletin*, and refers to the "very good medical films" which had been shown to the Association by the British Council during the period under review.

*Archivos Argentinos de Reumatología* (Buenos Aires) has published as part of vol. 11, 1949, a special number on the histopathology and pathogenesis of acute rheumatic disease (Bouillaud's disease). The number consists of a monograph by Dr Pedro I. Elizalde, professor of pathological anatomy and physiology in the National University, Buenos Aires. Typical rheumatic lesions of the cardiovascular system, lungs, liver, kidneys, thyroids and thymus, muscular system, tendons and skin are described, each section being illustrated with photomicrographs. The author comments on the high incidence of tonsillar infection and concludes that this is the most frequent cause of acute rheumatic disease.

Vol. 12, no. 2, of the same journal contains two articles on rheumatic disease and allergy, one on climate and rheumatism and a summary of the proceedings of the Seventh International Congress on Rheumatism which took place in New York in May-June 1949.

We have recently received vol. 14, no. 1, 1949, of the *Revista de Instituto Bacteriológico Malbrán* (Buenos Aires). This number consists of 33 reports of original work by members of the institute's staff. Subjects to which groups of four or more studies are devoted are influenza virus "A", *Coccidioides immitis* Rixford et Gilchrist, and *Leptospira*. The number is illustrated with drawings and with nearly 50 photomicrographs of a good standard.

From the Department of Parasitology, University of Chile, we have received two numbers, vol. 4, no. 1 and no. 2, 1949, of the *Boletín de Informaciones Parasitarias Chilenas*. Each number contains three original short articles, an abstract of an important paper on a relevant subject, and a section of news.

The Department of Parasitology and the School of Medicine of the University of Chile have been completely destroyed by fire, and the head of the Department, Professor Amador Neghme, appeals for assistance in re-equipping the laboratories. Publications concerning amoebiasis, trichinosis, trypanosomiasis, yellow fever and hydatid disease are urgently required, and papers dealing with

parasitology, biology, epidemiology, and public health in general, would be appreciated.

The introduction during the summer of 1949 of a limited scheme of BCG vaccination in Great Britain lends interest to a recent special number of the *Boletín Médico Social* (Santiago de Chile), organ of the Caja de Seguro Obligatorio (department of compulsory national insurance). In a covering letter, Dr Alfredo Biondi E., director of medical services in that department, refers to the slow economic development of Chile and its depressing effect on the general standard of living, and notes that "The mortality rate of tuberculosis does not seem to have decreased in the last fifty years (240 per 100,000 inhabitants)."

To break into this discouraging situation the Caja de Seguro Obligatorio launched a national propaganda campaign in favour of BCG vaccination. The campaign had the support of the medical profession, voluntary bodies and other government departments, and was followed by practical measures which it is hoped soon to co-ordinate into a national scheme. No. 164-168 of the *Boletín Médico Social*, May-September 1948, is issued in association with the campaign. Besides three articles by Chilean workers discussing national and local aspects of BCG vaccination, it contains ten others selected and translated from European and American literature; among these are two by Dr Arvid Wallgren, the Swedish pioneer in this field, and one by Dr C. Guérin. A third section includes a detailed history of BCG vaccination in Chile from 1925 to 1948, a group of official documents relating to the campaign, and correspondence on the subject taken from the *British Medical Journal*. The number is illustrated, and English summaries are appended to many of the main articles.

*Minerva Chirurgica* (Turin), another member of the famous group, published fortnightly, is now in its fourth year. Vol. 4, no. 17, September 1949, contains articles on conditions associated with the right half of the abdomen (Professor G. Peracchia), pharyngo-oesophageal diverticula (P. L. Bruzzone), treatment of secondary haemorrhages (Dr M. Pittoni), a case of intestinal occlusion from ascariasis (Dr M. Romano), and Breitman's test for autonomic nervous function in postoperative and post-traumatic states (C. Scartozzi & G. Martinetto). A section of abstracts from current literature completes the issue.

The group of medical journals published by Edizioni Minerva Medica is further enlarged by the appearance of *Minerva Ginecologica* (Turin), vol. 1, no. 1, October 1949. This journal succeeds *Folia Gynaecologica* and *La Ginecologia*, the history of which is outlined in the introduction. Original articles include two on pneumo-amniography (Drs G. Vecchiatti and E. Robecchi), one on surgical treatment of retroflexion of the uterus by the Acconci method (Dr M. Repetti), and one on sympathectomy in painful pelvic syndromes (Dr G. Passera). There is also a section of abstracts from literature, a guide to journals of obstetrics and gynaecology, notes and news, and a section of "Varia" touching on medical aspects of history and art. Summaries in French, English and German of the original articles are grouped together at the end of the journal.

We have received two further volumes in the series *Colección Española de Monografías Médicas*, published by Ediciones BYP of Barcelona, under the direction of Dr J. Puig Sureda. Each of these volumes is a double number: the first (1949, no. 99-100), *Bronquitis crónicas*, is by Dr D. Antonio Marcos Barbero; the second (1949, no. 101-102), *Osteoperiostitis*, is by Dr D. V. Bosch Olives. As is usual in this series, each volume includes, in addition to the main monograph, a section of short original articles on a number of subjects under the heading: "Practical notes on diagnosis and treatment."

The Sociedad de Medicina del Deporte y del Trabajo and kindred organizations in Argentina celebrated the first national congress of industrial medicine in Buenos Aires in May 1948. Its proceedings were published in two volumes, separately paged, during 1949. More than 50 contributions are included, representing nutrition, physiology, legislation, vocational guidance, accident prevention, industrial diseases and toxicology, history of industrial medicine,

## THE ROYAL COLLEGE OF SURGEONS OF ENGLAND 1800-1950

A century and a half is not a long history for an English institution. Yet, though the Royal College of Surgeons of England, younger than its sister colleges in Edinburgh and Dublin, is this year celebrating only the third jubilee of its charter of incorporation, it is the direct successor of guilds and companies of London surgeons whose lineal ancestry may be traced back without a gap for more than five hundred years.

Towards the end of the eighteenth century the Company of Surgeons was neglecting its business. It had separated from the Barber-Surgeons, with high hopes for independent success, in 1745. But after half-a-century it became legally necessary to make a fresh start. The reformers decided to begin on new lines and, instead of renewing the Company, founded under Royal Charter the College which is now looking back over 150 years of good work. And now the College has re-equipped itself in the most recent years to play an ever more active and useful part in the medical world of the future.

The new College of 1800 inherited from its predecessor a house, 41 Lincoln's Inn Fields, to which the Company had intended to move from its Hall in the Old Bailey its records and such plate and pictures as had been collected since 1745, and, above all, John Hunter's museum, the charge of which had been entrusted to the Company by Parliament. Hunter, the greatest biologist and surgeon of his day, had died in 1793, but the museum was still in his executors' hands. The College also inherited the duties of arranging anatomy lectures, and of examining candidates for the practice of surgery in London and in the national armed Forces. Of these duties the old Company had neglected all but the examining. The new College has developed them immeasurably and undertaken many other important activities. Since the reform of 1843 it has held a truly national position as the Royal College of Surgeons of England, not merely of London as theretofore. Its Fellowship examination instituted at that time is generally recognized as the most honourable surgical examination in Great Britain, if not in the world, and has long attracted aspirants from the distant dominions.

Between 1800 and 1843 the College was very much alive. It had built itself a fine house and museum in 1813, and rebuilt on a more ample scale in 1835 the familiar building, later much extended, but badly damaged in 1941, which is soon to be restored in yet more splendid scope. The Museum had been displayed and developed, and a fine library rapidly collected, both under highly competent officers. But the constitution remained antiquated: all control was in the hands of a self-perpetuating Council, whose members were elected for life from the then small circle of the metropolitan hospital staffs. The good work done by the College could not silence the objectors in the 1830s, when reform was on every man's lips. Fortunately wise opinions prevailed within the Council, and at the instigation of G. J. Guthrie and others, with Benjamin Brodie as the active spirit, a new Charter was obtained in 1843, which established the Fellowship on the basis of an advanced examination

in the surgical sciences. It made the Council elective, reasonably curtailed its privilege and tenure, and as said above made the College a national instead of a local body. So far-sighted was Brodie that no fundamental change in the constitution has been found necessary. Supplementary charters have enabled the College to improve its methods and extend its field of work. A Licence in Dental Surgery was instituted in 1859. In 1883 it joined with the Royal College of Physicians in forming the Conjoint Examining Board to manage the qualifying examination (M.R.C.S., L.R.C.P.); and a number of special diplomas were soon introduced. Women were admitted to full equality within the College in 1926. Since the end of the war in 1945, Faculties of Dental Surgery and of Anaesthetists have been formed. By these reforms the College has grown a hundredfold in membership, and the members are being drawn more than ever into touch with active collegiate life.

Every national institution has a double history. It plays its part, through the distinguished men who give their counsel to its deliberations, in the affairs of the nation. It also has its domestic history in the work of its officials and scientific staff. The College of Surgeons has thus taken a prominent part throughout its history in promoting the education and maintaining the professional standards of surgeons, and in wider medical questions. But of the great surgeons who have filled the presidential chair only a few, such as Brodie or Moynihan or Lord Webb-Johnson, have left a lasting mark on its domestic history. The greatest member of the College Council, Lister, was never President, just as a century earlier John Hunter served on the Court of the old Company but never became Master of it.

The Hunterian Museum was designed by its founder to exhibit on a very extended scale a comparative survey of biological form and function. Hunter seems to have been the first man to conceive of surgery as the application of a knowledge of all living processes to the cure of disease. By the work of Richard Owen, conservator of the museum from 1842 to 1856 and assistant to William Clift for the previous fifteen years, Hunter's collections were reorganized and extended, and fully explained in a series of detailed and illustrated catalogues, which were constructive contributions to the advancing knowledge of physiology and pathology.

One of the conditions under which Parliament entrusted the Hunterian Museum to the care of the College was that Hunterian Lectures should be regularly delivered. Competition to deliver one or more of these lectures, on a topic submitted by the lecturer, has always been keen among rising surgeons of a scientific bent. They have been supplemented by continuous lecture courses and demonstrations of museum specimens given every year by the members of the College's scientific staff. Among these regular courses are the Arris and Gale lectures, delivered under endowments dating back to 1645 and 1507. Since 1946 the College has established an integrated system of postgraduate teaching, and has opened a Residential College in two houses adjoining the central College building. This is only a forerunner of the Nuffield College of Surgical Sciences which will before long rise from the bombed site at the other side of the College. The late war, which did irreparable damage to the Hunterian Museum in the disastrous air-raid of May 1941, provided opportunity for resurgence on an unprecedented scale, which has been seized and exploited by Lord Webb-Johnson, President 1941-49, with masterful foresight. The College has been fortunate in attracting princely endowments for its scientific work, as well as countless donations large and small towards the rebuilding fund, and gifts of specimens for the re-equipment of the museum, not only at home but from overseas.

## ANNOTATIONS AND NEWS

Continued from page 359

psychology, hygiene and welfare, absenteeism, women in industry, and evaluation of work. The report is well printed, and illustrated where appropriate.

\* \* \*

The following journals have also been received:

*Acta Societatis Medicorum Upsaliensis* (Stockholm), vol. 55, nos. 1 & 2, 1950

*Aparato Respiratorio y Tuberculosis* (La Paz, Bolivia), year 6, nos. 21-22, 23, 1949

*The Diabetic Journal* (London), vol. 5, no. 12, 1949

*Gaceta Médica de Lima* (Lima), vol. 4, no. 3, 1949

*Les Instantanés Médicaux* (Paris), nos. 1 & 2, 1949 & 1950

*Liječnički Vjesnik* (The Journal of the Medical Association of Croatia) (Zagreb), vol. 71, no. 3, 1949

*Revista de la Federación Médica de Guatemala* (Guatemala), year 3, nos. 14 & 15, 1949

*Szovjet Orvostudományi Beszámoló* (Budapest), vol. 1, no. 1, 1949

Two or three extended periods of great productivity stand out in the College's history in the past 150 years. In the first of these, besides Owen's work in the museum, mentioned already, rapid progress was made in the 1830s in collecting a library which should be a working tool for the College's staff and students, and a real academic storehouse of the records of surgical discovery through the ages. Fifty years later, at the time when periodical publications were beginning to proliferate, the library was thoroughly reorganized. When the College celebrated its centenary in 1900 it possessed one of the finest medical libraries in the country. In the succeeding decades it was outstripped by other libraries of wider scope. But by virtue of its rich resources, early laid down, in surgical classics and basic scientific periodicals it remains one of the premier centres of medical literature in the Commonwealth, and fills an important niche as the specialist library of anatomy and surgery among the many medical libraries which have grown up during the twentieth century. The Council has always encouraged its use by those scientists and students beyond the immediate circle of the College who can produce suitable evidence of their bona fides.

Scientific research has not been neglected. The range of Owen's work in comparative anatomy, in which he included the palaeontological evidence, is still unrivalled. Sir Arthur Keith's epoch-making work in evolutionary anthropology showed what value the insight of genius could derive from the Museum's vast osteological collections, which to others seemed a Golgotha. In more recent years the Buckston Browne Farm and the Bernhard Baron Laboratories, both managed by the College, have contributed to the elucidation of urgent surgical problems: the pioneer work on surgery of the heart by Laurence O'Shaughnessy, a victim of the war, may be quoted. For nearly fifty years the College has been jointly responsible with the Royal College of Physicians for the Imperial Cancer Research Fund, from whose laboratories a series of fundamental *Scientific Reports* has issued. The College itself publishes an *Annual Scientific Report*, and has from time to time issued many publications of scientific value, mostly in connexion with the Museum. Twenty years ago the record of past Fellows was published in *Plarr's lives of the Fellows*, 1843-1930, the work of a former librarian, Victor Plarr. Three years ago the monthly *Annals* of the College were inaugurated, and have already achieved popularity. This journal publishes the scientific lectures delivered at the College, as well as recording current activities and describing historic possessions. By domestic activity no less than by the leading part it plays in the surgical life of the Commonwealth, the College continues to promote, in the words of its Latin motto, "Arts useful to all."

## THE DIFFERENTIATION OF FUNCTION OF THE ANTERIOR AND POSTERIOR ROOTS

### Historical Background

When Robert Whytt (1714-1766) became Professor of the Theory and Practice of Medicine at Edinburgh, his old university, in 1747, he busied himself chiefly with physiological experiments, in the course of which he was the first worker to localize a reflex. He obtained lasting dilatation of the pupil by compression of the optic thalamus. Whytt also showed, by experiments on a frog, that an intact portion of the spinal cord suffices for a reflex.<sup>1</sup> Whytt gained prominence in Germany, Switzerland, and France because his theories on neurophysiology brought him into conflict with Albrecht von Haller (1708-1777) of Berne.<sup>2</sup> Fearing, in his history of reflex action, says of Whytt:

Though Descartes is frequently credited with being the originator of the doctrine of reflex action, this is based largely on his chance use of an analogy in support of his theory of the human body as a material machine directed by a rational soul . . . In contrast, Whytt, under involuntary motion, as a result of a penetrating psychological and physiological analysis, recognized a separate class of animal action.<sup>3</sup>

On the clinical side, Whytt is noted as the first to describe tuberculous meningitis.

Another Edinburgh professor, Alexander Monro *secundus* (1733-1817), who described the foramen in the brain, which bears

his name, pointed out that the ganglia of the spinal nerves are formed on the posterior roots and that the anterior roots possess no ganglia:

Instead of this, I have observed, that the posterior fasciculus only of the spinal nerve enters into the ganglion; and that authors have been deceived, by not having slit open the external coat of these nerves.<sup>4</sup>

But as yet there was no appreciation of the true function of the anatomical arrangement.

The first person to insist on the separate functions of the anterior and posterior roots was Alexander Walker (1779-1832),<sup>5</sup> a lecturer in anatomy at the extramural school.<sup>6</sup> He was a brilliant man, though an eccentric; an excellent linguist, his translation of the reports of foreign workers on his own subject (*Documents and dates of modern discoveries in the nervous system*, London, 1839) is unimpeachable.<sup>7</sup> Walker was naturally deeply perturbed when none of his time gave him credit for his speculations. He apparently based his inferences on purely anatomical evidence, however, and unfortunately he made one mistake—he thought the anterior root was sensory and the posterior one motor.

Charles Bell (1774-1842) was the first person to discover that the anterior roots were motor in function. He was the youngest son of an Episcopalian clergyman in Scotland and was devoted to his mother: ". . . for twenty years of my life," he wrote on one occasion, "I had but one wish—to gratify my mother and do something to alleviate what I saw her suffer." After studying medicine in Edinburgh, he took over his brother John's class in anatomy there, but in 1804, to avoid being caught up in the vendetta being waged against his brother by the Professor of Medicine, James Gregory, Charles Bell went to London to seek his fortune. It was, however, in the extramural school at Edinburgh that Bell's attention was first directed to the study of nerves.<sup>8</sup>

Charles Bell had a long way to go before he was knighted for his physiological discoveries, but already he had been not unsuccessful. As a student in Edinburgh he published *A system of dissections*, in two volumes (Mundell, Edinburgh, 1798-1803), illustrated by his own drawings. (It must have been very inconvenient to use on the dissecting table, because it is so large; but then perhaps the idea was to ensure that the student read the relevant section before starting work.) His *Essay on the anatomy and philosophy of expression* (London, 1806) was in after years so to captivate Queen Victoria's interest that she read it with rapt attention for two hours; whilst the Nabob of Arcot had a copy bound in red morocco and satin.

Bell, however, was determined to make a discovery as fundamental as Harvey's on the circulation of the blood. As early as 1807 Bell began to formulate the conceptions which were to bring him fame; and in 1810 he wrote to his brother George:

Next it occurred to me that all the spinal nerves had within the sheath of the spinal marrow two roots—one from the back part, another from before . . .

Experiment 1. I opened the spine and pricked and injured the posterior filaments of the nerves—no motion of the muscles followed. I then touched the anterior division—immediately the parts were convulsed.

Experiment 2. I now destroyed the posterior part of the spinal marrow by the point of a needle—no convulsive movement followed. I injured the anterior part, and the animal was convulsed.<sup>9</sup>

When Bell married in 1811 the young bride soon found that research on nerve function "was the important object of his life", and she tried to understand what he talked about. In this year Bell printed privately his *Idea of a new anatomy of the brain; submitted for the observations of his friends* (Strahan & Preston, London, 1811). Here he referred to the results obtained in the experiments described the year before in his letter to his brother. This pamphlet has been reproduced in full in *Medical Classics* (1936, 1, 105) and fairly fully in J. F. Fulton's *Selected readings in the history of physiology*.<sup>10</sup> The copy in the Library of the Royal College of Surgeons of England has a list of the persons to whom Bell sent his essay, copied from a list in Bell's own handwriting. This shows that he presented copies to John Abernethy, Matthew Baillie, Sir Astley Cooper, Dr. Burrowe of Philadelphia, and others. A transcript of a letter from the printers, also annexed to this copy, establishes that Bell had 100 copies printed at the end of August 1811. It is clear from the *Idea* that at this time Bell still adhered to the old doctrine of the "sensibility" and "insensibility" of nerves.

Since 1822, when Magendie first put forward his claim, there has been controversy as to whether he or Bell deserve credit for the discovery of the functions of the anterior and posterior roots. Béclard, a fellow countryman of Magendie, openly declared in 1884

that there was no doubt that Bell was the first to settle this question by experiment.<sup>8</sup> A more recent writer, Dr J. F. Fulton, however, states:

Though one hesitates to pass judgement upon claims of priority, one cannot doubt that Bell was dishonest and that the chief credit for elucidating the function of the posterior as well as the anterior roots belongs to Magendie. It will be observed that he had clearly in mind the principle of specific nerve energies.<sup>9</sup>

This judgement may be considered harsh. It does appear that Bell's experiments in 1810, published in 1811, were the first, and that they did provide an anatomical basis which had previously not been complete. Certain it is that they inspired Magendie's work. In 1821 Bell's assistant and brother-in-law John Shaw (1792-1827), before his teacher's fame had reached its height there, demonstrated some of the experiments in Paris.<sup>9</sup> In the following year the publication there of the results of Magendie's experiments on a litter of eight puppies<sup>10</sup> proved conclusively that the anterior roots are motor and the posterior ones sensory; this was further confirmed in the frog by Johannes Müller (1831), in the fish by Wagner (1846) and Stannius (1849), and in birds by Panizza (1834) and Schiff (1858).<sup>11</sup> The fundamental law of neurophysiology which states that a nerve fibre cannot be both motor and sensory should, perhaps, be called the Bell-Magendie Law.

In connexion with the controversy, it may be of interest to quote two Orations. One was delivered in 1843 by James Moncrieff Arnott; the other in 1935, by Professor Edwin Bramwell. Dr Arnott said:

There remains to Bell clearly and unequivocally the merit of having first shown that in investigating the functions of the nervous system, we must first direct our attention to the roots and not to the trunks of nerves. That the nervous trunks conveying motion and sensation consist of two distinct sets of filaments in the same sheath. That the filaments for motion form a distinct root from those of sensation; leaving it to be inferred that the posterior are for sensation . . . And lastly, of having been the first who, dissatisfied with the observation and study of the mere form of the various parts of the nervous system, applied the method of experiment to aid him in determining their function.<sup>12</sup>

In the words of Professor Bramwell he

. . . formulated a working conception of the nervous system when all was in a state of chaos, a conception which stands today and has served as a basis for all subsequent inquiry and progress.<sup>13</sup>

In 1833 Marshall Hall (1790-1857) introduced the conception of the spinal cord as a chain of segments whose functional units are separate reflex arcs. Marshall Hall's demonstrations of tonic closure of the sphincters by reflex action, of cessation of strychnine convulsions after destruction of the spinal cord, and of the fact that most reflexes are more readily elicited by stimulating the appropriate end-organs rather than their trunks, although appreciated abroad, were for a time the subject of bitter controversy in Britain.<sup>5</sup>

Sir Charles Bell always retained his early love for drawing and painting, in which he had great skill, as shown in his first book on dissections. Paintings which he made of war wounds at Waterloo hang in the Museum of the Royal College of Surgeons of Edinburgh. In 1842, while on a sketching holiday in Worcestershire, Bell died suddenly during the night. He was buried in the village churchyard at Hallow Park.

Alexander Walker had died ten years previously, still convinced that the anterior root was sensory and the posterior one motor.

#### PAUL EHRLICH

Dr Johnson straddles English literature partly because he was fortunate enough to have the perfect biographer; in this respect Paul Ehrlich was also fortunate. When he declared to his friends that for successful work there must be four "G's"—*Geduld, Geschick, Geld und Glück* (patience, ability, money and luck)—Dr Meyer, one of his assistants, replied: "If the first three are present and used properly the fourth 'G' comes by itself". The truth of Dr Meyer's reply will be evident to the reader of Martha Marquardt's book.<sup>1</sup> By his faithful use of the first three "G's" Paul Ehrlich created for himself the fourth "G"; he provided Martha Marquardt with the opportunity to watch, to work, and to worship, and out of that association has grown a biography which is almost Boswellian in its faithful detail.

#### PAUL EHRLICH 1854-1915

Acknowledgements to William Heinemann Medical Books Ltd.

To the world at large, Ehrlich is simply the man who discovered salvarsan (606), a cure for syphilis. His claim to fame as a scientist goes much deeper. True, he discovered a number of useful remedies, but so have others whose names are now almost forgotten. Paul Ehrlich was the leader, almost the crusader, in a new branch of medical science which has added to the armamentarium of the practitioner many drugs which are now almost taken for granted as a natural heritage of man. Indeed, looking back to the decades before Ehrlich published his first papers, one wonders what the practitioners did beyond awaiting the natural outcome of a disease; take away serum therapy, arsenicals, antimonials, basic dyes, alkaloids, sulphonamides and antibiotics, and what is left?—a bare medical chest, indeed, for the treatment of microbial infections.

Ehrlich's theories on the mode of action of antibodies and drugs were attacked during his own time, and since, on the grounds that they were too naive or too pictorial; but it is evident from his own writings, and even more clear from Miss Marquardt's book, that he was endowed with more than an ordinary capacity for visualization of his problems. Although this tempted him to explain his theories in highly pictorial terms, it was also this characteristic which enabled him to direct research in the complex field of organic chemistry and to wed it so successfully to biological research.

<sup>1</sup> For particulars, see p. 394.

The fundamental problem which faces the student of chemotherapy today is selective toxicity. Why is penicillin or chloromycetin able to destroy infecting micro-organisms without showing any appreciable toxicity towards the host cells? We find the problem stated by Ehrlich in somewhat different terms: "It is quite evident that only those substances in which the organotropism and parasitotropism stand in a well-balanced relation to each other can be used in practical medicine as curative substances." It is easy to imagine how excited Ehrlich would have been over the recent discoveries in intermediary metabolisms and comparative biochemistry which begin at last to provide a clue that may solve the riddle.

Interwoven with the picture of Ehrlich the scientist is the picture of Ehrlich the man, and how vivid a picture Miss Marquardt has achieved! She has presented to us an autocrat, intolerant of criticism; a man of childlike simplicity; a lovable, generous and gentle soul devoted with a passionate singleness of purpose to a cause—the cause of science. It would have been easy for Miss Marquardt to gloss over some of the less likeable characteristics of her "chief" and still to have given us a moving picture of a great man; but instead she had the faith that the weaknesses were as essential to a genuine representation of Paul Ehrlich as the rest, and how right she was! This, we feel, is the true likeness of the man, and in its truth still great.

On one point only do I wish to dispute. On page 176 Miss Marquardt states that "606, like all the other substances previously prepared, was invented by Ehrlich *alone*." The italics are not mine. No scientist works in mental isolation; none of his ideas are due to himself alone, particularly when these ideas are worked over by a team such as that which Ehrlich led; and yet after reading this book one wonders, might not Paul Ehrlich himself have made such a claim?

Sir Henry Dale has written a valuable introduction, and while Miss Marquardt makes no attempt to deal with the scientific aspects of Ehrlich's contribution to medicine, she has admirably succeeded in producing a truly fascinating study of the workings of the mind of a great man.

1546

## WILLIAM HARVEY

It is safe to say that more has been said and written about William Harvey than about any other great figure in medicine, save only Hippocrates. Many writers have attempted an evaluation of his contributions to science; the effect of his discovery of the circulation of the blood has been fully studied. The comparatively little material available on the personality of Harvey has now been augmented by Mr Geoffrey Keynes, who has devoted his Linacre Lecture<sup>1</sup> to this subject. Mr Keynes has briefly but skillfully outlined Harvey's career and has at the same time attempted to re-discover his personality by a critical examination of the several portraits in existence, the opinions of Harvey's contemporaries, and the words and acts of the man himself. In discussing the iconography of Harvey, Mr Keynes speaks with authority, for in his Thomas Vicary Lecture for 1948 he gave a full account of the existing portraits, bringing some order to the confusion that had existed regarding them. The present scholarly work is a fitting complement to it and a small but valuable addition to the vast literature on Harvey.

# MEDICINE

## 1547 A Synopsis of Medicine

Henry Letheby Tidy. Ninth edition, revised and enlarged. Bristol: John Wright & Sons Ltd., 1949. xx + 1,243 pages. 19 x 13 cm. £1 10s. [£1.5]

(i) Specific infectious diseases; (ii) diseases due to physical agents; (iii) the intoxications; (iv) diseases of metabolism; (v) diseases of deficiency; (vi) diseases of the digestive system; (vii) diseases of the circulatory system; (viii) diseases of the respiratory system; (ix) diseases of the kidney and urinary tract; (x) diseases of the blood and spleen; (xi) diseases of the endocrine glands; (xii) diseases of the muscles, joints, and bones; (xiii) diseases of the nervous system. Index.

Of the many synopses available to the English-speaking medical student or postgraduate, "Tidy" holds pride of place. That it does so is due to the fact that it almost certainly contains within its covers more information than any other single-volume textbook of internal medicine. To criticize the new edition seems like sacrilege, but there are a few points which appear to merit discussion. On the diagnostic side, there is indeed little to quibble about. The clinical descriptions of disease are nearly always adequate and often encyclopaedic. The classification is beyond reproach. But it is otherwise with the sections on treatment. The author occasionally enters into the general conspiracy of writers of textbooks on internal medicine to conceal many useful points in modern therapy from the student. Thus, he does not mention surgery for hypertension or for portal cirrhosis; pneumoperitoneum for pulmonary tuberculosis, theophylline in status asthmaticus, and sulphamide prophylaxis of acute rheumatism are also passed over in silence. The statement that colectomy is contra-indicated in Hirschsprung's disease is diametrically opposed to Aird's experience. One has the impression that colchicine is more frequently used for gout than the older tincture of colchicum, and that phenobarbitone should be mentioned before the bromides in epilepsy. It is not sufficiently emphasized that in thrombo-angiitis obliterans the first thing to do is to stop the patient's smoking. No mention is made of the distinction between granuloma inguinale and lymphogranuloma venereum.

We are sorry to see that the London Hospital work on type I and type II nephritis is ignored, as is the concept of high-output and low-output cardiac failure. Errors are of course very few. We note "Hering-Breuer" for "Hering-Breuer" on p. 643 and "Harrington" for "Harrington" on p. 920.

In conclusion, the reviewer must confess that he has bought the last five editions of this book, which he regards as unrivalled for rapid reference.

S. S. B. Gilder

## 1548 The British Encyclopaedia of Medical Practice, Including Medicine, Surgery, Obstetrics, Gynaecology and Other Special Subjects. Medical Progress 1948

Edited by Horder. London: Butterworth & Co. Ltd. [1948] v + 511 + 28 pages; 5 figures. 25 x 17 cm. £1 10s. [£1.5]

Part I. Critical surveys. (i) Medicine; (ii) surgery; (iii) obstetrics and gynaecology; (iv) paediatrics; (v) cardiology; (vi) chest diseases; (vii) acute infectious diseases; (viii) aviation medicine; (ix) industrial medicine; (x) forensic medicine; (xi) psychological medicine; (xii) tropical medicine; (xiii) chemical pathology; (xiv) progress in vitamins. Part II. Drugs. (xv) Recent developments in pharmacology and therapeutics. Part III. Abstracts. (xvi) Abdominal pain and acute abdominal emergencies—yaws. Index.

For those to whom this annual favourite is unknown, it may be said that it is designed to supplement the information in the encyclopaedia which appeared just before the war. The record of progress is divided into three parts: a series of critical surveys of the most interesting topics of the year, a short section on new drugs, and a selection of abstracts of important articles which have appeared within the previous 12 months. In the present volume, a survey of the abstracting section suggests that no important paper has been overlooked. In the critical surveys, emphasis is on clinical work, and practically every section holds something of interest to the keen general practitioner. Special mention may be made of the brief but informative sections on medical and surgical aspects of hypertension and peptic ulcer, while the physician, surgeon and obstetrician all discuss the problems of thrombosis,

with reference to anticoagulant therapy. The sections on paediatrics and cardiology should be of great interest to all clinicians. There is a good discussion of salient advances in aviation medicine since 1941, and an article on forensic medicine in which the writer has wisely not attempted to cover recent literature, but has filled the space at his disposal with hints for the practitioner suddenly forced into the role of forensic expert *malgré lui*.

S. S. B. Gilder

## 1549 Traité de Médecine. Volumes VIII, X & XI

Edited by A. Lemierre et al. Paris: Masson & Cie, 1948.

Volume VIII: Maladies du foie et du pancréas. 1,166 pages; illustrations. 25 x 17 cm. 2500 fr. Volume X: Maladies du coeur. 1,167 pages; illustrations. 25 x 17 cm. 3600 fr. Volume XI: Maladies des vaisseaux. 545 pages; illustrations. 25 x 17 cm. 1400 fr.

Volume VIII: Maladies du foie. (i) Sémiologie physique du foie, radiologie hépatique; (ii) exploration fonctionnelle du foie. I. Les syndromes hépatiques; (iii) L'insuffisance hépatique; (iv) le syndrome d'hypertension portale; (v) les ictères. II. Maladies hépatiques. (vi) Les foies congestifs; (vii) les cirrhotiques; (viii) la maladie de ; hépatites ; toxiques; (ix) les dégénératives; (xii) ; les parasitaires; (xvi) les abcès du foie; (xvii) les kystes hydatiques du foie; (xviii) les tumeurs du foie; (xix) les affections vasculaires du foie; (xx) la leptospirose à spirochaeta ictero-hémorragique; (xxi) leptospirose grippo-typhosique et canaliculaire. III. Les affections biliaires. (xxii) Moyens d'exploration des voies biliaires; (xxiii) les troubles fonctionnels de la vésicule et des voies biliaires (dyskinésies biliaires); (xxiv) les cholécystites aiguës non lithiasiques; (xxv) les cholécystites chroniques non lithiasiques; (xxvi) la lithiase biliaire; (xxvii) les angiocholites aiguës et chroniques; (xxviii) traitement chirurgical de la lithiase biliaire et de ses complications; (xxix) les cholécystites; (xxx) les cancers des voies biliaires. Maladies du pancréas. (i) Sémiologie du pancréas; (ii) pathologie du pancréas; (iii) indications chirurgicales dans les pancréatites aiguës, chroniques et les tumeurs du pancréas.

Volume X: (i) Examen du cardiaque. I. Sémiologie cardiaque. (ii) Sémiologie cardiaque fonctionnelle et exploration fonctionnelle du coeur; (iii) sémiologie cardiaque clinique; (iv) sémiologie radiologique cardio-vasculaire; (v) la phonocardiographie; (vi) cardiographie et phlébographie en clinique; (vii) électrocardiographie; (viii) troubles du rythme cardiaque. II. Maladies du coeur. (ix) Les cardiopathies congénitales; (x) les cardiopathies acquises; (xi) les endocardites aiguës; (xii) troubles valvulaires chroniques; (xiii) affections du péricarde; (xiv) affections des artères coronaires, les angines de poitrine; (xv) les maladies du myocarde; (xvi) traitement médical des cardiopathies. Les médicaments à action myocardique; (xvii) indications du traitement chirurgical dans les maladies du coeur, du péricarde et des vaisseaux.

Volume XI: (i) Méthodes d'examen et sémiologie vasculaire; (ii) les syndromes d'hypotension artérielle; (iii) l'hypertension artérielle expérimentale; (iv) l'hypertension artérielle. Étude clinique et thérapeutique; (v) traitement chirurgical de l'hypertension artérielle chronique; (vi) les maladies de l'aorte; (vii) maladies de l'artère pulmonaire. The list of collaborators shows that there are many distinguished contributors to this series and indicates that it has the wide support of French medicine. The printing and production are excellent and the price is much lower than that of similar English and American books. This is a considerable virtue, for no highly priced encyclopaedia is likely to sell nowadays. An encyclopaedia is unavoidably uneven, for the contributors must be numerous, if each is to be expert in his subject; also, it must soon fall out of date, since knowledge advances so rapidly. For these reasons it is tending more and more to be replaced by the review and the monograph.

The only satisfactory way to review an encyclopaedia is to use it for a time as a reference book in one's daily work. When a book is frequently consulted in this way on the actual problems of diagnosis, treatment and teaching, its real value as a tool at the work-bench can be estimated. This test is extremely difficult to apply to the volumes under review because they are not indexed and the tables of contents are not sufficiently informative. This is normal French practice but it seems to be a bad one. Another major difference between this French treatise and Anglo-American literature is the differentiation of variants of diseases as separate syndromes and the preservation of eponyms for these syndromes. If we study any common disease, such as ulcerative colitis or disseminated sclerosis, we find that the course and prognosis vary with such factors as the onset and evolution of symptoms and the particular manifestations. In France there seems to be a tendency to crystallize these different manifestations under special titles, whereas in England we are more impressed by the underlying unity of the disease process. These two factors, the absence of an index and the isolation of unfamiliar

syndromes, make this encyclopaedia difficult reading for an English reviewer.

The difficulties are especially great in volume VIII, which deals with the liver and the pancreas. The opening pages describe methods of examination, including radiology and liver function tests, hepatic insufficiency and portal hypertension. One would have appreciated a more general discussion of the anatomy, physiology and biochemistry of the liver, and its role in health and disease, on lines such as McNee, McMichael and Himsworth have followed in Great Britain. Icterus is described almost entirely in clinical terms and there is repetition of much the same material under icterus and hepatitis. In consequence, newer work, such as the advances in knowledge of haemolytic disease of the new-born and of infective hepatitis, is dismissed too briefly. The recognition of the frequency and importance of "inoculation jaundice" is one of the major discoveries of the last decade, but little is said in this book about the relationship of catarrhal jaundice and infective hepatitis on the one hand and post-arsenical jaundice and serum jaundice on the other, or about the differences in symptoms and severity, the variation in communicability and in infectivity of stools, naso-pharyngeal secretions, etc., or the degree of immunity and cross-immunity conferred. In cirrhosis, it is possible that English and American authors have oversimplified the problem, but no such reproach can be made against this volume, which describes three different varieties of tuberculous cirrhosis, in addition to devoting a chapter to tuberculosis of the liver.

It is a relief to pass on to the later sections, where well-defined pathological entities are clearly described. There is a magnificent account of leptospirosis. In relation to the biliary tracts and the pancreas, there is a full discussion of accessory methods of examination, including not only biliary drainage and cholecystography but also angiography and biliary radiomanometry. It is interesting to compare this whole volume with volume III of Bockus' *Gastro-enterology* (1946). Bockus and his collaborators give a much more up-to-date and succinct account of the liver, whereas there is little to choose between the two in relation to biliary tract and pancreas; in fact, one supplements the other.

Volume X contains an account of heart disease on more or less familiar lines. There are excellent accounts of radiology of the heart, electrocardiography and phonocardiography. Angiography and cardiac catheterization are mentioned incidentally but no full-dress discussion of their effect on modern views on the etiology, diagnosis and treatment of heart failure is given. Volume XI contains only 550 pages as compared with over 1,100 in each of the other two volumes. There are full descriptions of vascular hypotension and hypertension, though unilateral renal disease and suprarenal tumours receive less attention than they deserve. Disease of the peripheral arteries is also perhaps treated more briefly than its growing importance merits. This volume is less fully illustrated than volumes VIII and X; throughout the series, the illustrations are of high quality and the radiographs excellently reproduced.

## 1550 Bedside Diagnosis

Charles Mackay Seward. Edinburgh : E. & S. Livingstone Ltd., 1949. xii + 372 pages; illustrations. 19 x 12 cm. 17s. 6d. [£0.875]

(i) Psychogenic symptoms; (ii) some general considerations regarding pain; (iii) head pain; (iv) thoracic pain; (v) epigastric pain; (vi) umbilical pain; (vii) hypogastric pain; (viii) lateral abdominal pain; (ix) anaemia; (x) epistaxis; (xi) haematemesis; (xii) haematuria; (xiii) haemoptysis; (xiv) cough; (xv) dyspnoea; (xvi) tachycardia; (xvii) dysphagia; (xviii) vomiting; (xix) diarrhoea; (xx) jaundice; (xxi) debility and loss of weight; (xxii) pyrexia. Index.

This useful book "was begun in India in 1945 as a distraction from the burden of the day and the heats", and occupied the spare time of the author for the ensuing four years. Its purposes are to help the medical student in his efforts to develop the art of diagnosis, and to assist the practitioner in so organizing his knowledge that he will bring it the more effectively to bear where it is most needed—at the bedside. The carefully considered plan of the book largely succeeds in gaining these objectives. After a brief introduction, short chapters are devoted to psychogenic symptoms and to general considerations regarding pain. Each successive chapter

then deals with a single main complaint or symptom. There is first a synopsis of its possible causes, then a discussion of its physiology and a more detailed consideration of etiology, followed by a discussion of the routine of examination and investigation which should lead to correct diagnosis.

The work underlines the mental processes which should take place in the physician's mind as he considers his case; it serves as a portable guide to differential diagnosis. One can only agree that more mistakes are due to failure to apply knowledge than to ignorance; in helping to guard against such failures the book will have its greatest value. The plan of the book, however, is not without its pitfalls; many diseases must of necessity fall under several chapter headings, and this leads to a plethora of cross-references and an interrupted and repetitive description of the various syndromes. The brevity of the book, a sine qua non of its purpose, exacts its toll of dogmatic statements which perhaps would benefit from qualification. Complaints of the extremities are not dealt with, arthritis is barely mentioned, and the syndrome of the extruded intervertebral disk escapes notice. This is regrettable, in view of the frequency with which the practitioner is confronted with the problem of the differential diagnosis of low back pain.

But these criticisms, after all, are minor; a great deal of useful information has been compressed into small compass, and the book is one to read and use as a practical manual rather than as a work of reference. Certain it is that the practitioner who absorbs and applies its teachings will find his approach to his patients at once more direct and more effective than before; the student will here find the answer to that frequently vexing question, "What should I do, or ask, next?" Dr Seward is to be congratulated on having written a book which should rapidly establish itself as a favourite.

D. F.

## 1551 An Index of Treatment, by Various Writers

Edited by Robert Hutchison, assisted by Reginald Hilton. Thirteenth edition. Bristol: John Wright & Sons Ltd., 1948. xi + 972 pages; 100 figures. 25 x 17 cm. £4 4s. [£4.2]

The object of this 40-year-old favourite is clearly set out in the preface. It is designed to supply the practitioner or general handyman of medicine with sound practical advice on the treatment of any condition—medical, surgical, gynaecological or obstetric—with which he may be confronted. For convenient reference articles are arranged alphabetically; they are contributed by a number of well-known British specialists. The advantage of such a book to the more self-reliant practitioner is clear. Where the contributor considers that an intelligent general practitioner could administer the necessary treatment himself, such treatment is described in detail. Where it is obviously beyond his powers, only the principles of therapy are discussed.

The inevitable drawback to such a book is of course the immense difficulty in editing. This drawback is sometimes evident in the present edition. Some contributors have given an excellent up-to-date account of their subject; others have allowed dead wood to remain. Thus, some drugs, such as iron, quinine and purgatives, appear in circumstances which would surprise the modern pharmacologist. It is difficult to believe that iodides arrest hypertrophy of the breasts, or that small doses of quinine help to clear up Eustachian catarrh. Occasionally, a diet recommended bears little relation to present-day food supplies in Britain. A notable omission is the fenestration operation for otosclerosis, which is surely worthy of notice by the most conservative.

Fortunately, the majority of the articles of importance to the general practitioner are full of sound advice. It is difficult to select for praise, but the reviewer was impressed by those on diabetes, mental deficiency, insomnia, the psychoneuroses and anorexia nervosa; on the surgical side the articles on head injuries, fractures, foreign bodies in the air passages, and, of course, the contributions by Hamilton Bailey and Denis Browne, are of the greatest value.

This work, and its companion volume on differential diagnosis, would go far to equipping an isolated practitioner with the knowledge necessary to his efficiency.

S. S. B. Gilder

## 1552 Early Recognition of Disease

Edited by Heneage Ogilvie & William A. R. Thomson. London: Eyre & Spottiswoode Ltd., 1949. (The Practitioner Handbooks.) 134 pages. 22 × 14 cm. 10s. 6d. [£0.525]

(i) Heart disease; (ii) respiratory disease; (iii) neurological disease; (iv) digestive disorders; (v) diseases of the blood; (vi) renal disease; (vii) endocrine disease; (viii) diseases of the eye; (ix) orthopaedic disabilities; (x) non-specific arthritis in adults; (xi) malignant disease; (xii) mental disorders; (xiii) the complications of pregnancy; (xiv) diseases of childhood. Index.

In the early years of medical practice there is a gradual blurring of the sharp outlines of knowledge acquired before qualification; in too many medical careers, symptoms which elicited an almost automatic diagnostic response in the student and house-physician gradually lose their effectiveness as stimuli. Hard-driven, for the most part, and immersed in everyday routine, the general practitioner of ten or a dozen years' standing can avoid or delay this process only by constant revision; and constant revision of the reasonably well-known is a difficult and unrewarding occupation. There is therefore a need for volumes such as this, which presents the views of 15 authorities in less than 125 pages. Each contributor has written a short essay summarizing the facts which should be in the minds of those who see disease in its early stages.

Crighton Bramwell writes on heart disease; his warnings against attributing symptoms to non-existent cardiac lesions in cases of neurocirculatory asthenia are very much to the point, and his statement that even patients with organic heart disease may develop symptoms on a neurotic basis is apposite. The article on neurological disease, by Macdonald Critchley, analyzes the common signs and symptoms attributable to organic disease of the nervous system in very brief compass, and should be of considerable value. The author makes a useful division of these into groups which do not necessarily, which usually, and which almost always, connote organic disease.

The contributions by John F. Wilkinson, "Diseases of the blood", and by Robert Platt, "Renal disease", should be of considerable assistance in differential diagnosis. Ian Lawson Dick and Sir Reginald Watson-Jones have collaborated to produce a useful short article dealing with the more common types of orthopaedic disability, and H. Gardiner-Hill has written on the early diagnosis of the metabolic group of endocrine diseases. There are nine other articles in the symposium which together cover most of the fields with which the general practitioner is concerned.

There is little room for criticism in the case of authors of such calibre, but one feels that the project has been a trifle ambitious for such a small book. Six pages on diseases of childhood by Professor Alan Moncrieff are well worth reading, but one feels that sixty pages would be more appropriate; it is difficult for even such a master to avoid the trite, and impossible, in such brief compass, to develop points worth expanding. The other articles share this handicap of undue brevity. In spite of this, however, there are few general practitioners who would not benefit from perusing this volume. It has, of course, been produced as a Practitioner Handbook and not in any sense as a work of reference.

## 1553 Diseases of Children. Volume II

Edited by Donald Paterson & Alan Moncrieff. Fourth edition. London: Edward Arnold & Co., 1949. vii + 1033 pages; 380 figures. 23 × 15 cm. £2

(i) Organic diseases of the nervous system; (ii) functional disorders of the nervous system; (iii) congenital mental defect in childhood; (iv) diseases of the eyes; (v) diseases of muscles; (vi) diseases of bones and joints; (vii) orthopaedic surgery; (viii) medical diseases of the genito-urinary system; (ix) surgery of the uro-genital system; (x) diseases of the liver, gall bladder and pancreas; (xi) diseases of the peritoneum; (xii) rheumatism; (xiii) diseases of the cardiovascular system; (xiv) blood disorders; (xv) infectious diseases; (xvi) venereal disease; (xvii) diseases of the skin; (xviii) malignant disease in children. Index.

The second volume of Garrod, Batten & Thursfield's *Diseases of children*, edited by Paterson & Moncrieff, includes the work of 24 contributors. Fifteen of these are on the staff of the Hospital for Sick Children, Great Ormond Street, London, so that the book represents the teaching of the London Institute of Child Health.

The two volumes of *Diseases of children* comprise the most up-to-date and detailed British textbook of paediatrics available. Vol. II, like Vol. I, is very well produced on good paper, the print is satisfactory, and the clinical photographs and photomicrographs are excellently reproduced. The x-ray reproductions, however, as is

usually the case, lack definition and detail. The amount of space given to each subject corresponds to its importance: the volume is packed with accurate factual information, and the index is reliable—points of paramount importance in a textbook. From the point of view of the would-be examinee it is regrettable, however, that no clinical photograph could be found to illustrate each of the rarer congenital bone abnormalities mentioned in the text.

Two major criticisms can be made of the book. One is of the references: those given at the end of each chapter are sadly inadequate, often of startling antiquity, and many authors' names, mentioned in the text, are searched for in vain among them.

The second criticism concerns the whole conception of the work. In its present size, it is too detailed for the undergraduate, yet neither text nor references are adequate for a reference book, to be used by the postgraduate student or the specialist. Surely there is room for a really exhaustive, standard British work on paediatrics, to be placed beside the great Continental and American systems.

## 1554 An Epitome of the Laboratory Diagnosis and Treatment of Tropical Diseases

Horace M. Shelley. Second edition. London: Staples Press, 1949. 147 pages; illustrations. 22 × 14 cm. 10s. 6d. [£0.525]

(i) Examination of the blood; (ii) blood diseases in the tropics; (iii) protozoal diseases; (iv) virus diseases; (v) the dysenteries and liver abscess; (vi) bacterial diseases; (vii) nutrition and deficiency diseases; (viii) climatic diseases; (ix) snake poisons and myiasis; (x) miscellaneous diseases; (xi) diseases due to fungi; (xii) diseases due to helminths; (xiii) compendium of drugs; (xiv) laboratory notes. Index.

This book is meant to "supply the busy practitioner of medicine in the tropics with simple details concerning the essentials of laboratory diagnosis and the treatment of diseases common to those climes. All mention of symptomatology and clinical signs is avoided . . ." This unusual combination of pathology and treatment is worked out in 14 very short sections, including those on examination of the blood, blood diseases in the tropics, protozoal diseases, virus diseases (this includes Bartonella infection), the dysenteries and liver abscess, bacterial diseases, nutrition and deficiency diseases, climatic diseases, snake poisons and myiasis (an odd mixture), miscellaneous diseases, diseases due to fungi and diseases due to helminths (in which are included lamblia and balantidiasis!). Laboratory notes include a list of requirements for the establishment of a small laboratory.

Some of the accounts of laboratory procedures are clear and straightforward and may be useful to general practitioners who have to do their own clinical pathological investigations. The rough sketches accompanying certain sections are, however, very crude and serve no useful purpose. The notes on the interpretation of results are sometimes misleading, and there are many points on which the reader may find himself in conflict with the author. For instance, Giemsa or Leishman stains only are recommended for staining blood-films in malaria. Rapid methods of staining now in common use, such as Field's, are referred to in the section on examination of the blood, but not in that on malaria. There is no mention of the importance of serological reactions in the diagnosis of yaws, or of serial serological examination for immune bodies in cases of suspected yellow fever. The details of the cultivation and differentiation of dysenteric bacilli are surely outside the stated scope of the book, quoted in the first sentence of this review. Needling of an amoebic abscess as a method of diagnosis is recommended, apparently without reserve. The inclusion on p. 104 of "Increase of haemoglobin to 110 with polycythaemia" as a pathological feature of "heat stroke" is thoroughly misleading and not accompanied by any explanation or qualification.

The sections on treatment are not always easy to follow, and the advice given may be questioned in places. The author's statement regarding paludrine is quoted: "It is considered superior to all other anti-malarial remedies and a single dose of 100 mg. has proved efficient in stopping clinical attacks of malignant tertian and benign tertian malaria." The dosage of mepacrine recommended for the treatment of the "uncomplicated case of acute malaria" (species unspecified) is lower than that in general use.

In blackwater fever the author recommends that "the patient should imbibe large quantities of fluid . . ." He does not stress the importance of maintaining a fluid balance, and the dangers of excessive fluid intake are not mentioned. Judging by his further recommendations in the treatment of blackwater fever, the author

does not adhere to any of the modern views of its pathogenesis. Twenty grains of sodium bicarbonate given every two hours during the first day (in Sternberg's mixture) "... renders the urine alkaline." Caffeine sodium citrate "can be used as a diuretic." Finally: "Antimalarial remedies should be withheld, for the damage has already been inflicted and at this stage the ordinary remedies are useless." The reviewer disagrees on every count, and believes he is in good company. Alkali will not always render the urine alkaline, particularly when the kidneys are already damaged; ordinary diuretics are of no value; antimalarial drugs other than quinine must be used if parasites are present in the peripheral blood.

B. G. Maegraith

## 1555 Bright's Disease

Henry A. Christian. New York : Oxford University Press ; London : Geoffrey Cumberlege, 1948. (Reprinted from Oxford Loose-Leaf Medicine with the same page numbers as in that work.) vi + 385 + 13 pages ; 40 figures. 24 x 16 cm. £2 5s. [£2.25]

Part I. General considerations. (i) Introduction; (ii) historical; (iii) normal renal structure and function; (iv) protein in urine (albuminuria); (v) casts and cells in the urine; (vi) blood chemistry; (vii) etiology; (viii) pathogenesis of renal lesions of Bright's disease; (ix) pathology; (x) pathological physiology; (xi) method of examining the patient with Bright's disease; (xii) clinical classification. Part II. Clinical aspects. (xiii) Introduction; (xiv) acute Bright's disease; (xv) acute Bright's disease, hemorrhagic type or type without nephrotic syndrome (acute hemorrhagic Bright's disease); (xvi) acute, subacute and chronic edematous Bright's disease, nephrotic type (nephrotic syndrome of Bright's disease); (xvii) subacute and chronic hemorrhagic Bright's disease; (xviii) chronic non-edematous Bright's disease; (xix) certain special syndromes of Bright's disease. Bibliography. Index.

In this book the distinguished Professor of Medicine at Harvard University gives his mature views on diseases of the kidney, which has been his principal subject of study for 47 years. There is a preliminary section of 138 pages which deals competently with the anatomical, pathological and physiological problems. Of special interest is the method of classification of nephritis. This is based on clinical rather than pathological and etiological criteria. It is not claimed that it is ideal but that it has the advantage of ease for clinical use and foretells with considerable accuracy how the disease will progress. The main divisions are: (i) acute Bright's disease, haemorrhagic type or type without nephrotic syndrome; (ii) acute, subacute and chronic edematous Bright's disease, nephrotic type; (iii) subacute and chronic haemorrhagic Bright's disease, and (iv) chronic non-oedematous Bright's disease. The text indicates that division (i) includes substantially all acute cases with or without oedema, the cases in division (ii) being subacute or chronic. This classification obviously cuts across the pathological basis to which we are accustomed.

Each section contains a number of illustrative cases reported in sufficient detail and so clearly that one can readily visualize the clinical appearance. It is of interest to observe how closely these cases fall into the appropriate division of the system of classification adopted. It might be unwise for an unqualified student in Great Britain to follow this method of classification. But to the postgraduate student, or to those who pay special attention to nephritis, the book is of the highest value. The statements in the text are based on a lifetime of study and observation. Any intelligent reader can reclassify the types as he pleases without affecting the material presented in the pages.

The text is clearly written and is easy to read and comprehend. The printing and paper are good, though there is a misprint on page 640 (3). The price seems somewhat high.

Henry Tidy

## 1556 Arterial Hypertension

David Ayman. Edited by Henry A. Christian. New York : Oxford University Press ; London : Geoffrey Cumberlege, 1948. (Reprinted from Oxford Loose-Leaf Medicine with the same page numbers as in that work.) iv + 93 + 2 pages. 24 x 16 cm. 12s. 6d. [£0.625]

(i) Introduction; (ii) history; (iii) etiology; (iv) pathological physiology; (v) pathology; (vi) constitutional type in hypertension; (vii) symptoms; (viii) evolution of essential hypertension from earliest stages; (ix) physical findings; (x) X-ray studies; (xi) electrocardiograms; (xii) other laboratory data; (xiii) differential diagnosis; (xiv) treatment. Bibliography. Index.

The experience of the last 15 years in the experimental production of hypertension in laboratory animals, and in the efforts to treat hypertension in man by such drastic procedures as lumbodorsal

sympathectomy, has led to a tremendous advance in our fundamental ideas of the nature of this most important, common, and intriguing condition. For those practitioners who wish to understand the modern outlook the monograph under review will form an excellent primer. It is impossible in some ninety pages to cover the whole subject of hypertension adequately. Dr Ayman succeeds, however, both in giving a balanced account of some of the more outstanding contributions to knowledge in recent years and in conveying appropriate instructions for the investigation and care of the hypertensive patient. The reader will find in this book full accounts of the part played by heredity, the nervous and psychological make-up of the patient, and the more measurable underlying organic faults such as the Goldblatt kidney and varied endocrinological disturbances. Body-build, racial factors, and the like are all given their proper place.

One or two matters of practical management, however, may seem strange to British readers. The author has been partly responsible for the habit of instructing patients, or members of their family, to take their own blood-pressures, and in one section of the book there is considerable discussion of the value of these "home readings". We should doubt whether such efforts on the part of the patient are for his benefit. In certain susceptible individuals they would undoubtedly do a great deal to increase the apprehension and misery of the patient. Sympathectomy is critically reviewed but the author is obviously a little biased in its favour. Taken by and large, this procedure has been a disappointing one, and we still do not know how to select the occasional case which admittedly does have a favourable response to the operation. Ayman thinks that the operation may do good even if it only abolishes the rises of blood-pressure which occur with emotion and excitement. The rice diet is discussed somewhat briefly, but perhaps this is of little importance, as enthusiasm for this line of therapy is as likely to wane with the years as enthusiasm for sympathectomy. It is curious to see it included under the heading of "Ineffectual forms of treatment". Treatment with potassium thiocyanate is recommended. A good deal of trouble has to be taken to control the blood-levels of this substance and it seems doubtful if the gain is worth the effort.

These, however, are minor criticisms in what is a useful and well-balanced monograph. We must admit that there is as yet no satisfactory treatment for this distressing condition and whatever line is taken by an author in a clinical publication is always open to easy attack. Dr Ayman has succeeded well in his task and no doubt when he writes the section again for a future edition the instructions on the care of patients will differ widely from those which are given in the present monograph.

J. McMichael

## 1557 An Introduction to Cardiology

Geoffrey Bourne. London : Edward Arnold & Co., 1949. viii + 264 pages ; 65 figures. 22 x 14 cm. 18s. [£0.9]

Section I. Examination of the heart. (i) History-taking and physical examination; (ii) special methods of investigation. Section II. Heart failure. (iii) The nature of heart failure; (iv) the symptoms of heart failure; (v) the signs of heart failure; (vi) the treatment of heart failure. Section III. The myocardium. (vii) Diphtheritic myocarditis; (viii) rheumatic carditis; (ix) myocardial degeneration; (x) the thyroid gland and heart disease; (xi) the heart in anaemia. Section IV. Cardiac disorders and irregularities. (xii) Premature beats; (xiii) paroxysmal tachycardia; (xiv) auricular flutter; (xv) auricular fibrillation; (xvi) heart block; (xvii) bundle-branch block. Section V. Pericardial disease. (xviii) Acute pericarditis; (xix) chronic pericarditis. Section VI. Valvular disease. (xx) Mitral disease; (xxi) aortic regurgitation; (xxii) aortic stenosis; (xxiii) disease of the tricuspid valve; (xxiv) congenital heart disease; (xxv) malignant endocarditis. Section VII. Vascular disease and the heart. (xxvi) The effects of arteriosclerosis upon the heart; (xxvii) hypertensive heart disease; (xxviii) cardiac infarction; (xxix) angina of effort; (xxx) left submammary pain and angina innocens; (xxxi) cor pulmonale; (xxxii) aneurysms. Section VIII. (xxxiii) The heart in pregnancy; (xxxiv) effort syndrome; (xxxv) cardiac signs in symptom-free young adults; (xxxvi) cardiac symptoms and signs in general medical diseases. Index.

This book is written for those who are relatively inexperienced in cardiology. Dr Bourne has aimed at providing a sound working knowledge and has wisely refrained from including the more specialized methods of investigation. Heart failure remains the central problem, and a readable and balanced account of this occupies four chapters. Individual disorders are methodically presented, and the scheme adopted should induce a good approach at the bedside. Use of the term "myocardial degeneration" as a clinical entity is perhaps open to criticism since it is but rarely the dominating factor. Among the best chapters is that devoted to the difficult subject of the heart in thyroid disease. It may be added,

however, that thyroid extract sometimes fails to alleviate angina in myxoedema, and may even render it more severe. Conduction defects and arrhythmias are illustrated by well-chosen electrocardiograms, a minor omission being the chest lead changes in bundle-branch block. There is sound advice on the recognition of pericarditis in all its forms, but not all cardiologists would consider auricular fibrillation a deterrent to operation in constrictive pericarditis.

Turning to mitral disease, the author firmly supports the contention that stenosis and incompetence, though often co-existing, are clinically separable entities. He considers mitral regurgitation alone to be relatively innocuous, and attributes eventual heart failure to weakening of the left ventricle by the original disease. Aortic valve disease is well portrayed, and the important point is made that both thrill and murmur of aortic stenosis may disappear with the advent of failure. There is an excellent chapter on congenital heart disease, which reflects the increased importance of the subject. Writing of hypertension the author considers that raised blood-pressure by itself produces no deleterious effect on the heart, but that with added coronary atheroma and myocardial degeneration the already hypertrophied left ventricle becomes rapidly enlarged. From the clinical view-point, however, many cardiologists would consider hypertrophy as evidence *per se* of heart disease, and some would correlate its degree with the duration of failure. There is a very useful section on the management of these difficult cases. Triple rhythm in the early stages of cardiac infarction would have deserved mention; though not invariable, it is valuable evidence when an electrocardiogram is unobtainable. A diagram showing the sites for routine chest leads would usefully supplement the text, which is somewhat misleading with regard to leads 5 and 6.

Dr Bourne writes in the scholarly style which we have come to expect from him, often illustrating his remarks with novel analogies and striking case examples. Although his views are occasionally unorthodox, he has succeeded in supplying both stimulus and basis for a fuller knowledge of the subject.

Robert Benson

## 1558 Cardiology

William Evans. London: Butterworth & Co. Ltd., 1948. xi + 310 + 20 pages; 269 figures. 25 × 17 cm. £1 15s. [£1.75]

(i) History taking and physical examination; (ii) heart sounds and murmurs; (iii) cardiac enlargement; (iv) arrhythmia; (v) congenital cardiovascular disease; (vi) diseases of the pericardium; (vii) endocarditis; (viii) aortitis; (ix) cardiac pain; (x) hypertension; (xi) the heart in disease of the lungs; (xii) heart failure; (xiii) heart disease and pregnancy; (xiv) the heart in endocrine disorders; (xv) the heart in miscellaneous conditions; (xvi) other vascular diseases and effects; (xvii) the life and livelihood of patients with heart disease. Index.

No fewer than 11 new textbooks on heart disease have appeared in English since 1947. Several of these have been inspired, if the word may be used in a broad sense, by an author's preoccupation with his own particular cardiological interests, others by a dissatisfaction with the previous form or technique of presentation of the subject. Many of them have seen the light of day on the most slender pretexts, and presumably are sustained by the allegiance of the medical school where they originated. Dr William Evans' book will not find itself in such company. Its content and form of presentation are not stereotyped and, time and again, new view-points of well-worn subjects are put forth with quiet candour. So often do they skirt the supposedly unorthodox that the casual reader may find himself at times doubting Dr Evans' words. However, one feels that this book was not written for the casual reader, and that a few of the rather unusual statements are thought-provoking, somewhat disturbing to one's own complacency, and certainly a stimulus to more careful clinical observation in the future. The author is perhaps at his best when he is quietly tilting against time-honoured methods of teaching.

The reviewer was visiting the United States when the first copies of the present book reached that country. He recalls the astonishment that greeted Dr Evans' definition of a raised blood-pressure, namely "... when the systolic pressure is 180 or over, and/or the diastolic pressure is 110 or over ..." and in the presence of clinical, radiological and cardiographic evidence of cardiovascular hypertrophy. These figures, even higher than the usually accepted levels in this country, were little short of startling in the United States, where a blood-pressure of a few millimeters greater than the sacrosanct 150/90 is regarded as quite a serious matter.

Acquaintance with Dr Evans' refreshing methods of teaching clinical cardiology to students and postgraduates will help in understanding the underlying philosophy of his book. There is much to praise in it and a little to criticize. He sounds a well-timed warning against what he calls "unwarranted cardiac invalidism", and this healthy advice re-echoes throughout the book. He rightly identifies auricular flutter with auricular tachycardia, but no mention is made of ventricular tachycardia. An unfortunate emphasis is laid on mean axis deviation in the electrocardiogram and as a result the more important signs of ventricular hypertrophy tend to be overlooked. This defect is clearly shown in an electrocardiogram of congenital subaortic stenosis (fig. 112) described as showing right axis deviation; it deserved the additional comment that chest leads would have demonstrated left ventricular hypertrophy. No mention is made of the value of chest leads in bundle branch block.

Since the book is addressed to medical students and general practitioners, a detailed account of recent advances in haemodynamics, cardiac catheterization or angiocardiology is not called for. One would have supposed, however, that the use of penicillin in cardiovascular syphilis would deserve mention either in support or condemnation and that dicumarol was promising enough to warrant more than six words.

In this book, medical students and general practitioners will find emphasis laid on the facets of heart diseases which concern them and will read and refer to it with profit. The selection and high quality of reproduction of the figures and especially of the teleradiograms are a credit to the author, the medical technicians and the publisher.

W. S.

## 1559 Cardiovascular Disease in General Practice

Terence East. Third edition. London: H. K. Lewis & Co. Ltd., 1949. x + 208 pages; 34 illustrations. 22 × 14 cm. 15s. [£0.75]

(i) The interpretation of symptoms; (ii) physical examination of the heart; (iii) heart failure; (iv) the treatment of heart failure; (v) failure of the coronary circulation; (vi) peripheral failure; (vii) the infections of the heart; (viii) subacute bacterial endocarditis; (ix) cardiovascular syphilis; (x) chronic valvular disease; (xi) pericarditis; (xii) hypertension; (xiii) thyrotoxicosis; (xiv) auricular fibrillation and flutter; (xv) ectopic disorders of rhythm; (xvi) disorders of conduction; (xvii) the cardiovascular system in anaemia, chronic pulmonary disease, chronic renal disease, minor infections, anaesthesia, pregnancy, athletics, deficiency conditions; (xviii) diseases of arteries and veins; (xix) congenital diseases of the heart; (xx) the heart in middle age and onwards; (xxi) some aberrations and the normal heart. Index.

There have been so many advances in cardiology during the past few years that the author has rightly decided to bring out a 3rd edition of this useful aid to general practitioners. The 2nd edition was published in 1946<sup>1</sup>. The new material is found chiefly in the sections on heart failure, ischaemic heart disease, high blood-pressure, congenital heart disease, pulmonary heart disease and thyrotoxicosis. Nevertheless, there are still no details of the low sodium diet, which is certainly the most important advance in the treatment of heart failure; the only practical change in the management of cardiac infarction is the selection of cases suitable for anticoagulant therapy, and this is not discussed; some information concerning the value of penicillin in the treatment of cardiovascular syphilis would have been welcome; the picture of pulmonary heart disease is not convincing, and essential points such as signs of vasodilatation, the difference between central and peripheral cyanosis, the masking effects of emphysema on the second heart sound, and the frequency of coincidental hypertension are not mentioned; in the treatment of thyrotoxicosis one is left with the impression that methyl thiouracil has practically replaced surgery, and that the general practitioner might well carry out the whole of the treatment himself—a view that may well be maintained by the author with some justification, but not one about which there is wide agreement; some further comment on the general therapeutic problem would not have been out of place.

These are criticisms of the newer work that has been incorporated in the book, and detract little from its original value, which was in the successful presentation of the elements of cardiology to the busy practitioner in the simplest and shortest way. To cover so much ground in 200 pages, omitting little of practical importance, apart from what has been mentioned above, is very commendable. The absence of electrocardiograms and x rays does not matter, because their interpretation should be left to the specialist.

Paul Wood

# 1560 B.C.G. Vaccination in Theory and Practice

K. Neville Irvine. Oxford : Blackwell Scientific Publications, 1949. xiii + 130 pages. 22 x 14 cm. 9s. 6d. [£0.475]

(i) History; (ii) the theory of vaccination; (iii) the production of the vaccine; (iv) variation in the virulence of B.C.G.; (v) virulence experiments in animals; (vi) the safety of B.C.G. vaccination for man; (vii) the resistance produced in animals; (viii) the resistance produced in man; (ix) the technique of vaccination; (x) a world survey of B.C.G. vaccination; (xi) discussion. Index of authors. Subject index.

Dr Irvine has produced an extremely useful and compact little book and, despite the great amount of matter condensed in its pages, he has contrived to make it clear and convincing. The lay-out is good, and the evidence offered for and against the different aspects of BCG theory and practice so clearly and compactly set forth that interest leads the reader on from chapter to chapter.

After mentioning other attempts to confer immunity, Dr Irvine outlines the evolution of BCG vaccine, the methods of its preparation and the theory behind its use. He summarizes the evidence for believing that the strain may be less virulent now than before 1930 owing to the dying out of the "S" variants, and discusses the possible attenuation of the strain in the future. His summary of the reasons for believing that present-day BCG is harmless is convincing. The weight of evidence he produces for considering that BCG confers immunity is fairly conclusive, though this must vary considerably in different populations and age-groups. As he says, any increase in immunity is better than none. His chapter on technique of vaccination is most useful.

In some of Dr Irvine's comparisons of morbidity rates in patients vaccinated and in control cases one is doubtful whether those developing "pulmonary tuberculosis" all had post primary lesions or merely the primary infection. Dr Irvine can, of course, only quote the literature as published. His discussion as to whether those vaccinated should be segregated or not, both before and after vaccination, is useful. He recommends the former, but the chest physician in Britain, at least, will find that the necessity for segregation will greatly reduce the number of contacts he can vaccinate. The difficulty is not only in arranging for segregation but in ensuring that a sufficient number are segregated at the same time, so that a BCG vaccination session becomes profitable. This is a most important point and the proper solution is the widespread boarding-out of contacts by local authorities and, preferably, the establishment of BCG teams.

Incidentally, for the help of those reading this book, Dr Irvine uses the term tuberculin "inversion", instead of tuberculin "conversion", in discussing tuberculin skin tests.

E. Aslett

# 1561 Die Tuberkulose des Kindes. Ein Lehrbuch aus der Kinderheilstätte, Wangen im Allgäu

Heinrich Brügger, Reiner W. Müller & Maria Birkenfeld. Stuttgart : Georg Thieme, 1948. viii + 340 pages; 209 illustrations. 25 x 18 cm. 16 Mk.

(i) Allgemeines über die Tuberkulose-Infektion und -Krankheit; (ii) allgemeine diagnostische Hilfsmittel; (iii) die endorhorakale Tuberkulose des Kindes; (iv) die Tuberkulose im Bereich des Halses und des Bauches; (v) Tuberkulose des Skelettsystems und der Weichteile; (vi) Hauttuberkulose. Index.

This textbook is designed to cover the whole of the subject of tuberculosis in children. Dr Brügger, who has evidently had long experience in his sanatorium for children at Wangen in southern Württemberg, is the editor and main contributor. Emphasis is laid on the general nature of the tuberculous disease process in childhood and the fact that it is seldom entirely confined to one part of the body. These facts are constantly kept before the reader and, in spite of the triple authorship, the book is successful in maintaining continuity and balance in the subject-matter and in avoiding needless repetition. Advances made in the post-war years receive no mention. This is hardly surprising, as, although published in June 1948 the book was completed in October 1946 and the authors had no access to foreign literature after 1939. The omissions are naturally most noticeable in the sections on therapeutics; under the heading of chemotherapy, only gold is mentioned (and, incidentally, condemned). BCG inoculation, not carried out in Germany since the Lübeck disaster, is considered shortly but with approval.

In his opening section, Dr Brügger clearly sets forth the generally accepted views on the natural history of tuberculosis. The section on diagnostic measures contains a particularly useful and compre-

hensive account of the methods of tuberculin tests and their significance. Over one-third of the book is devoted to primary intrathoracic tuberculosis, its complications, prognosis and treatment. Although the important part played by the complication of atelectasis is recognized, the reader is left wondering if some of the radiograms of the "benign perifocal infiltrations" do not really represent the former condition. For instance, fig. 20 might well be a collapse of the lateral segment of the right middle lobe and, in this connexion, it is unfortunate that for 40 anteroposterior radiograms of the benign infiltrations and atelectases there are only four lateral views. Again fig. 128, illustrating "basal triangles" in per-tussis, appears to represent bilateral basal collapse. There is no mention of the treatment of atelectasis by bronchoscopic suction and the rarer condition of obstructive lobar emphysema is not discussed. In the section on differential diagnosis, insufficient attention is paid to the question of collapse of non-tuberculous origin and a second edition will, no doubt, devote more space to the differential diagnosis of tuberculous meningitis, now that its early recognition has become so important. Adult-type tuberculosis in children is fully considered.

Dr Müller gives excellent accounts of the clinical findings and course of tuberculosis of the neck and abdomen. The section on tuberculous disease of the skeletal system is well arranged and Dr Birkenfeld's accurate descriptions of the clinical findings in tuberculous infections of individual bones and joints are particularly good. She rightly lays stress on the importance of early recognition of skeletal involvement. This treatise is obviously based on the author's very considerable experience and wide reading. Where a description of some infrequent manifestation is not based on personal observation, this is clearly stated. One is left with the impression that the authors are not only experienced in the subject of tuberculosis but are also good paediatricians, well understanding the difficulties of diagnosis and of prolonged hospital treatment in young children.

Most of the 209 illustrations are positive reproductions of radiograms and, though varying in quality, are for the most part as good as the paper permits and clearly demonstrate what is required. The text is interspersed with many illustrative case histories. There are 278 references, mostly to German works. The print is clear and the language not too circumlocutory.

The reviewer has no hesitation in commending this book, not only to senior students and trainee paediatricians, but also to physicians working in this branch of medicine.

J. P. M. Tizard

# 1562 Ankylosing Spondylitis : a Practical Guide to its Diagnosis and Treatment

F. Hernaman-Johnson & W. Alexander Law. London : Butterworth & Co. Ltd., 1949. viii + 200 pages; 41 figures. 22 x 14 cm. £1 5s. [£1.25]

Part I. (i) The spondylitic syndrome; (ii) aetiology and pathology; (iii) clinical diagnosis; (iv) radiographic diagnosis; (v) some reflections on treatment; (vi) X-ray treatment; (vii) vaccines; (viii) gold, bismuth and arsenic; (ix) thorium X; (x) general management of patients with spondylitis; (xi) mental factors : occupation, sex and marriage; (xii) cortisone and prednisolone in the treatment of "rheumatism," including spondylitis; (xiii) concluding remarks. Part II. (xiv) Conservative treatment; (xv) correction of the spinal deformity by osteotomy of the spine; (xvi) hip joint reconstruction by vitalium mould arthroplasty; (xvii) surgical treatment of joints less frequently involved in ankylosing spondylitis. Index.

This small monograph deals with the subject of ankylosing spondylitis from the somewhat doctrinaire point of view which is associated with the Charterhouse Rheumatism Clinic, of which the late Dr Hernaman-Johnson was physician. The "wide-field" technique of x-ray treatment is recommended in preference to the more commonly accepted "deep" technique, although it is said: "It must be admitted that, in Great Britain, the wide-field method has made little progress." The next method of attack upon the disease to be discussed is the use of vaccines, a procedure which the author admits to be "purely empirical", and one which has lost favour with other schools of rheumatological thought.

In the following chapter the use of gold salts, bismuth and arsenic is advocated. It is claimed that the first "almost deserves the name of a specific"—a view which is very far from representing the general opinion in this or any other country at present. Finally, the use of thorium X is recommended with enthusiasm. The author's remarks on the general management of patients with spondylitis are sensible and wise, and he has managed to include a brief chapter on cortisone and its relations.

Mr Alexander Law contributes the last four chapters, on the surgical treatment of the effects of ankylosing spondylitis, and this section will be read with interest and profit by all who are engaged in this field.

W. S. C. Copeman

### 1563 Surface and Radiological Anatomy: for Students and General Practitioners

Originally written by A. B. Appleton, W. J. Hamilton & Ivan C. T. Chaperoff. Third edition by A. B. Appleton, W. J. Hamilton & G. Simon. Cambridge: W. Heffer & Sons Ltd., 1949. viii + 332 pages; 390 figures. 25 x 19 cm. £1 15s. [£1.75]

General anatomy and methods. The upper limb. (i) Shoulder and arm; (ii) elbow, forearm and hand; (iii) vessels and nerves. The chest and back. (iv) Thoracic wall; (v) thoracic contents; (vi) physical examination of the thorax; (vii) great vessels; (viii) oesophagus. Abdomen. (ix) Abdominal wall; (x) physical examination of the abdomen; (xi) abdominal contents; (xii) perineum; (xiii) deep blood-vessels of the abdomen. Head and neck. (xiv) General features; (xv) the neck; (xvi) special organs and regions; (xvii) vessels and nerves; (xviii) the brain and its associated vessels; (xix) radiology. The vertebral column. The lower limb. (xx) Buttock and thigh; (xxi) region of the knee; (xxii) leg and foot; (xxiii) vessels and nerves. Index.

It is doubtful whether any single textbook can cover so wide a field as surface anatomy and radiological anatomy and yet meet the needs of both students and general practitioners. No one has yet succeeded in combining the best of the material in the textbooks of surface anatomy as they existed in the pre-Röntgen days with the best of the material in the books on radiology.

The most concentrated and precise presentation of surface anatomy was that of the late Sir Harold Stiles of Edinburgh, and this was first published as the last section of Cunningham's *Text-book of anatomy* in 1902. The most extensive and accurate presentation of radiological anatomy in any language is Alban Köhler's *Röntgenologie*, translated into English by A. Turnbull. The first German edition appeared in 1910 and the first English translation, of the 5th edition, was published in 1928. Köhler, by a stroke of genius, supported by incomparable clinical experience, gave the first and only clear survey of the borderlands of normal and of early pathological conditions in the radiograph. The combination of anatomy and radiology as presented by Stiles and Köhler is still unapproached, and most difficulties can be solved by reference to the one or the other.

The book under review contains a mass of detailed information of use to the student, but lacks any statement of those general principles which allow the student to organize the detail into a concrete whole. The anatomical illustrations are of the high quality expected from such a competent medical artist as A. K. Maxwell. The radiographs are well selected but their reproduction still leaves much to be desired. A well-reproduced radiograph demands a paper of photographic quality and this involves much expense.

The more recent techniques of tomography, ventriculography and pneumatization are presented in detail. A brief statement of the qualities of an adequate radiograph of any part of the body might be of help to the student, for it is the radiograph itself rather than any printed reproduction of it which gives the maximum information.

H. A. Harris

### 1564 Neuroradiology

Alexander Orley. Oxford: Blackwell Scientific Publications, 1949. xii + 421 pages; 572 figures. 26 x 18 cm. £3 3s. [£3.15]

(i) Radiography of the skull; (ii) radiography of the temporal bone; (iii) sphenoidal sinuses; (iv) the sphenoidal fissure; (v) cranial foramina; (vi) tomography; (vii) cranial deformities; (viii) head injuries; (ix) lesions of the cranium; (x) changes in the skull associated with systemic diseases; (xi) asymmetry of the skull; (xii) radiographic changes in the feeble minded; (xiii) non-pathological intracranial deposits of calcium; (xiv) displacement of calcified normal intracranial structures by space occupying lesions; (xv) pathological intracranial calcification other than neoplasms; (xvi) degenerative conditions in which abnormal intracranial calcification is usually absent; (xvii) increased intracranial pressure; (xviii) cranial and cerebral circulation; (xix) vascular tumours and anomalies of the brain; (xx) cerebral angiography; (xxi) arteriography in lesions of the blood vessels; (xxii) diagnosis of the histological structure of tumours from the angiogram; (xxiii) peripheral arteriography; (xxiv) cerebral neoplasms; (xxv) lesions and deformities of the sella turcica and parasellar lesions; (xxvi) meningioma; (xxvii) acoustic nerve tumours; (xxviii) congenital tumours; (xxix) tumours of the blood vessels of the brain; (xxx) metastatic tumours; (xxxi) calcified tuberculoma of the brain; (xxxii) intracranial abscess; (xxxiii) air studies of intracranial lesions; (xxxiv) interpreta-

tion of the normal ventriculogram; (xxxv) ventricular measurements; (xxxvi) different radiographic projections used in ventriculography; (xxxvii) encephalography; (xxxviii) ventricular changes following head injury; (xxxix) porroencephaly; (xl) arachnoiditis; (xli) encephalography in cases of mental deficiency and epilepsy; (xlii) ventriculography; (xliii) lesions and anomalies of the spine and spinal cord; (xliv) spinal injuries; (xlv) posterior prolapse of the intervertebral disc; (xlvi) spinal tumours; (xlvii) forecast of the histological nature of the tumour from radiographic evidence; (xlviii) myelography; (xlix) neuropathic disturbances. Bibliography. Index of authors. Index.

The author states that the greater part of the material on which this book is based was collected during the war of 1939-45. The field of neuroradiology during this period in Britain was somewhat restricted because of the divorce from free contact with the work in progress in other countries. This book reflects the situation. The author has read widely in his subject, as the very complete bibliography witnesses. It must, however, be realized that the material of the book and the opinions expressed therein are far behind present-day thought and methods.

The section on cerebral angiography is an outstanding example. The contrast material advocated is considered by most workers to be dangerously radioactive. The open method of injection described has been abandoned, in other than exceptional cases, in the percutaneous technique. The reproductions of angiograms are for the most part poor and cover little of the field of demonstrable abnormalities.

The technique of positioning in ventriculography is well described, but in the section on abnormal ventriculographic findings only four projections are used in the diagrams. The art of ventriculography lies in suiting the technique in each case to the initial findings, in order fully to demonstrate the lesion for the guidance of the neurosurgeon. There is little suggestion of the importance of this. The section on the technique of myelography is headed most misleadingly "Lumbar encephalography". Some of the statements which follow would be regarded as dubiously accurate by the majority of experienced workers in this field, and no mention is made of the possible use of opaque media other than iodized oil.

The standard of production of the book is high and it is the greater pity that some of the radiographs reproduced, notably those on pages 101-103 and 120, fail to demonstrate to the reader the conditions described. In the section on radiography of the temporal bone there are full instructions for radiographic procedure, though the standard American and Swedish projections are ignored, while adequate anatomical explanation of the resulting radiographs is not given. The format of this book is excellent, but the subject deserves a volume of much greater size and scope, and a wider basis in material. In the last 15 years this specialized field in radiology has produced evidence which has greatly influenced thought and procedure in neurology and neurosurgery. Technique has advanced rapidly in the past five years, and it was perhaps inevitable that, by the time the book was published, some of the statements in it should be behind current opinion.

### 1565 A Descriptive Atlas of Radiographs. An Aid to Modern Clinical Methods

A. P. Bertwistle. Seventh edition, revised and enlarged. London: Henry Kimpton, 1949. xxx + 622 pages; 980 illustrations. 26 x 18 cm. £2 10s. [£2.5]

(i) Radio-diagnosis; (ii) cancer campaign; (iii) X-ray museum; (iv) the clinical application of radiology; (v) X-rays in the diagnosis of internal disease; (vi) milestones in radio-diagnosis; (vii) silhouette radiograph process; (viii) normal bones and epiphyses; (ix) congenital abnormalities; (x) fractures; (xi) diseases of bones; (xii) tumours of bone; (xiii) injuries and diseases of joints; (xiv) nasal system; (xv) dental system; (xvi) alimentary system; (xvii) urinary system; (xviii) respiratory system; (xix) nervous system; (xx) vascular system; (xxi) ductless glands; (xxii) female generative system; (xxiii) muscles; (xxiv) medico-legal; (xxv) embryology; (xxvi) anthropology; (xxvii) helminthology; (xxviii) occupational diseases. Index.

The compiler of an atlas of radiographs who wishes to limit himself to one volume must always be faced with the problem of deciding on those examples which must be included and those which can be excluded. To be complete, many examples of every disease process would be needed, for there is no such thing as a typical appearance. Mr A. P. Bertwistle, in the 7th edition of this well-known book, has made a fairly representative selection, but there are some inevitable gaps.

In his introduction he declares that his aim is to show the capabilities of x rays and in the main he succeeds in this, but one regrets the omission of any examples of angiocardigrams, the recent development of which would appear to be of increasing importance. Few heart conditions, indeed, are represented. One would also

like to see examples of lateral chest films demonstrating lobar and segmental lung lesions. The appearance in this edition of a section on helminthology is welcome, though the reproductions are not, perhaps, quite up to the standard of the rest of the work. One would have welcomed a general word on capabilities and limitations as an introduction to each section.

The book is well produced and pleasingly free of misprints. The x-ray reproductions are, however, positives; to some, this may be a disadvantage. Many of the plates are accompanied by useful line diagrams which greatly assist in interpretation.

The book includes a most interesting and informative chapter on the milestones in radiodiagnosis; however, a bibliography of the work referred to would have been a useful addition.

This atlas should prove of value to the practitioner who is taking an intelligent interest in the ever-expanding science of radiodiagnosis and also to the student, as a supplement to that study of radiology which can truly be accomplished only at the bedside.

F. D. Beddard

## 1566 Standard Radiographic Positions

Nancy Davies & Ursel Isenbarg. Second edition. London: Baillière, Tindall & Cox, 1947. viii + 223 pages; 384 figures. 23 x 16 cm. £1 1s. [£1.05]

(i) Upper extremity; (ii) shoulder girdle; (iii) lower extremity; (iv) pelvic girdle; (v) spinal column; (vi) thoracic bones; (vii) skull; (viii) teeth; (ix) internal organs; (x) localisation of foreign bodies; (xi) stereoscopic radiography; (xii) the X-ray department; (xiii) the patient. Exposure chart. Index.

This book has been considerably enlarged since the 1st edition, and the radiographic data included have been brought up to modern standards. The section dealing with the skull, sinuses and mastoid positions is very ably written, and the diagrams are a useful reference for information about the various projections required by radiologists. The section on the preparation of the patient for various x-ray examinations is also very useful. Although preparation varies slightly in different departments the book is a good general guide to radiographers. For example, the section on bronchography includes a list of needles, dressings, forceps, etc., required during the examination. Other radiographic procedures are equally well described. The exposure chart section is concise and can be adapted to suit individual requirements on different types of x-ray apparatus.

This work will be an invaluable aid to student radiographers at the commencement of their training and the diagrams will be of assistance to them in anatomical drawing. It would be useful as a reference book in any x-ray department. The authors and publishers are to be congratulated on a good production, which has the added advantage of being reasonable in price.

L. Smith

## SURGERY

### 1567 Operative Surgery

Frederick C. Hill. New York: Oxford University Press; London: Geoffrey Cumberlege, 1949. xii + 698 pages; 255 figures. 24 x 16 cm. £3 3s. [£3.15]

(i) Preoperative treatment; (ii) general considerations; (iii) sutures, ligatures, and instruments; (iv) the skin and subcutaneous tissue; (v) the mouth, tongue, and salivary glands; (vi) the neck; (vii) the mammary gland; (viii) the pleura and lung; (ix) the mediastinum and contents; (x) the abdominal wall; (xi) the peritoneum, retroperitoneal tissue, and adrenal gland; (xii) the liver; (xiii) the gallbladder and bile ducts; (xiv) the pancreas; (xv) the spleen; (xvi) the stomach; (xvii) the duodenum; (xviii) the jejunum and ileum; (xix) the appendix; (xx) the colon; (xxi) the rectum and anus; (xxii) the uterus, Fallopian tube, and ovary; (xxiii) the female external genital organs, perineum, and vagina; (xxiv) the kidney and ureter; (xxv) the bladder and prostate; (xxvi) the male external genital organs; (xxvii) the bones and joints; (xxviii) the blood vessels; (xxix) the extremities; (xxx) postoperative treatment. Index.

Professor Hill, Associate Professor of Surgery in the Creighton University School of Medicine, Omaha, Nebraska, has produced a textbook of operative surgery suitable for students, interns, and junior surgeons. For the coverage of operative surgery which it affords, the book is compact. Not only technical details of operations are described, but pre-operative and postoperative treatment are considered at some length, and the positioning of the patient on the table and the draping of the operation field are explained in fuller detail than in most textbooks; surgical pathology, also, is well described. General operative methods, such as the tying of knots and the insertion of stitches, together with the different uses of the common surgical instruments, are very simply and concisely handled. In general, the author advises for each condition one single technique which he himself has found suitable, and which in most cases is a standard operative procedure. A careful selection has been made of relatively common procedures, and out-of-the-way operations are not described at any length. Plastic surgery is considered fairly fully, and the section on chest surgery is just what the undergraduate student requires. In most of the chapters dealing with the anatomical regions, operations which have a purely historical interest have been wisely omitted; in the chapter on the stomach, however, this does not altogether apply. The Roux type of anastomosis is described, for example, as also is wedge resection of a gastric ulcer. Approximately one-tenth of the book is devoted to gynaecology.

Perhaps the strictest selection has been in relation to orthopaedics, but, occasionally, the operations chosen for description seem a little strange. The general management of amputations, for example, and the principles which govern amputations at given levels, are rather inadequately considered, while a method for the removal of the intervertebral disk is discussed in some detail. It is

proper to say that the precise operative technique for amputations at the common levels is described.

The lay-out of the textbook is really excellent, the style is simple, and the book is easy to read. As a review of the field of operative surgery for the undergraduate student it can be very highly commended.

Ian Aird

### 1568 A Short Practice of Surgery. Parts I-V

Hamilton Bailey & R.J. McNeill Love. Eighth edition. London: H. K. Lewis & Co. Ltd., 1948-49. 1,050 pages; 1,198 figures. 22 x 14 cm. £2 12s. 6d. the set [£2.625]

Part I. (i) Non-specific infections and wounds; (ii) specific infections diseases; (iii) tumours; (iv) ulceration and gangrene; (v) blood and blood-vessels; (vi) lymphatics and lymphatic nodes; (vii) face and jaws, including the palate; (viii) teeth and gums; (ix) mouth and tongue; floor of mouth; (x) salivary glands; (xi) neck; (xii) thyroid gland; (xiii) thymus, parathyroid, and adrenal glands. Index. Part II. (xiv) Pharynx; (xv) oesophagus; (xvi) peptic ulcer; (xvii) stomach and duodenum; (xviii) spleen; (xix) liver; (xx) gall bladder and bile ducts; (xxi) pancreas; (xxii) peritoneum; (xxiii) intestines; (xxiv) intestinal obstruction; (xxv) vermiform appendix. Index. Part III. (xxvi) Rectum and anal canal; (xxvii) hernia; (xxviii) urinary symptoms. Investigation of the urinary tract. Anuria; (xxix) kidneys and ureters; (xxx) urinary bladder; (xxxi) prostate and seminal vesicles; (xxxii) urethra and penis; (xxxiii) testes and scrotum; (xxxiv) skin. Index. Part IV. (xxxv) Head; (xxxvi) spine; (xxxvii) nerves; (xxxviii) special nerves; (xxxix) breast; (xl) thorax; (xli) larynx; (xlii) infections of the hand. Index. Part V. (xliii) Injuries to the bone; (xliv) diseases of bones; (xlv) injuries to joints; (xlvi) diseases of joints; (xlvii) muscles, tendons, and bursae; (xlviii) deformities. Glossary. Index.

It is difficult to know what to say about the re-appearance of so well-known a "Short Surgery" even though it is disguised in five volumes, all coloured differently; but the appearance of an 8th edition speaks adequately for its popularity and use. The authors state that they have presented the book in sections because of the delay between the written and the printed word enforced by economic conditions in Britain today. This reviewer feels, however, that the time-lag, regrettable as it is, is not long enough for the principles of surgery to alter materially, and it is certainly a disadvantage for reference purposes to have a book in small sections.

The authors and publishers are to be congratulated on a very neatly turned out and well-finished series of volumes, which are profusely illustrated, as indeed are all the works of these two authors. While one agrees with the Chinese proverb quoted in the preface: "One picture is worth a million words", one must point out that there is a limit to the reduction in size of that picture, below which it ceases to illustrate the point requiring emphasis. This criticism applies to more than one of the illustrations in this work,

and especially to those, otherwise excellent and valuable, illustrating Dr. Hermitte's admirable pathological disquisitions.

The technical material is well arranged in sections and is dealt with tersely but adequately. All superabundance of detail, both in clinical signs and in treatment, is skilfully avoided. This is as it should be in a work which is intended only as a book of reference for the practitioner and surgeon, and not as the sole textbook of the undergraduate student. The authors are to be congratulated again on having produced a concise and comprehensive work which is of great value as a refresher course and a reference book; and they can feel assured of the continued popularity of their efforts.

Philip H. Mitchiner

### 1569 An Atlas of Traumatic Surgery: Illustrated Histories of Wounds of the Extremities

Josep Trueta. Oxford: Blackwell Scientific Publications, 1949. viii + 150 pages; 188 figures. 25 × 19 cm. £1 10s. [£1.5]

Introduction. (i) Upper limb; (ii) lower limb.

Professor Trueta's work is, as it professes to be, an atlas of many photographs showing the progress and end-results of the author's well-known and oft-advocated treatment of all wounds by early and thorough excision of destroyed and damaged tissue, and as such it pays tribute to the success of his methods and the correctness of his views. He is perhaps inclined to assume that before the Spanish Civil War no thorough and far-reaching excisions with subsequent plaster of Paris immobilization had been undertaken, at any rate with success, in any prior war, but he may rest assured that such methods were practised, and with success, especially by the French military surgeons on the Salonika front in 1916-18. Professor Trueta correctly acknowledges the value of chemotherapy as an adjunct, but *only* as an adjunct, to the success of early root and branch excision of wounds, and rightly stresses that in the presence of chemotherapy delayed union in some eight to ten days should be the routine practice in securing the early closing of the majority of war wounds. The illustrations are well produced, but in some cases might be considered as failing to convey the points required to show the uninitiated surgeon (on Professor Trueta's own admission he is writing hopefully for the presumably uninitiated surgeon in a war in the dim future) the full and terrible destruction of tissues which he must expect to meet and the root and branch surgery which he must carry out promptly and adequately if success is to be attained by these methods.

Professor Trueta is to be congratulated on this work which, like all his previous publications, is clear, helpful and instructive.

Philip H. Mitchiner

### 1570 Demonstrations of Physical Signs in Clinical Surgery

Hamilton Bailey. Eleventh edition. Bristol: John Wright & Sons Ltd., 1949. xii + 426 pages; 657 illustrations. 23 × 14 cm. £1 14s. [£1.7]

(i) Introductory; (ii) some basic physical signs; (iii) some general principles in the examination of joints; (iv) localized swellings; (v) ulcers and sinuses; (vi) the mouth; (vii) the face and jaws; (ix) the head; (x) the ear; (xi) the nose; (xii) the thyroid gland; (xiii) the breast; (xiv) the thorax; (xv) the shoulder, arm, and forearm; (xvi) the hand; (xvii) the foot; (xviii) non-acute abdominal conditions; (xix) non-acute abdominal conditions—special demonstrations; (xx) rectal and vaginal examination; (xxi) clinical examination of the urinary organs; (xxii) the male generative organs; (xxiii) common acute abdominal conditions; (xxiv) abdominal and pelvic injuries; (xxv) some rarer acute abdominal conditions; (xxvi) the sacro-iliac joint; (xxvii) the hip-joint; (xxviii) the knee-joint; (xxix) the leg and foot; (xxx) bone; (xxxi) the spine; (xxxii) the peripheral nerves; (xxxiii) examination of the blood-vessels of the extremities; threatened and established gangrene; (xxxiv) some signs to confirm a suspicion of neurosis. Glossary. Index.

In welcoming this new, 11th edition of Hamilton Bailey's book, one is astonished to find that the 1st edition appeared no less than 23 years ago. One can still recall the immediate and powerful appeal which it made to the medical student and there is little doubt that this latest edition will hold a similar attraction for the students of the present day.

The reason for the initial and continued popularity of this book is not far to seek. The author set out to demonstrate physical signs and to describe clearly to the student how he could elicit these signs, an object which would inevitably meet with the approval of

all medical students. If in any given case the student can obtain an accurate history and can carefully elicit and record the physical signs present, then he has the diagnosis ready-made, as it were. But if, on the other hand, unskilful examination has not only failed to elicit signs present but has discovered signs which in fact are not present, he will be misled by these false data and make a wrong diagnosis. It is, of course, the duty of the clinical teacher to demonstrate to his students how to elicit these signs, but it is a duty which one feels is at times neglected.

The two main methods available to the author, to enable him to fulfil his purpose, were careful descriptions of the methods of examinations, and good illustrations. The descriptions given in this book have always been excellent, clear and concise, but the great, and, at the time of its original publication, the novel virtue of the book was the lavish use of excellent illustrations, mostly first-class clinical photographs. It is perhaps not too much to say that this book when it originally appeared set up a new standard for medical textbooks in this respect.

These original virtues have never been allowed to fade. Indeed with each succeeding edition endeavour has been made to improve on its predecessor. Colour photography has been used increasingly, diagrams are excellent and the whole production reflects great credit on the author and his publishers. The continued popularity of the volume is assured by the issue of this new edition.

T. M. Millar

### 1571 A Text-Book of Surgical Pathology

Charles F. W. Illingworth & Bruce M. Dick. Sixth edition. London: J. & A. Churchill Ltd., 1949. viii + 726 pages; 317 illustrations. 24 × 16 cm. £2 5s. [£2.25]

(i) Inflammation; (ii) wound infections; (iii) constitutional effects of injury; (iv) tuberculosis; (v) actinomycosis; (vi) hydatid disease; (vii) tumours; (viii) diseases of bones; (ix) diseases of joints; (x) diseases of muscles, tendon sheaths and bursae; (xi) diseases of blood vessels; (xii) diseases of lymph glands and vessels; (xiii) diseases of the skull and brain; (xiv) diseases of the spine and spinal cord; (xv) diseases of peripheral nerves; (xvi) diseases of the thorax; (xvii) diseases of the pericardium, heart and great vessels; (xviii) diseases of the breast; (xix) diseases of the mouth, jaws, salivary glands and neck; (xx) diseases of the thyroid gland; (xxi) diseases of the parathyroid glands; (xxii) diseases of the pharynx, larynx and oesophagus; (xxiii) diseases of the stomach and duodenum; (xxiv) diseases of the small intestine; (xxv) diseases of the colon; (xxvi) diseases of the vermiform appendix; (xxvii) diseases of the peritoneum; (xxviii) diseases of the gall-bladder, liver and bile ducts; (xxix) diseases of the pancreas; (xxx) diseases of the spleen; (xxxi) diseases of adrenal glands; (xxxii) diseases of the urinary organs; (xxxiii) diseases of the male generative organs; (xxxiv) diseases of the female generative organs. Index.

The 1st edition of this textbook was published 18 years ago. In this, the 6th edition, there are new chapters on diseases of the heart and blood-vessels; and accounts of vascular hypertension, causalgia, and tumours of muscle have been added. The descriptions of thrombophlebitis, peptic ulcer, intestinal obstruction, and several other conditions have been re-written.

"This book has been written for graduates and senior students" and the authors have made "only passing reference . . . to such fundamental processes as inflammation, suppuration, ulceration and repair." These subjects are dealt with in the first chapter of 11 pages. The "passing references" are elementary and uninspiring and several opportunities are lost of stressing the importance of modern research in inflammation and trauma. Having the seniority of the reader in mind, there seems to be little point in retaining this rather inadequate first chapter, especially as these fundamental subjects are dealt with fully in most standard textbooks of general pathology.

The same criticism applies to the second chapter, dealing with wound infection. The account of the staphylococci occupies 15 lines. The surprisingly high proportion of normal individuals of all ages who carry pathogenic staphylococci in the nasal vestibule is not even mentioned. Staphylococcal coagulase is described as an exotoxin and no mention is made of the important practical value of distinguishing between pathogenic and non-pathogenic strains by testing for coagulase production. The account of the streptococci is brief and contains some inaccuracies. The description of the pathogenesis of gas gangrene is misleading, as no clear distinction is made between the growth requirements of clostridia, which are relatively unimportant, and the local and general lethal effects of specific clostridial toxins, which are fundamental. It is not improbable that students reading this book may be misled into thinking that these references to bacteriology contain all that a well-informed and intelligent surgeon can be expected to know. If this is a real danger, it might be considered advisable in future

editions to omit these "passing references" unless sufficient space can be found to deal with the subjects more fully.

The remainder of the book deals with the morbid anatomy and histology of diseases of surgical importance. It is quite clearly this part of the book which has ensured its popularity with students for the last 18 years. The chapters on the pathology of bone and peripheral vascular disease are outstanding and, of the re-written chapters, that on the spleen is excellent. The problem of fluid balance is given the prominence and careful explanation which it so fully deserves.

Geoffrey Hadfield

## 1572 Acute Injuries of the Head, their Diagnosis, Treatment, Complications and Sequels

G. F. Rowbotham. Third edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xx + 480 pages; 259 figures. 25 x 18 cm. £1 15s. [£1.75]

(i) The mechanisms of injuries of the head; (ii) pathology; (iii) diagnosis of closed injuries of the head; (iv) treatment of closed injuries of the head and surgical technique; (v) fractures of the skull; (vi) open or compound wounds of the head; (vii) traumatic osteomyelitis; (viii) results of injury to special parts of the brain and skull; (ix) the sequels of injuries of the head; (x) rehabilitation; (xi) post-traumatic epilepsy; (xii) the final results of head injuries; (xiii) the mechanism of birth injuries; (xiv) the residual illness. Index of authors. General index.

Mr Rowbotham introduces the subject of acute injuries of the head with a comprehensive and scientific survey of the physical mechanisms by which the skull, the brain and its membranes may lose continuity. He describes and illustrates the pathology of acute head injury anatomically and statistically, and deals at length with the problems of concussion and of the conduct of air-raid casualties. Drawing upon his knowledge of surgical literature, of physics, and of his own experiences, he discusses the diagnosis of closed injuries of the head in terms of the difficulties raised by the complex picture of each head injury and freely gives his opinion on matters of controversy. Whilst his methods of treatment of closed head injuries are not universally accepted, he gives them very full descriptions, and states their indications; closed cranial fractures and defects are described and treated along the usual lines.

Dealing with compound wounds of the head and such complications as cerebrospinal rhinorrhoea, he shows how war experiences have contributed to the treatment of these injuries and how thorough the approach to traumatic osteomyelitis must be. The chapter on injury to special parts of the brain makes interesting reading and has very useful statistical references; with descriptions of the sequelae of head injuries, much space is devoted to the social, psychological and medicolegal aspects of both diagnosis and treatment, and rehabilitation is elaborated with realism. The difficult subject of post-traumatic epilepsy is carefully reviewed and the management of cases of late onset advised. After a short survey of some statistics of late results of head injury, and a summary of the mechanism, diagnosis and treatment of birth injuries, Mr Rowbotham concludes with a final note on the relation between the head injury, the original personality of the individual, and the type and circumstances of the work and society to which the individual returns.

Too controversial and *décousu* for the undergraduate, this book should be read by every resident surgical officer; let him not, however, be deterred by those passages which he cannot understand, for the author boldly attacks all controversial matters and the book is the result of his wide reading and surgical experiences in the field of traumatic craniocerebral surgery.

W. J. Atkinson

## 1573 Abdominal Operations

Rodney Maingot. Second edition. London: H. K. Lewis & Co. Ltd., 1948. xxiii + 1274 pages; 468 figures. 25 x 17 cm. £4 4s. [£4.2]

Part I. Abdominal incisions. Part II. Stomach and duodenum. Part III. Spleen. Part IV. Pancreas. Part V. Gall-bladder and bile ducts. Part VI. Liver. Part VII. The vermiform appendix. Part VIII. Peritoneum, mesentery, omentum. Part IX. External abdominal hernia. Part X. Intestines. Part XI. Post-operative chest complications: diaphragmatic hernia: portal hypertension. Index.

Maingot's *Abdominal operations* was published first in 1940 and quickly achieved recognition as an authoritative work. It covers more than its title indicates, for it is concerned not merely with the technique of operations, but with the whole care of the patient during his stay in hospital. Thus in the chapter on duodenal ulcer,

after sections devoted to etiology, symptoms and diagnosis, there is a discussion on the choice of treatment, followed by a review of the principles of medical care, and finally a detailed account of the operations, with appropriate measures of preparation and after-care.

In this 2nd edition, Maingot has been assisted by several other surgeons. In addition to English colleagues they include Harold Dew of Sydney, who writes on hydatid disease; Lester Dragstedt on vagotomy; and Stuart Harrington on diaphragmatic hernia. Maingot himself, however, remains responsible for the greater part of the book, which thus avoids the unwieldiness and diversity of approach so often to be found in works of multiple authorship.

As is to be expected, the teaching throughout is entirely up to date, and the descriptions of operative technique are sufficiently detailed to be of real value to the surgeon. A special word of praise is deserved for the illustrations, which are excellent.

C. F. W. Illingworth

## 1574 Acute Intestinal Obstruction

Rodney Smith. With a chapter on radiological diagnosis, by Eric Samuel. London: Edward Arnold & Co., 1948. xii + 259 pages; 102 figures. 22 x 14 cm. 18s. [£0.9]

(i) The history of the surgery of acute intestinal obstruction. Pathology. (ii) General principles of pathology; (iii) simple occlusion; (iv) closed loop obstruction; (v) intestinal strangulation; (vi) functional intestinal obstruction; (vii) peritonitis and acute intestinal obstruction; (viii) protein deficiency in intestinal obstructions. Diagnosis. (ix) Clinical diagnosis; (x) radiography in acute intestinal obstruction. Treatment. (xi) The place of chemotherapy; (xii) the place of suction drainage; (xiii) the treatment of protein deficiency; (xiv) the relief of obstruction without operation: the conservative plan. Pre-operative treatment. (xv) The operation; (xvi) postoperative treatment. Individual varieties of acute intestinal obstruction. (xvii) Classifications; (xviii) congenital anomalies; (xix) strangulated external hernia; (xx) strangulated internal hernia; (xxi) obstruction by bands and adhesions; (xxii) volvulus; (xxiii) intussusception; (xxiv) acute obstruction by a neoplasm; (xxv) acute obstruction from inflammatory changes in the gut wall; (xxvi) intraluminal impaction; (xxvii) mesenteric vascular occlusions; (xxviii) functional intestinal obstructions; (xxix) postoperative intestinal obstruction. References. Index.

This practical monograph sets forth a modern account of the problems which present themselves in a case of suspected or confirmed intestinal obstruction. A thoughtful and encouraging foreword by Vaughan Hudson emphasizes the value of radiology in the detection of early obstruction, and pays tribute to former surgeons of the Middlesex Hospital who were pioneers in the diagnosis and treatment of these often difficult cases.

In his preface the author stresses the fact that the obstruction in itself is not immediately lethal, and that correction of dehydration and the adoption of intestinal suction are modern methods of treatment which will often tide the patient over the immediate crisis. The pathology of obstruction is then discussed, and the importance of protein deficiency and the correction of hypoproteinaemia by the oral or intravenous administration of amino-acids is emphasized. The section on diagnosis of acute obstruction is clear and concise, but the clinical examination of the abdomen surely merits more space than less than one page, especially as the chapter on radiography is allotted no less than 27 pages! Intraperitoneal chemotherapy is next considered, but no mention is made of micro-form suspension, which is the ideal preparation for combating peritoneal infections.

The treatment of various types of obstruction is considered in detail. A popular error is reiterated in connexion with a strangulated inguinal hernia, when it is stated that such a hernia is irreducible. The ideal treatment of a strangulated inguinal hernia of less than six hours' duration, provided it is previously reducible, is taxis, i.e., manual reduction. This is often accomplished by the patient himself, or by the medical attendant, and then the desirability of a subsequent operation can be considered at leisure.

It is also stated that, in the case of a strangulated inguinal hernia, abdominal examination reveals signs of early obstruction with hyperperistalsis. This statement may mislead the junior surgeon, as hyperperistalsis is absent in the case of Littre's hernia, or when omentum or a Fallopian tube is present in the sac.

Methods by which the viability of strangulated bowel is assessed are mentioned, but one important omission is the aid which can be given by the anaesthetist. In a doubtful case, the administration of pure oxygen for a period of two or three minutes is sometimes the deciding factor, as the colour of viable gut will then approximate to normal.

Mention is made of "prune juice" stools in acute intussusception. The stools in this condition are more correctly described as re-

sembling red currant jelly, as they are a mixture of mucus and blood. Physicians reserve the term "prune juice" to describe the expectoration which typifies a lung carcinoma. Vague and meaningless terms are not infrequent. How can a thoughtful reader assess such terms as "a fair number of recorded cases" or "a high percentage of cases"? The "baby boy" who is likely to suffer from an acute intussusception would better be described as a male infant of from six to nine months. What are the actual dimensions of the "large" gallstone which becomes impacted in the jejunum? It is generally accepted that a diameter of more than one inch will fail to negotiate the small intestine.

However, in spite of these defects, and other minor ones, which can be corrected in a subsequent edition, this book is a useful guide to a junior surgeon who is responsible for emergency work, and as such it can be warmly recommended.

R. J. McNeill Love

## 1575 Wounds of the Extremities

Edited by H. J. Seddon. Bristol: John Wright & Sons Ltd., 1949. (*British Journal of Surgery War Surgery Supplement No. 2*.) 104 pages; 75 figures. 26 x 18 cm. 12s. 6d. [£0.625]

(i) War injuries of the extremities and their treatment in forward areas; (ii) missile wounds involving bone; (iii) early treatment of penetrating wounds of joints; (iv) war injuries of peripheral nerves; (v) war injuries of the peripheral arteries.

The production, by the *British Journal of Surgery*, of a War Supplement which is devoted to wounds of the extremities, has admirably filled a gap in post-war surgical literature. In general presentation the supplement maintains the high standard of the first War Supplement of the *British Journal of Surgery*, which dealt with head injuries, and it contains many excellent illustrations, a valuable bibliography, and much useful statistical data. Under the able editorship of Mr H. J. Seddon, the subject is handled in five sections, and deals with treatment in forward areas, and the management of injuries involving bones, joints, peripheral nerves, and peripheral arteries.

There is no hint of smugness in these expositions; yet, throughout, the reader is aware of the very considerable progress made over the methods and results of the First World War. The Winnett-Orr technique, developed and extended in the Spanish Civil War, was thoroughly proven, and stood the test of the many varying conditions of the Second World War. The impact of chemotherapy, and in particular of penicillin, on the management of wounds is here well described. The initial enthusiasm for this method of treatment, with facile abandonment of surgical principles, was followed by the rapid realization that chemotherapy was but an aid to, rather than a substitute for, early and thorough surgical treatment. The better control of infection, together with early ambulation, more intensive rehabilitation, and the energetic use of such time-savers as early skin-grafting, all contributed to a greatly diminished period of hospitalization, and to a quicker return to full duty—the prime aim of a military surgeon. Vascular surgery benefited from segregation into special units, but the introduction of anticoagulants, which have so widened the possibilities of reconstructive arterial surgery, came too late to help in the management of war injuries.

It is a melancholy thought that all the valuable experience herein set down may be of little use to surgeons in a future conflict, in which wounds from missiles may seem very insignificant compared with new varieties of trauma from heat and radioactivity.

J. P. Bentley

## 1576 Ulcers and Eczema of the Leg: Sequels of Phlebitis, etc. Studies on Static Diseases of the Lower Limbs and their Treatment

Holger Bisgaard. Copenhagen: Einar Munksgaard, 1948. 111 pages; 36 figures. 25 x 16 cm. 15 Dan. kr.

Introduction. (i) Uncomplicated cases of infiltration; (ii) infiltrations and varicose veins; (iii) infiltrations and phlebitis; (iv) infiltrations and thrombophlebitis; (v) infiltrations and ulcers of the leg; (vi) infiltrations and eczema of the leg; (vii) infiltrations complicated by the deformity: "three star" cases; (viii) infiltrations complicated by the deformity crura quadrata; (ix) infiltrations and arthrosis deformans; (x) infiltrations in the most severe and last stage.

Dr Bisgaard's approach to the problems resulting from man's adoption of the erect posture was both stimulating and original. Until his recent death, Bisgaard worked as a general practitioner in Denmark, so that his methods of treatment of ulcers, eczema, and

oedemas of the legs were basically empirical. They, nevertheless, proved so successful in practice that they came to be employed in the State Hospital in Copenhagen, and earned the praise and support of Professor Haxthausen himself.

Bisgaard's thesis is briefly this: that a great deal of disability from pain, swelling, heaviness, and fatigue in the distal part of the legs arises from filtration oedema. This oedema, which Bisgaard calls an infiltration, may have a central or peripheral cause, but is itself responsible for many crippling sequelae. Thus, whilst he acknowledges that varicose veins are a common cause of infiltration, he lists many other causes as common, such as anaemia, heart disease, postoperative debility, and pregnancy, and, locally, fractures and phlebitis. He goes on to assert that the infiltration often persists for a long time after the causative factor has itself disappeared. Thus infiltration, from being a symptom, may become a disease.

Infiltration is recognized principally by a painful and tender puffiness in the malleolo-calcaneal spaces, especially on the inner side, and what Bisgaard calls the pathognomonic symptom is local pain and restlessness at night, relieved by movement. Bisgaard's treatment is meticulously described; it aims at dispersing the infiltration in three ways, by massage, by elastic bandaging, and by mobilization. Progress is assessed by repeated measurements of diameter at three levels in the leg. The latter part of the book contains case reports of cases of simple and complicated infiltrations, showing the benefit derived in each by the application of Bisgaard's methods of treatment.

Most workers in this country will probably feel that perhaps too much emphasis has been placed by Bisgaard upon this secondary phenomenon of infiltration, and that, in almost every case, appropriate treatment of the causative lesion will itself lead to the disappearance of the infiltration. In those cases, of course, in which infiltration is present without any treatable primary cause, elastic support has usually been resorted to. It is most valuable, however, to have Bisgaard's detailed instructions on how best to apply elastic support, and also to learn of the reliance he has placed on an exact technique of massage.

J. P. Bentley

## 1577 Varicose Veins

R. Rowden Foote. London: Butterworth & Co. Ltd., 1949. xiv + 226 pages; 181 figures. 2 coloured plates. 25 x 17 cm. £1 12s. 6d. [£1.625]

(i) Some historical landmarks in the treatment of varicose veins; (ii) anatomy, physiology and pathology; (iii) incidence and aetiology of varices; (iv) the investigation of the patient with varicose veins; (v) treatment; (vi) varicose ulceration; (vii) thrombophlebitis and pulmonary embolism; (viii) anticoagulant therapy; (ix) the supportive and compression treatment in varicose conditions; (x) the varicose vein clinic and some useful prescriptions; (xi) the recent work in varicose veins. Appendix A. Index.

Mr Rowden Foote is to be heartily congratulated on the high quality of this book, the first dealing solely with varicose veins to be published in Great Britain. The author rightly stresses the immense importance of varicose veins and their complications, in the life and work of the community, and reminds us of the astounding fact that during the last war varicose veins constituted the largest single group of admissions to hospitals in the Emergency Medical Service, accounting for almost 10% of all cases! The book covers the whole subject most comprehensively, starting with a historical survey, and passing through the etiology and pathology to a consideration of the various methods of treatment in vogue today.

His own preference for most cases is for a high ligation flush with the femoral vein, coupled with the distal injection of a phenol-glycerin-glucose solution through a "nutmeg-grater" needle by means of which mechanical, as well as chemical, trauma is applied to the tunica intima. This technique is said to give almost universally excellent results, though the theoretical objection remains that sclerosants injected into the thigh pass immediately into the deep venous system, as shown by Boyd and others in phlebographic studies. It might therefore seem possible for deep femoral thrombosis to be at any rate an occasional complication of this method of treatment. It would indeed be illuminating, also, if histological proof were available that the technique definitely avoided the incidence of recanalization of the internal saphenous vein after months or years. This is a crucial point. Bull and Hiatt of Columbia University, New York, believe that no method of treatment will prevent recanalization of the vein, and they have, in consequence, reverted to the old technique of total extirpation of the vein, using the Mayo vein stripper. They argue that every other method leads

to recanalization, with a thick-walled rigid vein and damaged valves, which, though not varicose, nevertheless causes venous back-pressure on distal areas, with all its attendant ills.

The whole book is splendidly and copiously illustrated, mostly with actual photographs, and detailed advice is given on many useful manoeuvres, from the application of a supportive bandage to the still insufficiently practised empty vein technique for the injection of sclerosants. There is also a most useful section dealing with the problems of thrombophlebitis and embolism, and anticoagulant therapy.

Throughout the book the author has made a praiseworthy and successful attempt to present the views of others as well as his own on this very controversial subject. Whilst indicating at each stage his own preferences, supported by cogent reasons, he has avoided the tendency to bigotry and dogma which so often characterizes utterances of those who have concentrated their interests on a relatively narrow and circumscribed field. In general, this book can be highly recommended to both surgeons and general practitioners, and is likely to become the standard work on the subject for some time to come.

J. P. Bentley

## 1578 Modern Practice in Ophthalmology, 1949

Edited by H. B. Stallard. London: Butterworth & Co. Ltd., 1949. xx + 525 pages; 231 illustrations; 30 colour plates. 25 x 17 cm. £3 5s. [£3.25]

(i) Anatomy and physiology; (ii) pathology; (iii) medical ophthalmology; (iv) methods of examination; (v) ocular therapeutics; (vi) diseases of the eyelids; (vii) diseases of the lacrimal apparatus; (viii) diseases of the conjunctiva; (ix) diseases of the cornea and sclera; (x) diseases of the uveal tract; (xi) diseases of the retina; (xii) diseases of the optic nerve; (xiii) diseases of the vitreous body; (xiv) diseases of the lens; (xv) glaucoma; (xvi) refractive errors; (xvii) strabismus and heterophoria; (xviii) injuries of the eye; (xix) diseases of the orbit; (xx) tropical ophthalmology; (xxi) surgical operations on the eye, eyelids and orbit. Appendix: standards of vision for the Services, etc. Index.

This book is written for the general practitioner, with the aim of providing him with a practical outline of modern ophthalmic practice, so that he may be able to share with the specialist the responsibility of treatment of ophthalmic cases or to deal with them efficiently in the absence of specialist help. This difficult task has been undertaken by a team of specialists who may be said to have achieved the first purpose of the book but to have fallen short, in some respects, of the second.

The first five chapters deal with general topics—atomy and physiology, pathology, medical ophthalmology, methods of examination and general therapeutics. These are for the most part excellent, covering wide fields concisely and clearly. Then follow chapters on diseases of each of the structures of the eye in turn. Those on the lids, the conjunctiva and the retina are instructive and straightforward. The others, one feels, fail as guides to the uninformed by not being sufficiently schematic and dogmatic. The chapter on the cornea, for example, though interesting and unusual in its approach, leaves one groping for the signs, symptoms and treatment of, say, a hypopyon ulcer. In the chapter on glaucoma also, though all the information is there, the clinical pictures are not sufficiently clearly defined and no sharp distinction is made between acute and chronic types. The chapter on refractive errors is most comprehensive and instructive and that on strabismus and heterophoria could hardly be better. There is also a useful short chapter on tropical ophthalmology. The final chapter on operations is well illustrated but hardly realistic in some respects. Illustrated details of emergency operations, rather than of such operations as conjunctivo-dacryocystostomy or recession of the inferior oblique, would be of value to the practitioner in remote districts. There is a useful appendix on visual standards required for various Services.

A chapter on ophthalmic symptoms in general would have been a valuable addition and one's general impression is that the book might have been given more of a "vade-mecum" character without losing in attractiveness.

A. Lister

## 1579 The Science and Art of Joint Manipulation. Vol. I. The Extremities

James Mennell. Second edition. London: J. & A. Churchill Ltd., 1949. xv + 215 pages; 299 figures. 25 x 19 cm. £1 4s. [£1.2]

Part I. General considerations. (i) Introduction; (ii) the joint lesion; (iii) referred pain; (iv) general rules for manipulation. Part II. The joints of the upper extremity. (v) The digital joints; (vi) the metacarpal joints; (vii) the

wrist region; (viii) the radio-ulnar joints; (ix) the elbow; (x) the shoulder joint; (xi) the clavicular joints. Part III. The joints of the lower extremity. (xii) The digital joints; (xiii) the metatarsal joints; (xiv) the tarsal joints; (xv) the ankle region; (xvi) the knee region; (xvii) the hip joint. Index.

Of the three standard works on manipulation by British authors, this is the most exhaustive. It comes from the pen of the doyen of physicians practising manipulation, and summarizes the results of many years' experience.

General considerations include subluxation and adhesion-formation at joints, together with the bearing of the shape of the articular surfaces on function. This aspect of applied anatomy runs through the whole volume and is admirably set out. Referred pain is considered next, with emphasis on the segmental distribution of symptoms arising from spinal lesions. The next chapter deals with the principles governing manipulation, but the indications for and against forcing movement might well have been set out in greater detail. Caution is wisely enjoined and the reader learns that the history, the amount of movement present at the joint, and the x-ray appearances must be considered; but this important section on the nature and evaluation of these and other clinical signs could well have been expanded further. The present-day tendency to rely too much on the radiograph and to neglect clinical signs is justly criticized.

The joints of the extremities are considered each in turn. The shape of the bony facets is correlated with the separate patterns of movement achieved voluntarily and passively. The influence of joint-contour on the manner of performing a manipulation always receives masterly exposition, and there are textual descriptions and illustrations of as many as ten or twenty different ways of manipulating one joint, so that not only is a full range obtained of those movements which can be carried out by active effort, but a number of movements not capable of voluntary performance are also achieved. The elbow is dealt with in unorthodox fashion. The chapter on the hip joint is wholly admirable.

This book provides a fund of information for the clinician experienced in the diagnosis and treatment of the disorders met with in manipulative practice. Whoever wishes to study dynamic articular anatomy in its relationship to the manner of manipulating joints will enjoy every page of this important work.

J. Cyriax

## 1580 Structure and Function as Seen in the Foot

Frederic Wood Jones. Second edition. London: Baillière, Tindall & Cox, 1949. viii + 333 pages; 155 figures. 22 x 14 cm. £1 5s. [£1.25]

(i) Introductory, dealing with the study of the foot; (ii) the principles of terminology; (iii) the human foot in phylogeny; (iv) the foot in ontogeny; (v) digital formula; (vi) metatarsal formula; (vii) external characters; (viii) the fascias; (ix) the bones; (x) the accessory bones; (xi) the sesamoid bones; (xii) the joints; (xiii) the extrinsic muscles; (xiv) the morphology of the extrinsic muscles; (xv) the intrinsic muscles; (xvi) the morphology of the intrinsic muscles; (xvii) the actions of the muscles; (xviii) the movements of adduction, abduction and opposition of digits; (xix) the movements of flexion and extension of the toes; (xx) tendons, tendon sheaths and bursae; (xxi) the arches of the foot; (xxii) the foot and the brain; (xxiii) the sensory nerves; (xxiv) the motor nerves; (xxv) the vascular channels. Index.

Over a quarter of a century ago Professor Wood Jones produced a rather novel anatomical book entitled *Principles of anatomy as seen in the hand*, in which the detailed anatomy of the hand was used as a text for generalizations on anatomical principles. This book deservedly became very popular and the author has recently written a companion volume, *Structure and function as seen in the foot*, now in its 2nd edition, which follows the same lines and is equally fascinating to read, although in view of the earlier treatise general principles have been described in less detail, while the special principles displayed in the structure and function of the foot have received more attention. This is no dull academic textbook describing structures on conventional lines, but a living anatomy from which we may not only learn the form, position, variations, morphology and functions of bones, muscles, joints and so on, but also may come to see the why and how. As an example of the particular method of presentation we may take the chapter on the vascular channels where it is shown how these vary from animal to animal depending upon such factors as the torsion of the limbs and their usual posture in use.

It is a sad commentary on the many conferences which have been held on anatomical nomenclature that the author has found it necessary to include a chapter, "The principles of terminology", in which he suggests the use of such terms as "pre-axial" and "post-axial" in place of the more usual medial and lateral, to avoid

ambiguity. Nevertheless he has been unable to avoid such clumsy expressions as "the fibular-sided head of the bicipital flexor hallucis brevis".

The physical anthropologist will find much useful information and much of interest in the chapters on digital and metatarsal formulae, and on the external characters of the foot (see Chapters V, VI and VII).

In Chapters III and IV there is a good discussion of phylogeny and ontogeny in their relationship to the origin of the human characteristics of the foot. As is well known, Professor Wood Jones holds some original and rather unorthodox views on the evolution of man and he has used many features in the development and structure of the foot as support for his general theory that the human foot is derived from a primitive mammalian foot. This part of the work is highly controversial and will undoubtedly be provocative. The author is particularly critical of what he terms the "gorilloid theory" of the evolution of man. "Those who look upon Man as being derived from a 'gorilloid' stock see human foot structures as being direct developments from those present in the Gorilla. Those who derive Man from an earlier stock, from which the giant apes also arose, see, in the Gorilla foot, an inception of some of those specialisations already achieved in Man". But it is only fair to point out that two of the authors whom he particularly picks out for criticism (Morton, D. J., *The human foot*; Lake, N., *The foot*) use the resemblances between the feet of gorilla and man precisely in this latter sense, i.e., as indicating the structural changes at the inception of the adaptation of the foot for bipedal progression; indeed, the author confesses that Morton's description of the forerunner of man as a relatively small-sized active and agile animal of erect posture is so unlike a gorilla that the term "gorilloid" would seem wrongly bestowed. Evidently the use of the word "gorilloid" is the "nigger in the wood pile". Nevertheless it is proper to take a very broad view and to remember that apart from the foot there are other close resemblances between man and the large anthropoids which cannot be overlooked, such as blood-groups, precipitin reactions, and menstrual cycles, which seem to indicate that our relationship is a very close one indeed. The two opposing schools of thought approach the matter from opposite view-points, the one emphasizing the resemblances, the other the differences; this book records the latter attitude.

In dealing with ontogeny the author, correctly, in our view, states that the recapitulation theory is no more than a useful guiding principle and that it has largely lost its reputation for infallibility. However, if this is so, we can scarcely pay much attention to the statement that the internal cuneiform even in its earliest developmental stages shows no gorilloid characteristics in the distal joint surface, so that "be ancestral history what it may, it cannot be claimed that there is any embryological evidence that the ancestral human hallux was opposable, though it was doubtless divergent"; this would seem to involve the direct application of the recapitulation theory to a very small detail, and that, as the author himself says earlier, would "reduce this so-called law to absurdity".

The comparative anatomy of the musculature of the foot is very well done but it is doubtful whether the writer's list of "features in which the muscles of the human foot show a plan more primitive than that existing in any monkey" would be accepted by some competent comparative anatomists.

Perhaps the most satisfactory summing up of the present position is by W. Straus: "In its musculature as in its skeleton and outer form the foot of the gorilla more closely approaches that of man than does the foot of any other primate. But at the present time it is difficult to decide which of these similarities are indications of close genetic relationships and which are merely due to convergence produced by interaction of environmental forces and an ancient ground plan".

The question of the development of the arches of the foot is a very controversial one and it is interesting to record that Wood Jones does not entirely subscribe to the modern orthopaedic teaching that the arches are transient postural structures; he reinstates the ligaments in their important function of controlling the general form of the arch which itself is nevertheless "plastic and mobile" and capable of depression by body-weight and elevation by muscle action. This is a middle position between the extreme schools of thought on the subject and is probably correct.

Except for one or two small points the 2nd edition of this work is the same as the 1st. The book is full of interest and provocation; it is truly educative and stimulating and for these reasons can be highly recommended. There are a large number of line drawings by the author himself; their anatomical accuracy is thus assured and they clearly illustrate the arguments of the text.

Norman C. Lake

## OBSTETRICS AND GYNAECOLOGY

## 1581 A Synopsis of Obstetrics and Gynaecology

Aleck W. Bourne. Tenth edition. Bristol: John Wright & Sons Ltd., 1949. vii + 522 pages; 167 illustrations. 19 x 13 cm. £1 1s. [£1.05]

Part I. A synopsis of obstetrics. Section I. Normal pregnancy. (i) The ovum, fertilization, and early development; (ii) chorion, amnion, placenta, umbilical cord, and foetus; (iii) changes in the maternal organism; (iv) diagnosis of pregnancy; (v) duration and management of pregnancy. Ante-natal care and examination. Section II. Abnormal pregnancy. (vi) Auto-intoxications; (vii) abnormalities of the generative tract; (viii) diseases of the ovum; (ix) ectopic gestation; (x) abortion; (xi) associated disorders. Section III. Normal labour. (xii) Physiology and course of labour; (xiii) mechanism of normal labour; (xiv) management of normal labour. Section IV. Abnormal labour. (xv) Occipito-posterior positions; (xvi) face and brow presentations; (xvii) pelvic presentations; (xviii) transverse positions; (xix) prolapse of cord and limbs. Twins; (xx) contracted pelvis; (xxi) difficult labour due to abnormalities of soft parts; (xxii) anomalies of uterine action; (xxiii) maternal injuries; (xxiv) ante-partum haemorrhage; (xxv) post-partum haemorrhage. Section V. The puerperium and the new-born child. (xxvi) Physiology and management of puerperal state; (xxvii) puerperal infection; (xxviii) sudden death and miscellaneous disorders in the puerperium; (xxix) the new-born child; (xxx) post-natal examination and care. Section VI. Obstetric surgery. (xxxi) Forceps; (xxxii) version; (xxxiii) induction of labour and abortion; (xxxiv) craniotomy—cleidotomy—evisceration—decapitation; (xxxv) caesarean section—symphysiotomy—pubiotomy. Part II. A synopsis of gynaecology. (xxxvi) Anatomy; (xxxvii) development and malformations of the genital organs; (xxxviii) sex hormones—menstruation—puberty—the menopause; (xxxix) amenorrhoea—menorrhagia—metrorrhagia; (xl) dysmenorrhoea; (xli) leucorrhoea; (xlii) infections of vulva and vagina; (xliii) infections of cervix and corpus uteri; (xliv) infections of Fallopian tubes, ovaries and pelvic peritoneum; (xlv) gonorrhoea; (xlvi) new growths and miscellaneous affections of the vulva; (xlvii) new growths, cysts, and fistulae of the vagina; (xlviii) fibromyomata; (xlix) malignant disease of the uterus; (l) ovarian and parovarian tumours; (li) displacements of the uterus; (lii) vaginismus, dyspareunia, and sterility; (liii) disorders of micturition. Index.

A specialist may be tempted to turn up his nose at a "synopsis" in his own subject. Any such tendency on the part of this reviewer was counteracted by the recollection of how he himself had often had hurried but beneficial recourse to a well-known synopsis of medicine, and by the thought that a synopsis of obstetrics and gynaecology could not be in better hands than those of a man of such proved independence of thought and judgement as Mr Bourne. He had to read no further than the preface to get confirmation of his view in the refreshing statement that the author had tried to suppress "out-dated ideas and methods, though the 'fixing' of teaching by the demands of examiners has prevented the deletion of some matter which has little relation to modern theory and practice."

In reviewing this little volume one has to keep ever in mind the narrow and irksome limits within which the author has had to work; and the same applies to the thumb-nail type of illustration which seems to be all that is admissible within the limits of a synopsis. Nor may the peculiar needs of the prospective readers be overlooked. It is not hard to detect some of the dead wood which Mr Bourne rightly regards as dear to the hearts of some examiners; and while the eradication of it from the synopsis would not uproot it from their minds, yet its retention here, as in any other widely-read book, merely tends to give its roots stronger attachment.

In view of the author's difficulties and of the fact that this is clearly not the type of book in which to stress individual views, we refrain from any detailed comment, but we must admire the masterly way in which the great mass of material has been handled. If one may parody Goldsmith's familiar couplet on the village schoolmaster, still the wonder grows how one small book can carry such a vast content of information.

The book is intended for rapid revisal of the subject by the student examinee, or for quick consultation on individual points by the busy practitioner. In both capacities it may be commended as a thoroughly reliable guide.

R. W. Johnstone

## 1582 The Anatomy of the Female Pelvis

F. A. Maguire. Fourth edition. London: Angus & Robertson, 1949. xv + 176 pages; 55 figures. 23 x 15 cm. £2 2s. [£2.1]

(i) The pelvic wall; (ii) muscles of the pelvis; (iii) pelvic fascia; (iv) the urogenital diaphragm; (v) the vulva; (vi) the pelvic viscera in general; (vii) the pelvic peritoneum; (viii) the pelvic connective tissue; (ix) pelvic blood-vessels and lymphatics; (x) the supports of the uterus; (xi) the uterus; (xii) the uterine (Fallopian) tubes; (xiii) the ovaries; (xiv) the vagina; (xv) the genital organs before, during, and after the reproductive epoch of life; (xvi) the struc-

tures between the layers of the broad ligament; (xvii) the lower urinary passages; (xviii) the lower bowel; (xix) the ischio-rectal fossa; (xx) applied anatomy; (xxi) the physical examination. Index.

It is close upon a decade since the previous edition of this little book was issued (the author being, in the interval, on active service) and it may not be as familiar as it deserves to be amongst present-day students.

Dr Maguire has the double qualification for writing such a book in that before advancing into gynaecology he was for six years the Professor of Anatomy in the University of Sydney. Perusal reveals a third qualification of no less importance—that he is obviously a man with a natural aptitude for teaching. Consequently his book offers a singularly clear and comprehensive account of its subject, with what one may call "teaching points" skilfully emphasized, particularly those with any special bearing upon either the design or the performance of gynaecological operations. It is, therefore, a book that should be most helpful to students of all grades of seniority who are preparing for examination in anatomy or in gynaecology, and not less so to those engaged in gynaecological operating or teaching. One of the best chapters is the last—on the physical examination of the pelvis in the living subject—where the clinical and scientific experience of the author is gathered up and blended in simple, clear instructions.

Sir William Fletcher Shaw has contributed a foreword in which he traces the evolution of those plastic operations on the female pelvic floor which form such a distinctive feature of modern gynaecology and for which we owe so great a debt to British gynaecologists and to the Manchester School in particular.

With 55 illustrations, semi-diagrammatic certainly, but beautifully drawn and admirably reproduced on art paper, this must have been an expensive book to produce, and both author and publishers are to be congratulated. One can only hope that medical students of today are more affluent than they were when an appreciative reviewer had the pleasure of being one of their number.

## 1583 Atlas of Mahfouz's Obstetric and Gynaecological Museum. Volume I

Noguib Pacha Mahfouz. Altrincham: John Sherratt & Son, 1949. xviii + 417 pages; 219 figures. 25 x 19 cm. £9 9s. the set of 3 volumes [£9.45]

(i) Structure of the genital organs: malformations of the female genital organs; (ii) the supporting structures of the genital organs: prolapse of the pelvic organs; (iii) menstruation and its functional disturbance; (iv) the pituitary gland during pregnancy; (v) the formation of the placenta: diseases of the membranes and placenta; (vi) disorders of pregnancy; (vii) hydatidiform degeneration of chorion: chorion-epithelioma; (viii) antepartum haemorrhage; (ix) the toxæmias of pregnancy; (x) the accidents of labour.

Few men can have had a richer experience or a more fruitful territory from which to derive a vast collection of pathological material than Mahfouz Pacha. Not only has he collected a unique museum of obstetrical, gynaecological and neonatal pathology, but his friends and colleagues have all lent a hand in swelling the total. There can be no museum in Britain which approaches this one.

It is therefore right and timely that a catalogue and atlas of his specimens should be published, and this very considerable work will appear in three volumes, the first of which is now available to the public. The production of this atlas must have given the author an immense amount of labour, for the book has obviously been compiled with meticulous attention to detail.

The author's plan has been to subdivide his subject into chapters, each of which starts with a short introduction. Although this is short, it is extremely succinct and contains more meat in a few lines than many a textbook in several pages. Mahfouz has rigorously excluded anything that is experimental, hypothetical and untried, and has steadfastly kept to the orthodox. In this way he may perhaps be criticized in certain places for being a little old-fashioned, but I think that, on the whole, this is a good trait in a book which will have a wide appeal to students. After the preamble there follows the series of illustrations in black and white, and in colour, relevant to the subject under discussion, each with a small sub-title in seven languages—French, German, Italian, Spanish, English, Arabic and Russian. These illustrations are superbly reproduced and the artist is to be congratulated. The histology is well reproduced.

It is difficult to pick out the best chapters in a book of a standard so uniformly good, but the chapters on the uterus and on hydatidiform mole and chorionepithelioma are outstanding. In fact, the latter is the best I can remember even in a textbook of gynaecology; and Mahfouz's *Atlas* is not a textbook.

There are few criticisms to be made about this book, but one or two points should be noted. First, there is a number of unfortunate spelling mistakes; the author should have his proofs read for the next edition by a classical scholar. It would also be an improvement to the next edition to have the names of those authors who are mentioned in the text tabulated for reference at the end of the chapter, so that the more advanced student would be able to explore the subject further should he wish to do so. This reviewer thinks it is a pity that a book which is going to have a wide appeal to the less opulent medical student should not be sold in separate volumes at 3 guineas each; to subscribe nine guineas for three volumes, two of which may not be delivered for several months, will deter a number of would-be purchasers.

Finally, every medical library and every medical school in the world should certainly have a copy of this *Atlas*. It will be of equal interest to teacher, specialist and student of the humblest qualifying examination. It bears the stamp of genius and is a monument to the unique experience of a man who has had one of the biggest gynaecological practices in the world.

J. Howkins

### 1584 *Lehrbuch der Gynäkologie*

Edited by Hans Guggisberg. Second edition. Basle: S. Karger, 1947. xlii + 717 pages; 354 illustrations. 25 × 17 cm. 72 Sw. fr.

(i) Anatomie des weiblichen Genitalapparates und seiner Nachbarorgane; (ii) die Entwicklung des weiblichen Urogenitalapparates; (iii) die Entwicklungsstörungen der Geschlechtsorgane; (iv) die Konstitution der Frau; (v) Konstitutions- und Wachstumsstörungen; (vi) die Physiologie der Frau; (vii) die Funktionsstörungen und die krankhaften Erscheinungen des weiblichen Genitale; (viii) Pathogenese der organischen und funktionellen Genitalleiden; (ix) die gynäkologische Diagnostik; (x) die Erkrankungen des äusseren weiblichen Genitale; (xi) die Erkrankungen der Vagina; (xii) die Erkrankungen des Uterus; (xiii) die Krankheiten der Ovarien; (xiv) die Erkrankungen der Tube; (xv) die Erkrankungen des Beckenbindegewebes und des Bauchfells; (xvi) die Erkrankungen der Bauchdecken; (xvii) die Erkrankungen des Darmes und ihre Beziehungen zum weiblichen Genitale; (xviii) die Erkrankungen der Harnorgane; (xix) die Infektion der Genitalorgane; (xx) Lage- und Gestaltveränderungen der Genitalorgane; (xxi) die Endometriosen; (xxii) die Sterilität; (xxiii) die Kontrazeption; (xxiv) die Therapie mit körpereigenen Wirkstoffen; (xxv) die physikalische Therapie; (xxvi) die Strahlentherapie; (xxvii) Diätetik (die therapeutische Verwendung der Vitamine); (xxviii) Hygiene der Frau. Sachregister.

### *Lehrbuch der Geburtshilfe. Vols. I and II*

Edited by Th. Koller. Basle: S. Karger, 1948. xxiv + 1323 pages; 711 figures. 25 × 17 cm. 110 Sw. fr. the set of two volumes

Vol. I. (i) Geschichtlicher Überblick über die Entwicklung der Geburtshilfe; (ii) Embryologie des Menschen und Morphologie des Neugeborenen; (iii) die normale Schwangerschaft inklusive Schwangerschaftshygiene und Schwangerenfürsorge; (iv) die normale Geburt; (v) das physiologische Wochenbett (Puerperium); (vi) Physiologie des Neugeborenen; (vii) Mehrlingsschwangerschaft und Geburt; (viii) die Geburt aus Beckenendlage; (ix) die Pathologie der Schwangerschaft; (x) die Extrauterin gravidität. Vol. II. (xi) Die regelwidrige Geburt; (xii) das pathologische Wochenbett; (xiii) die Missbildungen des Feten; (xiv) Pathologie des Neugeborenen. Sachregister.

This three-volume work comprehensively describes present-day Swiss teaching in obstetrics and gynaecology. The editors felt that such a work was more than ever necessary because of the non-appearance of German-language textbooks in these fields due to the recent war. The fact that a 2nd edition of vol. I was required within a few months of the publication of the 1st indicates the soundness of this judgement.

The first section of vol. I, *Lehrbuch der Gynäkologie*, deals with the anatomy of the female reproductive organs and is profusely illustrated. Unfortunately, many of these illustrations lack clarity, and perhaps might have been differently chosen with advantage. For example, the relationship between the ureter and the uterine artery is described in the text, but is not illustrated. There follow chapters dealing with the embryology and physiology of the female sex organs. Functional abnormalities are well documented and the medical, surgical and radiological treatment of these is fully considered.

The chapter on gynaecological diagnosis is up to date and present-day methods are fully described. The chapter on the pathology of the external genitalia is noteworthy because of its excellent coloured drawings, a contrast to the illustrations which appear earlier in the book. Noteworthy also is the fullness of treatment of myomata of the uterus.

Two volumes are devoted to obstetrics, titled vols. I and II, though listed as vols. II and III in the series. The chapters on normal pregnancy and labour are fairly full, though perhaps more stress might have been laid on the value and routine of antenatal care. The sections on the diseases of pregnancy and the pathology of labour and the puerperium are comprehensive and include a chapter on the pathology of the breast.

This work has been written by authors of great experience; it is perhaps a little too full for the undergraduate student, but will prove a trustworthy and valuable help to the postgraduate student and a useful reference volume to the specialist.

Oskar Burger

## NEUROLOGY AND PSYCHIATRY

## 1585 International Congress on Mental Health, London 1948, Vols. 1, 2, 3 &amp; 4

Edited by J. C. Flugel. London : H. K. Lewis & Co. Ltd. ; New York : Columbia University Press [1949]. Vol. I : History, development and organisation. 154 pages ; illustrations. 22 x 15 cm. 10s. [£0.5]. Vol. II : Proceedings of the International Conference on Child Psychiatry, 11th-14th August. xiii + 142 pages. 22 x 15 cm. 10s. [£0.5]. Vol. III : Proceedings of the International Conference on Medical Psychotherapy, 11th-14th August. xv + 129 pages. 22 x 15 cm. 10s. [£0.5]. Vol. IV : Proceedings of the International Conference on Mental Hygiene, 16th-21st August. ix + 330 pages. 22 x 15 cm. £1

Vol. I : (i) Origins and aims of the Congress ; (ii) development of the programme ; (iii) group work before and during the Congress ; (iv) United States participation ; (v) the International Preparatory Commission ; (vi) press and publicity ; (vii) organisation. Vol. II : (i) Aggression in relation to emotional development, normal and pathological ; (ii) aggression in relation to family life ; (iii) psychiatric problems in the educational sphere ; (iv) the community and the aggressive child. Vol. III : (i) The genesis of guilt ; (ii) guilt and dynamics of psychological disorder in the individual ; (iii) collective guilt ; (iv) advances in group and individual therapy. Vol. IV : (i) Problems of world citizenship and good group relations ; (ii) the individual and society ; (iii) family problems and psychological disturbance ; (iv) mental health in industry and industrial relations ; (v) planning for mental health : organisation, training, propaganda ; (vi) conclusions and recommendations.

The 1948 International Congress on Mental Health, held in London under the presidency of Dr J. R. Rees, was not only one of the largest gatherings of its kind, but was conceived as an experiment in trans-national and inter-disciplinary communication. The first volume of its Proceedings deals with the steps taken to secure this end, and with the analysis of mistakes for those who come after. In this, the writers are perhaps hard on themselves as planners of the Congress. The feat of arousing some 4,000 persons, in many instances leaders in the field, from 28 different professions in 20 countries, to serious preparatory group discussions, fact-finding and even original research, some 18 months before the actual Congress, is probably unprecedented, and possibly the most significant among the achievements of this gathering.

In order to appreciate the material in the other three volumes it is essential to keep in mind that the Congress aimed less at individual brilliance than at finding the areas of agreement and disagreement among the disciplines concerned with promoting the purposes of a good society. Hearing and re-reading the statements from eminent psychiatrists, psychologists, social scientists and so forth, one is astonished at the rapidity with which their concepts, and even their language, have converged in the last decade. The cross-fertilization between disciplines, resulting from preparatory groups and from the efforts of individuals who had achieved considerable integration of psychological and sociological thinking, is evidenced in many papers and less formal contributions. Psychiatrists have begun to think socially and social scientists psychiatrically. A new science of "human relations" or "sociatry" is being born.

The Congress was a fusion of three conferences : on child psychiatry, on medical psychotherapy, and on mental hygiene, separately sponsored. Thanks to co-ordination, the major topics of each fitted into the theme of the whole : "Mental health and world citizenship". It is permissible to paraphrase the handling of this large subject by the Congress as "The study, diagnosis, therapy and prevention of the development of unhealthy or dangerous tensions within individuals, between individuals, within groups and between groups". Nearly half the published material consists of reports of the views of representative groups concerning such matters as aggression, guilt and their bearing on human relations. Among these expressions of common purpose and doctrine there are stimulating and profound discourses by distinguished leaders in the fields of psychiatry and social science. Margaret Mead, Franz Alexander, William Line, L. K. Frank, Anna Freud, T. F. Rodger and J. C. Flugel seem to stand out in this galaxy. The contents of these volumes, therefore, not only deal with recent work but are also authoritative and will repay careful study by any worker, whether concerned with individual welfare or with public hygiene, administration or policy.

This is perhaps especially the case with a succinct statement of basic concepts and practical recommendations for prophylactic

action, prepared by a small, picked group of persons representing various countries and disciplines meeting for some weeks before the Congress—the so-called International Preparatory Commission (Vol. IV, p. 285 *et seq.*). The statement is a condensed but readable digest of current views and trends on a canvas sufficiently broad to be applicable to countries at all stages of mental health service development. Recommendations are grouped under the headings of "Principles underlying the practice of mental health", "Planning and organisation of national mental health services", "Education of the general public", "Education of specialists", and "Research". Recommendations for international action are addressed to the United Nations, the World Health Organization, and other specialized agencies. This statement was adopted with virtual unanimity by the Congress as a whole.

The main conclusions point to an acceptance of human nature as plastic, dynamic and capable of exhibiting an infinity of behaviour patterns ; it is therefore capable of change and not predetermined. It is social habit or institution that is resistant to change. This offers a message of reasonable hope in our power to influence changes in such patterns by social, medical and educational action. The recommendations show that neither psychiatry, nor any other single discipline, has any illusions or grandiose fantasies about its powers to heal a distracted world. What emerges is a sober design for constructive assistance ; mental health workers must broaden their conception of their work to include the total human situation rather than wait for patients to flood their clinics. The statement is a challenge to social policy. The front line of the battle for mental health lies in the education of parents, teachers, public health and infant welfare workers, and above all of policy makers and leaders of men, in the understanding of human beings, as individuals and in their social units, as ascertained by adequate scientific study.

The work accomplished by the Congress bids fair to cut the last bit of ground from under those who would still wish to maintain that the human sciences are nothing but warring camps and that medicine or classical economics can afford to ignore their teaching and their claim to contribute to human welfare. It is made clear that the World Health Organization and UNESCO have both officially signified their acceptance of the Congress recommendations and have conferred recognition on the World Federation of Mental Health founded during the Congress. One wishes these proceedings could be made obligatory reading in all postgraduate schools of medicine and of social science. The volumes are adequately produced and edited.

H. V. Dicks

## 1586 The Trend of Scottish Intelligence. A Comparison of the 1947 and 1932 Surveys of the Intelligence of Eleven-Year-Old Pupils

Sponsored by the Population Investigation Committee & the Scottish Council for Research in Education. London : University of London Press Ltd., 1949. xxviii + 151 pages ; 7 figures. 22 x 14 cm. 7s. 6d. [£0.375]

(i) Introduction ; (ii) administrative arrangements ; (iii) sociological inquiry ; (iv) individual testing ; (v) correction of scripts and coding of sociological schedules ; (vi) results of group test ; (vii) intelligence and family size ; (viii) comparison of the 1947 and 1932 individual test results ; (ix) the implications of the 1947 survey.

At the beginning of the present century, fears were repeatedly expressed lest the alleged differences in fertility between the different social classes might not be producing a decline in the national intelligence.<sup>1</sup> The first actual surveys of intelligence, carried out by means of standardized tests, were those commenced in 1913 by Burt as Psychologist to the London County Council schools. The results revealed a small but undeniable negative correlation between children's intelligence and the size of the families from which they came. It was also shown that the correlation within each social class was quite as marked as the correlation with class differences ; in fact, class differences as such proved a somewhat irrelevant factor.

<sup>1</sup> See also *Brit. med. Bull.* 1947, Vol. 5, pages 226 & 228.—Ed.

The decline in average intelligence suggested by the figures was too small to be distinctly observable over a short period of time, particularly in an area like London with its shifting population. On the other hand, if no other factors were operative, the changes at the extreme ends of the scale, in the number of defectives and of scholarship children respectively, ought to have been discernible in the course of 10 or 20 years. But neither subsequent surveys nor the observations of teachers, school medical officers, or scholarship examiners, revealed anything like the increase in the changes deduced from arm-chair calculations. The conclusion tentatively suggested was that, partly but not wholly, the effects of differential fertility were being counterbalanced by the concurrent effects of certain genetic influences, easy to suggest but hard to prove.

This left the problem still undecided. Later investigations, like that of Dr Fraser Roberts at Bath, fully confirmed the negative correlation. And in 1932 a survey of all the children in Scotland born in 1921 was organized by the Scottish Council for Research in Education. No records were obtained at the time for the size of the various families. But in 1945 the Population Investigation Committee suggested a repetition of the survey, and undertook to secure the necessary financial aid. The suggestion was carried out in 1947; and the methods used and the data collected are fully described in the report now published.

The general arrangements were the same as before. An entire age-group, consisting of all the children in Scotland aged 11, was tested; and the same group test as that used in the 1932 survey was employed. So far from any decline being manifested, the average score turned out to be higher. The difference amounted to 2.3 points (somewhat more on an I.Q. scale), and was fully significant. The application of the individual tests to selected samples revealed a similar difference; but this might be explicable by a change in the Binet scale employed.

The main results have evidently come as a surprise to the investigators. They discuss various explanations that might account for the increase, and, on the whole, seem disposed to conclude that it is mainly due to increasing familiarity with intelligence tests of the type employed. So far, therefore, the main issue still remains unsolved. Further analyses of the data collected may conceivably lead to a more decisive conclusion. Meanwhile, the account of the planning, of the administrative organization, of the selection of tests, questionnaire items, and the like, will furnish much valuable assistance to those who may be contemplating similar surveys in the near future.

## 1587 Psychological Aspects of Clinical Medicine

Stephen Borton Holl. London: H. K. Lewis & Co. Ltd., 1949. xi + 416 pages. 22 x 14 cm. £1 1s. [£1.05]

(i) Introduction; (ii) investigation; (iii) intellectual development: psychometry and its application to medicine; (iv) emotional development and psychopathology; (v) common forms of psychoneurosis; (vi) psychological symptoms and physical disease; (vii) psychosomatic relationships; (viii) abnormal behaviour as a symptom of disease; (ix) relation of psychoneurosis to psychosis; (x) personality disorders; (xi) psychological aspects of management and treatment. Index of names. Index of subjects.

New books on psychiatry are plentiful, but many of them merely reflect the views of well-established works and are inferior to the originals. This book, however, is fairly new in concept and extremely ably written. The author has a sound grasp of his subject, and what he has to say is derived not merely from other books but from a wide clinical experience. His book covers those aspects of psychiatry which are likely to be of most concern to general practitioners and physicians; he develops his themes so steadily that his description of neurosis and psychosomatic relationships is reasonably easy to follow.

A minor criticism is that the chapter on psychopathology is somewhat condensed; the beginner would welcome more detail about mental mechanisms. Certain other criticisms on matters of detail could be made; for example, on page 59, dealing with the five grades of score on the progressive matrices tests, it is stated that grade 1 begins at the 95 percentile score; the other percentile scores given are also not those generally accepted. Grade 1 is usually placed at the 90 percentile score, grade 2 at the 70 percentile score, and so on. Again, on page 71 there is a numerical error. The sum of three weighted scores is multiplied by 5 and divided by 3, not multiplied by 5.3 as the text reads.

The conditions given on page 140 for the diagnosis of psychogenic illness compose an excellent summary which is well worth

teaching to students as it stands. The list of physical conditions frequently diagnosed as functional in nature is an interesting, but a personal, one. In the opinion of this reviewer, disseminated sclerosis is diagnosed as functional more frequently than the author suggests; and visceroptosis must be regarded with some suspicion as an organic diagnosis.

In the discussion of psychosomatic disorders an important fact, which is indeed frequently overlooked, is omitted. It is usually stressed and is now well recognized that certain disorders may be neurotically determined; but surely the author must have seen many psychosomatic disorders which were secondary to psychosis? Asthma often occurs in agitated depression, and pruritus ani and vulvae are also seen as depressive symptoms. In the discussion on delirium in relation to infective illness, the fact that there is usually a diurnal variation might have been emphasized; it might also have been pointed out that the infective element is often missed and is by no means necessarily obvious.

The chapter dealing with the relation of the psychoneuroses to psychosis is extremely good, and the discussion of the differential diagnosis is sound. There is no doubt that there is a difference between severe exogenous depression and melancholia. In extreme degrees these conditions are obviously different, and in the reviewer's opinion are different at the beginning even in their milder forms. The author rightly stresses that psychoanalytic treatment of an early psychosis may be disastrous. In this, as in all branches of medicine, correct diagnosis is essential before commencing treatment.

The criticisms of this book are, after all, minor; it can be heartily recommended to medical students and physicians, and psychiatrists will also find it worthy of their attention.

Robert Orton

## 1588 An Introduction to Physical Methods of Treatment in Psychiatry

William Sargant & Eliot Slater. With a chapter on treatment of the epilepsies, by Denis Hill. Second edition. Edinburgh: E. & S. Livingstone Ltd., 1948. xv + 215 pages. 22 x 14 cm. 10s. 6d. [£0.525]

(i) The insulin treatment of schizophrenia; (ii) modified insulin therapy; (iii) convulsion therapy; (iv) treatment of the epilepsies; (v) chemical sedation and stimulation; (vi) continuous sleep treatment; (vii) the use of drugs in psychotherapy; (viii) diet, vitamins and endocrines; (ix) prefrontal leucotomy; (x) the treatment of general paralysis; (xi) the relation of psychological to somatic treatment. Bibliography. Index.

The success of this comprehensive manual of psychiatric therapies, as shown by the appearance of this 2nd, revised edition, is first and foremost due to the full, lucid descriptions and explanations of the various more or less novel methods of physical treatments. They are taught by experts who speak from their own wide practical experience and the reader has the feeling that he makes contact, not with literature, but with the physician used to applying the treatment he describes. From the first sensational success of physical treatment in psychiatry 30 years ago—the malaria treatment of general paresis—all those therapeutic procedures which have stood the test of time and have become reliable adjuncts of psychiatric work in hospitals are dealt with: the various uses of insulin and hypoglycaemic treatment, convulsive therapy in its different modifications, chemical sedation, treatment by diet, vitamins and endocrines, and prefrontal leucotomy. In the new edition of this book the methods are brought up to date and new techniques, such as the abreaction methods using drugs, have been added and are fully discussed. Another important addition is the chapter on the treatment of epilepsy, written by Dr Denis Hill, who has incorporated recent progress on the theory of this illness as well as the practical application of electroencephalography into his clear and skilfully written discourse.

Beyond its practical usefulness, the present small book has the distinction of representing a new approach to psychiatry which has gained it many friends: the authors' restrained enthusiasm for active integration of psychiatry into clinical medicine and away from speculative and philosophical doctrines. In the introductory chapter as well as in the concluding part on the relation of psychological to somatic treatment this approach finds a concise and striking expression. These chapters, in fact, contain a psychiatric theory in a nutshell; this theory deserves elaboration and application on a much larger scale.

W. Mayer-Gross

### 1589 Psycho-Analysis. A Handbook for Medical Practitioners and Students of Comparative Psychology

Edward Glover. Second edition. London: Staples Press, 1949. 367 pages. 22 x 14 cm. 15s. [£0.75]

(i) Introductory. Section I. Theory of psycho-analysis. (ii) The embryology of mind; (iii) the dynamic aspects of mind; (iv) the structure of mind; (v) the economics of mind; (vi) phases of mental development; (vii) dreams and symptomatic acts; (viii) symptom formation. Section II. Clinical psycho-analysis. (ix) Introductory; (x) psycho-neuroses; (xi) psycho-somatic and allied disorders; (xii) psychoses; (xiii) transitional groups; (xiv) psychosexual disorders; (xv) social difficulties; (xvi) psycho-analysis of children. Section III. (xvii) Practical applications. Appendix. Glossary. List of books recommended. Index.

In his preface to this 2nd edition the author welcomes the opportunity of re-stating the basic theory of psychoanalysis but, in fact, the chapters on theoretical subjects occupy less than one-third of the book and are followed by a survey of the clinical field. There is much sound advice to general medical practitioners on the applicability of psychoanalytic methods of treatment. Finally, the book contains a useful glossary of psychoanalytic terms and a guide to the literature.

Glover claims that psychoanalysis is not merely a method of treatment, but that it has become an instrument of "diagnosis in depth" by applying the developmental approach to the classification of mental diseases. It has also been turned into an instrument of research and has produced a theory of mind—by utilizing three approaches to the full understanding of every mental event. In the topographic approach, Freud based his theory of mental structure on the concept of the reflex arc, with mind as the central system subdivided into a number of component parts, the mental institutions. The second, dynamic, approach deals with the excitations which disturb this central system, e.g., stimulations of unsatisfied instincts which produce either mental experiences (thoughts and feelings) or motor discharges which make up conduct and behaviour. Finally, mental activity may be regarded as an economic process, by which the psychic apparatus attempts to deal with instinct excitations which cannot be immediately discharged and which might produce discomforts, such as anxiety. The mind seeks to reduce stimulation and, on the other hand, deals with undischarged excitations by means of a number of mental mechanisms. Normality depends upon the degree of success which attends these manoeuvres, and this economic approach confirms that normality is an artificial concept and that "neuroses and other mental disorders are simply forms of unsatisfactory (inappropriate, unrealistic) discharges which occur when the individual has been unable to achieve a working balance between his instinct-tensions and the outlets permitted them either by himself or by his social environment". Psychological symptoms are regarded as "mental policies" to resolve conflicts between inner drives and wishes with outer reality; they may even be looked upon as "in part a spontaneous attempt at self-cure".

In addition to the further elaboration of these theories and their clinical application, the book contains numerous references to recent psychoanalytic work and concepts. Among these should be mentioned Glover's own contribution to ego development, in which he suggests that ego nuclei are laid down during the successive stages of development of instinct. These nuclei are looked upon as organized systems of memory traces and ideations contributing at first to the gratification and later to the control of specific instincts. The author admits the hypothetical nature of many central psychoanalytical tenets, especially those relying on interpretations of phenomena observed during the first 18 months of life, and yet at the same time he seems to accept as the only important inborn constitutional factor the individual's ability to tolerate frustration. The clinical part of the book contains a comprehensive account of the psychoanalytic contribution to the understanding and treatment of psychiatric disorders, ranging from the classical neuroses and psychoses, through the drug addictions, psychosomatic conditions and psychosexual disorders, to disabilities primarily of social rather than medical importance.

Very little space is given to a discussion of the methods of psychoanalytic research and of the way in which Freud and his pupils arrived at their theories, and it must, therefore, be assumed that this book is addressed to a reader who is already acquainted with psychoanalytic thinking; he will, however, find much to clarify his understanding of the theory and present-day trends of orthodox Freudian psychoanalysis.

Felix Post

### 1590 Psychobiology and Psychiatry. A Textbook of Normal and Abnormal Human Behavior

Wendell Muncie. Second edition. London: Henry Kimpton, 1948. 620 pages; 70 illustrations. 26 x 18 cm. £2 5s. [£2.25]

Part I. Psychobiology—the study of normal behavior. (i) Historical and philosophical bases of psychobiology; (ii) student's personality study; (iii) student's personality study (continued); (iv) student's personality study (continued). Part II. Abnormal behavior—pathology and psychiatry. (i) Historical account; (ii) examination methods and immediate findings; (iii) the static constitutional types; (iv) plastic psychodynamic minor reactions; (v) plastic psychodynamic minor reactions (continued); (vi) major reactions (holergasias); (vii) affective reactions; (viii) affective reactions (continued); (ix) topical delusional states and para-reactions; (x) para-reactions (continued); (xi) the support disorders (dysergasias); (xii) the acquired organic deficit reactions (anergasias); (xiii) the acquired organic deficit reactions (anergasias) (continued); (xiv) the convulsive state and allied conditions (the epilepsies). Part III. Treatment. (i) General bases of treatment and the procedure; (ii) important therapeutic aids; (iii) important therapeutic aids (continued); (iv) treatment of the static constitutional reactions; (v) treatment of the psychodynamic minor reactions; (vi) treatment of the major reactions (holergasias); (vii) para-reactions; (viii) dysergic reactions; (ix) organic deficit states; (x) treatment of convulsive disorders (the epilepsies); (xi) mental hygiene. Index.

The 1st edition of this American textbook for students appeared in 1939. The author is an Associate Professor of Psychiatry at Johns Hopkins University and he has worked with Adolf Meyer for almost 20 years. The book was welcomed as an authoritative account of the school of psychobiology, especially as the teaching of Meyer had been handed on mainly by word of mouth and no full and definitive version had previously been available, although the standard English textbook of Henderson & Gillespie was inspired by Meyer's views. Both in North America and in Britain these views have had an enormous influence on psychiatry, although they have received less attention on the continent of Europe where Meyer lived for the early part of his life. At a time when the opposing views of Kraepelin and Freud held the field, Meyer developed an eclectic approach which kept to the broad middle of the road. He regarded mental disorder as an "experiment of nature" and for him genetic-dynamic considerations took the place of hidden etiological factors; all the relevant exogenous, organogenic, neurogenic, psychogenic and constitutional elements in the individual were considered and evaluated. Unfortunately, in the exhaustive search for the patient's personality his disease tended to be overlooked. Thus the need for exactitude in diagnosis and prognosis was minimized, and treatment became similarly inexact and opportunistic. In diseases such as schizophrenia the followers of Meyer spent much time in tracing the development of the disease from a series of life-long maladaptations to various psychological and physical traumata, and they spent even more time in unrewarding efforts to treat schizophrenia by re-education. In the understanding and treatment of the superficial neuroses the Meyerian approach has borne more fruit.

These criticisms are criticisms of psychobiology; as an exposition of psychobiology, no adverse criticisms can be made of this book. In the first part, of 136 pages, the student is introduced to the study of personality in its longitudinal development and he is set useful exercises in self-appraisal. The second part, of 378 pages, describes the neuroses and psychoses, and numerous case-histories illustrate the psychobiological approach. The final part, of 94 pages, describes therapy. This 2nd edition has been brought up to date but is essentially unchanged from 1939. It gives a complete and readable picture of the work of Adolf Meyer, whose hitherto paramount influence on Anglo-American psychiatric thought is being lessened by the advance of other schools.

Hunter Gillies

### 1591 Conditioned Reflexes and Neuron Organization

Jerzy Konorski. Cambridge: University Press, 1948. xiv + 267 pages; 18 figures. 22 x 14 cm. 18s. [£0.9]

(i) Conditioned reflexes and the physiology of the central nervous system; (ii) an outline of Pavlov's theory of the activity of the cerebral cortex; (iii) a criticism of the Pavlov theory. Addendum: the Baritoff theory; (iv) general laws of the functioning of the nervous system; (v) excitability and plasticity in the nervous system; (vi) the conditioned reflex; (vii) alliances and antagonisms in the field of conditioned reflexes. (The summation of conditioned reflexes and external inhibition); (viii) the generalization of conditioned reflexes; (ix) internal inhibition. 1. Its nature and varieties; (x) internal inhibition. 2. The basic properties of inhibition. Addendum: on the phenomenon of sleep; (xi) the dynamic stereotype and hypnotic phases; (xii) conditioned reflexes of the second type; (xiii) nomenclature of the physiology of higher nervous activity; (xiv) conclusion. Index.

The acknowledged aim of this book is to build a bridge between Pavlov's massive, if somewhat insecure, theoretical edifice and the

more solid structure of Sherringtonian neurophysiology. This task is far from easy. As the author himself points out, the whole style of Pavlov's doctrine is foreign to traditional physiological thought. In particular, the neurone theory, with all that it implies for contemporary neurophysiology, finds no essential place in Pavlov's system. Although it might be possible, by special pleading, to reconcile some aspects of the latter with more orthodox conceptions of nervous activity, Dr Konorski has set himself the harder, but infinitely more rewarding, task of reinterpreting the whole of the data so painstakingly assembled by Pavlov and his school in the light of Sherringtonian principles. Even if he does not entirely succeed, no reader of this book can deny that he has tried extremely hard and, on the whole, extremely intelligently.

After a preliminary outline and critique of Pavlov's main theories, Dr Konorski undertakes a detailed examination of conditioned reflexes and their more important properties. The formation of a conditioned reflex he views in terms of the establishment of new synaptic connexions (presumably functional) between the cerebral "centres" involved. This is certainly an improvement on Pavlov's disconcertingly vague conception of the association process. In somewhat the same way, he regards internal inhibition as involving the formation of new and independent synaptic connexions of an inhibitory character. On this view, when a conditioned reflex is extinguished, a new inhibitory reflex is built up in such a way that, when the conditioned stimulus is applied, its cortical locus emits both excitatory and inhibitory impulses to the "centre" corresponding to the unconditioned stimulus. The magnitude of the resulting response will then depend on the relative density of the two hypothetical volleys of impulses. Although somewhat speculative, this is certainly a better idea than Pavlov's notion of an inhibitory process irradiating in some obscure manner from the central locus of the conditioned stimulus. Even so, it must be borne in mind that Konorski's hypothesis, although agreeing well with certain experimental data, at bottom does little more than postulate that, in the conditioning process, some change in cortical synaptic conduction patterns is involved. Its reception will presumably depend upon the extent to which it can stimulate fruitful experimental inquiry.

After a long theoretical discussion of various other conditioning phenomena, such as generalization and summation, the author passes on to some aspects of Pavlov's work relatively little known in this country. These do much to relate the fragmentary reactions studied by the classical conditioning technique to broader problems of behaviour. Thus it was shown by Pavlov himself that "... in conditioned reflex experiments each trial is not an independent event but forms a certain whole with other trials." This he termed the "dynamic stereotype". It is adduced to explain such facts as that when a system of conditioned stimuli is repeated daily for a long period in the same order of succession, a change in the sequence of the stimuli will produce comparatively little effect upon the response. If, for example, a strong stimulus is replaced by a weak one its effect will nevertheless be strong. Dr Konorski devotes some interesting discussion to "temporal patterning" of this kind which will do much to mollify those who have taken Pavlov to task for his apparent neglect of "gestalt" principles.

Dr Konorski's book is perhaps the first critical examination of the theory of the conditioned reflex to appear from one who was himself trained in the strict Pavlovian school. As might be expected, it testifies to a wide and intensive knowledge of the original literature. It is evident, too, that the author is first and foremost an experimentalist who was led to undertake this inquiry less from pure theoretical interest than from a wish to disentangle fact from dogma and so to free the road for fresh empirical research. Although Dr Konorski cannot rank as a theorist of the first order, his brave and scholarly book deserves close scrutiny. Despite its difficult and somewhat abstruse style, it will remain as a notable attempt to pierce the "iron curtain" of Soviet science and to relate what is most valuable in Pavlov's work to the general development of neurophysiology.

O. L. Zangwill

## 1592 Neurological Anatomy in Relation to Clinical Medicine

A. Brodal. Oxford: Clarendon Press; London: Geoffrey Cumberlege, 1948. xv + 496 pages; 94 figures. 25 x 16 cm. £2 2s. [£2.1]

(i) Introduction, methods, correlations; (ii) the peripheral motor neuron; (iii) the pyramidal tract; (iv) the extra-pyramidal system; (v) the cerebellum; (vi) the somatic afferent system; (vii) the cranial nerves; (viii) the optic system; (ix) the acoustic system; (x) the olfactory system; (xi) the autonomic nervous system; (xii) the cerebral cortex. Bibliography. Index.

This book, which first appeared in Norwegian in 1943, is an attempt to correlate the anatomy and physiology of the nervous system with clinical neurology. It was designed to be an up-to-date vade mecum for the clinical neurologist. It therefore omits most of the simple anatomy which one finds in the ordinary textbooks of neuro-anatomy and also omits most of the basic facts of neurophysiology. Such a book has the merit of placing the reader in contact with much recent work, both experimental and clinical, and saves the labour of hunting through the recent journals. The author successfully runs the risk of putting into italics any statements of fundamental value which are now verifiable postulates.

On the other hand, the very newness of the data tends to militate against the ordered historical perspective of the development of clinical neurology. Many of the new data are hot from the press, but they may not all stand the test of time. *Difficilis est sigillum veritatis*, particularly in neurology.

The introduction deals with the laboratory, experimental and clinical methods of the subject and then proceeds to deal in sequence with the lower motor neurone, the pyramidal tract, the extra-pyramidal system and the cerebellum. This is followed by chapters which deal in turn with the somatic afferent system, the cranial nerves, the optic system, the acoustic system and the olfactory system. The remaining two chapters deal with the autonomic system and the cerebral cortex. Thus the order of presentation, successful though it be, bears little relationship to the phylogenetic or ontogenetic development of the nervous system. The author is naturally at his best when dealing with his own well-known researches on the cerebellum. The section on the autonomic system is the most comprehensive in terms of space.

The reading of this book compelled the reviewer to re-read Romberg's *Lehrbuch der Nervenkrankheiten* (1840-46), Horsley's *Fullerian lectures for 1891* (1892) and Llewellys Barker's *The nervous system* (1900), and to conjecture whether in the near future we may have a book on clinical neurology based on the simple functional classification of Horsley. The latter maintained that the five kinds of function to be provided for were: (i) movement; (ii) sensation; (iii) tone; (iv) nerve supply to the blood vessels; (v) secretion.

The present volume by Brodal is timely and collects together much work of the last two decades. The illustrations are purposeful and concise. The English is clear. No clinical or laboratory library can afford to be without this book.

H. A. Harris

## 1593 Pathology of the Nervous System. A Student's Introduction

J. Henry Biggart. Second edition. Edinburgh: E. & S. Livingstone Ltd., 1949. xii + 352 pages; 232 figures; 10 coloured plates. 22 x 14 cm. £1 1s. [£1.05]

(i) The neurone and its reactions to disease; (ii) the reactions of the interstitial cells to disease; (iii) the cerebrospinal fluid in disease; (iv) vascular disease and the brain; (v) acute bacterial disease; (vi) chronic infections; (vii) diseases due to viruses; (viii) diseases of unknown etiology, possibly infective; (ix) intoxications and deficiency diseases; (x) degenerative diseases; (xi) injuries to the nervous system; (xii) tumours of the nervous system; (xiii) tumours of the nervous system (*continued*); (xiv) errors in development. Index.

As the quotation given by the author on the fly-leaf of this book says: "The study of things caused must precede the study of the causes of things!" Whilst recent knowledge of the latter is adequately summarized, emphasis is laid upon the morbid anatomy and histology of the common and important pathological conditions. The student, for whom the book is still intended as an introduction to neuropathology, gains much from the knowledge of general pathology possessed by Professor Biggart. A remarkable amount of information is contained within the covers of this excellent book, which, in spite of additional text and figures, is only 17 pages longer than the 1st edition. The use of coloured plates is very helpful, especially in the section on pituitary tumours. The new matter includes sarcoidosis, parasitic and fungal infections and polyarteritis nodosa. At the end of each chapter there is a short bibliography, which does not, unfortunately for the more

serious student, contain all the papers considered important enough to be mentioned in the text. It is not quite clear from the text that obstruction to large cerebral arteries causes ischaemic necrosis not only of the cortex but also of a wedge-shaped portion of underlying white matter. The presentation of the book is of the excellence one associates with Messrs Livingstone, but there

would be advantages in a larger page: illustrations and relevant text are more often visible together and there is less frequent turning of pages. In spite, however, of these criticisms it remains one of the best books on neuropathology, not only for students but also for their seniors.

W. Blockwood

## SOCIAL MEDICINE

### 1594 Mental Health Services. A Handbook on Lunacy and Mental Treatment and Mental Deficiency

F. B. Motthews. London: Shaw & Sons Ltd. [1949]. vi + 483 pages. 22 x 14 cm. £1 15s. [£1.75]

(i) Introduction; (ii) mental defectives and persons of unsound mind; (iii) the administrative structure—central and local; (iv) the powers and duties of the administrative bodies; (v) discharge of patients from detention. Appendix I: Lunacy, mental treatment and mental deficiency Acts, as amended. Appendix II: Lunacy, mental treatment and mental deficiency Orders, Rules and Regulations. Appendix III: Miscellaneous Acts and Orders, etc., dealing with mental patients or their income. Index.

This is a legal handbook dealing with the very complicated statutory law concerned with lunacy and mental deficiency in England and Wales. There is an excellent introduction, historical in character, and illuminating for those not familiar with the background of the development of legislation. Essentially a reference work, this book would appear to be by far the most comprehensive and accessible source of information now available, and is especially suitable for officers of mental hospitals, members of hospital boards, and medical officers of health. The illuminating notes, the attention to accurate detail, and the great care which has been given to devising a logical arrangement make the book unique; and the author manages, nevertheless, to call the reader's attention continuously to the main purposes for which the legislation was formed.

With the passing of the last remnants of the Poor Law and the disappearance of the officials who for so long had rather illogical statutory duties in "lunacy" and mental deficiency procedure, the time is particularly opportune for a re-statement of the law. No matter how drastic the change in social legislation in Britain and no matter how great the necessity appears for complete re-statement, a complete codification of the law in a single statute is never achieved nor, indeed, ever appears really seriously to be attempted.

Before the National Health Service Act of 1946, the major local authorities had become accustomed to administering the law regarding mental defectives and persons of unsound mind. Even if responsibilities were divided between departments, and if the provision of the old Poor Law sometimes entailed curious variations in practice, these local authorities dealt with all aspects of the problems of mental health. Now the public assistance committees and their officials who administered the Poor Law have gone, the mental institutions have passed to the Regional Hospital Boards, and there have been and still may be minor difficulties.

It seems to the reviewer that the intelligent use of this book should enable anyone in doubt to find the powers to take action and procedure for all the difficult situations which arise in practice.

Alon C. Stevenson

### 1595 Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death. Sixth Revision of the International Lists of Diseases and Causes of Death, Adopted 1948. Volume 1

World Health Organization. Geneva: World Health Organization, 1948. (Bulletin of the World Health Organization, Supplement 1.) xxxvii + 376 pages. 24 x 16 cm.

(i) Introduction; (ii) list of three-digit categories (detailed list); (iii) tabular list of inclusions and four-digit subcategories; (iv) medical certification and rules for classification; (v) special lists for tabulation; (vi) suggested form of multiple-cause tabulation; (vii) regulations.

This is the first volume of a two-volume statistical classification and index of diseases, injuries and causes of death. It follows the tradition established by the International List of Causes of Death and synthesizes the varied experiences of different countries in their use of the 1938 International List. Compiled by a group of recognized experts on health statistics, it represents the logical result of efforts dating from 1853 directed towards an internationally accepted classification upon which comparable statistics relating to causes of illness and death can be based. The classification is an improvement upon all previous lists in that it is designed for morbidity as well as mortality statistics, and, by its unanimous acceptance at the Sixth Decennial Revision Conference held in Paris in April 1948, wider international agreement than before has been achieved as to its use. The international agreement extends to details of tabulation and to standard groupings of diagnoses.

Volume I contains the classification itself and sets out the detailed categories and sub-categories of causes of illness and death, together with a supplementary classification of special admissions, live births, stillbirths, prophylactic inoculation, impairments, blindness and deafness. There is a section on medical certification and rules for classification, and other relevant material. There are 17 headings in the main classification which contain in detail some 612 categories of morbid conditions. The disease rubrics of the previous International List have been expanded to provide special categories for non-fatal diseases and injuries, whilst at the same time permitting comparability with certain categories of the preceding International List.

Volume II will provide a comprehensive alphabetical index to the classification in Volume I. At present it is a difficult matter to code some diseases and conditions. Several users of the *Manual*, however, are of opinion that when this index is available the classification will leave little to be desired, although further opinion based on its full practical application will be awaited with interest. The *Manual*, which must represent an enormous amount of work, contains several special aspects which warrant notice, particularly the section which covers accidents, poisons and violence, because here there is a departure from previous methods of classification and coding.

"The World Health Organization is offering this *Manual* in the hope and expectation that it will be, not merely an object of interest to medical statisticians, but the instrument for collecting information into a common pool of knowledge from which, in time, all mankind will benefit." This quotation from the preface to the volume makes the character and the aim of the classification clear.

L. E. Griffith

### 1596 The Design and Equipment of Hospitals

Ronald Ward. London: Baillière, Tindall & Cox, 1949. xvi + 360 pages; 177 figures; 50 plates. 25 x 19 cm. £2 2s. [£2.1]

(i) Introductory; (ii) general considerations; (iii) administrative considerations; (iv) medical considerations; (v) special wards; (vi) special hospitals; (vii) construction. Conclusion. Bibliography. Index.

This book, published at an appropriate moment following the inauguration of the National Health Service and in anticipation of

a revival of hospital building projects, provides a wealth of information of practical use to all who are interested in modern trends of hospital design and in the development of the hospital and public health services.

It is intended for doctors, hospital administrators, public health officials and architects. It provides guidance also for members of boards and committees in their consideration of building schemes and the policies involved. Though hardly to be classed as popular reading it will repay perusal by non-technical members of the public, and it should be welcomed particularly by students and by younger members of the architectural profession who intend to specialize in hospital design and who hitherto may have found the search for adequate and essential data on the subject to be somewhat arduous. The arrangement of the contents and the well-compiled index render the book useful for ready reference to any particular point.

The introductory section deals with general considerations of the hospital as it existed before the passing of the National Health Service Act, 1946, and with the formulation of hospital building schemes. The procedure relating to such schemes is described, and broadly meets the present position under the National Health Service Act; the main differences arise from the fact that the majority of hospitals are now vested in the Minister of Health and expenditure upon them is included in the annual estimates of the Ministry and is met by the Treasury, whose consent is necessary before expenditure is made on proposals costing over £10,000.

In the second section, the site and lay-out of the hospital, horizontal versus vertical planning, sizes of wards, orientation, interrelation of the various units and so on are dealt with. The advantages and disadvantages set forth provide useful material for discussion and final decision. The need for collaboration between the architect, the doctor, the administrator, and the heads of administrative, nursing and other departments is emphasized, with a view to ensuring that the hospital will meet fully the needs of the patients and will simplify the work of those engaged in their treatment and care.

The general hospital is comprehensively described and although some special hospitals, e.g., the mental hospital, receive less attention, the principles of planning are set out in such detail that their application, with such modification as is necessary to meet special needs, should not entail any great difficulty to those concerned. The frequent references in various sections to planning simple and beautiful buildings, of architectural interest externally and internally, in pleasant surroundings, and with colour schemes which have soothing effects upon the patients, are summarized in the conclusion.

The book is illustrated with diagrammatic plans and photographs of interiors, and provides a general survey of the present trends in design. It is worthy of study by all who have at heart the welfare of the sick. Sufficient mention is made of standardization to show the dangers of stereotyped planning which can hinder progress; though some standardization of fittings and equipment may effect saving in cost, the need for continual research and experiment in planning and equipment, to effect still greater advances and improvement, is imperative. Readers may disagree with many of the views expressed; this is not undesirable, however, as it may lead to discussion of these views and to further efforts to improve upon them in an endeavour to attain the ever-elusive perfection.

**1597 Hadden's Health and Welfare Services Handbook. Being a General Guide to the Law Relating to the Health and Welfare Services Administered by Local Authorities, Together with National Insurance and National Assistance**

John Moss. London: Hadden, Best & Co. Ltd., 1948. xxi + 376 pages. 19 x 12 cm. £1 5s. [£1.25]

(i) Central and local authorities; (ii) National Insurance and National Assistance; (iii) National Assistance Act, 1948 (extract from Ministry of Health Circular 87/38, June 7, 1948). Appendix B: National Assistance Act, 1948 (Second Schedule). Index.

The passage of the National Health Service Act, 1946, the National Assistance Act, 1948, and, to a lesser degree, the Children Act, 1948, has laid upon local authorities new and complex duties. Mr Moss's handbook sets out these duties in a simple and easy form, and, at the same time, shows how important it is for anyone who wishes fully to grasp the potentialities and significance of these Acts to have some understanding of the various schemes of national insurance provided by the National Insurance Act, 1946, and the National Insurance (Industrial Injuries) Act, 1946. The book reviewed here provides a short, but clear and admirable, guide to all this complicated legislation; the appearance of Mr Moss's name upon the title-page is the best guarantee of its excellence.

One of the results of the break-up of the Poor Law has been the development of a too rigid separation between those who need residential accommodation because they are sick, e.g., in hospital under the Regional Hospital Boards, or Boards of Governors, and those who need it because they are destitute, using the word in its broadest sense, e.g., in accommodation provided under Part III of the National Assistance Act, where local authorities are required to make provision for persons who "... by reason of age, infirmity or other circumstances are in need of care and attention". Under the Poor Law the Relieving Officer could arrange accommodation for all who needed it. This accommodation was often not ideal, but at least a roof, bed, food and nursing were available. Now there is emerging a type of person whom the Regional Hospital Board or Board of Governors will not accept because they are not really ill, yet who are too infirm to be accommodated in an institution or hostel for the healthy. Ultimately they will be dealt with under Part III of the National Assistance Act, but even when the provisions of the local authority services are available to the full, it will be necessary to have the closest co-operation between the Regional Hospital Boards and Boards of Governors and the local authority so that a patient who is being accommodated under the provisions of Part III can be easily transferred to a hospital, and a hospital patient who is not in need of full medical and nursing care similarly transferred to accommodation under Part III. Mr Moss rightly emphasizes the importance of this "two-way" traffic, which is, indeed, the only way to ensure the continuance of an excellent principle that was inherent in the Poor Law, whereby patients could move easily from workhouse to hospital as their condition required. Failure to secure this co-operation would lead to the development of a new type of infirmary where the chronic, or long-term sick, would lie for years with little or no medical attention.

There is also a danger that the substitution of 300 area offices of the National Assistance Board for some 1,500 Relief Districts will make it more difficult for the old and the destitute, if "relief" is to be used in its fullest sense, meaning that it can be obtained in an emergency, when it is needed most. The Relieving Officer resided in his district, and being personally responsible for what went on in that district, knew the people most likely to be in need of relief, and maintained what was, to all intents and purposes, a 24-hour service. As Mr Moss points out, such a service cannot be restricted to ordinary office hours, but the 24-hour service will be more difficult to maintain when it is administered from a number of central offices.

The other important change that is discussed in this book is the new situation that has arisen with the passing of the Children Act, 1948. Under this, a special officer, the Children's Officer, is appointed to look after the welfare and interest of those children who have been deprived, for one reason or another, of normal home life and parental care. The admirable intention of this Act was to bring up these children, living in accommodation provided by the local authority, in as normal and happy a way as possible. The health and education departments of a county or county borough council deal with normal children at varying stages of their life, and it might have been wiser if the Children's Officer had been a member of the staff of one or other of these departments, preferably of the former, and thus to have assured that these unfortunates, with all other children, would have been the responsibility of the same department of the council. This would have assisted in enabling them to live as normal a life as possible and to grow into normal adults.

Mr Moss's book is clearly written and well indexed, with a wealth of reference to the Statutes and to the many Regulations and Orders made under them. Certainly no local authority can afford to be without this book, and anyone working in the field of welfare today will find it a valuable possession.

Amulree

### 1598 Taylor's Principles and Practice of Medical Jurisprudence. Volume II

Originally written by Alfred Swaine Taylor. Tenth edition edited by Sydney Smith, with a complete revision of the legal aspect by W. G. H. Cook and of the chemical aspect by C. P. Stewart. London: J. & A. Churchill Ltd., 1948. vii + 841 pages; 7 illustrations. 25 × 16 cm. £2 10s. [£2.5]

Part I. Sexual medical jurisprudence, obstetric and criminal. (i) Impotence and sterility; (ii) virginity and defloration; (iii) pregnancy; (iv) delivery; (v) dissolution and nullity of marriage; (vi) legitimacy and paternity; (vii) rape; (viii) abortion; (ix) natural birth and medico-legal questions connected therewith; (x) infanticide; (xi) unnatural offences. Part II. Poisoning and toxicology. (xii) The law of poisons, including the definition of a poison or noxious thing; (xiii) dangerous drugs; (xiv) the action of poisons and the circumstances which influence it; (xv) diagnosis of poisoning; (xvi) what to do in cases of poisoning; (xvii) classification of poisons. A chapter on medical jurisprudence in India. Appendix: the rhesus factor. Index.

The 10th edition of this work,<sup>1</sup> although retaining the principal features of "Taylor," has been thoroughly revised and brought up to date. In some parts, the arrangement of the book has been slightly altered, and certain sections have been completely rewritten; a considerable quantity of fresh material has been added.

For review of Vol. I see *BMB* 1355 (*Brit. med. Bull.* 1949, 6, 99).—Ed.

Volume II of the work, which is considered here, is divided into Part I, which treats the wide subject of sexual medical jurisprudence, and Part II, which covers the field of toxicology. The sexual subjects include impotence and sterility, nullity of marriage, pregnancy, rape, abortion, infanticide, and unnatural offences. Each of these sections includes appropriate decisions of English Courts of Law.

The section on toxicology deals with the law controlling the sale of poisons, including a description of the various poisons and their actions; it also describes the diagnosis and treatment of poisoning and the post-mortem findings in fatal cases. It is unfortunate that the list of drugs composing the Fourth Schedule of the Pharmacy and Poisons Act, 1933, and the list of dangerous drugs as set out in the Dangerous Drugs Act, 1932, have not been brought up to date, and that the omissions from these lists should include such drugs as tridione and pethidine, respectively. The accounts of the mode of action and symptomatology of the various poisons are very well represented and are most informative. It seems odd that, in a book of this size, there should be a complete absence of photographic plates.

Those responsible for the revision and editing of this second volume have to be congratulated on their success in completing such a difficult task.

John Glaister

## MEDICAL SCIENCES & RESEARCH

### 1599 The Mammalian Adrenal Gland

Geoffrey H. Bourne. Oxford: Clarendon Press, 1949. vi + 239 pages; 226 figures; 15 plates. 24 × 16 cm. £1 10s. [£1.5]

(i) Historical; (ii) vertebrate adrenals and classification of mammals; (iii) the adrenals of the monotremata; (iv) the adrenals of the metatheria; (v) the adrenals of the eutheria; (vi) general summary of mammalian adrenals. Bibliography. Index. Plates.

If, as far as endocrinology is concerned, the twenties of this century were the decade of insulin and thyroxine, the thirties the decade of the sex hormones, the forties the decade of the anterior pituitary, then all the signs indicate that the fifties are likely to be the decade of the adrenal cortex. Though Addison's famous clinical study of adrenal deficiency provided one of the opening chapters of the long story of endocrinology, the complex pattern of the participation of the adrenal cortex in a variety of physiological functions is only now being unravelled. Intensive work on the chemistry and physiological function of the numerous steroids secreted by, or at least obtainable from, the adrenal cortex, hitherto rather a close preserve of the specialist, and presenting by its very complexities a somewhat forbidding aspect to the general biologist, has recently been illumined by the spectacular discovery of incalculable therapeutic possibilities for the application of one of the cortical steroids as a palliative for one of the most intractable and crippling diseases which afflict mankind, rheumatoid arthritis. This discovery seems likely to appeal to the public imagination in the same way as did the discovery of insulin, and there is no doubt that scientific attention is likely to be focused on the adrenal gland for a long time to come. This being so, the recent appearance of one or two books dealing with this endocrine gland, of which Dr Bourne's is one, can be considered timely.

At the outset it should be said that the title of Dr Bourne's monograph is not as informative as it might well have been. An abbreviated title of such general implication might lead the reader to expect a treatise dealing not only with the anatomy but also with the physiology, pharmacology and metabolic functions of the adrenal and especially of the cortex. In fact, as the author explains in his preface, it is based largely on material submitted many years ago for the degree of D.Sc., and this, the main theme of the book, comprises a comparative study of the anatomy of the adrenal gland in a wide variety of mammalian forms. A monograph of this type is usually caviare to biologists in general, since by its very nature it is addressed to specialists, for whom it constitutes a valuable source of reference. For this reason such monographs are often not easy to get published, and when they are published the price is

apt to be high. Happily this is not the case with the book under review.

The first chapter is historical and opens, in the reviewer's opinion mistakenly, with a passage in Latin of which no translation is provided. Another Latin quotation follows hard on the heels of the first. This is apt to be irritating to readers educated by those who do not consider an ability to read obsolete Mediterranean languages as necessarily an essential ingredient of a good education. Other descriptive chapters follow in which the anatomy of the adrenal gland in various mammalian species is considered, often rather catalogue-wise. At times one may detect a certain emphasis on Australian mammals, which perhaps reflects the author's own interests. Many of the descriptions are given here for the first time by the author and descriptions given by others are discussed where appropriate. One feels that in some cases the description is based on too few specimens to carry full conviction while often, as the author is careful to point out, the material is far from ideal for histological study, having been taken from museum specimens after many years in preservative. Nevertheless we have here a conspectus of much out-of-the-way descriptive data which may well be of interest to other specialists in this field.

The material of more general and immediate interest to the endocrinologist is confined to a final chapter entitled "General summary of mammalian adrenals." This chapter, besides embodying a general summary, one might say an attempted synthesis, of what has gone before, includes brief surveys of the physiology of cortex and medulla. The general nature of the book's title, already referred to, might well have led the reader to expect more extensive treatment of what is at the present time very much a live experimental subject, as attested by the number of symposia and reviews on adrenal cortex endocrinology which have appeared in recent years. Effective use could have been made of these in expanding this part of the book without necessarily swamping the anatomical section, with an enhancement of the value of the book and a widening of its appeal. This final chapter also includes an excursion along the perilous path of attempting to deduce evolutionary relationships (with particular reference to marsupials) from the anatomical position of the adrenal glands. Such speculations are always interesting, seem a peculiarly fruitful cause of lively, even heated, controversy, and are justified provided the conclusions are not too finely drawn.

As is to be expected from this publisher, the volume is a good piece of book-making. Unfortunately lack of care in proof reading is evidenced by too frequent occurrence of errors in spelling. Authors' initials are omitted from the bibliography, which is a pity,

S. J. Folley

Edited by *Frank L. Horsfall*. New York : Columbia University Press ; London : Geoffrey Cumberlege, 1949. x + 153 pages ; illustrations. 23 x 15 cm. £1 1s. [**£1.05**]

epidemic, murine, and scrub typhus, as well as Q fever; (xii) the diagnosis of Rocky Mountain spotted fever and rickettsialpox; (xiii) the diagnosis of infectious hepatitis.

One of the most useful chapters is that on primary atypical pneumonia, where the unsatisfactory position with regard to this broad group of infectious diseases is clearly set out by Horsfall, who edited the volume.

There is a striking omission of any instruction on the collection of material for the diagnosis of smallpox, although the symposium took place after a series of cases in New York in 1947. The diagnosis and control of the pox group of diseases is one of the main public health problems over a considerable part of the globe. On the other hand, there is a chapter on infectious hepatitis, although no specific *in vitro* test or susceptible experimental animal has been found for this presumed virus infection.

Most chapters follow the same general pattern. First, there is a brief general note and frequently some remarks on the epidemiology of the disease. A description of the type of specimens required is given, also the time at which they should be collected for virus isolation, and the methods used in the laboratory. This is followed by instructions for the collection of sera for antibody estimations, the tests used and the interpretation of the results.

Investigation of virus disease in the laboratory is still somewhat specialized work, but this book should be of considerable value to the pathologist who wishes to start work in this field himself, and, what is more important to all concerned, it should aid the physician to obtain the correct material at the correct time for suitable investigation.

The material is clearly laid out and there are numerous useful tables and graphs. Each chapter contains an adequate bibliography up to 1947 or 1948. It is unfortunate that this book, and others of its kind, should be so expensive.

*F. O. MacCallum*

David Thomson & Robert Thomson, assisted by James Todd Morrison. Edinburgh: E. & S. Livingstone Ltd., published for the Pickett-Thomson Research Laboratory, 1948. xi + 329 pages. 28 x 22 cm. £2 2s. [£2.1]

Part I. Oral immunization, general information. (i) Introductory; (ii) historical; (iii) histology of the digestive tract and the mechanism of absorption; (iv) the phenomenon of enterotropism; (v) the protective defences of the digestive tract against the oral invasion of living bacteria; (vi) experimental evidence regarding the permeability of the intestinal mucosa to living bacteria; (vii) methods of increasing the permeability of the intestinal mucosa to bacteria and bacterial toxins; (viii) are bacterial vaccines and toxins given by the mouth altered by the gastro-intestinal secretions as to become useless for immunization purposes? (ix) theories on the mechanism of the immunity induced by oral vaccines. Part II. Oral method of prophylactic immunization against various diseases. (x) Typhoid fever; (xi) bacillary dysentery; (xii) cholera; (xiii) plague; (xiv) tuberculosis; (xv) diphtheria; (xvi) Malta fever; (xvii) oral cocci; (xviii) oral immunization against colds and coccocal vaccines; (xx) oral gonococcal vaccines; (i) oral streptococcal vaccines; (xixii) oral vaccines; (xxiv) autogenous oral faecal vaccines in treatment of intestinal infections; (xxv) *Bacillus pyocyaneus* vaccines given per rectum; (xxvi) oral vaccines against animal diseases; (xxvii) oral prophylactic immunization against smallpox; (xxviii) oral immunization against measles with placental extracts; (xxix) passive immunization by serums administered by mouth; (xxx) oral pus vaccines in treatment of wound infections; (xxxi) oral immunization in hay fever and ragweed pollinosis; (xxxii) oral immunization against poison ivy dermatitis. Part III. Oral prophylaxis with toxins and toxin-antitoxin mixtures. (xxxiii) Scarlet fever; (xxxiv) diphtheria (prophylactic immunization against diphtheria with toxin-antitoxin mixtures by the mouth); (xxxv) staphylococcus toxin; (xxxvi) oral tetanus toxin, etc.; (xxxvii) animal experiments with *Clostridium botulinum* toxin; (xxxviii) treatment of diphtheria antitoxin. Part IV. Immunization by oral vaccines. (i) regional vaccination at the portal of entry; (xlii) treatment of wound infections by submucous injections rough the skin by means of cutaneous intunction; (xliii) tuberculosis treated with tuberculin; (xliv) animal experiments with tuberculin. References to literature. Index of subjects.

As the authors state in the preface, "This book is an attempt to bring together into one volume the results of many researches on oral vaccines and attempts at immunization by other non-parenteral routes." They have succeeded in compiling a well-documented work of reference which will be of considerable value to those interested in the research aspects of immunization by non-parenteral routes and in their practical application in preventive medicine.

It is agreed that gastric acidity plays an important part as a bactericidal line of defence against orally ingested living bacteria. There is also no doubt about the permeability or penetrability of the intestinal mucosa by certain living organisms—tubercle bacillus, typhoid and paratyphoid bacilli, and *Salmonella* and *Brucella* organisms—but how much of this is due to damage to the intestinal mucosa caused by the organisms themselves, or to entry via minor abrasions of the mucosa, is not proven.

It is claimed that bacteria are constantly invading the intestinal mucosa. In dysentery, however, where infection is usually confined to the mucous membrane of the gut but accompanied by ulceration, serum antibody production is very weak; moreover, there is little or no evidence of concurrent antibody formation vis-à-vis the normal flora which might be expected to pass the damaged mucosa.

One-third of the volume is devoted to oral immunization against tuberculosis, especially with living BCG vaccine. The majority of investigators agree that oral BCG does produce immunity, but only after a long interval, and the percentage of positive tuberculin reactors following immunization is not as high as expected. Despite the pioneer work of Calmette and many others, there is now a definite swing from the oral route to the intracutaneous method of administration of BCG.

Prophylactic immunization against typhoid fever by oral vaccines provides the most conclusive evidence of immunity induced by this route. On balance the degree of immunization produced appears at best to be as good as, but in general of a lower order than, that produced by immunization by the usual parenteral routes. There is much less certainty that a satisfactory level of immunity will be produced by the oral route.

Oral vaccines of dysentery (Shiga and Flexner), cholera, and plague organisms have given either inconclusive or disappointing results. Vaccines of dysentery organisms appear to produce a local cellular immunity with little evidence of humoral immunity. No evidence of value in human immunization is adduced for oral vaccines prepared from staphylococci, gonococci, streptococci, *Salmonellae* or *B. coli*.

A section is devoted to oral immunization against colds and influenza, but these are virus infections, and oral vaccines made from pathogenic and suspected pathogenic respiratory organisms could not be expected to induce immunity, except possibly to secondary invaders. Claims to prevent colds and influenza by the use of bacterial vaccines given orally (or parenterally) must be

viewed very critically and the evidence brought forward provides little support for their value.

Reference is made to investigations as to the value of vaccines administered by inhalation, intratracheally, intranasally, spraying into the nose and throat, incorporated in toothpastes, in ointments for skin inunction, and via the rectum and conjunctiva. There does not appear to be much future for these routes except perhaps by skin inunction, and the immunity produced is slow to develop and not so potent as that produced by injection methods.

In fine, oral vaccines appear to be subject to wide variation in the absorptive powers of the intestinal mucosa in different individuals; much larger doses are required—40 to 100 times greater than those given by the usual parenteral routes; antibodies are slow to develop, and the level of immunity produced does not appear in general to be as high as that introduced by immunization by skin injection methods. On the credit side, there is the ease of administration, repeated as often as may be desired, and the almost total absence of reactions.

## 1602 The Filterable Viruses

Francis O. Holmes. London: Baillière, Tindall & Cox, 1948. (Supplement No. 2, Bergey's Manual of Determinative Bacteriology, Edition VI, 1948.) 160 + xxiii pages. 23 × 15 cm. £1

The classification of bacteria has long been a matter for disagreement. Undoubtedly we shall eventually attain the ideal of a comprehensive classification using the binominal system of nomenclature but it is impossible simply to adopt the rules which have been found applicable to the taxonomy of animals and plants. Ambitious schemes have been suggested, notably by Bergey and his collaborators, and their system is expounded in the well-known *Manual of determinative bacteriology*. However, their classification has not received any general assent because many feel that the criteria used to define species are too unstable to be of a taxonomic significance and that the time is not yet ripe for any detailed system because of the peculiar way in which bacteriology has been studied, i.e., mainly as an applied medical science. The study of viruses is even more in its infancy, and to attempt any classification at this stage is a most hazardous undertaking. This supplement to Bergey's *Manual*, however, represents such an attempt.

While the reviewer is not competent to criticize the treatment of the plant viruses, he must state his opinion that the classification of the animal viruses and of the bacteriophages is far from satisfactory. The suggested classification of the bacteriophages is useless for all practical purposes and adopts an extremely limited view of even our present knowledge of these ubiquitous viruses. The classification of the animal viruses is somewhat of a travesty. It is possible to mention here only a few examples to illustrate the curiosities which abound.

There is no agreement that the common-cold virus has ever been isolated, yet it is here classified as *Tarpeia premens* (from *Tarpeia*, name of a Roman maiden who treacherously opened a citadel to an enemy). In contrast, there are many well-recognized viruses, such as Horsfall's mouse pneumonia virus, which are not mentioned at all. There is no recognition of the fact that the ectromelia virus is closely related to the pox group. The mumps virus is classified for no good reason with the animal salivary gland viruses, but its relationship to the viruses which cause haemagglutination is disregarded. The urgent practical problem of discovering the relationships between the poliomyelitis viruses, Theiler's O virus, the S.F. groups, and the M.M. group, is not considered.

The new names proposed have nothing to recommend them except their unfamiliarity and their elusive classical connotations. In bacteriology it has happened that elaborate systems of classification of certain groups of which we have special knowledge, such as the Salmonellae, have received wide agreement. In the same way tentative schemes for the classification of the influenza viruses have begun to appear. And it is better that taxonomy should proceed for a time in this piece-meal fashion.

It is to be earnestly hoped that at the next International Microbiological Congress the present proposal will be repudiated and that the attempt to classify viruses will be postponed until more is known of this subject.

Forrest Fulton

## 1603 Haemoglobin: A Symposium Based on a Conference Held at Cambridge in June 1948 in Memory of Sir Joseph Barcroft

Edited by F. J. W. Raughton & J. C. Kendrew. London: Butterworth's Scientific Publications, 1949. xii + 317 pages; illustrations. 25 × 16 cm. £2

(i) Tributes to Sir Joseph Barcroft; (ii) reversible reactions with oxygen and carbon monoxide; (iii) analysis and amino acid composition; (iv) X-ray crystallography; (v) physico-chemical properties; (vi) biochemical and physiological aspects; (vii) differences between adult and foetal haemoglobin; (viii) comparative biochemistry and physiology of oxygen carriers. Author index.

This is a memorial volume to Sir Joseph Barcroft, who died in March 1947. It contains contributions of those who were invited from all parts of the world to attend a symposium on haemoglobin. The symposium was held in Cambridge in June 1948 in commemoration of Barcroft, to whose classical work is owed so much of the knowledge of the respiratory function of blood. The symposium was also held to carry on the annual meetings to discuss problems related to haemoglobin that Barcroft inaugurated in Cambridge after the war.

The book illustrates how biological science makes use of every available tool of the physical sciences. Thus there are contributions from physical chemistry, organic chemistry, spectroscopy, crystallography and mathematical physics; this makes the book of great interest to chemists, as well as to physiologists and biochemists.

The first of the book's eight sections contains tributes by eight physiologists who knew and worked with Barcroft. They give a vivid and delightful insight into his personality and greatness, each revealing a different facet of his quality. Each of the sections following contains original papers by different authors, giving their context, and can thus be appraised by anyone unfamiliar with the field. The work described is outstanding; the papers are stimulating and readable. The majority deal with experimental work, but some are entirely given to theoretical discussion. For example, Wyman discusses the relation of the kinetic data of the reactions of haemoglobin to the shape of the molecule (for a fuller account see *Advances in Protein Chemistry*, vol. 4), and Pauling discusses its electronic structure in relation to its properties.

The papers are not well arranged, however, and this gives a disjointed impression. It would have been more logical to place Raughton's gasometric determinations of oxygen dissociation curves, and their relation to the intermediate-compound hypothesis, before Drabkin's latest elegant spectrophotometric measurements *in vivo*. The latter do not coincide with gasometric measurements, the validity of which when applied to the living animal is questioned. The arrangement of the crystallographic section can also be criticized. Here a simplified explanation of mathematical methods used in crystallography appears at the end. Anyone but a crystallographer would find it helpful to read this before the other papers, which include brilliant analyses of horse haemoglobin and myoglobin, in which the shapes of the molecules are deduced in remarkable detail.

Lack of space prevents even a cursory indication of the most interesting papers, which include an account of a new method of determining "end-groups" in proteins. Apart from a small section on cytochrome C, the book is concerned only with haemoproteins functioning as oxygen carriers, and furthermore embraces an interesting comparison of the oxygenation efficiency of haemoglobin and haemocyanin, whose prosthetic group is not a porphyrin. Most of the work described was unpublished at the time of the conference, and so the book is up to date.

## 1604 Cardiovascular Studies

Kenneth J. Franklin. Oxford: Blackwell Scientific Publications, 1948. xvi + 306 pages; 102 figures. 25 × 19 cm. £2 2s. [£2.1]

Part I. Historical note on the Eustachian valve and the intervenous tubercle of Lower. Part II. (i) Terminology; (ii) techniques, and the evolution of a concept; (iii) note-taking; (iv) some general references to the literature, and an introduction to personal observations; (v) *Homo sapiens*. References to the literature, personal observations, and Table I. Part III. References to the literature, and personal observations on other mammals. (i) Primates; (ii) Menotyphla; (iii) Lipotyphla; (iv) Chrysochloridae; (v) Dermoptera; (vi) Chiroptera; (vii) Carnivora (Carnivora vera, or Fissipedia); (viii) Pinnipedia; (ix) Cetacea; (x) Rodentia (or Rodentia simplicidentata); (xi) Lagomorpha (or Rodentia duplicidentata); (xii) Proboscidea; (xiii) Hyracoidea; (xiv) Perissodactyla;

G. Weddell

W. F. F. & M. P. S.

## J. N. Davidson

## M. E. Morgans

This book must be unique in having contributions, representing attacks on a common fundamental problem, from physicists, physiologists, anatomists, histologists, photochemists, and psychologists. Neuro-anatomy, the quantum theory and non-Euclidean

geometry are all involved. It is difficult therefore for the reviewer to do justice to the variety of material; to be equally happy with the descriptive anatomy of the micro-structure of the retina, the terminology used in colour psychology and with the mathematics of highly contorted surfaces. If, however, he cannot express an expert opinion on each and all of the papers, he can at least be thankful that the bad old days of acrimonious debate between protagonists of different colour vision theories conceived from physical, psychological, comparative anatomical, physiological or evolutionary standpoints, have given way to a state of affairs where the bulk of the interested parties from a large part of the world can gather together and genuinely begin to understand each other's language and approach. Let us hope that this will be the first of many similar conferences.

It is a pity, in view of the particular nature of the compilation, that the discussions are not more fully reported. One gets a few accounts of the cross-questioning of, for example, a physiologist by a physicist; but more might have been included. There are some glaring examples of faulty logic (dare I say, more particularly on the part of biologists?). Polyak in his paper on the structure of the retina concludes (p. 31) that because the central foveal cones are morphologically fairly uniform, they must all be alike in photochemical properties. Again, he concludes (p. 43) that because there is colour vision in the central fovea, an area he declares to be rod-free, "... this rules out the rods from the rank of mechanisms instrumental in colour vision in the strict sense." Hartridge and Granit, both physiologists, appear to have come in for the heaviest fire of criticism. It is difficult to avoid the impression that the former, in spite of a fine collection of references, has not understood them all, or at least is not accurately representing the arguments of others, while the latter offsets brilliant experimental ability with a lack of critical appraisal in presenting his results and conclusions.

Altogether this is a most stimulating book, of no narrow interest, not only to researchers on colour vision, but to neurologists, experimental psychologists, biophysicists and many others. It is handsomely produced and typographical errors are few. To have included an index would have been rather a luxury. If there is any complaint about the production it is that a better type face might have been chosen for a book on vision. One is surprised also to find no mention of the contents of the preceding volumes, I and II in the *Advances in Ophthalmology* series.

H. V. W.

## 1609 Visual Development. Vol. 1

J. H. Prince. Edinburgh: E. & S. Livingstone Ltd., 1949. xii + 418 pages; 190 figures. 22 x 14 cm. £2 10s. [£2.5]

Part I. (i) Photoreception; (ii) perception; (iii) retinal structure in man; (iv) retinal structure in animals; (v) photochemical aspects; (vi) retinal stimulation quanta. Part II. (vii) Evolution (invertebrate); (viii) evolution (vertebrate); (ix) the evolution of nocturnality and the return to diurnality; (x) pupillary function; (xi) increased sensitivity of the retinal bacillary layer; (xii) tapeta; (xiii) sightless vertebrates and luminous organs. Part III. (xiv) Colour appreciation in the lower orders; (xv) evolution of colour vision; (xvi) colour vision in man. Part IV. (xvii) Night-vision and dark-adaptation in man; (xviii) night-vision and dark-adaptation tests; (xix) the association of nystagmus with retinal defects. Part V. (xx) Routine examination of the eyes of animals; (xxi) examination of sections through the microscope; (xxii) fundus significance. Glossary. Bibliography. Index.

As we look into the outside world, we are conscious of the shapes and sizes of external objects; we perceive their colour, their solidity and their form; we can estimate their distance from us; we can discern their movement, or we can observe our own movement with respect to these objects; moreover, we can perform many of these feats over a very wide range of illumination, and we can carry away mental pictures of all that we have seen.

When we study our own eyes, we can to some extent correlate structure with function; and when we study the eyes of animals we see other patterns and other arrangements correlated with the same and other functions. By comparative methods a fuller understanding is obtained, and in no subject is this more true than in vision, for the field of vision has indeed many sides. Important contributions to the growth of knowledge in that field have come, and must come again, from physicists, physiologists, psychologists, physical chemists, zoologists and naturalists.

When the breadth of the subject is thus considered, it is clear that the author of *Visual development* has set himself a large task and has thus of necessity laid himself open to much criticism, since it is hardly possible to be equally expert in all branches. Never-

theless, in this first volume, he brings together much important information and compels the student of vision to think beyond the range of purely human sight. It is with the help of contributions of this type that the human eye can be seen in its true relationship as a single point in the evolutionary development of the eye in general, with some advantages over other eyes and with some disadvantages.

The book is divided into five parts. In Part I, the general functions of the eye are discussed and the salient features of retinal structure and cerebral representation in man and animals are described. This part, like so many earlier discussions of the subject, suffers from some confusion of thought, much of which arises out of the definition or lack of definition of the terms "rod" and "cone". Moreover the illustrations in this part of the book do not assist as much as they might.

Part II is devoted first to the evolution of eyes in both invertebrates and vertebrates, and this is followed by a discussion of eyes in relation to diurnal and nocturnal activity, with particular reference to such things as pupil shape, retinal structure and the formation of tapeta. In much of this section attention has been diverted to aspects of evolution other than those concerned directly with vision. Sometimes this is helpful, but often it borders on the irrelevant. Nevertheless it is clearly an important approach to a proper understanding of vision to relate the evolution of the optical structure to the evolution of the animal's structure and behaviour as a whole.

Part III discusses the significance of colours and colour vision, and gives an account of the occurrence and possible significance of colour vision in different groups. Some of the chief theories of human colour vision are also discussed. In Part IV, an account of dark-adaptation and its measurement, and of the relationship of nystagmus with night vision, is given. Part V jumps surprisingly from a description of how to hold live snakes to a practical guide to the preparation of eyes for routine histological examination, and thence to a descriptive account of the structure of the fundus of a wide variety of eyes.

The volume as a whole contains much interesting, and often unusual and important, information, but it is somewhat uncritical in outlook and devotes, at times, far too much space to matters which seem beyond its proper domain.

E. N. Willmer

## 1610 Pathology

Edited by W. A. D. Anderson. London: Henry Kimpton, 1948. xii + 1453 pages; 1183 illustrations; 10 colour plates. 25 x 17 cm. £3 15s. [£3.75]

(i) Introduction; (ii) cells and their behavior; (iii) inflammation; (iv) degenerative changes and disturbances of metabolism; (v) disturbances of circulation; (vi) physical agents in the causation of injury and disease; (vii) chemical injury; (viii) effects of radiation; (ix) general principles of infection and resistance; (x) bacterial diseases; (xi) tuberculosis; (xii) tuberculous conditions; (xiii) leprosy; (xiv) spirochetal and venereal diseases; (xv) rickettsial and viral diseases; (xvi) fungus infections; (xvii) protozoal and helminthic infections; (xviii) vitamins and deficiency diseases; (xix) neoplasms; (xx) the heart; (xxi) the blood and lymphatic vessels; (xxii) the kidneys; (xxiii) the lower urinary tract and male genitalia; (xxiv) the lung; (xxv) the organs of special senses; (xxvi) the lips, mouth, teeth, and neck; (xxvii) the gastrointestinal tract; (xxviii) the liver; (xxix) the gall bladder and bile ducts; (xxx) the pancreas; (xxxi) diabetes mellitus; (xxxii) the blood and bone marrow; (xxxiii) the spleen, lymph nodes, and reticulo-endothelial system; (xxxiv) the thymus; (xxxv) the pituitary gland (hypophysis); (xxxvi) the pineal; (xxxvii) the thyroid; (xxxviii) the parathyroids; (xxxix) the adrenals; (xl) the female genitalia; (xli) the breast; (xlii) the skin; (xliii) the bones; (xliv) the joints; (xlv) the nervous system; (xlvi) heredity and constitution in disease. Index.

This book is the result of the successful collaboration of 32 American pathologists, who represent 18 of the 48 United States of America. It weighs seven pounds, has 46 chapters, 1453 pages and 1183 illustrations. An almost staggering amount of detailed pathological information has been compressed between its covers, largely by the liberal use of small type. The illustrations, with few exceptions, are of good standard; an appreciable number is excellent.

Approximately one-third of the book deals with general pathology and in this section there are excellent chapters on chemical and physical injury and the effects of irradiation. The detailed treatment of the latter subject is fully justified by the widespread use of therapeutic irradiation, and the large amount of information presented could otherwise be obtained only by reference to special articles. The effects of atomic bomb injury are described. There is a clearly written and well-illustrated account entitled "Vitamins and deficiency diseases," by Henry Pinkerton. More

than one-fifth of the book deals with specific infections and there are special chapters on protozoal and helminth infections which, it is claimed, should now be included in any pathological textbook in view of the rapid progress of world-wide travel. Included also in the section on general pathology are several short chapters which introduce the student to major pathological problems. These are without exception clearly and carefully written. E. V. Cowdry's chapter on cells and their behaviour is stimulating and original. Paul R. Cannon writes a terse introduction of a few pages to the general problems of infection and resistance, and the introductory account of the general pathology of tumours by Shields Warren is one of the best in the book. There is an admirable chapter on the general pathology of tuberculosis by Francis D. Gunn.

Many of the sections dealing with special pathology are almost monographic. Ernest M. Hall's chapter on the special pathology of the heart occupies 70 pages and contains 309 references. The endocrine system is dealt with by the editor, W. A. D. Anderson, in six chapters occupying 88 pages and giving 507 references. Diseases of the blood and lymphatic vessels, the kidneys, the lung and liver are afforded the same almost encyclopaedic treatment. A commendable feature of the book is the special consideration given to diseases of the ear, nose, throat, and eye, of the skeletal tissues, the skin and the nervous system. It is claimed that these branches of pathology have previously received insufficient consideration in textbooks and there is obviously every justification for their inclusion in a book of this size. There is no doubt that these chapters add materially to the value of the book as a work of reference.

In almost all chapters considerable emphasis is laid on structural changes, but outstanding clinical features and the morbid physiology of disease receive attention, and neither bacteriology nor immunology are neglected. In some instances the correlation between altered structure and abnormal function could have been extended. There is a brief account of the consequences of abnormal function in liver disease but no corresponding general introduction to renal efficiency and failure in the chapter on the kidney. A short chapter on the functional efficiency of organs and the general principles of its estimation might well be included in the general pathology section. The descriptions of some common diseases, peptic ulcer for instance, are too brief having regard to their clinical importance, and it might be advantageous if a short general introduction to the reticulo-endothelial system were included in the earlier part of the book. This would provide the student with a demonstration of the part played by experimental pathology in the evolution of the subject.

There is no question that this book will take its place as an important contribution to pathological literature. Most of the earlier chapters on general pathology, especially the excellent account of inflammation by Morton McCutcheon, could be read with profit by the undergraduate medical student, but the chapters on special pathology are far too detailed for undergraduate study. To pathologists and clinicians it will prove to be an exceptionally useful reference book, especially with regard to recently acquired pathological knowledge.

G. Hadfield

## 1611 Textbook of Bacteriology. (Eleventh Edition of Muir & Ritchie's "Manual")

C. H. Browning & T. J. Mackie. Eleventh edition. London: Geoffrey Cumberlege, Oxford University Press, 1949. x + 907 pages; 226 figures. 25 × 16 cm. £2 10s. [£2.5]

(i) General morphology and physiology of bacteria; (ii) relations of bacteria to disease—infection—production of toxins by bacteria; (iii) immunity; (iv) bacteria associated with acute inflammation and suppuration—staphylococci and related organisms: streptococci; (v) the pneumococcus (*Diplococcus pneumoniae*); (vi) the meningococcus and gonococcus and allied organisms (Neisseriae); (vii) the diphtheria bacillus and allied organisms (Corynebacteria); (viii) the tubercle bacillus and the commensal and saprophytic acid-fast bacilli (Mycobacteria); (ix) the leprosy bacillus: bacillus of John's disease; (x) the anthrax bacillus; (xi) the bacilli of glands and melioidosis; (xii) bacillus pyocyaneus, bacillus proteus, and bacillus faecalis alkaligenes; (xiii) the coliform bacilli and the enteric group (the typhoid bacillus and the monella group of food-poisoning organisms; (xv) the bacillus of plague and allied organisms; (xvi) the bacillus of undulant fever and epizootic abortion (Brucella group); (xviii) the influenza bacillus, bacillus pertussis, and allied organisms; (xix) the cholera vibrio and allied organisms; (xx) the sporing anaerobic bacilli (Clostridia); (xxi) actino-

myces and allied organisms; (xxii) bacillus (or actinomycetes) necrophorus; bacteroides; bacillus fusiformis; bacterium pneumosintes; streptobacillus moniliformis; bacterium monocytogenes; erysipelothrix; organism of bovine pleuropneumonia and allied organisms: bacterium tularensis; (xxiii) *Treponema pallidum* and *Treponema pertenue*; (xxiv) spirochaetes of the relapsing fevers (*Borrelia obermeieri* or *recurrentis*; *Borrelia duttoni*, etc.); *Borrelia vincenti*; (xxv) *Leptospira icter*; (xxvi) the rickettsiae of typhus fever; (xxvii) general: neurotropic viruses—rabies, et al; and animals: lymphocytic viruses—smallpox and vaccinia; chickenpox; herpes simplex; molluscum contagiosum; warts; (xxix) viruses (continued)—yellow fever; Rift Valley fever; infective hepatitis and homologous serum jaundice; dengue; phlebotomous fever; psittacosis, etc.; lymphopathia venereum (lymphogranuloma inguinale); trachoma; inclusion conjunctivitis; (xxx) viruses (continued)—epidemic influenza, etc.; infectious coryza; virus pneumonia; measles; rubella; Durand's disease; infective mononucleosis; mumps; epidemic kerato-conjunctivitis; epidemic gastroenteritis; canine distemper; rinderpest; swine fever; virus myocarditis; infectious neoplasms of rabbits: virus diseases of domestic birds; (xxxi) bacteriophage; (xxxii) the pathogenic fungi; (xxxiii) pathogenic protozoa—malaria plasmodia; babesia (piroplasma); animal trypanosomes; (xxxv) pathogenic protozoa (continued)—leishmania; toxoplasma; (xxxvii) chemotherapy; (xxxviii) the bacterial flora of the normal skin and mucous membranes; (xxxix) the bacteriology of air, water, sewage, soil, and milk, from the hygienic standpoint. Appendix. Bibliography. Index.

"Muir & Ritchie" was first published 53 years ago, and many bacteriologists and others who began their studies with it will be glad that this outstanding textbook is being maintained. It now appears in a new format, the larger page and the use of small type for subsidiary matter enabling the subject to be treated as fully as in earlier editions, although the bulk of knowledge to be presented has, of course, greatly expanded. The authors have been successful in preserving the style of the original in adding to, or re-writing, the text.

The latter part of the book includes a full account of viruses, a chapter on the pathogenic fungi by R. Cranston Low, and four chapters on protozoology—exceptionally thorough treatment of this subject in such a work. There are, also, chapters on chemotherapy, the normal flora of the body, the bacteriology of air, water, sewage, soil, and milk, and a full appendix on methods. Finally, there is a classified bibliography of no less than 54 pages; this is so extensive that the average student may well recoil from it, and some of the citations, going back well into the last century, are of little more than historical interest.

The feature most likely to attract criticism is the use of the terminology of previous editions, in which, for instance, the generic name for every rod-shaped organism is "bacillus." In headings of sections dealing with specific bacteria modern equivalents are given only in brackets after the old nomenclature. Admittedly the new terminology is not even yet universally agreed or accepted, but surely the time has come when the well-recognized, more descriptive modern generic names should be used by every author. Their use is now required by the editors of almost every journal of standing published in the English language, and if in Britain we have not all yet gone so far as to adopt *Escherichia* and *Eberthella*, everyone knows what is meant when *Bacterium* and *Salmonella* are used instead. Other, though less important, features of previous editions of the book, the inclusion of which might well be reconsidered in the next edition, are occasional descriptions of named bacteria with uncertain claims to recognition as distinct species, and discussions of the value of vaccine treatment for various infections—the fact that after so many years the verdict often remains inconclusive or frankly sceptical surely suggests that some of these methods had better be forgotten. The description of antibiotics is rather cursory and brief, and it might well have been mentioned in Chapter X that bacilli are the source of many interesting substances of this kind.

The book has many solid merits. It contains far more detailed information than the majority of single-volume works on bacteriology, which should commend it to the more ambitious student who is not content with a book containing only the minimum that he should know. It stands in fact almost alone among British publications, in a position intermediate between the ordinary small textbook and the more encyclopaedic works of reference. It is profusely and, in general, well illustrated; some of the photographs, particularly of bacterial colonies, attain a high degree of excellence. As a source of detailed and accurate information it will be useful in many directions to the professional bacteriologist as well as to the advanced student.

L. P. Garrod

# 1612 Principles of Human Physiology

Originally written by E. H. Starling. Tenth edition by C. Lovatt Evans, with chapters on the special senses, by H. Hartridge. London: J. & A. Churchill Ltd., 1949. xii + 1193 pages; 693 illustrations. 25 x 16 cm. £2 2s. [£2.1]

(i) Introduction. Book I. General principles. A. Structural principles. (ii) The structural basis of the body. B. Biochemical principles. (iii) The elementary constituents of protoplasm; (iv) the proximate constituents. C. Biophysical principles. (v) The energy of molecules in solution; (vi) the properties of colloids; (vii) the passage of water and solutes through membranes; (viii) bioelectric potentials; (ix) enzymes and enzyme action. Book II. Tissues subserving movement and conduction—muscle and nerve. (x) Voluntary striated muscle; (xi) plain muscle and other contractile tissues; (xii) nerve fibres. Book III. Centralized control and co-ordination—the central nervous system. (xiii) General features of a central nervous system; (xiv) the receptors; (xv) the spinal cord and its relationship to the higher parts of the central nervous system; (xvi) the excitability of neurones and the properties of conduction at synapses; (xvii) characteristics of reflex actions; (xviii) the labyrinth, and postural reflexes; (xix) higher afferent paths; (xx) the cerebral hemispheres and the efferent paths; (xxi) functions of the cerebral cortex; (xxii) the cerebellum; (xxiii) the autonomic system: the hypothalamus; humoral transmission. Book IV. The supplying of information—the special senses. (xxiv) The nervous mechanism of sensation; (xxv) vision; (xxvi) hearing and speech; (xxvii) cutaneous sensations; (xxviii) sensations of smell and taste. Book V. Systems for distribution of materials—blood, circulation and respiration. (xxix) The blood; (xxx) general features of the circulation; (xxxi) physiology of the heart; (xxxii) factors which modify the heart's action; (xxxiii) dynamics of the circulation; (xxxiv) local regulation of blood flow; (xxxv) the pulmonary, hepatic and cerebral circulations; (xxxvi) examples of circulatory adaptation; (xxxvii) lymph, tissue fluids, and cerebro-spinal fluid; (xxxviii) the defence of the organism against infection; (xxxix) respiration; (xl) the regulation of the respiratory movements. Book VI. The intake of materials—nutrition, metabolism. (xli) The exchanges of matter and energy in the body; (xlii) the vitamins; (xliii) the normal diet of man; (xliv) the physiology of digestion—changes undergone by the foodstuffs in the alimentary canal; (xlv) the absorption of the foodstuffs; (xlvi) the history of the foodstuffs. Book VII. The removal of waste material and temperature conservation—excretion and temperature regulation. (xlvii) Renal excretion; (xlviii) the skin and the skin glands; (xlix) the temperature and heat-balance of the body. Book VIII. The provision of special chemical stimulants, and of measures for continuance of the species—the endocrine organs and reproduction. A. Endocrine organs. (i) The endocrine organs. B. Reproduction. (ii) The formation of germ cells; (lii) reproduction in man and other mammals; (liii) the secretion and properties of milk; (liv) heredity. Index.

In 1911 the Sharpey Scholarship at University College was awarded by Professor Ernest Starling to a candidate at the Second Medical Examination who was not a student of the College but an external candidate from Birmingham. The successful scholar was outstanding in his year and within two years was awarded the doctorate in science. He then qualified in medicine and, after a distinguished career in the First World War, progressed via the Chair of Physiology at Leeds, and the National Institute at Hampstead, to the Starling Chair at University College, from which he retired in 1949. With the Chair, Lovatt Evans inherited the principles of Starling in all senses of the word and the high tradition of this well-known book is maintained in this revised edition.

It is distinguished among books because the present author is qualified to speak and write from his personal research experience in both the biochemical and biophysical branches of physiology. In addition to authoritative discussion of the subject, the cultured, and wide but balanced, treatment it receives evinces itself particularly in this edition.

Each section is prefixed by a full and lucid account of the historical evolution of the present position. Collectively, the historical sections would make a co-ordinate history of physiology worthy of publication, as such, alone. In addition, physiology has been interpreted in a very wide sense, in that the ancillary aspects of biology which contribute to human physiology are brought into the picture, notably the basic principles of immunity, morphogenesis and genetics. Where a subject is treated lightly the reader is enabled to delve deeper by using the carefully selected references, both in the footnotes and at the chapter endings—a particularly useful feature of the book.

Probably, however, the most important feature is the excellent and thorough treatment that is given to the modern advances in biochemistry, and particularly the "bio" aspect of that subject, so often slurred over by the biochemist. This could not have been done if Evans' training and research had not been uniformly spread over both the chemical and experimental fields in the living animal or human being, as well as in the test-tube or colorimeter. There probably is no other university teacher living who could do this. The work is extremely up to date and is parallel with the growing points of physiology.

It would be invidious to point out the inaccurate footnote on p. 1135, or to suggest that this or that might be written more fully. The author has provided an up-to-date textbook of convenient size and a sound philosophy of true scientific method. In this, as in previous editions, the aid he has received from Professor Hamilton Hartridge, in the latter's own field of the special senses, adds lustre to the book. The gift possessed by this collaborator in describing the complex in simple words is well exhibited in this section.

This standard book is still pre-eminent as a scientific guide to human medicine. May it long remain so.

A. St. G. Huggett

# 1613 La Streptomycine

Marcel Morin, Jaques Nehllil & Remy Pichon. Paris: Masson et Cie, 1949. viii + 509 pages; 49 figures. 25 x 17 cm. 1950 fr.

Part I. (i) Historique; (ii) production; (iii) propriétés générales; (iv) récépération dans les urines; (v) autres substances antibiotiques élaborées par *Streptomyces griseus*; (vi) titrage de la streptomycine; (vii) action "in vitro"; (viii) traversée dans l'organisme. Absorption. Diffusion. Elimination; (ix) mode d'emploi; (x) toxicité; (xi) résistance secondaire à la streptomycine. Part II. (i) La streptomycine dans les infections liées aux bactéries hémophiles; (ii) la streptomycine dans les infections à *Klebsiella pneumoniae* (pneumobacille de Friedländer); (iii) la streptomycine dans les infections liées aux bactéries gram-négatives d'origine intestinale; (iv) la streptomycine dans les infections à *Pseudomonas aeruginosa* (bactérie pyocyanique); (v) la streptomycine dans la fièvre typhoïde et les salmonelloses; (vi) la streptomycine dans les shigelloses; (vii) la streptomycine dans le choléra; (viii) la streptomycine dans les brucelloses; (ix) la streptomycine dans les pasteurelloses; (x) la streptomycine dans l'infection à "*Streptobacillus moniliformis*"; (xi) la streptomycine dans les infections à "*Listeria monocytogenes*"; (xii) la streptomycine dans les infections à gonocoques (*Neisseria gonorrhoeae*); (xiii) la streptomycine dans les infections liées aux cocci gram-positifs; (xiv) la streptomycine dans l'infection charbonneuse; (xv) streptomycine et diphtérie; (xvi) streptomycine et infections à germes anaérobies; (xvii) la streptomycine dans les infections intestinales; (xviii) la streptomycine dans les infections hépato-biliaires; (xix) la streptomycine dans les infections urinaires; (xx) la streptomycine dans les infections génitales; (xxi) la streptomycine dans les infections pulmonaires non tuberculeuses; (xxii) streptomycine et péritonites chirurgicales; (xxiii) streptomycine et affections chirurgicales diverses; (xxiv) la streptomycine en neuro-chirurgie; (xxv) la streptomycine en oto-rhino-laryngologie; (xxvi) la streptomycine en ophtalmologie; (xxvii) la streptomycine dans la tuberculose; (xxviii) la streptomycine dans la lèpre; (xxix) la streptomycine dans les spirochétoses; (xxx) la streptomycine dans les infections à ultra-virus, dans les infections à pleuropneumonia, dans les rickettsioses et dans les infections à protozoaires; (xxxi) streptomycine et affections diverses. Bibliographie.

Ten years ago there was but one antibiotic of practical therapeutic value; today there are four of paramount importance and nearly two hundred others which, either because of their limited chemotherapeutic effect, their inactivation by serum, or their toxicity, have not as yet found a place in the treatment of human diseases. So rapid has been the development of antibiotic therapy that it would now be almost impossible to keep abreast of every development were it not for the appearance of books such as this volume by Dr Morin and his collaborators from the Clinique des Maladies Infectieuses of the Paris Faculty of Medicine. This work of more than 500 pages is briefly introduced by Professor Mollaret, after which there are chapters on the history, production and chemistry, and general properties of streptomycin. The next two chapters deal with other antibiotics produced by *Streptomyces griseus* and the amounts present in the urine. The titration of streptomycin, its in vitro action, and its pharmacology, are then considered, together with the methods of application, toxicity, and the development of bacteria resistant to streptomycin.

Thereafter the action of the antibiotic on specific infections is considered. Of special value is the long and detailed chapter on tuberculous infections. This chapter, like many others, contains a large amount of original work carried out in the authors' own clinic; in addition, many Continental observations not readily available to readers in Britain are ably summarized. Not the least valuable feature of this important volume is a bibliography of 30 pages, the full titles of the original papers being given. This book will be indispensable to all those who are working or propose to work on streptomycin. There are only two possible criticisms: firstly, as with so many French books, there is no index, and secondly, the binding is so bad that in a very short space of time the cover comes adrift and the book begins to disintegrate.

G. M. Findlay

## HISTORY AND BIBLIOGRAPHY

## 1614 Tom Cullen of Baltimore

Judith Robinson. Toronto: Oxford University Press; London: Geoffrey Cumberlege, 1949. xii + 435 pages; 20 illustrations. 24 x 16 cm. £1 5s. [£1.25]

Part I. Canadian preparation. Part II. Hopkins beginnings. Part III. Continuing in Baltimore. Part IV. Achievements. Part V. The fighting years. Part VI. "What's best for the patient . . ." Part VII. Getting things done. Appendix: published works. Index.

This handsome production of the Toronto branch of the Oxford University Press, written by a Toronto journalist, is addressed to the general public, but should not be missed by anyone interested in gynaecology, in echoes of Osler, or in the growth of the Johns Hopkins Hospital and its Medical School and Bulletin. The subject of this biography is the discoverer of "Cullen's sign", the inventor of the forceps bearing his name, and the author of the now classical books on cancer of the uterus, adenomyoma of the uterus, myoma of the uterus, and the embryology, anatomy and diseases of the umbilicus. His many papers bear witness to his belief in publication—not for its own sake, but for permanent record and in order to pass on results to both research workers and clinicians; this belief was also largely responsible for the valuable volumes of collected papers of his department.

The critical reader may in this case profitably look beyond journalese and over-emphatic chapter titles to the account of the achievements of this great surgeon and teacher and of the developments in his field and in Johns Hopkins which have coincided with his long and fruitful career. When young Tom Cullen finished a year's internship in the Toronto General Hospital, he had the opportunity to assist at an operation performed by Dr Howard Kelly, gynaecologist-in-chief of Johns Hopkins; that experience turned him from medicine to surgery, and with characteristic decision he immediately obtained the promise of a junior internship with Kelly. The next September he started humbly enough on his work among the giants of Hopkins' early days—the head of the medical department was another Canadian, Dr William Osler—with a preliminary three months in pathology, under William H. Welch. Cullen was later to refuse offers from elsewhere of greater seniority and reward, in order to stay with the department of gynaecology at Hopkins; in 1938 he retired from its direction at the age of seventy—a retirement which was an expansion into even fuller public activities than before. Since then the Johns Hopkins' Professor Emeritus of Gynaecology has returned once or twice each year, at the invitation of his successor, to conduct his operative clinics. Although he has a reputation as a great teacher, Professor Cullen himself claims he has never "taught" students: "I just try to show them what there is to learn. It's all anybody can do."

This is the story of a life bridging several generations and two worlds—the present with that nostalgic past when an impecunious young transatlantic research worker not only successfully controverted von Recklinghausen, but at a day's notice left for a spring and summer in Europe, where he visited Leyden and Göttingen, learned German by using it, and worked in the laboratory of Johannes Orth, *Lieblingsschüler* of Virchow. It is also a book full of the charm and vitality of its central figure and the ceaseless flow of his anecdotes about colleagues, patients, and plain people. It can hardly fail to interest anyone who reads it.

H. P.

## 1615 The Healing Touch

Harley Williams. London: Jonathan Cape, 1949. 408 pages; 8 illustrations. 20 x 14 cm. 15s. [£0.75]

Part 1. Three royal physicians. (i) Sir William Knighton, Bart.; (ii) Sir James Clark, Bart.; (iii) Sir William Jenner, Bart. Part 2. Two prophets. (i) Sir Edwin Chadwick; (ii) Thomas Southwood Smith. Part 3. Florence Nightingale. Part 4. Charles Edouard Brown-Séquard. Part 5. A new world of medicine. References.

The "healing touch" of which Dr Harley Williams writes is an "instinctive faculty" which "can produce prodigious improvements in our tough human material." He has selected a series of remarkable men and women (not all doctors) of the last century and a half, in whom this faculty expressed itself and who, through their personality, influenced medical progress and altered the attitude of ordinary people to health and sickness. The book is written

for non-specialist readers and is superficially a piece of journalism, chatty and sometimes cheap. It is, however, more serious than at first appears. Dr Williams is attracted by contrasts, both within the individual and in historic relationships, and his character sketches are in consequence vivid if not profound. He ranges from court physicians, with little scientific knowledge but with a gift for managing such august and difficult patients as George IV and Queen Victoria, to the self-effacing Mayo brothers, who devoted their lives to the development of a first-class surgical centre in the Middle West. Between these extremes he sketches the English prophets of the new hygiene, Edwin Chadwick, Thomas Southwood Smith, and Florence Nightingale, and the cosmopolitan conjurer of physiology, Brown-Séquard, a character of contradictions after Dr Williams' heart.

A startling and tragic contrast is the story of the Prince Consort's death. Ignorance of proper nursing was a contributory factor, yet only a year earlier Florence Nightingale had sent Queen Victoria, who knew and admired her, a copy of *Notes on nursing* which was intended to make the essentials of nursing clear to every educated woman. Dr Williams tells the story and points the moral admirably.

Many great figures make brief appearance between the principal actors. Florence Nightingale, with her fanatical sense of vocation, is contrasted with Elizabeth Fry, who led a full normal life while carrying on her philanthropic work in the prisons. The mystic Southwood Smith was a devoted disciple of the extravagantly matter-of-fact Bentham. Brown-Séquard, born in Mauritius of mixed French and Irish-American parentage, moving feverishly between France, England and America, was the successor of Claude Bernard, who lived for his small laboratory.

The chapter on the Mayo brothers summarizes the story of modern surgery and includes a clever thumb-nail impression of John B. Murphy, and more extended appreciations of Virchow and Billroth, of "Popsy" Welch, William Stewart Halstead and Harvey Cushing.

W. R. Le Fanu

## 1616 Hindu Medicine

Henry R. Zimmer. Edited by Ludwig Edelstein. Baltimore: Johns Hopkins Press; London: Geoffrey Cumberlege, Oxford University Press, 1948. lxxii + 203 pages. 20 x 14 cm. £1 12s. [£1.6]

Introduction. (i) Medical tradition and the Hindu physician; (ii) the human body: its forces and resources. Notes to Introduction. Notes to Chapter I. Notes to Chapter II. Index of passages.

The late Professor Zimmer gave the Hideyo Noguchi lectures at the Johns Hopkins Institute of the History of Medicine in 1940. When Zimmer died on 20 March 1943, the first lecture and most of the second had been extensively revised and rewritten, but there were only brief notes on the problems to be dealt with in the third chapter. Dr Ludwig Edelstein who edited this material has had the first two lectures printed as they stood.

The first lecture is concerned with medical tradition and the Hindu physician. It describes the complexity of magic cures; the many-sided approach to the disease-demon; the elaborate spells to ensure the complete effectiveness of amulets, special foods, and ceremonial gestures; and, throughout the cure, the appeal by suggestion to the patient, who is made aware of the whole process and progress of healing. A hymn of 28 stanzas, part of a medical rite for cases of consumption, is translated and annotated, as is a long chant from the Vedic pharmacopoeia. An important asset of the Hindu magician-physician was his ability to league himself with all the divine healing forces. He could call upon the divine powers and spiritual energies of all the herbs he used. The close relationship of religious philosophy—there was no other philosophy—with medicine is reflected in the Four Noble Truths of Buddhism, which correspond exactly to the four successive problems that the physician must formulate and solve in treating any patient. The works of Suśruta in the fourth century and Caraka in the first century A.D. differed only in essentials from the 17th century Jivānanda and all three show Hindu medicine and surgery as an integral part of philosophy and religious life.

This first lecture, which sets medicine against the wide cultural background, leads naturally to the second lecture—on the Hindu

view of the human body. The body, like the whole universe, is held to be a manifestation of divine substance and energy, and its principal faculties and forces are the microcosmic counterpart of all the powers and processes in the world. This concept and its variations are traced from pre-Aryan antiquity to the latest classic system of the Tantras and to the technique of Yoga, which is intended to bring into consciousness the essence of the five elements—aether, air, fire, water, and earth. This correspondence between microcosm and macrocosm is important in Hindu medicine. The three humours, for example, wind, bile, and phlegm, represent three divine universal forces, wind, sun, and moon. The aim of the Yoga adept is to fill with concentrated wind or life-breath the two channels which begin at the nostrils, and, crossing and entwining the spinal column, descend to the sacrum. One channel is related to the lunar and the other to the solar forces. Hindu medicine lists five kinds of life-breath, Yoga ten, and none of them is related to the lungs—the principal seat of phlegm. The three humours and the blood share the 700 tubular vessels in the body, all of them taking origin from the navel. After analyzing this schematic speculative anatomy, Zimmer goes on to compare Greek medicine in its most dynamic phase with the static conservatism of traditional Hindu medicine. Greek and Hindu beliefs about generation and gestation are also contrasted; there, unfortunately, the unfinished second lecture ends abruptly.

This is a book that no one who is interested in the history of medicine can neglect. It is fragmentary and unfinished. There are omissions and repetitions, and a number of interpretations which are not likely to meet with general acceptance. Yet it is impossible to reach the last page without a feeling of frustration and deep regret—frustration because this is the beginning and the middle only of an important thesis, regret because Zimmer was not spared to write the third and last section.

### 1617 Discoverers for Medicine

William H. Woglom. New Haven, Conn.: Yale University Press; London: Geoffrey Cumberlege, 1949. x + 229 pages; 14 illustrations. 24 × 16 cm. 18s. [£0.9]

(i) Introduction; (ii) the blood pressure; (iii) respiration; (iv) the foxglove; (v) vaccination; (vi) the laryngeal mirror; (vii) the Eustachian tube; (viii) eye-glasses and spectacles; (ix) the itch; (x) quinine; (xi) phagocytosis; (xii) X rays; (xiii) heredity; (xiv) milk sickness. Bibliography. Index.

The meaning of the rather curious title which Dr Woglom has given his book becomes plain only after his introduction is read. The author has set out to give an account of some of the notable contributions made to medicine by laymen, and the proposition in

the title is intended to suggest this distinction. In most of the 14 separate studies in this volume the discovery is credited to an individual; e.g., Stephen Hales (blood pressure), Manuel Garcia (the laryngeal mirror), and Benjamin Franklin (spectacles). In others, it is attributed to the vast anonymous herd who sustain and enlarge popular tradition; e.g., the folk tradition about the use of the foxglove, cowpox inoculation, etc.

It is an interesting conception, and the natural antithesis to the many studies of the debt that is owed to medical men by workers in other fields. Unfortunately, this book fails to convince us that any new light can be thrown on medical history by such an approach. As the bibliographies at the end of the book indicate, all the subjects dealt with here have been studied in greater detail elsewhere, so that this book will interest the general reader or the student rather than the historian who is already acquainted with the standard works on the subject.

In spite of the author's persuasive introduction it is debatable how far such figures as Metchnikoff, Roentgen, Hales, or Pasteur (who is omitted here) can be regarded as "laymen". Hales was as much a physiologist as any occupant of a modern chair; the only distinguishing factor is that he did not earn a living by his physiological studies but as the "perpetual curate of Teddington". Roentgen, already a celebrated physicist when he discovered x rays, made a discovery within his own field of knowledge. That its applications have been so momentous in the advance of medicine is due to the work of medical men (e.g., Cannon) who immensely extended the range of its usefulness. Metchnikoff is not the only biologist whose work has forwarded medical knowledge. Surely it shows a lack of historical perspective to regard such men as amateurs. The fact that they were not doctors of medicine with diplomas duly signed and sealed seems quite unimportant.

As for the non-professional laymen such as Jesty, and the first unknown herb-gatherers who discovered the virtues of foxglove, how does their "work" compare with that of the medical men who established vaccination and digitalis in regular medical practice? We are told, a point overlooked by Dr Woglom, that country women in Ireland 100 years ago used the mould *penicillium* for cuts and wounds, but should they be set beside Fleming and Florey as "discoverers"?

But perhaps this is captious criticism of a very readable book which, while adding nothing to our knowledge, gives useful short accounts of the background of a number of important medical advances. The book is a product of the widespread interest in medical history in the United States and was originally published by the Yale University Press.

#### [1539] Antibiotics : a Survey of Penicillin, Streptomycin, and Other Antimicrobial Substances from Fungi, Actinomycetes, Bacteria, and Plants. Vols. I & II

H. W. Florey, E. Chain, N. G. Heatley, M. A. Jennings, A. G. Sanders, E. P. Abraham, M. E. Florey. London : Geoffrey Cumberlege, Oxford University Press, 1949. xxii + 1774 pages ; 265 figures. 25 × 16 cm. £8 8s. [£8.4]

Vol. I : Part I. (i) Historical introduction. Part II. General experimental methods. (ii) Detection and extraction of antibacterial substances ; (iii) the assay of antibiotics ; (iv) methods for measuring the sensitivity of micro-organisms to antibiotics ; (v) antibiotics in differential culture media. Part III. Antibiotics from fungi—general considerations. (vi) Review of species examined. Part IV. Antibiotics from fungi—substances other than penicillin. (vii) Substances produced by fungi imperfecti and ascomycetes ; (viii) substances produced by basidiomycetes, phycmycetes, and unidentified fungi. Part V. Antibiotics from actinomycetes. (ix) Substances other than streptomycin. Part VI. Antibiotics from bacteria. (x) Antibiotics from bacteria in the genus *Bacillus* ; (xi) antibiotics from other bacteria ; (xii) antibiotics from chromogenic bacteria. Part VII. Antimicrobial substances from lichens, algae, and seed plants. (xiii) Substances from lichens and algae ; (xiv) substances from seed plants. Vol. II : Part VIII. Penicillin. (xv) Historical introduction ; (xvi) penicillin-producing fungi ; (xvii) the production of penicillin ; (xviii) extraction and purification of penicillin ; (xix) metabolic changes during penicillin fermentation ; (xx) the chemistry of penicillin. Historical introduction ; (xxi) physical and chemical properties of the penicillins ; (xxii) the components of the penicillin molecule ; (xxiii) hydrogenolysis products of penicillin ; (xxiv) penicillin sulphone, penicillin sulphoxide, and the thiocyanate derivative of penicillin ; (xxv) products of isomerization of the penicillins ; (xxvi) thiazolidines and  $\beta$ -lactams ; (xxvii) the structure of the penicillin molecule ; (xxviii) attempts to synthesize the penicillins ; (xxix) modifications of *p*-hydroxybenzylpenicillin ; (xxx) biogenesis of penicillin ; (xxxi) the activity of penicillin against micro-organisms ; (xxxii) methods of testing material containing penicillin for sterility ; (xxxiii) penicillinase ; (xxxiv) acquired resistance of micro-organisms to penicillin ; (xxxv) the action of penicillin on micro-organisms ; (xxxvi) the combined action of penicillin with other drugs ; (xxxvii) the pharmacology of penicillin. Toxicity ; (xxxviii) the pharmacology of penicillin. Absorption ; (xxxix) the pharmacology of penicillin. Distribution in the body ; (xl) the pharmacology of penicillin. Excretion and loss in the body. Part IX. Streptomycin. (xli) Production and isolation of streptomycin ; (xlii) chemical properties and structure of streptomycin ; (xliii) the activity of streptomycin and dihydrostreptomycin against micro-organisms ; (xliv) acquired resistance of micro-organisms to streptomycin ; the action of streptomycin ; (xlv) the pharmacology of streptomycin and dihydrostreptomycin ; (xlvi) mannosidostreptomycin (strepto-

mycin B), other streptomycins, and streptomycin residues. Part X. (xlvii) The action of antibiotics on bacteria. Part XI. (xlviii) Conclusions. Appendix and tables of antibiotics. Bibliography. Author index. Subject index.

## Shorter Notices

### Trends in Medical Education. The New York Academy of Medicine Institute on Medical Education, 1947

Edited by Mahlan Ashford. New York: The Commonwealth Fund; London: Geoffrey Cumberlege, 1949. xiv + 320 pages. 22 x 14 cm. £1 4s. [£1.2]

The Committee on Medical Education of the New York Academy of Medicine held six conferences on medical education in April 1947; more than fifty prominent persons were present, and this volume records the fruits of their deliberations. The contributors include deans and professors in medical schools, specialists in all branches of medicine, general practitioners, and even educationalists concerned with future medical students in secondary schools and universities. It is not, therefore, surprising to find that the book contains diverse and irreconcilable opinions; indeed, there are perhaps more points of disagreement than the reverse.

Some conclusions, however, do emerge: there is no doubt that in American medicine specialization is increasing and that the undergraduate and postgraduate programmes are changing and will be further modified to meet the requirements of the would-be specialist. This is, of course, most striking in the postgraduate field; carefully graduated courses of five years and longer are being followed by increasing numbers of neophytes aspiring to the accolade of specialism.

The discussion reflects a considerable degree of uncertainty about the role of the general practitioner; there is general agreement that the family physician is necessary, but considerable doubt about what he should do and even graver uncertainty as to how he should be trained. The development of group practice in the smaller communities might, some contributors felt, be the logical step in the further evolution of medical practice.

The book gives an excellent cross-section of American conditions and opinions in this field which is the scene of so much controversy. Medical educators in countries other than the USA will find it useful to compare and contrast with their own experiences and opinions.

### Tuberculosis Nursing

Jessie G. Eyre. London: H. K. Lewis & Co. Ltd., 1949. xii + 291 pages; 103 illustrations. 22 x 14 cm. £1 1s. [£1.05]

This comprehensive and well-illustrated book, by the Senior Sister Tutor of St. Helier Hospital, Carshalton, England, fills a gap in nursing literature. It is intended as a guide to those wishing to gain additional postgraduate experience or to specialize in tuberculosis nursing. The author gives considerable attention to collapse therapy and chest surgery, in which branches the modern treatment of pulmonary tuberculosis has most developed; the care of the patient in hospital is also dealt with. Other chapters of special interest are those on chemotherapy (including the use of streptomycin, calciferol and *para*-aminosalicylic acid), on tuberculosis of bones and joints, and on the care and after-care of tuberculous patients.

### Food Inspection Notes. A Handbook for Students

H. Hill & F. Dodsworth. Third edition. London: H. K. Lewis & Co. Ltd., 1949. viii + 125 pages; 17 x 11 cm. 7s. 6d. [£0.375]

This little book is addressed primarily to the student food inspector. Its aim is to give him the essentials of food inspection in concise form and in this it succeeds admirably. As the title suggests, the material is set out in note form throughout. The first half of the book is devoted to meat inspection under the headings of ante-mortem inspection, slaughter-houses, slaughtering and dressing, anatomy and physiology, and diseases of animals. This last section is particularly useful. Each disease is briefly but clearly described and in each case the description concludes with a "judgment," i.e. action to be taken by the food inspector. To give just two examples, for rheumatism the "judgment" is: "Consider on merits. Joints affected, removed and condemned. If general emaciation, carcase and organs condemned"; and for anthrax: "Notifiable disease, special Order. Carcase and organs condemned."

The second half of the book deals with the examination of poultry, game, milk, canned foods and miscellaneous foods. The chapter dealing with food-poisoning is not up to the standard of the rest of the book and requires bringing up to date. It is not now true that canned meat and salmon are the commonest causes of poisoning by the *Salmonella* group, or that the *staphylococcus* is only occasionally a cause of food poisoning. The last chapter deals briefly with the technique of food sampling.

The book has the great merit of being essentially practical in its approach. The authors have concentrated upon providing the facts which the practising food inspector must know. This, coupled with the arrangement in note form, means that the book cannot be, and is not intended to be, a substitute for a textbook. The handling of food is of course mentioned incidentally in various places, but in view of its increasing importance it would merit a special chapter in future editions.

It is clearly impossible for a book of this type to deal adequately with legislation and the authors have chosen to omit this altogether. Nevertheless, the food inspector works in practice within the framework of legislation and must always keep in mind his legal duties and legal powers. For this reason, the value of the book to the student would be enhanced if the relevant legislation were cited, say, as footnotes.

D. B. Bradshaw

### Meet Yourself at the Doctor's

Mass-Observation, with drawings by Ronald Searle. London: The Naldrett Press, 1949. 70 pages; 20 illustrations. 19 x 12 cm. 3s. 6d. [£0.175]

After a spate of publications concerning the National Health Service, its administration, its legal aspects, its finances and the first year's working, this attempt to evaluate the reactions of men and women of all classes is illuminating and amusing. There are comments made by the public before and after the adoption of the Act; there is a comparison of the points of view of Dr D. and Dr Y., and the story of the doctor's working day. One chapter reports on conversations heard in the waiting-room and another on accounts by patients of procedure inside the surgery. The attitude of mothers to the infant-welfare service and the protests of those who still prefer such alternatives to state medicine as osteopathy and Christian Science are also dealt with. Against evidence of overwork and waste of time and money has to be set a woman's comment, "It's everything to a mother to know that you can

call the doctor even when you haven't the money ready." Written with serious intention, the text and conversations present a well-balanced assessment of human reactions, to which Ronald Searle's illustrations give gaiety.

H. M. C.

### Gas and Air Analgesia

R. J. Minnitt. Fourth edition. London: Baillière, Tindall & Cox, 1949. vii + 86 pages; 22 figures; 18 x 12 cm. 5s. [£0.25]

The 4th edition of this excellent handbook for midwives has now been published. As would be expected from the originator of the method, it is authoritative and contains all that the midwife needs to know. It will also prove useful to those anaesthetists entrusted with the preparation of lectures to midwives on analgesia.

The text remains substantially the same as that of the previous editions except that some of the details of technique have been elaborated. The latest regulations of the Central Midwives Board have been included. The print, paper, illustrations and binding are alike excellent, and the book should be able to withstand the hard wear to which it will doubtless be subjected.

C. Langton Hewer

### Temas de Tisiología

José F. Verna et al. Córdoba, Argentina: Imprenta de la Universidad, 1949. 271 pages; figures. 23 x 16 cm.

Professor Verna and his associates are to be congratulated on this volume; they have succeeded in presenting a group of papers on tuberculosis, ranging from the technique of thoracoplasty to the radiology of intestinal tuberculosis. The first paper, by Professor Verna, deals with pulmonary tuberculosis and cancer; he points out that pulmonary tissue already damaged by tuberculous infiltration is not less favourable to the growth of neoplasm than any other tissue equally damaged by a pathological process. Although tuberculosis may develop in a neoplastic lesion, the reverse process is more frequent. Tuberculosis may establish a predisposition to cellular metaplasia, and once both processes are co-existent, their further evolution is somewhat independent of each other. It has been found that carcinoma grows more readily on tuberculous lesions which are still active; this is perhaps due to the scanty or absent fibrous tissue reaction of the active lesion.

After a discussion of the relationship between tuberculosis and climate by Professor Sarmiento, Professor Sonzini describes the anatomy and surgical technique of thoracoplasty, following the principles expounded by Finochietto and his colleagues in Argentina. This operation stresses separation rather than division of muscles; it has not met with much enthusiasm in Britain, as ample exposure is considered far more important than the avoidance of muscle splitting. Professor Menso gives a brief review of intrathoracic pathology and lung resection, and there is also a short paper on Kahn's reaction in plasma, by Dr Manavella. In his paper on the re-inoculation of the previously tuberculinized guinea-pig, Dr Astrada reaches the interesting conclusion that tuberculin diminishes the phagocytic power of leucocytes against the tuberculous organism, rendering the animal more susceptible to the action of the injected germ.

The paper on the radiology of intestinal tuberculosis, by Professor Moreno, is well presented, and deals with the differential diagnosis of this condition. The various other papers which complete the volume are also of great interest; the book will no doubt be eagerly read by many workers, both laboratory and clinical, in the field of tuberculosis.

# Guide to the Journals

## Anaesthesia

4: October 1949

- Continuous caudal analgesia in obstetrics. (A. H. Galley) 154-168  
The anaesthetic out-patient clinic. (J. A. Lee) 169-174  
Clinical test of atensin. A Swedish myanesisin preparation. (O. Friberg) 175-180  
The pulse during anaesthesia with pentothal and curare. (G. Harrison) 181-187  
The discovery of ether. (M. H. A. Davison) 188-193  
The calibration of a Boyle's apparatus. (W. M. Shearer) 194-197

5: January 1950

- Trichlorethylene anaesthesia. (P. J. Helliwell & A. M. Hutton) 4-13  
Practical aspects of dental anaesthesia. 1. The dental surgeon's point of view. (J. H. Hovell) 14-17. 2. The anaesthetist's point of view. (W. S. McConnell) 17-20  
Anaesthesia for total laryngectomy. (A. M. Cbester & C. B. Lewis) 21-25  
Oscillometry during anaesthesia. (C. T. Barry) 26-35  
Cardiac resuscitation. Two unusual cases. (W. B. Primrose) 36-37  
Post-operative bronchoscopy. (D. Reckless) 38-39  
Anaesthetic adaptor for a bronchoscope. (R. A. C. Herron) 40, 43  
Ether peroxides as a probable cause of pulmonary oedema. (R. J. Stout) 41-43  
An anaesthetic record card for thoracic cases. (R. I. W. Ballantine) 44-46

## Annals of Eugenics

15: October 1949

- Congenital absence of permanent maxillary lateral incisor teeth: a preliminary investigation. (L. C. Mandeville) 1-10  
A further note on discriminatory analysis. (M. H. Quenouille) 11-14  
The association of characters as a result of inbreeding and linkage. (J. B. S. Haldane) 15-23  
The measurement of taste sensitivity to phenylthiourea. (P.T.C.) (H. Harris & H. Kalmus) 24-31  
Chemical specificity in genetical differences of taste sensitivity. (H. Harris & H. Kalmus) 32-45  
A pedigree of hereditary progressive muscular dystrophy. (J. W. Boyes, F. C. Fraser, S. D. Lawler & H. J. Mackenzie) 46-51  
Data relating to seven genetical characters in six endogamous groups in Bombay. (L. D. Sanghvi & V. R. Khanolkar) 52-76  
The combination of blood groups in a sample of 250 people. (R. Sanger & R. R. Race) 77-90

## Annals of the Rheumatic Diseases

8: September 1949

- The subcutaneous nodules of rheumatoid arthritis with lipid deposition. (M. Horwitz) 181-190  
Can the defence mechanism of the body be influenced by roentgen irradiation? Report on a preliminary clinical investigation of the plasma or serum protein pattern in rheumatoid arthritis. (H. Ney) 191-204  
Focal infection in rheumatoid arthritis. A comparison of the incidence of foci of infections in the upper respiratory tract in one hundred cases of rheumatoid arthritis and one hundred controls. (L. S. P. Davidson, J. J. R. Duthie & M. Sugar) 205-208  
Plasma viscosity. (J. S. Lawrence) 209-216  
Early symptoms of rheumatoid arthritis. (N. Egelius, N. G. Hävermark & E. Jonsson) 217-219  
Cervical sympathetic block in periarthritis of the shoulder joint with secondary reflex dystrophy. (K. Jespersen) 220-222  
Estimation of gold in biological fluids. (T. N. Fraser, H. Conway & S. L. Rae) 223-225  
Salazopyrin in the treatment of rheumatoid arthritis. (R. J. G. Sinclair & J. J. R. Duthie) 226-231  
The value of repeated colloidal gold tests in rheumatoid arthritis. (J. N. Swanson) 232-237

8: December 1949

- Muscle lesions in rheumatoid arthritis. (M. Horwitz) 258-266  
Morquio-Brailsford's disease simulating the arthritic manifestation of rheumatoid disease. (P. Ellman) 267-276  
Effect of blood transfusion on rheumatoid arthritis. (N. R. W. Simpson, G. D. Kersley & D. H. Brooks) 277-284  
Stimulation of the suprarenal glands in the treatment of rheumatoid arthritis. Preliminary report. (Z. Z. Godlowski) 285-292  
Treatment of rheumatoid arthritis with adenosinetriphosphoric acid (ATP). (B. Carlström & O. Lövgren) 293-295  
The neutral 17-ketosteroids in rheumatoid arthritis and spondylitis. (M. H. L. Desmarais) 296-298  
Differential sheep-cell agglutination test in rheumatoid arthritis. (R. Brown, J. J. Bunim & C. McEwen) 299-301

## Annals of the Royal College of Surgeons of England

5: September 1949

- Osteogenic tumours of the jaws. (K. H. Thoma) 143-157  
Recollections of Lord Lister. (L. V. Cargill) 158-166  
A patient remembers Lister. (J. Bond) 166-168  
Hare-lip. (D. Browne) 169-187  
Amputations, limb fitting and artificial limbs. (A. W. J. Craft) 190-207

5: October 1949

- The aetiology, pathology, diagnosis and treatment of acute pancreatitis. A review of 110 cases. (R. A. R. Taylor) 213-239  
Acute subdural and extradural haematoma in closed head injuries. (W. Lewin) 240-274

5: November 1949

- Treatment of burns. (A. B. Wallace) 283-300  
The treatment of advanced parodontal disease. (E. W. Fish) 301-317  
The development of micturition control with special reference to enuresis. (D. F. E. Nash) 318-344

5: December 1949

- The Barber Surgeons of Edinburgh. (H. Wade) 353-366  
Chemotherapeutic drugs: a review. (G. Brownlee) 367-393  
Visceral actinomycosis. (V. Z. Cope) 394-410

6: January 1950

- Hypoglycaemia and hyperinsulinism. (H. Cohen) 3-27  
The properties and surgical problems of malignant melanoma. (R. W. Raven) 28-55  
Surgical procedures in the treatment of chronic arthritis of the spine. (W. A. Law) 56-69

## Annals of Tropical Medicine and Parasitology

43: October 1949

- On the control of malaria in Freetown, Sierra Leone. II. Control methods and the effects upon the transmission of *Plasmodium falciparum* resulting from the reduced abundance of *Anopheles gambiae*. (G. A. Walton) 117-139  
Blackwater fever in West Africa, 1941-45. I. Blackwater fever in European military personnel. (G. M. Findlay) 140-154  
Studies in the chemotherapy of cholera. I. The laboratory evaluation of remedies for cholera. (H. O. J. Collier, I. F. Hall & P. D. Waterhouse) 155-163  
The relationship between the effect of certain therapeutic agents on infusoria and on pathogenic protozoa. (D. M. James) 164-173  
Rapid treatment of Chinese kala-azar with urea subamine. A report of twelve cases. (Tzu Ta Chen) 174-181  
Further studies on the distribution of immunity to yellow fever in east and south-east Africa. (K. C. Smithburn, K. Goodner, G. W. A. Dick, S. F. Kitchen & R. W. Ross) 182-193  
Studies on the chemotherapy of melaminyl arsenicals and antimonials in laboratory trypanosome infections. (I. M. Kollo, J. Williamson & E. M. Lourie) 194-208  
A note on the distribution and excretion of antimony in mice treated with sodium p-melaminylphenylstibonate. (J. Williamson) 209-212  
Blackwater fever in West Africa, 1941-45. II. Blackwater fever in African military personnel. (G. M. Findlay) 213-224  
Studies on the liver circulation. I. Active constriction of the hepatic venous tree in anaphylactic shock. (B. G. Macgregor, W. H. H. Andrews & C. E. M. Wenyon) 225-228  
Studies on the liver circulation. II. The micro-anatomy of the hepatic circulation. (W. H. H. Andrews, B. G. Macgregor & C. E. M. Wenyon) 229-237  
Observations on *Litomosoides carinii* (Travassos, 1919) Chandler, 1931. III. The first-stage larva in the peripheral circulation. (W. E. Kershaw). With a statistical analysis by R. L. Plackett. 238-260

## Archives of Disease in Childhood

24: September 1949

- Hydrolysed casein for parenteral administration to infants. (Y. J. Williams, E. A. Bishop & W. F. Young) 159-170  
Oral penicillin in the newborn. (B. Levin & C. A. Neill) 171-179  
Urea clearance in the immediate post-natal period. (J. Thomson) 180-188  
The early diagnosis of rickets. (J. D. Gray & F. S. Carter) 189-194  
A case of congenital idiopathic hypertrophy of the heart. (D. J. Conway) 195-199  
Thrush in infancy. (H. Lederer & R. M. Todd) 200-207  
The changing incidence of convulsions in childhood. (R. A. Shanks & R. A. Robb) 208-213  
Congenital malformations in one of monozygotic twins. (J. E. Morison) 214-218  
Familial congenital stridor. (H. V. L. Finlay) 219-223  
Polyarteritis in childhood. (A. V. Neale) 224-229

24: December 1949

- The treatment of diabetes in childhood. (A. Lichtenstein) 237-244  
Studies in coeliac disease: fat absorption. (W. Sheldon & A. MacMahon) 245-249  
Protein requirements of infants. 2. Marasmus. (W. F. Young, E. A. Bishop, E. M. Hickman & Y. J. Williams) 250-263  
The diagnostic value of cardiac catheterization in isolated pulmonary stenosis and large interventricular septal defects. (E. Mannheimer) 264-268  
Symmetrical cortical necrosis of the kidneys in infancy and childhood. (A. C. P. Campbell & J. L. Henderson) 269-285  
Miliary sebaceous cysts and blisters in the healthy newborn. (I. Gordon) 286-288  
A study of ten children after treatment with streptomycin for tuberculous meningitis. (J. Lorber) 289-293  
The physical and mental development of children with congenital heart disease. (M. Campbell & G. Reynolds) 294-302  
Congenital toxoplasmosis: a report of two cases. (J. H. Hutchison) 303-308  
Complete auriculo-ventricular heart block in the foetus and newborn. (I. D. Riley) 309-311  
Case report. Embryoma of the kidney with symptoms at birth. (C. Josephs) 312-313

## Biochemical Journal

45: 1949

- The intermediary metabolism of the mammary gland. 1. Respiration of lactating mammary gland slices in presence of carbohydrates. (S. J. Folley & T. H. French) 117-125

Observations on the mono-amine oxidase activity of placenta and uterus. (R. H. S. Thompson & A. Tickner) 125-130

Effect of sulphhydryl-combining compounds on the activity of the succinic oxidase system. (E. C. Slater) 130-142

The relationship between the constitution and the effect of chemical compounds on plant growth. 1. 2-Pbenoxyethylamine derivatives. (R. L. Jones, T. P. Metcalfe & W. A. Sexton) 143-149

The reduction of gastric acidity by back-diffusion of hydrogen ions through the mucosa. (C. Turner) 150-158

Studies in detoxication. 26. The fates of phenol, phenylsulphuric acid and phenylglucuronide in the rabbit, in relation to the metabolism of benzene. (G. A. Garton & R. T. Williams) 158-163

The biogenesis of porphyrins. The distribution of  $^{14}\text{N}$  in the ring system. (H. M. Muir & A. Neuberger) 163-170

Factors affecting synthesis of ascorbic acid in cross seedlings. 2. Ascorbic acid synthesis in relation to sugar formation. (L. W. Mapson, E. M. Cruickshank & Yu-Tuan Chen) 171-179

Studies on metabolic products of the *Penicillium luteum* series. (G. G. Freeman & C. S. Macpherson) 179-189

The sedimentation and diffusion of polysaccharides from *Penicillium luteum*; interpretation of the results obtained from polydisperse material in the Gouy diffusiometer. (A. G. Ogston) 189-191

Metabolic products of *Trichothecium roseum* Link. (G. G. Freeman, R. I. Morrison & S. E. Michael) 191-199

Acid-soluble pigments of molluscan shells. 2. Pigments other than porphyrins. (A. Comfort) 199-204

Acid-soluble pigments of molluscan shells. 3. The indigoid character of the blue pigment of *Halotis cracherodii* Leach. (A. Comfort) 204-208

Acid-soluble pigments of molluscan shells. 4. Identification of shell porphyrins with particular reference to conchoporphyrin. (R. E. H. Nicholas & A. Comfort) 208-210

Distribution and nutritive value of the nitrogenous substances in the potato. (Chick & E. D. Slack) 211-221

The pectic enzymes of the mould *Bystochlamys fulva*. (G. H. Beaven & F. Brown) 221-224

Studies on suramin (Antypol: Bayer 205). 7. Further observations on the combination of the drug with proteins. (E. J. Wilson & A. Wormald) 224-231

The phosphorus compounds of wheat starch. (H. S. Rooke, L. H. Lampitt & E. M. Jackson) 231-236

Studies in vitamin A. 9. The role of the thyroid in carotene and vitamin A metabolism. (H. R. Cama & T. W. Goodwin) 236-241

Metabolism of derivatives of toluene. 3. *o*-, *m*- and *p*-xylenes. (H. G. Bray, B. G. Humphris & W. V. Thorpe) 241-244

## 45 : 1949

The distribution of glycogen in the liver of rabbits. (A. Nys, X. Aubert & C. de Duve) 245-246

Prosthetic groups of the cytochromes present in *Corynebacterium diphtheriae* with especial reference to cytochrome *a*. (W. A. Rawlinson & J. H. Hale) 247-255

The oxidation of manganese by plant extracts in the presence of hydrogen peroxide. (R. H. Kenten & P. J. G. Mann) 255-263

The biochemistry of locusts. 1. The carotenoids of the integument of two locust species (*Locusta migratoria migratorioides* R. & F. and *Schistocerca gregaria* Forsk.). (T. W. Goodwin & S. Srisukh) 263-268

Some observations on astaxanthin distribution in marine crustacea. (T. W. Goodwin & S. Srisukh) 268-270

The intermediary metabolism of the mammary gland. 2. Respiration and acid production of mammary tissue during pregnancy, lactation and involution in the rat. (S. J. Folley & T. H. French) 270-275

Tryptophan and the biosynthesis of nicotinamide. (P. Ellinger & M. M. Abdel Kader) 276-281

Some observations on the amino-acid distribution of collagen, elastin and reticular tissue from different sources. (J. H. Bowes & R. H. Kenten) 281-285

A differential method for the detection of small differences in mobility of colloids in electrophoresis. (H. Hoch) 285-294

Chromatographic studies of nucleic acids. 1. A technique for the identification and estimation of purine and pyrimidine bases, nucleosides and related substances. (R. Markham & J. D. Smith) 294-298

Studies in vitamin A. 10. Vitamin A, and retinene, in relation to photopic vision. (S. Ball & R. A. Morton) 298-304

Studies in vitamin A. 11. Reactions of retinene, with amino compounds. (S. Ball, F. D. Collins, P. D. Dalvi & R. A. Morton) 304-307

Studies in vitamin A. 12. Whale-liver oil analysis: preparation of kitol esters. (R. K. Barua & R. A. Morton) 308-317

Studies in vitamin A. 13. The alleged formation of vitamin A from  $\beta$ -carotene treated with iodinated casein. (H. R. Cama & T. W. Goodwin) 317-320

The pyruvate-oxaloacetate system in brain and the tricarboxylic acid cycle. (R. V. Coxon, C. Liébecq & R. A. Peters) 320-325

Acceleration of bacterial glutamic decarboxylase and glutaminase by cetyltrimethylammonium bromide. (D. E. Hughes) 325-331

Factors influencing the polysaccharide content of *Escherichia coli*. (S. Dagley & E. A. Dawes) 331-337

Breakdown of the oxidized forms of coenzymes I and II by an enzyme from the central nervous system. (H. McIlwain & R. Rodnight) 337-342

Apparent vitamin C in the walnut (*Juglans regia*). (F. Wokes & R. Melville) 343-352

Chemical factors in the germination of spore-bearing aerobes. The effect of yeast extract on the germination of *Bacillus anthracis* and its replacement by adenosine. (G. M. Hills) 353-362

Chemical factors in the germination of spore-bearing aerobes. The effects of amino-acids on the germination of *Bacillus anthracis*, with some observations on the relation of optical form to biological activity. (G. M. Hills) 363-370

Studies in vitamin A. 14. The alleged mobilization of vitamin A by adrenaline. (T. W. Goodwin & A. A. Wilson) 370-372

## 45 : 1949

The intracellular mode of action of the sulphonamide derivatives. Some condensation products of reduction. (E. A. Bell, W. Cocker & R. A. Q. O'Meara) 373-377

The micro-estimation of citric acid. (H. Weil-Malherbe & A. D. Bone) 377-381

Studies in detoxication. 27. The orientation of conjugation in the metabolites of 4-chlorocatechol and 4-chlororesorcinol, with some observations on the fate of (+)-adrenaline, protocatechuic acid and protocatechuic aldehyde in the rabbit. (K. S. Dodgson & R. T. Williams) 381-386

Occurrence of cytochrome and coproporphyrin in mycobacteria. (C. M. Todd) 386-390

Quantitative studies on mutants of *Bacterium aerogenes* requiring nicotinic acid and histidine. (P. Devi & C. Higginbottom) 391-396

The composition of foetal fluids of sheep at different stages of gestation. (E. I. McDougall) 397-400

A photoelectric flame photometer. (W. R. Domingo & W. Klyne) 400-403

Vitamin A in seals. (K. Rodahl & A. W. Davies) 408-412

A method for the estimation of micro amounts of amino nitrogen and its application to paper partition chromatography. (A. J. Worsfold) 412-417

Long-chain unsaturated fatty acids as essential bacterial growth factors. Substances able to replace oleic acid for the growth of *Corynebacterium* "Q" with a note on a possible method for their microbiological assay. (M. R. Pollock, G. A. Howard & B. W. Boughton) 417-422

Phospholipin metabolism in rabbit-liver cytoplasm. (G. L. Ada) 422-423

Isolation of L-threonine from proteins. (D. F. Elliott) 429-435

The distribution of ascorbic acid in developing salmon (*Salmo salar* L.). (J. R. Daniel) 435-438

Studies in biochemical adaptation. Effect of diet on the intestinal phosphatase of the rat. (N. R. Lawrie & J. Yudkin) 438-440

The reactions of haems with cyanides and isocyanides. (J. Keilin) 440-443

On the properties and nature of dihydroxyhaem. (J. Keilin) 448-455

The semi-micro estimation of lactose alone and in the presence of other sugars. (F. H. Malpress & A. B. Morrison) 455-459

Displacement chromatography on synthetic ion-exchange resins. 4. The isolation of glucosamine and histidine from a protein hydrolysate. (S. M. Partridge) 459-463

Enzyme activities in the blood of infants and adults. (P. E. H. Jones & R. A. McCance) 464-467

The fate of certain organic acids and amides in the rabbit. 9. Lower aliphatic amides. (H. G. Bray, S. P. James, W. V. Thorpe, M. R. Waddell & P. B. Wood) 467-471

The biochemistry of locusts. 2. Carotenoid distribution in solitary and gregarious phases of the African migratory locust (*Locusta migratoria migratorioides* R. & F.) and the desert locust (*Schistocerca gregaria* Forsk.). (T. W. Goodwin) 472-479

The enzymic degradation of adenosinetriphosphate. (K. Bailey) 479-486

Preparation of the antibiotic nisin. (N. J. Berridge) 486-493

The cholinesterase activity of the serum of newborn animals, and of colostrum. (R. A. McCance, A. O. Hutchinson, R. F. A. Dean & P. E. H. Jones) 493-496

The glucuronide-synthesizing system in the mouse and its relationship to  $\beta$ -glucuronidase. (M. C. Karimairatnam, L. M. H. Kerr & G. A. Levy) 496-499

Chemical studies of peripheral nerve during Wallerian degeneration. 1. Lipids. (A. C. Johnson, A. R. McNabb & R. J. Rossiter) 500-508

Determination of *p*-aminosalicylic acid as *m*-aminophenol. (A. L. Tarnoky & V. A. L. Brews) 508-511

## 45 : 1949

The potato eelworm hatching factor. 1. The preparation of concentrates of the hatching factor and a method of bioassay. (C. T. Calam, H. Raistrick & A. R. Todd) 513-519

The potato eelworm hatching factor. 2. Purification of the factor by alkaloid salt fractionation. Anhydrotetrone acid as an artificial hatching agent. (C. T. Calam, A. R. Todd & W. S. Waring) 520-524

The potato eelworm hatching factor. 3. Concentration of the factor by chromatography. Observations on the nature of eelcypic acid. (D. H. Marrian, P. B. Russell, A. R. Todd & W. S. Waring) 524-528

The potato eelworm hatching factor. 4. *Solanum nigrum* as a source of the potato eelworm hatching factor. (P. B. Russell, A. R. Todd & W. S. Waring) 528-530

The potato eelworm hatching factor. 5. Attempts to prepare artificial hatching agents. Part I. Some furan derivatives. (P. B. Russell, A. R. Todd & W. S. Waring) 530-532

The potato eelworm hatching factor. 6. Attempts to prepare artificial hatching agents. Part II. Some active arylidene- $\Delta^8$ - $\gamma$ -butenolides and related compounds. (D. H. Marrian, P. B. Russell & A. R. Todd) 533-537

The fermentation process in tea manufacture. 10. The condensation of catechins and its relation to the chemical changes in fermentation. (E. A. H. Roberts) 539-542

The deamination of glycine by  $\alpha$ -radiation from the disintegration of boron in a nuclear reactor. (W. M. Dale, J. V. Davies & C. W. Gilbert) 543-546

Observations on antisera against complexes of di-2-chloroethyl sulphide and protein. (D. S. Fleming, A. M. Moore & G. C. Butler) 546-552

Investigations into cholinesterase levels in serum and cerebrospinal fluid of psychotic patients. (D. F. Early, R. E. Hemphill, M. Reiss & E. Brummel) 552-556

Amino-acid decarboxylases of rat liver. (G. H. Sloane-Stanley) 556-559

Methods for the determination of *N*-methyl-2-pyridone-5-carboxylamide and of *N*-methyl-2-pyridone-3-carboxylamide in human urine. (W. I. M. Holman & D. J. de Lange) 559-563

The terminal peptides of insulin. (F. Sanger) 563-574

Regulation of urinary steroid excretion. 2. Spontaneous changes in the pattern of daily excretion in mental patients. (M. Reiss, R. E. Hemphill, J. J. Gordon & E. R. Cook) 574-578

Optical rotation of the molybdate complex of dextro-isocitric acid. (L. V. Eggleston & H. A. Krebs) 578-579

The use of buffered columns in the chromatographic separation of 2 : 4-dinitrophenyl amino-acids. (S. Blackburn) 579-584

The mechanism of the action of nontin. (R. Bentley & A. Neuberger) 584-590

An apparatus for the micro-electrolysis of water. (R. Bentley) 591-592

Growth factors for *Corynebacterium diphtheriae*. 4. Preparation from yeast. (F. W. Chantaway, D. E. Dolby, D. A. Hall & F. C. Hapgood) 592-598

A new manometric method for determination of respiratory quotients. (H. Laser & Rothschild) 598-612

Carotenoids, vitamin A and 7-dehydrosteroid in the frog (*Rana temporaria*). (R. A. Morton & D. G. Rosen) 612-627

A histological method for the biological estimation of vitamin A. (W. H. K. Coetzee) 628-637

Studies in detoxication. 28. The biosynthesis of *o*-, *m*- and *p*-cyanophenylglucuronides. (J. N. Smith) 639-639

## 46 : January 1950

- The swelling of collagen in alkaline solutions. 1. Swelling in solutions of sodium hydroxide. (J. H. Bowes & R. H. Kenten) 1-8
- A study of the peptides of cystine in partial hydrolysates of wool. (R. Conden & A. H. Gordon) 8-20
- The respiration of rat-liver slices in the presence of some aliphatic amines, hydroxy amines and quaternary ammonium salts. (C. Long) 21-27
- The reaction of oxidizing agents with wool. 1. The division of cystine into two fractions of widely differing reactivities. (P. Alexander, R. F. Hudson & M. Fox) 27-32
- The utilization of non-protein nitrogen in the bovine rumen. 5. The isolation and nutritive value of a preparation of dried rumen bacteria. (M. L. McNaught, J. A. B. Smith, K. M. Henry & S. K. Kon) 32-36
- The utilization of non-protein nitrogen in the bovine rumen. 6. The effect of metals on the activity of the rumen bacteria. (M. L. McNaught, E. C. Owen & J. A. B. Smith) 36-43
- The turnover of radioactive phosphate injected into the subarachnoid space of the brain of the rat. (O. Lindberg & L. Ernster) 43-47
- The determination of N-methyl-2-pyridone-5-carboxylic acid in human urine. (W. I. M. Holman & D. J. de Lange) 47-49
- Studies in the biochemistry of micro-organisms. 81. The colouring matters of *Penicillium islandicum* Sopp. Part 2. Chrysophanic acid, 4:5-dihydroxy-2-methylantraquinone. (B. H. Howard & H. Raistrick) 49-53
- Changes in water and ion metabolism and in kidney functions during the development of oedema in rats fed on protein-deficient diets. (S. E. Dicker) 53-62
- Pigments derived from tryptophan: (1) urochrome, (2) tryptochrome. (W. R. Fearon & W. A. Boggust) 62-67
- The oxidation of manganese by peroxidase systems. (R. H. Kenten & P. J. G. Mann) 67-73
- Some properties of the insulin core. (J. A. V. Butler, D. M. P. Phillips, J. M. L. Stephen & J. M. Creeth) 74-80
- Studies on the composition of horse oil. 1. Composition of horse oil in relation to the depot fats of other pasture-fed animals. (E. G. Brooker & F. B. Shorland) 80-85
- Bile pigment precursors in normal human erythrocytes. (C. Gardikas, J. E. Kench & J. F. Wilkinson) 85-88
- The action of enzymes on chlorophenylalanines. (H. Blaschko & J. Stiven) 88-90
- The assimilation of amino-acids by bacteria. 9. The passage of lysine across the cell wall of *Streptococcus faecalis*. (V. A. Najjar & E. F. Gale) 91-95
- Properties of brain pyrophosphatase. (J. J. Gordon) 96-99
- Are phospholipids transmitted through the placenta? (G. Popják & M.-L. Beeckmans) 99-103
- In search of a phospholipin precursor. (G. Popják & H. Muir) 103-113
- The effect of adrenal cortical preparations added *in vitro* upon the carbohydrate metabolism of liver slices. 1. The effect of adrenal cortical extract (eschatin) upon synthesis of glycogen and of total carbohydrate. (C. Y. Chiu & D. M. Needham) 114-120
- The effect of adrenal cortical preparations added *in vitro* upon the carbohydrate metabolism of liver slices. 2. The effect of some pure steroids upon carbohydrate synthesis, oxygen uptake and non-protein nitrogen. (C. Y. Chiu) 120-124
- Studies in detoxication. 29. The orientation of glucuronic acid conjugation in chloroquinol. (K. S. Dodgson, J. N. Smith & R. T. Williams) 124-128

## Brain

## 72 : September 1949

- A study of efferent connexions of the frontal lobe in the human brain after leucotomy. (M. Meyer) 265-296
- The relative sympathetic contribution to individual roots of the brachial plexus in man. (S. Sunderland & G. M. Bedbrook) 297-301
- Adequate stimuli with special reference to cutaneous nerves. (J. H. Parsons) 302-311
- Sensation and volition. (W. Gooddy) 312-339
- Hereditary ataxia with optic atrophy of the retrobulbar neuritis type, and latent pallido-Luysian degeneration. (M. A.-V. Leeuwen & L. Van Bogaert) 340-363
- The remote reference of pain aroused in the skin. (D. C. Sinclair) 364-372
- Progressive fibrinoid degeneration of fibrillary astrocytes associated with mental retardation in a hydrocephalic infant. (W. S. Alexander) 373-381
- Subacute combined degeneration of the cord: I. Response to liver extracts. II. Trials with vitamin B<sub>12</sub>. Appendix: Quantitative method of assessing neurological status. (C. C. Ungley) 382-427
- The cross-sectional area of peripheral nerve trunks devoted to nerve fibres. (S. Sunderland & K. C. Bradley) 428-449
- The spontaneous electrical activity of the human thalamus. (D. Williams & G. Parsons-Smith) 450-482

## British Dental Journal

## 87 : 2/9/49

- Some trends in dental undergraduate education in the United States. (R. Bradshaw) 113-118
- Symposium on oral diseases in tropical countries. (Continued)
- III. Some observations on cysts, adamantinomatous and osteomyelitis of the jaws among the population in Malaya. (A. Karim) 118-120
- IV. Yaws (frambesia tropica). (M. M. Williamson) 120-124
- A pathologically detached enamel cap. (E. A. Scher) 124-125

## 87 : 16/9/49

- Enamel caries: a chemico-physical hypothesis. Phase One—chemical. (J. L. Hardwick) 137-142
- Two histological abnormalities. (M. A. Rushton) 142-143
- A modified oral screen made of latex. (A. J. W. Day, P. A. Trotter & N. Norris) 143-147
- The effects of vacuum investing on the compressive strength of investments. (J. Ireland) 148-151

## 87 : 7/10/49

- Tuberculosis of the jaw. T-hypoplasia, a new factor in the... (J. Hodson) 167-180
- ... (H. Thomson) 181-184

## 87 : 21/10/49

- A method of preparing decalcified serial sections in paraffin wax of human enamel and dentine *in situ*. (E. B. Brain) 199-205
- Acrylic crazing: its significance, prevention and treatment. (S. A. Leader) 205-207
- The New Zealand School Dental Service. (S. H. Brennan) 207-211
- A survey of the New Zealand school and adolescent dental services. (F. Owen) 211-215
- Apparatus for registering forces exerted in the extraction of the tooth. (C. Balogh) 216

## 87 : 4/11/49

- Complex composite odontomes: origin, histology, development and pathology. (E. K. Trautman) 229-236
- A comparison of the effects of enemy occupation and post-war conditions on the incidence of dental caries in children in the Channel Islands in relation to diet and food supplies. (E. R. Bransby & E. M. Knowles) 236-243
- The forward movement of the mandible during bite closure and its relation to excessive alveolar resorption in edentulous cases. (A. O. Chick) 243-246

## 87 : 18/11/49

- Esmarch's operation for the relief of ankylosis and of pain in the temporomandibular joint. A modified operative technique. (P. Clarkson & H. H. Ken-shole) 257-264
- Oral symptoms in acute leukaemia. (W. S. Matheson) 265-268

## 87 : 2/12/49

- Chairman's address at the opening of the fifty-seventh session of the Dental Board of the United Kingdom. (E. W. Fish) 279-282
- An investigation into the dimensional changes of the oral tissues during sectioning in paraffin wax. (E. B. Brain) 282-291
- Further analysis of wartime caries observations: an opportunity and a responsibility. (R. F. Sognnaes) 291-294

## 87 : 16/12/49

- Dental pain. (B. G. B. Lucas) 307-312
- Dental extractions in cases of haemophilia. (W. S. Matheson) 312-321
- Dental caries among 5-year-old German children attending kindergartens at Wuppertal in the British zone of Germany. (H. Mellanby) 321-325

## 88 : 6/1/50

- A survey of antero-posterior abnormalities of the jaws in children between the ages of two and five and a half years of age. (H. F. Humphreys & B. C. Leighton) 3-15
- The problem of children. (W. S. Ross) 15-17

## 88 : 20/1/50

- Progressive asymmetry of the mandible. (W. B. Balderston) 25-28
- A high speed section cutting machine. (H. F. Atkinson) 29-31
- Three appliances to aid the arrest of dental haemorrhage. (P. Felix) 32-36
- Full dentures: a new and simple technique. (A. Macgregor) 36-37
- Public dental service in Great Britain with reference to the New Zealand scheme. (G. E. M. Hallett) 38-41

## British Heart Journal

## 11 : October 1949

- Cardiac infarction with bundle branch block. (W. Somerville & P. Wood) 305-324
- Aortic sinus aneurysms. (A. M. Jones & F. A. Langley) 325-341
- The Q-T interval in acute rheumatic carditis. (D. G. Abrahams) 342-349
- A clinical trial of *Rauwolfia Serpentina* in essential hypertension. (R. J. Vakil) 350-355
- The phonocardiography of heart murmurs. Part I. Apparatus and technique. (E. D. H. Cowen & D. H. Farnum) 356-359. Part II. Clinical results and discussions. (E. D. H. Cowen) 360-369
- The natural history of coronary disease: a clinical and epidemiological study. (J. A. Ryle & W. T. Russell) 370-389
- Coronary disease. (J. H. Dadds & C. Hoyle) 390-397
- ... in congenital heart disease. (L. Fatti & ...)

## 12 : January 1950

- William Withering. (K. D. Wilkinson) 1-9
- Coronary involvement in dissecting aneurysm of the aorta. (S. Oram & M. C. Holt) 10-16
- The cardiovascular system in gargoyism. (S. Lindsay) 17-32
- Pure aortic stenosis. (G. A. Kiloh) 33-44
- The problem of excessive radiation during routine investigations of the heart. (T. H. Hills & R. W. Stanford) 45-53
- Khellin in the treatment of angina of effort. (H. A. Dewar & T. A. Grimson) 54-60
- Sinus bradycardia with cardiac asystole. (R. S. B. Pearson) 61-64
- Angiocardiography in cyanotic congenital heart disease. (M. Campbell & T. H. Hills) 65-95

## British Journal of Cancer

## 3 : September 1949

- The increase in deaths attributed to cancer of the lung. (J. A. Heady & E. L. Kennaway) 311-320
- Familial carcinoma of the duodenum in adolescence. (H. Ungar) 321-330
- Culture of human leukaemic blood cells *in vitro*: some effects of X-rays. (F. W. Gunz) 330-344
- Mammary tumours in hybrid mice: growth and progression of spontaneous tumours. (L. Foulds) 345-375
- Induction of breast cancer by oestrogens and methylcholanthrene in high- and low-breast-cancer strain mice. (L. Dmochowski & J. W. Orr) 376-384
- The persistence of latent tumour cells induced in the mouse's skin by a single application of 9:10-dimethyl-1:2-benzanthracene. (I. Berenblum & P. Shubik) 384-386
- The relative carcinogenic activity of six isomeric aminoazotoluenes. (H. G. Crabtree) 387-398

- Prevention of abdominal fibroids induced with artificial oestrogens. (S. Bruzzone) 398-400  
 The effects of thiourea on the development of spontaneous tumours on mice. (E. Vazquez-Lopez) 401-414  
 The influence of the protein content of the diet on the response of Walker rat carcinoma 256 to X-radiation. (L. A. Elson & L. F. Lamerton) 414-426  
 The effects of injection of purine and pyrimidine compounds on grafted mice. (G. R. Barker, M. M. Dhar & L. D. Parsons) 427-429  
 Further experiments on the *in vivo* metabolism of 3:4-benzpyrene in the mouse skin. (A. K. Powell & G. Calcutt) 430-432

## 3 : December 1949

- A statistical report on 955 cases of cancer of the cervix uteri and 321 cases of cancer of the corpus uteri. (W. L. Harnett) 433-473  
 The status of genetical studies in human cancer. (J. Clemmesen) 474-484  
 Meningeal tumours with extracerebral metastases. (E. Christensen, W. Kjaer & S. Winblad) 485-493  
 Squamous differentiation in mouse mammary: spontaneous and induced. (B. D. Pullinger) 494-501  
 Some effects of urethane on the growth and mitosis of normal and malignant cells *in vitro*. (I. Lasnitzky) 501-509  
 Composition of nucleic acids: the guanine and thymine content of nucleic acids isolated from normal tissues and animal tumours. (D. L. Woodhouse) 510-519  
 Chemically induced breast tumours and the mammary tumour agent. (L. Dmochowski & J. W. Orr) 520-525  
 Some data on the distribution of the milk factor. (L. Dmochowski) 525-533  
 The development of malignancy in experimentally-induced adenomata of the thyroid. (W. H. Hall & F. Bielschowsky) 534-541  
 Studies on experimental goitre: the transplantability of experimental thyroid tumours of the rat. (F. Bielschowsky, W. E. Griesbach, W. H. Hall, T. H. Kennedy & H. D. Purves) 541-546  
 The role of thyroxine deficiency in the formation of experimental tumours of the thyroid. (F. Bielschowsky) 547-549  
 Investigations into the varying manifestations of leukaemic lesions following injections of 9:10-dimethyl-1:2-benzanthracene into different subcutaneous sites in chole mice. (R. Rask-Nielsen) 549-556  
 Effect of choline on experimental carcinogenesis. (J. W. Cook & R. Schoental) 557-558  
 The ascorbic acid and glutathione content of the livers of rats with sarcoma induced by 1:2:5:6-dibenzanthracene. (J. W. Meduski) 559-562  
 Effects of repeated X-radiation of the whole body on the development of tumours in rats due to feeding *p*-dimethylaminoazobenzene. (C. Hoch-Ligeti) 562-569

## British Journal of Dermatology and Syphilis

## 61 : October 1949

- Experimental assessment of therapeutic efficiency of antifungal substances. (S. R. M. Bushby & S. M. Stewart) 315-321  
 Pityriasis versicolor with subsequent leucodermic patches. (H. G. Adamson) 322-323  
 Pulmonary fibrosis in scleroderma. (J. E. M. Wigley, V. Edmunds & R. Bradley) 324-327

## 61 : November 1949

- Chronic eczema as a variant of dermatitis herpetiformis. (S. Gordon & L. J. A. Loewenthal) 359-378

## 61 : December 1949

- Observations on some cholinergic dermatoses, including a case of cholinergic erythema nodosum. (L. J. A. Loewenthal) 403-409  
 Polynuriatosis as an apparent complication of calciferol treatment and some observations on its local use. (G. H. V. Clarke) 409-413  
 Chronic deep monilia albicans infection of the mucous membrane of the mouth. (H. Ephraïm) 414-416  
 A case for diagnosis: ? reticulosis cutis benigna. (H. D. Chambers) 416-421  
 Fungi and fungus diseases. (G. C. Ainsworth) 421-424

## 62 : January 1950

- The molecular structure of skin, hair, and related tissues. (W. T. Astbury) 1-15  
 Some investigations on the value of calciferol therapy in lupus vulgaris. (M. Ruiter & H. D. Groen) 15-19  
 Tuberculosis cutis ulcerosa hyperergica. (B. J. v. d. Meer) 19-22  
 Fixed eruption and urethritis due to phenolphthalein. (H. Haber) 22-25  
 Atypical neurodermatitis. (A. D. Porter & H. Haber) 25-27

## British Journal of Experimental Pathology

## 30 : August 1949

- Studies on a factor in normal allantoic fluid inhibiting influenza virus haemagglutination. Precipitation-dissolution reaction in mixtures of active virus and inhibitor. (A. Svedmyr) 237-247  
 Studies on a factor in normal allantoic fluid inhibiting influenza virus haemagglutination. Precipitation reaction in mixtures of inactive virus and inhibitor. (A. Svedmyr) 248-254  
 Studies on a factor in normal allantoic fluid inhibiting influenza virus haemagglutination. The effect of active virus, proteolytic enzymes and periodate on the inhibitor. (A. Svedmyr) 254-266  
 Experimental liver cirrhosis in rats produced by prolonged subcutaneous administration of solutions of tannic acid. (B. Korpásky & K. Kovács) 266-272  
 The kaolin-adsorption method for the quantitative assay of urinary gonadotrophins. (J. Dekanski) 272-282  
 The tissue response to heat-killed streptococci in the skin of normal subjects, and in persons with rheumatic fever, rheumatoid arthritis, subacute bacterial endocarditis and erythema nodosum. (J. H. Humphrey & W. Pagel) 282-288  
 Quantitative studies in diphtheria prophylaxis: the primary response. (L. B. Holt) 289-297  
 Studies on staphylococcus mutation: an investigation of the growth requirements of a "G" (gonidial) variant. (J. H. Hale) 297-301  
 A rapid concentrating still. (W. E. van Heyningen) 302-305  
 Antibiotics from a strain of *B. subtilis*: bacilipin A and B and bacilysin. (G. G. F. Newton) 306-319

- The fixation of diphtheria toxin to skin tissue with special reference to the action of circulating antitoxin. (A. A. Miles) 319-344  
 The nature of antistreptolysin "S" in the sera of man and of other species: antistreptolysin titres in normal and diseased states. (J. H. Humphrey) 345-351  
 The effect of several diluents on prothrombin activity curves. (B. Fisher) 352-355  
 Nitrate adaptation: an apparent effect of penicillin which can be reversed by salt. (E. F. Gale) 356-364

## 30 : October 1949

- The nature of antistreptolysin S in the sera of man and of other species. The lipoprotein properties of antistreptolysin S. (J. H. Humphrey) 365-375  
 Experimental beryllium poisoning. (W. N. Aldridge, J. M. Barnes & F. A. Denz) 375-389  
 Some effects of anterior pituitary extract on liver metabolism. (A. H. Ennor) 389-394  
 Serological protection against the "fatty liver"—producing effect of anterior pituitary extracts. (A. H. Ennor & E. Singer) 395-397  
 The isolation of antibiotics produced by *Proactinomyces (Nocardia) gardneri*. (R. Q. Marston) 398-407  
 The antibacterial and pharmacological properties of the proactinomycins A<sub>1</sub> and B. (R. Q. Marston & H. W. Florey) 407-418  
 The genetic character of O-D change in influenza A. (F. M. Burnet, J. D. Stoue, A. Isaacs & M. Edney) 419-425  
 Ayfavin: an antibiotic from *B. licheniformis*: production in potato-dextrose medium. (A. Arriagada, M. C. Savage, E. F. Abraham, N. G. Heasley & A. E. Sharp) 425-427  
 Ayfavin: production in chemically defined media and comparison with licheniformin. (G. M. Hills, F. C. Belton & E. D. Blatchley) 427-443  
 Ayfavin: extraction, purification, and chemical properties. (V. E. Sharp, A. Arriagada, G. G. F. Newton & E. P. Abraham) 444-457  
 Biological observations on ayfavin. (A. Arriagada, H. W. Florey, M. A. Jennings & I. G. Wallmark) 458-469  
 The preparation and properties of enzymes from *Cl. welchii* (type B) filtrates which destroy blood-group substances. (M. V. Stack & W. T. J. Morgan) 470-483  
 The serological analysis of mixed flocculating systems by means of diffusion gradients. (S. D. Elck) 484-500  
 Spontaneous mutation to streptomycin resistance in *Escherichia coli*. (G. W. Scott) 501-505  
 Blood histamine in the anaphylactoid shock produced by anti-platelet serum in dogs. (H. Moussatché & W. O. Cruz) 506-507

## British Journal of Industrial Medicine

## 6 : October 1949

- Weil's disease in the north-east of Scotland. (J. Smith) 213-220  
 Vital capacity measurements in Cornish tin-miners. (J. Garra) 221-229  
 Silicosis in the potteries: some observations based on seven hundred and fifty necropsies. (A. Meiklejohn) 230-240  
 Silicosis in sandstone workers: some observations based on two hundred and seventy-five necropsies. (A. Meiklejohn) 241-244  
 Inhalation risk and particle size in dust and mist. (C. N. Davies) 245-253  
 Photoelectric measurement of coal dust stains on filter paper. (C. N. Davies & M. Aylward) 254-258

## 7 : January 1950

- Skin cancer in the engineering industry from the use of mineral oil. (C. N. D. Cruickshank & J. R. Squire) 1-11  
 The fate of siliceous dusts in the body. I. A comparison of the *in vivo* solubilities of cement, carborundum, quartz, and moulding sand. (P. F. Holt) 12-16  
 Observations on the working ability of Bantu miners with reference to acclimatization to hot humid conditions. (J. S. Weiner) 17-26  
 Effect of aluminium on the silicosis-producing action of inhaled quartz. (E. J. King, B. M. Wright, S. C. Ray & C. V. Harrison) 27-36  
 The effects of granite on the lungs of rats. (E. J. King, S. C. Ray, C. V. Harrison & G. Nagelschmidt) 37-41  
 Graphite pneumoconiosis. (L. Parmeggiani) 42-45

## British Journal of Nutrition

## 3 : 1949

- The digestion of pentosans in hay by sheep. (R. A. Marshall) 1-2  
 An outbreak of nutritional (iron deficiency) anaemia in weaning stock rats. (A. L. Bacharach, W. F. J. Cuthbertson & D. M. Thomson) 3-12  
 Nutrition of domestic rabbits. 3. Variations in carcass composition of rabbits reared for meat. (J. C. D. Hutchinson & C. J. L. Baker) 12-24  
 Nutrition of Nigerian peasant farmers, with special reference to the effects of vitamin A and riboflavin deficiency. (B. M. Nicol) 25-43  
 A photoelectric spectrophotometer suitable for the measurement of vitamin A by the antimony-trichloride reaction. (S. Y. Thompson) 43-50  
 The conversion of  $\beta$ -Carotene to vitamin A in the intestine. (S. Y. Thompson, J. Ganguly & S. K. Kon) 50-78

## 3 : 1949

- Imbalance of vitamin B factors. The effect of conditioned pyridoxin deficiency on the development of young rats. (M. B. Richards) 109-132  
 Influence of the extraction rate of flour on conditioned pyridoxin deficiency in rats. (M. B. Richards) 132-152  
 Further observations on conditioned pyridoxin deficiency in rats during lactation. (M. B. Richards) 153-161  
 Fluorine content of teas consumed in New Zealand. (M. F. Harrison) 162-166  
 Urinary excretion of fluorine in some New Zealand subjects. (M. F. Harrison) 166-170  
 Thiourea and methylthiourea as supplements in rations of fattening pigs. (R. Braude & E. Cotchin) 171-186  
 The nutritive value of colostrum for the calf. 1. The effect of different fractions of colostrum. (R. Aschaffenburg, S. Bartlett, S. K. Kon, P. Ferry, S. Y. Thompson, D. M. Walker, C. Briggs, E. Cotchin & R. Lovell) 187-196  
 2. The effect of small quantities of the non-fat fraction. (R. Aschaffenburg,

- S. Bartlett, S. K. Kon, D. M. Walker, C. Briggs, E. Cotchin & R. Lovell) 196-200. 3. Changes in the serum protein of the newborn calf following the ingestion of small quantities of the non-fatty fraction. (R. Aschaffenburg) 200-204
- Hypocupraemia in dairy cows. (R. Allcroft & W. H. Parker) 205-217
- Haematuria in pyridoxin-deficient rats. (L. R. C. Agnew) 217-233
- Effect of small quantities of a yeast preparation on the recovery of appetite in sheep. (J. Tosic) 234-241

### British Journal of Ophthalmology

33 : September 1949

- Some aspects of ocular melanotic growth. (A. Loewenstein) 525-543
- Blindness associated with haemorrhage. (S. Lockett) 543-555
- Some observations on the causation and elimination of Sattler's veil. (H. Treisman) 555-567
- A preliminary note on a new method of fixing corneal grafts. (C. A. Pittar) 567-573
- Further investigations on the action of detergents on the eye. (M. Ginsburg & J. M. Robson) 574-579
- The artificially produced retinal pulse. (N. Pines) 579-583

33 : October 1949

- Studies on the intra-ocular fluids. Part 4. The dialysis of aqueous humour against plasma. (S. Duke-Elder, H. Dawson & D. M. Maurice) 593-601
- An investigation into the mode of heredity of congenital and juvenile cataracts. (J. Saebø) 601-629
- The motor impulse elicited by the retinal stimulus and the binocular optical reflexes. (J. E. Winkelman) 629-635
- Hyaline membranes on the posterior corneal surface. (P. D. Trevor-Roper) 635-643
- Local application of urea for the treatment of dendritic ulcer. (M. Klein & S. J. H. Miller) 643-651
- The relative importance of direct and indirect ophthalmoscopic examination in the treatment of retinal detachment. (H. Arruga) 651-653

33 : November 1949

- Von Hippel-Lindau disease, clinical and pathological. Report of a case. (I. C. Michaelson & J. Hill) 657-664
- Antihistamines in ophthalmology. (L. Németh) 665-669
- Some war time statistics. (G. C. Dansey-Browning) 670-677
- The effect of hyaluronidase injection on the vitreous humour of the rabbit. (A. Pirie) 678-684
- Bilateral congenital anophthalmos. (F. Papolczy) 685-688
- A therapeutic step in chronic glaucoma. (G. de L. Fenwick) 688-693
- Early post-operative detachment of the choroid. (F. Csillag) 694-700
- Primary tumour of the optic nerve (glioblastoma multiforme). (J. Saebø) 701-708
- An incomplete form of mandibulo-facial dysostosis (Franceschetti's syndrome). (G. P. Halberg & J. M. Paunessa) 709-713
- Ocular allergy in handlers of streptomycin. (J. Charamis) 714-715
- Contact shell applicator for use as a corneal bath. (M. Klein) 716-717

33 : December 1949

- Investigations into hyaluronidase and hyaluronidase in the subretinal fluid in retinal detachment, partly due to ruptures and partly secondary to malignant choroidal melanoma. Preliminary report suggesting a new hypothesis concerning the pathogenesis of retinal detachment. (E. Godfredsen) 721-732
- Choroidal sarcoma with metastasis in the opposite orbit. (S. Philips) 732-739
- Histo-pathological studies of the blood-vessels of the eye. (R. Syst) 739-754
- Convergence. An investigation into the normal standards of age groups. (A. Mellick) 755-763
- Adeno-carcinoma (mixed tumour) of the lacrimal gland. (N. Fleming) 763-769
- Thyroidectomy and thyrotropic exophthalmos (exophthalmic ophthalmoplegia). A review of 1001 thyroidectomies. (H. Ryan) 769-773
- The glass rod test in glaucomatous eyes. (T. L. Thomassen) 773-778
- Extraction of cataract in a case of sympathetic ophthalmia. (F. W. G. Smith) 779-780
- Simple camera support for the operating theatre. (G. P. Halberg) 780-781

34 : January 1950

- Electroretinography of experimental animals. (J. W. Waters) 1-15
- Treatment of infected corneal ulcer by subconjunctival injection of penicillin in doses of 1,000,000 units. (A. Sorsby & R. A. Burn) 16-29
- Aurcomycin in ophthalmology. (A preliminary report.) (S. Duke-Elder, D. Ainslie & A. J. Boase) 30-37
- Injection of the retinal vascular system in the enucleated eye in diabetic retinopathy. (N. Ashton) 38-41
- Convergence deficiency: an investigation into the results of treatment. (A. Mellick) 41-46
- A contribution to the theory of the vascular origin of glaucoma. (E. Dienstbier, J. Balík & H. Kafka) 47-58

### British Journal of Pharmacology and Chemotherapy

4 : September 1949

- The mechanism of action of anticholinesterase drugs. (A. S. V. Burgen) 219-228
- The pharmacology of the methyl and benzyl esters of  $\gamma$ -crotonic betaine ( $\gamma$ -carboxyallytrimethyl-ammonium chloride). (A. S. V. Burgen & F. Hobbiger) 229-233
- The methylation of noradrenaline by minced suprarenal tissue. (E. Bülbring) 234-244
- Formation of adrenaline from noradrenaline in the perfused suprarenal gland. (E. Bülbring & J. H. Burn) 245-247
- Studies in the chemotherapy of tuberculosis: part V. Thiosemicarbazones and related compounds. (E. Hogarth, A. R. Martin, N. E. Storey & E. H. P. Young) 248-253
- The estimation of some thiosemicarbazones and their blood concentrations in experimental animals. (A. Spinks) 254-259
- The effect of diethanol on survival time in rats and mice poisoned with organic arsenicals. (J. A. C. Weatherall & M. Weatherall) 260-273

- Dimercaprol and the biliary excretion of lead in rabbits. (M. Ginsburg & M. Weatherall) 274-276
- pA<sub>2</sub> and competitive drug antagonism. (H. O. Schild) 277-280
- Some pharmacological properties common to antihistamine compounds. (N. K. Dutta) 281-289
- The presence of acetylcholine in *Trypanosoma rhodesiense* and its absence from *Plasmodium gallinaceum*. (E. Bülbring, E. M. Lourie & U. Pardoe) 290-294
- The fate of tubocurarine in the body. (M. Mahfouz) 295-303
- The pressor and depressor effects of certain sympathomimetic amines. (L. Wislicki) 304-307
- Effect of reduction of potassium on the action of acetylcholine on rabbit auricles. (J. D. P. Graham) 308-310
- Isopropylnoradrenaline inhalation and mucous membranes. (H. Herzheimer & R. H. D. Short) 311-312
- The amount of nicotine absorbed in smoking. (H. W. Ling & C. B. W. Parry) 313-314

4 : December 1949

- Effects of some isothiurea and guanidine salts on various preparations of smooth and striped muscle. (F. N. Fastier) 315-322
- Some relationships between anti-nicotine activity and specific antagonism. (J. Tripodi) 323-328
- The tolerance of the dog to intrathecal injections of crystalline penicillin. (T. H. B. Bedford) 329-332
- Studies with a radioactive spinal anaesthetic. (F. Howarth) 333-347
- The effect of dimercaprol on lead poisoning in mice. (A. B. Anderson) 348-350
- The effects of dimercaprol and parathyroid extract on the subacute distribution of lead (acetate) in rabbits. (K. R. Adam, M. Ginsburg & M. Weatherall) 351-358
- The antagonism of curarizing activity by phenolic substances. (G. A. Moge & P. A. Young) 359-365
- Personal error in penicillin assay. (P. A. Young) 366-372
- The action of noradrenaline. (J. H. Burn & D. E. Hutcheon) 373-380
- The pharmacological actions of polymethylene bistrimethylammonium salts. (W. D. M. Paton & E. J. Zaimis) 381-400
- The assay of substances from the adrenal medulla. (J. H. Gaddum & F. Lembeck) 401-408

### British Journal of Physical Medicine

12 : September-October 1949

- An industrial accident and rehabilitation service: engineering methods in occupational therapy. (A. R. Thompson) 114-121
- Ulceration of the legs: treatment by the Bisgaard method. (P. Bauwens) 122-123
- Osteoarthritis of the knee: notes on the principles of Bisgaard in treatment. (F. Bach) 124-126
- Ankylosing spondylitis: measurement of hip and spine movements. (W. F. Dunham) 126-129
- Hydrotherapy. Part IV. (M. B. Ray) 129-131

12 : November-December 1949

- Rehabilitation of miners. (S. B. Davis) 139-143
- The influence of "red light" and of "ionization" upon the penetration of the skin by penicillin. (M. Cutner) 144-147
- Hydrotherapy. Part V. (M. B. Ray) 148-150
- Cardiac rupture during rehabilitation. (T. H. Howell & A. P. Piggott) 151-152

13 : January 1950

- The effects of micro-waves: a preliminary investigation. (A. C. Boyle, H. F. Cook & T. J. Buchanan) 2-9
- Systemic thermotherapy with special reference to hot-air baths. (V. R. Ott) 9-14
- Hydrotherapy. Part VI. (M. B. Ray) 16-18
- Rheumatoid arthritis: physiotherapy and psychotherapy in spa treatment. (G. Armour) 19-21

### British Journal of Plastic Surgery

2 : October 1949

- The treatment of major injuries of the hand. (E. M. Evans) 150-174
- The anatomy and function of the extensor complex. (F. Braithwaite, G. D. Channell, F. T. Moore & J. Whillis) 175-187
- A suggested explanation of the non-healing traumatic ulcer. (M. Douglas) 188-191
- The columella. (H. Gillies) 192-201
- The rapid transfer of abdominal tubed pedicles. (W. Hynes) 202-211
- A bilateral one-piece breast prosthesis. (A. M. Brown) 212-218

### British Journal of Radiology

22 : September 1949

- Carcinoma of the vulva: Symposium.
- I. The treatment of cancer of the vulva. (E. G. E. Berven) 498-507
- II. Radium implantation treatment of carcinoma vulva. (M. C. Tod) 508-512
- III. Cancer of the vulva treated by radiation. An analysis of 127 cases. (F. Ellis) 513-520
- The influence of energy absorption and electron range on dosage in irradiated bone. (F. W. Spiers) 521-533
- The radiological diagnosis of lipoma of the corpus callosum. (D. Sutton) 534-539
- De-ossification in a lumbar transverse process. (R. A. Roberts) 540-543
- Jejuno-gastric intussusception. (D. M. Coates) 544-546
- Haemosiderosis and dust reticulosis of coal-miners. (A. Meiklejohn) 547-548

22 : October 1949

- The radiological localisation of the placental site. Part I. Normal implantation. (F. Reid) 557-566
- The differentiation of mediastinal tumour and aneurysm: value of angiocardiology. (I. Steinberg & C. T. Dotter) 567-572
- Pneumoconiosis in graphite workers. (L. Dunner & D. J. T. Bagnall) 573-579
- Osteogenic sarcoma as a complication of osteitis deformans. Some personal experiences and reflections. (H. R. Sear) 580-587

- The organisation of hospital physics departments: Symposium.  
 I. (L. F. Lamerton) 588-591  
 II. Physics in a large radiotherapy centre. (H. Miller) 591-596  
 III. The broader view of hospital physics. (S. B. Osborn) 596-598  
 An experimental study of back-scatter with X-ray beams of small area. (D. V. Mabbs) 600-604  
 Two devices for improving accuracy in X-ray beam direction. (I. G. Brown & J. L. Howarth) 605-608

## 22 : November 1949

- The National Radium Commission in retrospect. Silvanus Thompson lecture 1949. (F. G. Spear) 617-626  
 Fluoroscopic preselection of the tomographic plane in chest lesions, with a note on the use of a double grid. (E. Calder) 627-633  
 Cholechoenteric fistulae (internal biliary fistulae). (F. Greenwood & E. Samuel) 634-637  
 The radiological features of chronic pulmonary schistosomiasis. (H. Erfan & A. A. Deeb) 638-642  
 The radiological localisation of the placental site. Part II. The radiological diagnosis of placenta praevia. (F. Reid) 643-665  
 A special X-ray tube for angiocardiology and cerebral angiography. (J. D. F. Williams) 666-668  
 Stabilisation of X-ray therapy apparatus by ionization current. (C. G. Clayton & F. T. Farmer) 669-671

## 22 : December 1949

- The experimental determination by ionization methods of the rate of emission of beta- and gamma-ray energy by radioactive substances: the isotopes  $\text{Na}^{24}$ ,  $\text{P}^{32}$ ,  $\text{Co}^{60}$  and  $^{131}\text{I}$ . (L. H. Gray) 677-697  
 External measurement of radio-iodine in the thyroid gland. (T. H. Oddie & R. K. Scott) 698-705  
 Clinical radiation dosage. II. Inter-relation of time, area and therapeutic ratio. (L. Cohen) 706-713  
 Breast carcinoma treated with stilboestrol and deep X ray: report of a case. (G. G. Binnie) 714-716  
 Pneumoconiosis and tuberculosis in dockers dealing with grain and seeds. (L. Dunner) 717-722  
 Military calcification of the liver: report of a case. (R. Astley & N. Harrison) 723-724  
 Xanthomatosis associated with vertebra plana. (P. M. Davies) 725-728  
 Photographic naming of X-ray films. (M. Wood) 729-731

## 23 : January 1950

- Microradiography of bone. (H. A. Sissons) 2-7  
 Techniques of post-mortem angiography of the stomach. (A. L. Woolf) 8-14  
 Anomalous ossification of ribs as a cause of pseudarthrosis. (J. Aspin) 15-17  
 The reciprocal vicinity effect of irradiated tissues on a "diffusible substance" in irradiated tissues. (B. Jolles) 18-24  
 Clinical radiation dosage. III. A biological factor in radon and isotope dosage. (L. Cohen) 25-27  
 Medical aspects of protection from ionizing radiations. (F. Ellis) 28-34  
 The radiation hazards of radiotherapeutics staff. (J. R. Nuttall) 35-40  
 Cytological aspects of protection from ionizing radiations. (A. Glücksman) 41-45  
 Absolute measurements of the activity of beta emitters. (J. L. Putnam) 46-63

## British Journal of Social Medicine

## 3 : July 1949

- Visual tests of fatigue in operational flying. (D. D. Reid) 101-109  
 The care of the chronic sick. I. Medical and nursing requirements. (C. R. Lowe & T. McKewen) 110-126  
 A study of the efficiency of groups of ex-miners disabled by pneumoconiosis employed in light industries in South Wales. (J. A. P. Treasure) 127-138  
 Variations in energy expenditure during walking. (C. Delbue, R. Passmore, J. Thomson & J. A. Watt) 139-142

## British Journal of Surgery

## 37 : October 1949

- The War Collection. (G. Gordon-Taylor) 129-146  
 The diagnosis and treatment of vascular diseases: with special consideration of clinical plethysmography and the surgical physiology of the autonomic nervous system. (R. H. Goetz) 146-156  
 The blood-supply to the sigmoid colon and rectum: with reference to the technique of rectal resection with restoration of continuity. (J. C. Goligher) 157-162  
 Primary carcinoma of penile urethra. (N. F. Kirkman) 162-165  
 Postgastrectomy syndromes. (A. Muir) 165-178  
 Modern trends in hare-lip and cleft palate surgery: with a review of 500 cases. (M. C. Oldfield) 178-194  
 Concerning the unfavourable late results of certain operations performed in the treatment of cardiopasm. (N. R. Barrett & R. H. Franklin) 194-202  
 Reconstruction of the trachea and cervical oesophagus: preliminary report. (C. G. Rob & G. H. Bateman) 202-205  
 The surgical treatment of non-resectable duodenal ulcer: the antral exclusion operation (Bancroft-Plenk modification). (M. Makkas & G. Marangos) 206-212  
 The problem of the localized surface intracranial haemorrhage causing compression of the brain. (N. Whalley) 212-219  
 Duplications of the foregut. Superior accessory lung (2 cases); epiphrenic oesophageal diverticulum; intrapericardial teratoid tumour; and oesophageal cyst. (H. S. Baar & A. L. d'Abreu) 220-230  
 Rhabdomyosarcoma of skeletal muscle. (P. Childs) 230-234  
 Leiomyoma of terminal ileum. (J. Borrie) 235-237  
 Primary carcinoma of the ureter. (A. L. Carroddus & V. S. Howarth) 238-239  
 Adenomatoid leiomyoma of the epididymis. (W. W. Wilson) 240-241  
 A case of traumatic aneurysm of the right superficial temporal artery. (F. Smith) 241-242  
 Haemoperitoneum following rupture of a granulosa-cell tumour of the ovary. (J. N. Ward-McQuaid) 242-244

- A case of partial atresia of the pyloric antrum due to a mucosal diaphragm of doubtful origin. (C. F. Sames) 244-246  
 Traumatic fat necrosis in greater omentum: with clinical and radiographical features simulating carcinoma of the sigmoid colon. (S. L. Spencer) 246-247  
 Acute intestinal obstruction due to lymphosarcoma of the ileum in a child aged 5 years. (C. M. Ordley) 247-248

## 37 : January 1950

- The renal fascia. (G. A. G. Mitchell) 257-266  
 Engelmann's disease. Osteopathia hyperostotica (sclerostosis) multiplex infantilis; progressive diaphyseal dysplasia. (A. C. Bingold) 266-274  
 Adenocarcinoma of thyroid gland. A case report; and discussion of the significance of the Hürthle cell. (P. Childs) 274-278  
 Giant hypertrophic gastritis. A survey of the literature and the record of a case treated surgically. (W. R. Forrester-Wood) 278-282  
 Wilms' tumour. (R. A. R. Taylor) 283-287  
 Solitary myeloma with generalized metabolic disturbance. (J. R. Nassim & T. Crawford) 287-291  
 Evaluation of surgical procedures for gastric and duodenal ulcers. (G. G. Miller) 291-294  
 Lymphangioma of mesentery. (I. Macnab & T. Menzies) 294-298  
 Congenital absence of the sacrum and coccyx. Report of a case and review of the literature. (B. Freedman) 299-303  
 Epidermoid cysts in the region of the rectum and anus. A report of four cases. (G. M. Bonser, F. P. Raper & H. S. Shucksmith) 303-306  
 Haemostasis with absorbable alginates in neurosurgical practice. (L. C. Oliver & G. Blaine) 307-310  
 Carcinoma of the adrenal cortex. Report of a case without endocrine changes. (E. Griffiths) 311-314  
 A case of acute insufficiency of small intestine: with a discussion and review of the literature. (F. B. Cockett) 314-317  
 The treatment of suppurative arthritis of the interphalangeal and metacarpophalangeal joints. (A. G. Riddell) 317-320  
 Inferior mesenteric vascular occlusion. (J. Y. W. Russell) 321-323  
 A case of so-called lateral aberrant thyroid: the importance of hemithyroidectomy. (R. S. Murley) 324-326  
 Solitary kidney. A report of three cases. (V. S. Howarth) 327-328  
 Retroperitoneal cystic adenoma. (V. S. Howarth) 329-330  
 Case report on pedicled nerve graft. (F. G. St. C. Strange) 331-333  
 The anatomy of the blood-vessels in the region of the pancreas. (C. W. A. Falconer & E. Griffiths) 334-344  
 Nasopharyngeal tumours. The place of leucotomy in the terminal stages of the disease. (E. C. Mekie & G. Ransome) 344-346  
 Lymphangioma of the kidney. (D. Wynn-Williams & A. D. Morgan) 346-349  
 A case of colon and ileum duplex. (J. Aiken) 349-351  
 The effect of tetra-ethyl ammonium bromide on the renal pelvis and ureter. A contribution to the study of hydronephrosis. (A. G. Marshall) 352-356  
 Duplications of the alimentary tract. (G. H. Wooler) 356-358  
 A case of osteochondritis dissecans of the ankle. (T. R. Simpson) 359-360  
 A case of tuberculosis of the colon with carcinoma of the rectum. (P. Hickinbotham) 360-361  
 A case of traumatic avulsion of a main-stem bronchus from its lung, treated by immediate pneumonectomy. (E. R. Kirkpatrick) 362-363  
 Meckel's diverticulum with a peritoneal caul. A unique cause of intestinal obstruction. (J. F. Carr) 363-364  
 Solitary caecal diverticulitis. (N. F. Kirkman) 365-367  
 Perisemilunar dislocation of the carpus. A case of perisemilunar-transstriaqueal dislocation. (J. N. Wilson) 367-368  
 A case of "idiopathic" gangrene of the scrotum. (D. H. Randall) 368-369  
 A recurrent benign giant-cell synovitis of tendon-sheath of 34 years' duration. (M. J. Stewart & C. J. E. Wright) 370  
 A case of direct inguinal hernia illustrating improvement in tone of the oblique musculature of the abdominal wall as a result of surgical repair of the hernia. Preliminary report. (D. H. Patey) 371-372

## British Journal of Tuberculosis and Diseases of the Chest

## 43 : July 1949

- Cavities of the lower lobe in pulmonary tuberculosis: pathology and treatment, with special reference to pneumoperitoneum. (B. Rozenblat) 47-74  
 Solitary cystic disease of the lung. (J. Almeyda) 74-84

## 43 : October 1949

- A therapeutic rationale in tuberculous broncho-stenosis. (A. Hurst, H. Laif & G. Oguro) 93-99  
 Some considerations in the post-operative course of patients submitted to thoracoplasty. (S. J. MacHale) 99-112  
 The familial aspects of sarcoidosis. (E. R. Bickerstaff) 112-116

## British Journal of Urology

## 21 : September 1949

- Master surgeons in urology. John William Thomson-Walker (1870-1937). (J. Everidge) 190-193  
 The bactericidal properties of some disinfectants in common use. (W. Hayes) 198-208  
 Retrocaval ureter: a case diagnosed pre-operatively and treated successfully by a plastic operation. (J. C. Anderson & W. Hynes) 209-214  
 The treatment of vesical neck obstruction by endoscopic resection. (N. E. Berry & E. P. White) 215-222  
 Gelfoam in prostatectomy: an aid to haemostasis. (C. A. Wells & R. Marcus) 223-228  
 Cystic disease of the right kidney in an infant. (J. H. Carver) 229-231  
 Primary carcinoma of the male urethra. (H. K. Vernon & R. D. Williams) 232-236  
 Uncommon types of congenital renal abnormality: two cases. (W. J. Hanbury) 237-240  
 Observations on familial polycystic disease of the kidney. (J. D. Ferguson) 241-242  
 Management of anuria. (A. Miller) 243-245

## 21 : December 1949

- Classification of epithelial tumours of the bladder. (C. E. Dukes & F. Masina) 273-295  
 The antibiotics in urology. (M. E. Florey) 296-301  
 The antibiotics in urology. (C. A. Wells) 302-319  
 The antibiotics in urology. (R. Marcus) 320-328  
 Testicular tumours: late results of radical surgery. (A. W. Adams) 329-333  
 Function in the hydronephrotic kidney. (A. I. A. Maitland) 334-341  
 Some observations on bladder neck obstruction. (H. D. Winsbury-White) 342-349  
 The investigation of subfertility in the male. (W. S. Tulloch) 350-356  
 Preliminary communication on the intracavitary irradiation of the bladder mucosa by radioactive isotope solution. (D. M. Wallace, R. J. Walton & W. K. Sinclair) 357-364

## British Journal of Venereal Diseases

## 25 : September 1949

- Venereal disease in peace and war, with some reminiscences of the last forty years. (T. E. Osmond) 101-114  
 Is bejel syphilis? (F. Akrawi) 115-123  
 Psychiatric implications of venereal disease: an American survey. (M. Pahmer) 124-132  
 Some aspects of congenital syphilis. (D. Nabarro) 133-146  
 The Ford Robertson and Colquhoun modification of the Meinicke clarification reaction compared with the Harrison-Wyler Wassermann and the standard Kahn reactions: together with a new method of notation. (W. H. McMenemey & W. H. Whitehead) 147-154  
 Keratoderma blennorrhagica following Reiter's disease. Report of a case successfully treated with massive doses of penicillin. (W. Davies) 155-156  
 Complement fixation technique. Estimation of complement doses. (I. N. O. Price) 157-158  
 False positive serological reactions for syphilis in leprosy. (B. Singh) 159-160

## 25 : December 1949

- Recent advances in the study of venereal diseases. (J. E. Moore) 169-178  
 Venereal disease as a cause of infertility and sterility: assessment and treatment. (R. H. Boyd) 179-184  
 Reiter's disease. (A. H. Harkness) 185-201  
 A mechanical pipette. (B. Singh) 202-204  
 A rack for use in precipitation tests. (I. N. O. Price) 205

## British Medical Journal

## 2 : 3/9/49

- Reform in medical education. (W. M. Arnott) 497-502  
 The teaching of physiology. (G. W. Pickering) 502-505  
 The teaching of chemistry. (E. C. Dodds) 505-508  
 On the teaching of biology as a preparation for medicine. (F. A. E. Crew) 508-510  
 The teaching of anatomy to the medical student. (T. P. MacMurray) 510-512  
 On teaching physics to medical students. (D. W. Smithers) 512-515  
 The training of the teacher. (W. R. Niblett) 526-527

## 2 : 10/9/49

- Centenary of Pavlov's birth. (E. D. Adrian) 553-555  
 Myxoedematous madness. (R. Asher) 555-562  
 Optimal methods in the treatment of ophthalmia neonatorum. (A. Sorsby & I. Kane) 562-565  
 Bacteriophage types in penicillin-resistant staphylococcal infection. (M. Barber & J. E. M. Whitehead) 565-569  
 Infection with penicillin-resistant staphylococci in hospital and general practice. (G. B. Forbes) 569-571  
 Homologous serum jaundice. (D. Lehan, C. M. S. Kwantes, M. G. Upward & D. R. Thomson) 572-574  
 Iso-immunization by blood-group factors A and B in man. (P. O. Hubinont) 574-575  
 Diagnosis and treatment of cutaneous anthrax. (J. A. Holgate & R. A. Holman) 575-579  
 Acute pericarditis simulating cardiac infarction. (W. A. Bourne) 579-580

## 2 : 17/9/49

- The results of thyrectomy in myasthenia gravis. (G. Keynes) 611-616  
 Incidence of cross-infections in children's wards. (A. G. Watkins & E. Lewis-Faning) 616-619  
 Effect of tetraethylammonium bromide on gastric secretion and motility. (I. R. MacDonald & A. N. Smith) 620-622  
 Nitrogen mustard therapy, with special reference to Hodgkin's disease. (J. D. N. Nabarro) 622-625  
 Treatment of ringworm of the scalp. (H. Haber, R. T. Brain & J. W. Hadgraft) 626-627  
 Aspirin poisoning. (I. Leveson) 628-630  
 Haematemesis as a surgical problem. (G. Bohn) 630-633  
 Iontophoresis in the treatment of peripheral vascular disease. (H. S. Pemberton & D. C. Watson) 633-634

## 2 : 24/9/49

- The use of experience. (H. Ogilvie) 663-667  
 Serological classification of viridans streptococci from subacute bacterial endocarditis, teeth, and throats. (F. R. Selbie, R. D. Simon & R. H. M. Robinson) 667-672  
 Treatment of early syphilis with penicillin combined with neosarsphenamine and bismuth. (J. W. Bames & D. H. Miller) 672-676  
 Sex hormone upset in Africans. (J. N. P. Davies) 676-679  
 Direct vein graft in rupture of popliteal artery: report of a case. (P. Martin) 680  
 The agglutinin anti-M associated with pregnancy: report on two cases. (C. C. Bowley & I. Dunsford) 681-682  
 The rhesus factor Du: a note on its practical importance. (F. Stratton & P. H. Renton) 682-684  
 Notes on an experimental study of intellectual deterioration. (S. Crown) 684-685  
 Tuberculous meningitis with paraplegia as the dominant feature. (E. Knowles) 686

- Case of oesophageal carcinoma. (I. MacDougall) 686-687  
 Localized fat atrophy after jelly-fish sting. (M. A. R. Gunn) 687

## 2 : 1/10/49

- Fat absorption and some of its problems. (H. S. Raper) 719-724  
 Modern trends in radiology. (J. F. Brailsford) 724-728  
 Value of sphincter-preserving operations in cancer of rectum, with special reference to reconstructive abdomino-perineal excision. (S. O. Aylett) 728-731  
 A new mechanism of vitamin deprivation, with special reference to the sprue syndrome. (A. C. Frazer) 731-733  
 Tuberculosis of the breast. (R. W. Raven) 734-736  
 Solitary cerebral metastases from bronchial carcinomata: their incidence and a case of successful removal. (G. Flavell) 736-737  
 Human infestation with *Tricho-strongylus* in South Persia. (I. S. Stewart) 737-738  
 A case of pulmonary strongyloidiasis. (F. L. Corrigan) 738-739  
 A tidal-air whistle. (F. C. Eve) 739-740  
 A case of twins. (A. P. M. Dring) 740  
 Congenital pyloric stenosis in three successive male babies of the same parents. (J. L. Adlington) 740-741  
 Congenital pyloric stenosis in binocular twins. (E. S. R. Hughes, H. A. D. Small & J. W. F. Macky) 741

## 2 : 8/10/49

- Fat metabolism and the sprue syndrome. (A. C. Frazer) 769-773  
 The treatment of malignant tertian malaria. (G. Covell) 773-777  
 Continuous caudal analgesia in obstetrics, surgery, and therapeutics. (R. A. Hingson) 777-781  
 Some observations on pulmonary tuberculosis in the Nigerian African. (B. S. Jones) 781-784  
 Myoidema. (G. F. Taylor & P. N. Chhuttani) 784-787  
 Lymphadenopathy in brucellosis. (H. Conway) 787-788  
 Clinical trials of succinates and of heparin in rheumatic fever. (A. J. Glazebrook & F. Wrigley) 789-791  
 Subacute poisoning by thallium treated with BAL. (E. S. Mazzei & F. Schaposnik) 791-792  
 Fatal bronchospasmodic crisis complicating miliary tuberculosis of lungs. (T. A. Brand & J. Burkinshaw) 793  
 A cholera centenary. (M. Greenwood) 797

## 2 : 15/10/49

- Malaria, with special reference to certain experimental, clinical, and chemotherapy 825-830  
 (G. I. M. Swyer) 830-835  
 eye. (A. Carleton) 835-837  
 (G. S. Graveson) 838-840  
 ion. (B. C. Thompson) 841-843  
 Aetiology of erythema nodosum in children. (S. A. Doxiades) 844-845  
 Post-operative thrombosis: investigation of a proposed test for its prediction. (G. W. V. Greig) 845-847  
 Incidence of signs usually connected with thyrotoxicosis, with special reference to the lid lag. (W. P. U. Jackson) 847-848  
 Actinomycotic empyema. (H. W. Bowyer) 848-849  
 Unusual case of nutritional anaemia. (M. McLean) 849-850  
 An extrarenal hypernephroma. (P. Forty) 850  
 Refresher course for general practitioners. The acute throat. (T. Anderson) 860-862

## 2 : 22/10/49

- Artificial kidney. (G. Murray, E. Delorme & N. Thomas) 887-891  
 Malaria, with special reference to certain experimental, clinical and chemotherapy investigations. (N. H. Fairley) 891-897  
 The natural history of asthma, a review of 300 cases. (E. O. Williams & G. E. O. Williams) 897-900  
 Antihistamines in bronchial asthma. (H. Herxheimer) 901-905  
 A case of toxoplasmosis. (A. B. Nutt, T. Wright, J. H. Bowie & C. P. Beattie) 905-907  
 Chloramphenicol in typhoid fever: a preliminary report of clinical trial in 6 cases. (J. C. Patel, D. D. Banker & C. J. Modi) 908-909  
 Pneumococcal meningitis of refractory type treated by replacement of C.S.F. with penicillin. (A. A. Reid) 910-911  
 Refresher course for general practitioners. The acute ear. (W. M. Mollison) 923-925  
 Heparin administration by polythene tubing. (W. A. L. MacFadyen) 925-926

## 2 : 29/10/49

- Individuality in medicine. Harveian Oration delivered before the Royal College of Physicians on October 18, 1949. (G. Marshall) 941-944  
 I. P. Pavlov. (J. Konorski) 944-950  
 Penicillin in subacute bacterial endocarditis. (R. V. Christie) 950-951  
 Sudden obesity and psychological trauma. (H. J. Shorvon & J. S. Richardson) 951-956  
 Upper-limb pain due to lesions of the thoracic outlet. The scalenus syndrome, cervical rib, and costoclavicular compression. (L. Rogers) 956-958  
 The comparative merits of sodium and procaine penicillin given infrequently. (E. Griffiths, P. F. Jones, R. A. Shooter & J. A. Heady) 958-961  
 "Neo-epinine" in the dyspnoea of coal-miners. (C. K. Robertson) 961-962  
 Rectal haemorrhage associated with infectious mononucleosis. (P. Eckstein & A. L. P. Peeney) 962-963  
 Dissecting aneurysm of the aorta simulating embolism at the aortic bifurcation. (H. S. Shucksmith & I. Macpherson) 963-964  
 Refresher course for general practitioners. Failed forceps. (F. J. Browne) 975-976

## 2 : 5/11/49

- Liver damage produced by feeding alcohol or sugar and its prevention by choline. (C. H. Best, W. S. Hartroft, C. C. Lucas & J. H. Ridout) 1001-1006  
 The pre-erythrocytic stage of *Plasmodium falciparum*: a preliminary note. (H. E. Shortt, N. H. Fairley, G. Covell, P. G. Shute & P. C. C. Garnham) 1006-1008  
 Rehabilitation and resettlement of the tuberculous. (F. Heaf) 1008-1011  
 Prostatic obstruction. (H. H. Stewart) 1011-1016  
 Multiple myeloma: a note on eight cases. (D. P. Degenhardt & D. Sheehan) 1016-1018

Fatal poisoning of an infant by anti-anaemic pills containing iron, manganese, and copper. (J. H. Prain) 1019-1020  
 Synovial osteochondromatosis: two uncommon examples. (J. F. Curr) 1020-1022  
 A study in visual defects in young children. (P. A. Tyser & T. W. Letchworth) 1022-1023  
 Acute adrenal insufficiency after adrenalectomy for pre-pubertal virilism. (B. V. Jones) 1023-1024  
 Refresher course for general practitioners. The use and abuse of vitamins. (L. S. P. Davidson) 1036-1038  
 A medical view of the Soviet Union. (M. T. Gillies) 1038-1039

## 2 : 12/11/49

Tuberculosis in Europe during and after the second world war. (M. Daniels) 1065-1072  
 Risk of neurological complications in pernicious anaemia treated with folic acid. (M. C. G. Isaacs & J. F. Wilkinson) 1072-1075  
 Aureomycin: a new treatment for syphilis? (R. R. Willcox) 1076-1077  
 Common difficulties in infant feeding. (R. S. Illingsworth) 1077-1081  
 Antihistamines in the treatment of nausea and vomiting of pregnancy. Report on a clinical investigation. (T. Dougray) 1081-1083  
 Anaemia of pregnancy in Glasgow and district. (J. M. Scott & A. D. T. Govan) 1083-1087  
 Acute mastoiditis in children treated with penicillin and sulphadiazine. (A. J. Moffett & G. A. Dalton) 1087-1089  
 Electrocardiographic investigation of 264 cases of hypertension. (P. Bechgaard) 1089-1090  
 Sensitization to denture material as a cause of angular stomatitis. (H. R. Vickers) 1091-1092  
 Analgesic inhaler for trichlorethylene. (H. G. Epstein & R. R. Macintosh) 1092-1094  
 Refresher course for general practitioners. Management of the premature baby. (A. Moncrieff) 1104-1105

## 2 : 19/11/49

Further studies concerning the participation of the adrenal cortex in the pathogenesis of arthritis. (H. Selye) 1129-1135  
 Tuberculosis in Europe during and after the second world war. (M. Daniels) 1135-1140  
 Variations in bacteriology of throat and rectum of infants in two maternity units. (A. M. McFarlan, P. B. Crone & G. H. Tee) 1140-1144  
 Incidence of infections in infants in two maternity units. (J. D. Roscoe) 1144-1146  
 The relation of *Staphylococcus pyogenes* to infantile diarrhoea and vomiting. (G. Martyn) 1146-1148  
 Mortality and survival rates in males with silicosis or silico-tuberculosis. (H. M. Turner & W. J. Martin) 1149-1150  
 Paraffin pneumonia. (M. Gelfand) 1151-1152  
 Successful treatment of two cases of gangrenous intussusception in childhood. (D. J. Conway & R. L. G. Dawson) 1153-1154  
 Refresher course for general practitioners. Fracture of the clavicle. (T. P. McMurray) 1165-1167  
 Surgical travels in Colombia. (R. W. Raven) 1167-1169

## 2 : 26/11/49

Chemotherapy in the treatment of malignant disease. (E. C. Dodds) 1191-1193  
 Chemotherapy in the treatment of malignant disease. (S. Cade) 1193-1196  
 Pruritus vulvae. (T. N. A. Jeffcoate) 1196-1200  
 Relief of post-operative pain and its influence on vital capacity. (H. E. Pooler) 1200-1203  
 Low-salt diet in treatment of hypertension and hypertensive heart disease. (H. O. Bang, P. Bechgaard & A. L. Nielsen) 1203-1206  
 Symptomatic treatment of myotonia atrophica. (L. Bussell) 1206  
 An unusual case of Simmonds's disease. (D. McCracken) 1207-1208  
 Amoebiasis in infancy. (P. C. C. De Silva) 1208-1210  
 Acute phlegmonous caecitis. (S. G. Nardelli) 1210-1211  
 Origins of the Royal Faculty of Physicians and Surgeons of Glasgow. (S. Alstead) 1223-1224  
 Refresher course for general practitioners. Management of acute pneumonias in adults. (J. G. Scadding) 1225-1228

## 2 : 3/12/49

Electron microscopy of bacteria and viruses. (A. S. McFarlane) 1247-1250  
 Clinical tests of a new coumarin substance. A report to the Medical Research Council. (C. C. Burt, H. P. Wright & M. Kuhik) 1250-1254  
 Isolation of salmonellae from dogs, cats, and pigeons. (J. C. Cruickshank & H. W. Smith) 1254-1258  
 Hospital outbreak of enteritis due to duck eggs. (L. P. Garrod & M. B. McIlroy) 1259-1261  
 The Martius bulbo-cavernosus interposition operation. (W. Shaw) 1261-1264  
 Thrombosis of the internal carotid artery. (T. G. I. James) 1264-1267  
 Ogilvie's syndrome of false colonic obstruction. Is it a new clinical entity? (J. A. Macfarlane & S. K. Kay) 1267-1269  
 Kartagener's syndrome. (C. T. Andrews) 1269-1270  
 Death from dermatitis and stomatitis during streptomycin therapy. (R. A. Pallister) 1271-1272  
 Unusual manifestations of malaria. (A. K. Nandi) 1272-1273  
 Refresher course for general practitioners. Chills. (J. T. Ingram) 1284-1286  
 An approach to electron microscopy. (A. W. Haslett) 1286-1289

## 2 : 10/12/49

Can a scientific society be stable? (B. Russell) 1307-1311  
 Visceral actinomycosis. (V. Z. Cope) 1311-1316  
 Ogilvie's syndrome for peptic ulcer: indications and results. (I. M. Orr & H. D. Johnson) 1316-1319  
 The use of procaine penicillin with aluminium monostearate in adults. (E. J. Wayne, J. Colquhoun & J. Burke) 1319-1322  
 Herpes zoster after irradiation. (F. Ellis & B. A. Stoll) 1323-1328  
 Male subfertility. Interim report of 3,182 cases. (H. A. Davidson) 1328-1332

Thumb reconstruction by transfer of big toe. (P. Clarkson & R. Furlong) 1332-1334  
 Refresher course for general practitioners. The management of diabetes mellitus. (W. Oakley) 1345-1347

## 2 : 17/12/49

Crystalline anti-pernicious-anaemia factor. (E. L. Smith) 1367-1369  
 Vitamin B<sub>12</sub> in pernicious anaemia: parenteral administration. (C. C. Unley) 1370-1377  
 Vitamin E in the menopause. (H. C. McLaren) 1378-1382  
 Treatment of Dupuytren's contracture with vitamin E. (G. R. Thomson) 1382-1383  
 Polycythaemia with leucocytroblastosis. (F. G. Marson & M. J. Mayneall) 1384-1386  
 A case of Weil's disease with tests for liver function. (F. E. de W. Cayley) 1386-1387  
 Primary lymphosarcoma of appendix occurring in childhood. (W. H. Galloway & E. J. Owens) 1387-1388  
 Surgical management of the aged: a survey of results of major surgery in 99 patients over 70. (P. Childs & S. A. Mason) 1389-1392  
 Refresher course for general practitioners. Diagnosis and treatment of ketosis and hypoglycaemia. (W. Oakley) 1403-1406

## 2 : 24/12/49

Authors and psychopaths. (W. R. Brain) 1427-1432  
 The fate of the foreskin. A study of circumcision. (D. Gairdner) 1433-1437  
 The use of radiographs in assessing disproportion. (J. C. Moir) 1437-1440  
 Growth of the fetal biparietal diameter during the last four weeks of pregnancy. (S. Josephs & H. Campbell) 1440-1443  
 The short oesophagus: a review of 31 cases. (J. B. Rennie, F. T. Land & S. D. S. Park) 1443-1449  
 Trifluene analgesia in paediatric practice. (J. Thomson, D. A. I. Grewar & J. G. Grounds) 1449-1451  
 Leucotomy and hypertension: a case report. (R. W. Tibbets) 1452-1454  
 Refresher course for general practitioners. The management of acute dyspepsia with special reference to gastric and duodenal ulcer. (F. A. Jones) 1463-1466  
 Men and medicine. (T. M. Taylor) 1466  
 With whales and seals. (H. R. Lillie) 1467-1468

## 2 : 31/12/49

A quantitative approach to the study of transplantable tumours. (J. Craigie) 1485-1491  
 Anticoagulant therapy. (H. W. Fullerton & G. Anastasopoulos) 1492-1495  
 The excretion of chorionic gonadotrophin by pregnant diabetics. (J. A. Loraine) 1496-1499  
 Vitamin A, total carotenoids, and thymol turbidity levels in plasma: test in normal subjects residing in the Midlands during 1947. (D. A. Campbell & E. L. Tonks) 1499-1501  
 Chloramphenicol in treatment of infantile gastro-enteritis: a preliminary report. (K. B. Rogers, S. J. Koegler & J. Gerard) 1501-1504  
 Paratyphoid B fever treated with chloramphenicol. (M. Cartin) 1504-1506  
 Diffraction methods of measuring red cell diameters: their use in clinical haematology. (A. J. Hird) 1506-1509  
 Two successful resections for carcinoma of pancreas. (H. Dodd) 1509-1511  
 Refresher course for general practitioners. Analgesia in childbirth. (C. L. Hewer) 1521-1523

## 1 : 7/1/50

Advances in medicinal therapeutics. (H. D. Dale) 1-7  
 Surgery 1900-1950. (G. Jefferson) 8-12  
 Fifty years of midwifery. (R. W. Johnstone) 12-16  
 Fifty years of medical research and practice. (H. Cohen) 16-21  
 Fifty years of clinical pathology. (L. Whitty) 21-25  
 Prevention and control of infection. (R. Cruickshank) 25-30  
 The development of psychological medicine. (J. Rickman) 30-37  
 Fifty years of tropical medicine. (J. S. K. Boyd) 37-43  
 Fifty years of radiology. (S. C. Shanks) 44-48  
 Fifty years of public health legislation. (A. S. MacNalty) 48-53  
 Fifty years of progress as shown by vital statistics. (P. Stocks) 54-57  
 Medical progress from 1850 to 1900. (C. Singer) 57-60

## 1 : 14/1/50

The bearing of recent work on the virus theory of cancer. (C. H. Andrews) 81-85  
 Age of phtery in the tropics. (R. W. B. Ellis) 85-89  
 The pathology of hypersensitivity reactions in man. (H. Bergstrand) 89-92  
 The structure and functions of the synovial membrane. (D. V. Davies) 92-95  
 Birth weight and subsequent weight. (R. S. Illingsworth) 96-97  
 Comparison and estimate of group and individual methods of treatment. (A. S. Thorley & N. Craske) 97-100  
 Primary torsion of the ovum in children. (A. B. MacLean) 100-101  
 The stomach of the recently deceased. (A. W. Williams) 102-104  
 Diphtheria immunization with P.T.A.P. in adults. (T. M. Vogelsang) 104-105  
 Cortisone and ACTH: the present position in America. (J. W. McNee) 113-115  
 Refresher course for general practitioners. The early diagnosis of bronchial carcinoma. (R. C. Brock) 116-118

## 1 : 21/1/50

Thymectomy in myasthenia gravis. (H. R. Viets) 139-147  
 Proguanil-resistant falciparum malaria in Malaya. (J. F. B. Edeson & J. W. Field) 147-151  
 Hirschsprung's disease in infancy. (E. D. Burnard) 151-156  
 The future of occupational health. (D. Stewart) 156-159  
 Prognosis in disseminated sclerosis. (M. Rheinhold) 160-162  
 Gynaecomastia and testicular aplasia. (D. Ferriman) 162-163  
 Brachial plexus block: report on 350 cases. (S. V. Humphries) 163-164  
 Ankylosing spondylitis treated by osteotomy of the spine. (F. W. Smart & G. K. Rose) 165-166  
 Refresher course for general practitioners. The diagnosis of early phthisis. (J. L. Livingstone) 175-177

1 : 28/1/50

- Production of hypertension and hyalinosis by desoxycortisone. (H. Selye) 203-206
- Progress of gastric surgery in the last half-century. (J. Walton) 206-210
- Acute perforated peptic ulcer: a study of the recent fall in mortality. (F. A. Jones, P. J. Parsons & B. White) 211-215
- Perforated carcinoma of the stomach simulating perforated gastric ulcer. (R. Doll) 215-218
- Psoriasis. (H. W. Barber) 219-223
- Sciatic paralysis in newborn infants. (F. P. Hudson, A. McCandless & A. G. O'Malley) 223-225
- Anaphylactoid purpura in pulmonary tuberculosis. (P. G. Dalglish & B. M. Ansell) 225-227
- Refresher course for general practitioners. Measles. (J. V. Armstrong) 238-240
- Soviet biology and British commentators. (E. Ashby) 241-242

## Clinical Science

8 : September 1949

- Quantitative observations on vascular reactions in human digits in response to local cooling. (H. H. Wolff & E. E. Pochin) 145-154
- The impairment of sensation in burns and its clinical application as a test of the depth of skin loss. (J. P. Bull & J. E. Lennard-Jones) 155-167
- Heparin tolerance in rheumatic fever. (D. G. Abrahams & L. E. Glynn) 171-180
- The role of gastric acidity in the pathogenesis of peptic ulcer. (A. H. James & G. W. Pickering) 181-210

8 : December 1949

- An improved calorimeter for the hand. (A. D. M. Greenfield & H. Scarborough) 211-215
- A comparison of methods for gauging the blood flow through the hand. (K. E. Cooper, K. W. Cross, A. D. M. Greenfield, D. M. Hamilton & H. Scarborough) 217-234
- The mechanism of the reduction of clot retraction by sedormid in the blood of patients who have recovered from sedormid purpura. (J. F. Ackroyd) 235-267
- The cause of thrombocytopenia in sedormid purpura. (J. F. Ackroyd) 269-289
- The mechanism of pleural and ascitic effusions, with a suggested method for the indirect estimation of portal venous pressure. (A. H. James) 291-314

## Dental Record

69 : October 1949

- An investigation of 202 pairs of twins regarding fundamental factors in the aetiology of malocclusion. (A. Lundström) 251-264
- Gold inlays in Black's Class III decay cavities. (J. Campbell) 264-268
- Preliminary study in the treatment of dry sockets. (C. Levy) 270-274
- A visit to the convention of the American Association of Orthodontists. (H. Anderson) 275-278

69 : November 1949

- The ideal form of the human dental arcade, with some prosthetic application. (M. A. MacConaill & E. A. Scher) 285-302
- The term "balanced articulation," its origin, development and present significance in modern odontology. (G. Lindblom) 304-311

69 : December 1949

- The fixation and stability of the teeth in the jaws with relation to their morphology. (R. Selmer-Olsen) 322-334
- Acrylic models for educational and teaching purposes. (W. M. Gibson) 337-341
- Pliers for making Selmer-Olsen tubes. (J. H. Gardiner) 341-342
- The management of the third lower molar in private practice. (L. A. Westwater) 343-349

70 : January 1950

- The ideal form of the human dental arcade, with some prosthetic application. (M. A. MacConaill & E. A. Scher) 1-11
- Congenital absence of permanent molars. (M. E. H. Davis) 23-26
- Treating cases with removable appliances. (J. R. Dimock) 26-29

## Guy's Hospital Reports

98 : 1949

- Sir William Hale-White. (M. Campbell) 1-17
- Congenital pulmonary stenosis with closed ventricular septum. (K. D. Allanby & M. Campbell) 18-53
- Emphysema of the mediastinum and spontaneous pneumothorax following incisions in the lower part of the neck. (P. Reading) 54-68
- James Blundell and blood transfusion in man. (A. J. Drew) 69-87
- Argyria: report of a case. (W. D. Brinton) 88-94
- Primary generalized amyloidosis in a young adult. (G. P. Baker, S. De Navasquez & K. S. Maclean) 95-109
- An unusual congenital heart lesion. A case of functional *cor batriatum trilobulare* complicated by closure of a persistent ductus arteriosus. (M. J. Greenberg) 110-112
- Ulcerative colitis: treatment by psychotherapy. (J. L. K. Maine & D. O'Neill) 113-117
- Palliation of oesophageal obstruction. A historical note. (R. E. Horton) 118-120
- Edward Jenner. (F. N. Doubleday) 121-125

## Journal of Anatomy

83 : October 1949

- Bones, muscles and vitamin C. III. Repair of the effects of total deprivation of vitamin C at the proximal ends of the tibia and fibula in guinea-pigs. (P. D. F. Murray & E. Kodicek) 285-295
- The size relationships subsisting between body length, limbs and jaws in man. R. H. Shepherd, D. A. Sholl & A. Vizoso) 296-302

- The projection of the caudal segments of the spinal cord to the lingula in the spider monkey. (Hsiang-Tung Chang & T. C. Ruch) 303-307
- Two early human embryos. (W. R. M. Morton) 308-314
- Ovarian autografts in monkeys. (A. M. Mandl & S. Zuckerman) 315-324
- Studies on hair growth in the rat. (A. Durward & K. M. Rudall) 325-335
- Internode lengths in the nerves of fishes. (P. K. Thomas & J. Z. Young) 336-350
- Diffusion phenomenon complicating the histochemical reaction for alkaline phosphatase. (B. F. Martin & F. Jacoby) 351-363
- The development of mouse hair *in vitro* with some observations on pigmentation. (M. H. Hardy) 364-384

## Journal of Bone and Joint Surgery

31B : November 1949

- Natural history and treatment of pulp space infection and osteomyelitis of the terminal phalanx. (H. Bolton, P. J. Fowler & R. P. Jepson) 499-504
- Anomalous innervation of the hand muscles. (T. Rowntree) 505-510
- Inter-metacarpal bone graft for thenar paralysis. Technique and end-results. (D. M. Brooks) 511-517
- The results of treatment in Kienböck's disease. (A. Dornan) 518-520
- A case of rupture of flexor tendons, secondary to Kienböck's disease. (J. I. P. James) 521-523
- Inter-carpal dislocations and fracture-dislocations. A review of fifty-nine cases. (T. B. Russell) 524-531
- A case of recurrent subluxation of the carpal scaphoid. (O. J. Vaughan-Jackson) 532-533
- Osteoarthritis of the trapezio-metacarpal joint. (C. Lasserre, D. Pauzat & R. Derennes) 534-536
- Excision of the trapezium for osteoarthritis of the trapezio-metacarpal joint. (W. H. Gervis) 537-539
- Arthrodesis of the trapezio-metacarpal joint for osteoarthritis. (G. M. Müller) 540-542
- A congenital abnormality of the trapezium and first metacarpal bone. (A. F. Rushforth) 543-546
- Variation in extension of the metacarpo-phalangeal and interphalangeal joints of the thumb. (H. Harris & J. Joseph) 547-559
- Léri's pleonostosis, carpal tunnel compression of the median nerves and Morton's metatarsalgia. (R. Watson-Jones) 560-571
- Excision of the carpal scaphoid for ununited fracture. (F. C. Dwyer) 572-577
- Pronation injuries of the forearm, with special reference to the anterior Monteggia fracture. (E. M. Evans) 578-588
- Ralph Cuming and the interscapulo-thoracic amputation in 1808. (J. J. Keevil) 589-595
- Pioneers of osteogeny. Frederick Oldfield Ward. (J. Dobson) 596-599
- From an atlas of general affections of the skeleton. 11. Achondroplasia. Synonyms—chondroostrophia foetalis, micromelia. (H. A. T. Fairbank) 600-607. 12. Cranio-eloide-dysostosis. (H. A. T. Fairbank) 608-617

## Journal of Clinical Pathology

2 : November 1949

- The laboratory diagnosis of lymphogranuloma venereum. (S. P. Bedson, C. F. Barwell, E. J. King & L. W. J. Bishop) 241-249
- The plate virulence test for diphtheria. (S. D. Elek) 250-258
- The laboratory diagnosis of toxoplasmosis. (I. A. B. Cathie & J. A. Dudgeon) 259-265
- Urea clearance tests. (H. F. Smith) 266-272
- The significance of the urea clearance. (D. D. Van Slyke & V. P. Dole) 273-274
- The interrelations of the serum proteins in liver damage, with special reference to the thymol test. (N. H. Martin) 275-279
- Faecal fat values on present British diets. (R. J. Bromfield) 280
- Vibratory movement in the cytoplasm of erythrocytes. (R. J. V. Pulvertaft) 281-283
- Iso-immunization of rare Rh-antigens as a cause of haemolytic disease of the newborn and transfusion reactions. (J. J. van Loghem & M. v. d. Hart) 284-288
- Technical methods. A slide method for demonstrating soluble haemolysin. (J. C. Monckton) 289. The determination of serum iron with ferricyanide. (J. Fitzpatrick & K. W. Howells) 290-291

## Journal of Endocrinology

6 : October 1949

- The response of the ovary of the anoestrous goat to pregnant mares' serum gonadotrophin. (S. J. Folley, A. L. Greenbaum & A. Roy) 121-131
- The histochemical demonstration of ketosteroids in adrenal tissue. (R. J. Boscott & A. M. Mandl) 132-136
- The influence of thiouracil on reproduction and growth in the rat. (S. B. Barker) 137-144
- The relative growth of the mammary gland in normal, gonadectomized and adrenalectomized rats. (A. T. Cowie) 145-157
- Innervation of the rabbit adenohypophysis. (E. Vazquez-Lopez) 158-168
- Mating of spayed-adrenalectomized rats given oestrogen. (S. A. Simpson & P. C. Williams) 169-170
- Some effects of pregnancy and lactation on the liver. (R. M. Campbell & H. W. Kosterlitz) 171-183
- Serum gonadotrophin and ovarian activity in the pregnant mare. (I. W. Rowlands) 184-191
- The neutral steroids of human urine. (S. L. Tompsett) 192-196
- Adrenalectomy in the goat and its effects on the chemical constituents of the blood. (A. T. Cowie & J. Stewart) 197-204
- The effects of castration and stilboestrol treatment of the semen production of the boar. (C. Wallace) 205-217
- Distribution of glycoprotein hormones in the anterior pituitary gland of the rat. (H. R. Catchpole) 218-225
- The reaction of the body to multiple ovarian grafts. (M. M. Breward & S. Zuckerman) 226-234
- Investigations of human thyroid function with the use of small doses of radioactive iodine, and the effect of thyrotrophic hormone on  $I^{131}$  uptake and excretion. (M. Reiss, R. E. Hemphill, B. M. Murphy, J. M. Halkerston & F. E. Badrick) 235-243

6 : January 1950

- Chemical changes in the tissues of the rat after adrenalectomy. (D. F. Cole) 245-250
- The effects of deoxycorticosterone acetate on electrolyte distribution in the tissues of the adrenalectomized rat. (D. F. Cole) 251-255
- The effect of androgen and oestrogen on the testes of immature monkeys. (P. L. Krohn & S. Zuckerman) 256-260
- The effect of steroid hormones on the water content of tissues. (S. Zuckerman, A. Palmer & D. A. Hanson) 261-276
- Some properties of ovarian connective tissue in relation to parenchymatous changes. (H. R. Catchpole, I. Gersh & S. C. Pan) 277-281
- Glycoproteins in the thyroid gland of rats. (I. Gersh) 282-287
- Mucolytic activity of the thyroid gland. (M. D. Levine) 288-292
- The fecundity of the immature rat following induced superovulation. (C. R. Austin) 293-301
- The intravaginal assay of naturally occurring oestrogens. (C. W. Emmens) 302-307
- The effects of growth and sex on the composition of the liver cells of the rat. (R. M. Campbell & H. W. Kosterlitz) 308-318
- The estimation of chorionic gonadotropin in the urine of pregnant women. (J. A. Loraine) With an addendum on errors. (J. H. Gaddum) 319-331
- Urinary oestrogen excretion during labour. (B. E. Clayton & G. F. Marrian) 332-339
- Epidermal mitotic activity in the adult female mouse. (W. S. Bullough) 340-349
- The mitogenic actions of starch and oestrone on the epidermis of the adult mouse. (W. S. Bullough) 350-361

## Journal of the Faculty of Radiologists

1 : October 1949

- Radiological investigation of pancreatic disease. (R. A. K. Harper) 75-86
- Direct angiography : experiences with 10 exposures per second. (J. Lind, C. Wegelius, G. Fredzell & E. Wasser) 87-97
- The radiotherapeutic technique of palliation in late cancer of the breast. (J. R. Nuttall) 98-102
- The treatment of advanced breast cancer. (A. J. D. Smith) 103-106
- Palliative treatment for advanced breast cancer. (G. W. Blomfield) 107-111
- An experimental study of an iodine emulsion for hepato-lymphography. (M. E. Grossmann & G. H. Cooray) 112-120
- Orbital emphysema following fracture of the nasal sinuses. (R. S. Murray) 121-130
- Severe tracheobronchial lesions in cases of bronchial carcinoma treated by X rays. (R. C. Nairn) 131-135
- Sarcoma of the small intestine. (R. Astley) 136-139
- Radiometry of an inclined plane. (P. Cave) 140-141

1 : January 1950

- A brief outline of the pathology of tumours of the kidney. (R. A. Willis) 145-146
- Tumours of the kidney. (A. S. Johnstone) 147-156
- Renal tumours in childhood. (T. T. Higgins) 157-164
- Tumours of the kidney. (R. O. Ward) 165-171
- Results of the treatment of hypernephroma. (M. Snelling) 172-175
- Pulmonary oedema and the "batwing" shadow. (C. J. Hodson) 176-186
- Methods of measuring results in the treatment of cancer. (P. Stocks) 187-197
- Coarctation of the aorta. (J. H. Smitham) 198-221

## Journal of General Microbiology

3 : September 1949

- Obituary notice. Marjory Stephenson, 1885-1948. (S. R. Elden & N. W. Pirie) 329-339
- Flagellation of certain species of *Pseudomonas* as seen with the electron microscope. (J. W. Bartholomew) 340-346
- The biological assay of penicillin by a modified plate method. (K. A. Brownlee, P. K. Loraine & J. Stephens) 347-352
- The relationship of the aluminium phosphate precipitation of organisms of *Haemophilus pertussis* strains to their other biological properties. (J. Ungar & P. W. Muggleton) 353-360
- Differentiation of the vegetative and sporogenous phases of the actinomycetes. 4. The partially acid-fast proactinomycetes. (D. Erikson) 361-368
- The assimilation of amino-acids by bacteria. 8. Trace metals in glutamic acid assimilation and their inactivation by 8-hydroxyquinoline. (E. F. Gale). With a note on relative dissociation constants of some metal-oxine complexes. (P. D. Mitchell) 369-386
- The relationship of certain branched bacterial genera. (K. A. Bisset & F. W. Moore) 387-391
- The toxicity of small concentrations of cystine to acid-producing bacteria. (J. G. Heathcote) 392-394
- The synthesis of polysaccharides by bacteria isolated from soil. (W. G. C. Forsyth & D. M. Webley) 395-399
- Antibiotics produced by *Bacillus licheniformis*. 1. A practical chemically-defined medium for production of licheniformin. (F. C. Belton, G. M. Hills & J. F. Powell) 400-409
- The influence of magnesium on cell division. 2. The effect of magnesium on the growth and cell division of various bacterial species in complex media. (M. Webb) 410-417
- The influence of magnesium on cell division. 3. The effect of magnesium on the growth of bacteria in simple chemically defined media. (M. Webb) 418-424
- Bacillus polymyxa* and its bacteriophages. (A. E. Francis & J. E. Rippon) 425-433
- Origin, development and significance of L-forms in bacterial cultures. (E. Klieneberger-Nobel) 434-443
- International Bacteriological Code of Nomenclature. (Edited by R. E. Buchanan, R. St. John-Brooks & R. S. Breed) 444-462

4 : January 1950

- The sporulation of *Clostridium tetani*. (K. A. Bisset) 1-3
- An investigation of pleuropneumonia-like organisms isolated from the bovine genital tract. (D. G. ff. Edward) 4-15
- The influence of the bacterial environment on the excystment of amoebae from soil. (L. M. Crump) 16-21

- The relation of toxicity and enzyme activity in the lecithinases of *Clostridium bifermentans* and *Clostridium welchii*. (E. M. Miles & A. A. Miles) 22-35
- A note on the globular forms of *Vibrio cholerae*. (P. B. White) 36-37
- Chemical factors in the germination of spore-bearing aerobes : observations on the influence of species, strain and conditions of growth. (G. M. Hills) 38-47
- The non-toxicity of *Bacillus anthracis* cell material. (H. K. King & J. H. Stein) 48-52
- Interpreting relationships between the concentrations of plant viruses and numbers of local lesions. (A. Kleczkowski) 53-69
- The assay of the antibiotic nisin. (A. Hirsch) 70-83
- Some aspects of cell division in *Saccharomyces cerevisiae*. (A. A. Barton) 84-86
- The reducing sugars liberated during the bacterial synthesis of polysaccharides from sucrose. (W. G. C. Forsyth & D. M. Webley) 87-91
- Classification of the streptococci of subacute bacterial endocarditis. (J. S. Porterfield) 92-101
- The effect of the gas-phase on differential inhibition of intestinal bacilli. (J. Brodie & W. Shepherd) 102-105

## Journal of Hygiene

47 : June 1949

- Qualitative differences among toxins and toxoids. (M. Barr & A. T. Glennly) 107-114
- The occurrence of natural antibodies in rabbit sera in relation to the paracolon group of organisms. (H. Schwabacher) 115-118
- An experimental study of haemolytic disease of the newborn due to isoimmunization of pregnancy. I. An attempt to produce the syndrome in the rabbit. (D. H. Heard, I. T. Hinde & L. S. Mynors) 119-131
- The conglutination phenomenon. V. Further experiments on the importance of the choice of complement when examining antisera for the presence of complement-fixing or complement-absorbing antibodies. (A. M. Bloomfield, R. R. A. Coombs & N. H. Hole) 132-141
- An antibiotic from *Pseifferella whittmori*. (J. E. Jameson) 142-145
- Inhibition of bacterial growth by pure ozone in the presence of nutrients. (M. Ingram & R. B. Haines) 146-158
- The pathogenicity for mice of group B streptococci of bovine origin. (I. H. Pattison) 159-165
- An epidemic of infantile gastro-enteritis in Queensland caused by *Salmonella botis-morbificans* (Basenau). (I. M. Mackerras & M. J. Mackerras) 166-181
- The nuclear cycle in bacteria. (K. A. Bisset) 182-187
- The standard error of an estimate of expectation of life, with special reference to expectation of tumourless life in experiments with mice. (J. O. Irwin) 188-189
- The housing of laboratory animals. (J. I. M. Jones & E. C. Wood) 190-196
- Record keeping for laboratory animals. (N. T. Gridgeman) 197-201
- Feeding and breeding of laboratory animals. IX. A complete cubed diet for mice and rats. (H. M. Bruce & A. S. Parkes) 202-203
- Feeding and breeding of laboratory animals. X. A compound diet for monkeys. (D. J. Short & A. S. Parkes) 209-212
- The source of infection in pemphigus neonatorum. (M. T. Parker & J. Kennedy) 213-219

47 : September 1949

- The association of certain types ( $\alpha$  and  $\beta$ ) of *Bact. coli* with infantile gastro-enteritis. (J. Smith) 221-226
- A new antigenic relationship among faecal bacilli due to a common  $\beta$  antigen. (R. Mushin) 227-235
- A bacteriological study of dried whale meat with particular reference to the presence of clostridia. (R. H. M. Robinson, A. M. Pugh & F. R. Selbie) 236-243
- The plague of the Philistines. (J. F. D. Shrewsbury) 244-252
- A study of herpes zoster particularly in its relationship to chickenpox. (H. E. Sellar) 253-262
- An evaluation of Richardson's verification test in the sero-diagnosis of syphilis. (G. F. Roberts & J. Swale) 263-270
- Quaternary ammonium compounds : a new technique for the study of their bactericidal action and the results obtained with cetavlon (cetyltrimethylammonium bromide). (G. E. Davies) 271-277
- Glycine and formic hydrogenlyase. (J. Gordon & L. H. Stickland) 278-280
- Post-partum breeding in the guinea-pig. (I. W. Rowlands) 281-287
- The effect of radiation from the surroundings on subjective impressions of freshness. (A. F. Munro & F. A. Chrenko) 288-296
- The relative viability of human spermatozoa. (A. C. Crooke & A. M. Mandl) 297-302
- Effect of treatment at the sewage works on the numbers and types of bacteria in sewage. (L. A. Allen, E. Brooks & I. L. Williams) 303-319
- Destruction of bacteria in sewage and other liquids by chlorine and by cyanogen chloride. (L. A. Allen & E. Brooks) 320-336

## Journal of Laryngology and Otology

63 : September 1949

- A second interim report on the result of over five hundred cases of the fenestration operation. Factors attributable to success and failure, and a description of a modification in the author's fenestra. (E. G. Pásse) 495-500
- Some manifestations of nasal allergy. A survey of 150 cases in the Middle East. (P. F. King) 501-510
- Vertigo after radical mastoidectomy. (W. McKenzie) 511-519
- Aural vertigo (Ménière's syndrome) : an audiographic survey. (N. Asherson) 520-530
- A case of supposed Boeck's sarcoidosis of the larynx. (D. A. Barley) 531-533

63 : October 1949

- Residual capacity to hear of pupils in schools for the deaf. (A. I. Goodman) 551-579
- Remarks on a theory of the evolution of the tetrapod middle ear. (F. R. Parrington) 580-595
- Mid-line congenital malformations of the nose. (A. S. Handousa Bey) 596-599
- Pharyngo-oesophageal diverticulum. (S. Horowitz) 600-604
- Two cases of lateral sinus thrombosis. (E. H. Hadfield & R. T. Hinde) 605-609
- Individual inserts for hearing aids. (E. A. Dennison, A. C. Deverell, T. S. Littler & E. Whemall) 610-613

## 63 : November 1949

- Operative treatment of chronic suppurative otitis media. (W. I. Daggett) 635-646  
 The treatment of recurrent otitic barotrauma by irradiation (with special reference to lymphoid tissue in the sub-mucosa of the eustachian tube). (E. D. D. Dickson & J. E. G. McGibbon) 647-671  
 Idiopathic haemotympanum. (D. Ranger) 672-681  
 Cholesteatoma causing cerebellar abscess. (T. J. Wilmot) 682-684

## 63 : December 1949

- Extensions of the tympanic cavity. (V. Lambert) 711-733  
 Proboscis lateralis: a rare malformation of the nose—its genesis and treatment. (J. J. Biber) 734-741  
 The Medresco in the service of a deafness clinic. (E. Whettnall) 742-755  
 The endomesial spine and fissure (an anatomical note). (A. Tumarkin) 756-758  
 Laryngeal polypoid growths following endotracheal anaesthesia. (Ali El-Mofti) 759-761

## 64 : January 1950

- Tonsillar function: review of the evidence. (A. J. Wright) 1-11  
 Orogenous thrombophlebitis of the lateral sinus and jugular bulb. (A. B. Smith) 12-16  
 A case of herpes zoster confined to the tenth cranial nerve. (G. H. Bateman & S. R. Mawson) 17-18  
 A case of massive cholesteatoma in childhood. (D. A. Badey) 19-20  
 Bilateral rhinolith of endogenous origin. (A. S. Walker) 21-22

## Journal of Mental Science

## 95 : October 1949

- The role of the mental hospital in the National Health Service. (J. I. Russell) 785-794  
 Some reflections on the nature of affective disorders, arising from the results of prefrontal leucotomy. (M. Partridge) 795-825  
 Investigation into intellectual changes following prefrontal leucotomy. (R. K. Freudenberg & J. P. S. Robertson) 826-841  
 Delinquent types of mentally defective persons. (K. O. Milner) 842-859  
 Educational types of mentally defective children. (L. T. Hilliard) 860-866  
 Impressions of Scandinavian psychiatry. (A. Harris) 867-873  
 Dynamic factors in aphasia. (R. Klein) 874-879  
 Neurosis in the women's auxiliary services. (L. Rees) 880-896  
 Observations on foreign-body swallowing in prisons. (J. J. Landers) 897-900  
 School problems in children of average or superior intelligence: a preliminary report. (A.-L. Ansell) 901-909  
 The treatment of mental defectives with thiamine. (G. de M. Rudolf) 910-919  
 The treatment of depression with desoxyephedrine (methedrine). (G. de M. Rudolf) 920-929  
 The action of glutamic acid in hypoglycaemic coma. (H. Weil-Malherbe) 930-944  
 A comparative study of the a-b ridge count on the palms of mental defectives and the general population. (T. C. Fang) 945-948  
 Physiological instability in children. (G. D. Morgan) 949-959  
 Differential diagnosis of some emotional disorders of adolescence (with special reference to early schizophrenia). (H. Edelson) 960-967  
 The depersonalization syndrome: report of a case. (S. Bockner) 968-971  
 Slowing of the alpha-rhythm of the electro-encephalogram and its association with mental deterioration and epilepsy. (A. Stoller) 972-984

## Journal of Neurology, Neurosurgery and Psychiatry

## 12 : November 1949

- The recording of nerve action potentials through skin in man. (G. D. Dawson & J. W. Scott) 259-267  
 "Insertion activity" in electromyography, with notes on denervated muscle response to constant current. (E. Kugelberg & I. Petersén) 268-273  
 An experimental investigation of the connexions of the olfactory tracts in the monkey. (M. Meyer & A. C. Allison) 274-286  
 Degeneration of the granular layer of the cerebellum. (A. D. Leigh & A. Meyer) 287-296  
 Intramedullary trigeminal tractotomy and its place in the treatment of facial pain. (M. A. Falconer) 297-311  
 Cerebral angiography: tolerance for contrast media of diodrast type. (O. Olsson) 312-316  
 Cerebral tumour causing hydrocephalus with filling defect of the temporal horn. (C. A. Gleadhill) 317-321  
 Ruptured congenital aneurysm of anterior cerebral artery: report of a case with successful surgical removal. (N. Whalley) 322-324  
 Clinical and electro-encephalographic studies of prisoners charged with murder. (D. Stafford-Clark & F. H. Taylor) 325-330

## Journal of Obstetrics and Gynaecology of the British Empire

## 56 : October 1949

- Rh immunization in pregnancy. (J. Murray & M. Taylor) 741-754  
 Stromatous endometriosis: a report of five cases. (W. W. Park) 755-758  
 The nature of stromatous endometriosis. (W. W. Park) 759-776  
 Convulsive seizures, questionably eclamptic, diagnosed solely by placental examination (case report). (S. R. Poliakoff & R. A. Bartholomew) 777-778  
 Bipartite placenta with a report of a case. (W. H. Carlisle) 779-784  
 Primary uterine inertia. (D. J. MacRae) 785-798  
 Repair of the placental site in the rabbit. (M. M. Bull) 799-818  
 Report on a series of 129 cases of cancer of the corpus uteri. (G. Dearnley) 819-832  
 Oxytocic drugs in the third stage of labour. (D. A. F. Shaw) 833-837  
 The treatment of contraction ring dystocia. (W. G. Mills) 838-846  
 An essay on the physiology of the third stage of labour. (J. R. C. Burton-Brown) 847-855  
 On the factors determining the size of the newborn. (H. H. Knaus) 856-859  
 A case of puerperal septicaemia due to *Pseudomonas pyocyanea* with a short review of the literature. (H. F. Hills) 860-867  
 Myasthenia gravis complicating pregnancy. (A. Gunn & B. W. Sanderson) 868-871

- An early case of caesarean section in England. (R. B. Pugh) 872-874  
 A case of neuro-epithelioma of the rectovaginal septum. (B. Solomons & G. Dockery) 875-876

## 56 : December 1949

- The displacement of the bladder and urethra during labour. (P. Malpas, T. N. A. Jeffcoat & U. M. Lister) 949-960  
 An anaesthetist's contribution to the resuscitation of the newborn. (H. Roberts) 961-970  
 Total hysterectomy and carcinoma of the cervical stump. (G. C. Donnelly & W. A. G. Bauld) 971-975  
 Spontaneous subperitoneal haemorrhage complicating pregnancy. (H. Roberts) 976-982  
 Cervical dystocia. (H. R. Arthur) 983-993  
 The urinary excretion of amino-acids in normal and abnormal pregnancies. (J. A. M. Smith) 994-1003  
 The origin of amniotic fluid and the bearing on this problem of foetal urethral atresia. (R. E. Shaw & H. J. Marriott) 1004-1009  
 Dissecting aneurysms and "rupture" of the aorta in association with pregnancy. (J. W. Joule) 1010-1013  
 Pregnancy test with the male toad (*Bufo viridis*). (F. G. Sulman) 1014-1017  
 Uterus pseudo-didelphus with simultaneous pregnancies. (L. Colaco) 1018-1023  
 Rupture of the transverse uterine scar after lower segment caesarean section. (R. F. Lawrence) 1024-1027  
 Oxygen therapy for the newborn. (T. J. C. MacDonald) 1028-1029  
 Pregnancy in a case of vagina duplex with the septum in a coronal vaginal plane. (S. Malkin & I. W. Monie) 1030-1032  
 Increased gonadotrophin production in a case of detachment of placenta due to placental haemangioma. (F. G. Sulman & E. Sulman) 1033-1034  
 Acute salpingitis during pregnancy. (G. G. Lennon) 1035-1037  
 Cavernous haemangioma of the perineum. (N. Alders) 1038-1040  
 Pregnancy following pelvic irradiation. (A. M. Giles) 1041-1043  
 Mobile resuscitation trolley. (J. B. Joyce) 1044  
 Cornual pregnancy. (B. Solomons) 1045  
 The treatment of postabortal peritonitis by surgery. (M. Schneider) 1046-1050  
 Placental extracts. (J. A. Loraine) 1051-1071

## Journal of Pathology and Bacteriology

## 61 : April 1949

- A case of diffuse plasmacytosis with deposition of protein crystals in the kidneys. (H. Siki) 149-163  
 Multiple plasma-cell myeloma with crystalline deposits in the tumour cells and in the kidneys. (V. Neumann) 165-169  
 The effect of vitamin C on mucopolysaccharide production in wound healing. (J. R. Penney & B. M. Balfour) 171-178  
 Sites of antibody production. (C. L. Oakley, G. H. Warrack & I. Batty) 179-194  
 The cytochemical demonstration of gonadotropic hormone in the human anterior hypophysis. (A. G. E. Pearce) 195-202  
 On the mode of formation of Lamb's excrescences and their relation to chronic thickening of the mitral valve. (F. B. Magarey) 203-208  
 A case of kala-azar with cirrhosis of the liver and jaundice. (C. S. Chu Wu, I. T. Chu & T. T. Wu) 209-215  
 An experimental study of mucocoele of the appendix and pseudomyxoma peritonici. (Kwok-Kew Cbeng) 217-225  
 A case of intradural spinal lipoma. (D. H. Collins & W. R. Henderson) 227-231  
 Reticulosarcoma of the thyroid gland. (H. S. Kellert & T. W. Sutherland) 233-244  
 The presence and significance of alkaline phosphatase in the cytoplasm of mast cells. (J. F. Riley & J. M. Drennan) 245-251  
 Changes in the meningeal vessels in acute and chronic (streptomycin-treated) tuberculous meningitis. (I. Doniach) 253-260  
 A case of the Arnold-Chiari malformation of the hind brain. (R. Rodda) 261-265  
 Adrenal cortical carcinoma with metastases in an ovariectomised Strong A mouse. (J. Flaks) 266-269  
 The staining of tubercle bacilli with Sudan black B. (H. L. Sheehan & F. Whitwell) 269-271  
 Rapid recurrence of a giant-cell synovium of tendon sheath. (C. J. E. Wright) 271-274  
 The presence of oleic acid-requiring diptheroids on human skin. (M. R. Pollock, S. D. Wainwright & E. E. D. Manson) 274-276

## 61 : July 1949

- Hepatic changes in young pigs reared in a cold and damp environment. (J. M. Naftalin & J. W. Howie) 319-328  
 The effect of penicillin on the tubercle bacillus: tubercle penicillinase. (C. N. Iland & S. Baines) 329-335  
 The immunisation of mice against group-B streptococci by the intraperitoneal inoculation of living cultures combined with penicillin. (I. H. Pattison) 337-342  
 A screening plate for the rapid identification of faecal organisms. (R. Knox) 343-351  
 Bacteriological examination of faeces. (G. T. Cook & R. Knox) 353-358  
 Craniopharyngioma or para-pituitary adamantinoma (Erdheim's tumour). (W. Walker) 359-366  
 Nephroblastoma occurring in adult life. (H. A. Sissons) 367-373  
 Experimental pulmonary oedema of nervous origin. (G. R. Cameron & S. N. De) 375-387  
 The identification of *Clostridium oedematiens* and an experimental investigation of its role in the pathogenesis of infectious necrotic hepatitis ("black disease") of sheep. (S. Jamieson) 389-402  
 Histological observations on dermatomyositis. (W. Pagel, A. L. Woolf & R. Asher) 403-411  
 Histological observations on parodontal disease in the golden hamster (*Cricetus auratus*): calculus, food particles and other foreign bodies as aetiological factors. (J. D. King) 413-425  
 Local blood-flow changes in experimental burns. (S. Sevvitt) 427-442  
 The staining of erythrocytes in tissue sections. A new method and observations on some of the modified Mallory connective tissue stains. (A. C. Lendrum) 443-448  
 Acid fixation (1) for the prevention of artefacts and (2) for decalcification of bone. (J. H. Bayley) 448-449

Persistent venous valves of the heart. (R. A. B. Drury) 449-451  
Glycogen in the collecting tubules of new-born animals. (I. T. Hinde) 451-453  
Some tumours found in whales. (R. E. Rewell & R. A. Willis) 454-456  
Antigenic modification of human red cells by periodate. (F. S. Stewart) 456-458  
Aneurysm of the ductus arteriosus. (J. L. Pinniger) 458-460  
An unusual case of urinary tract and cardiac abnormalities. (R. R. Wilson & W. J. Matheson) 461-464

## Journal of Pharmacy and Pharmacology

1 : September 1949

Analgesics: some developments. (A. D. MacDonald) 569-575  
The antidotal activity of some dithiols and acetyldithiols in mice poisoned with oxophenarsine. (M. Weatherall) 576-592  
The partition chromatography of alkaloids. Part II. The alkaloids of Australian *Datura ferax* and of Indian henbane. (W. C. Evans & M. W. Partridge) 593-595  
The assay of mercuric salicylate. (M. Dombrow) 599-602  
The properties and reactions of decamethonium iodide and hexamethonium bromide. (I. E. Balaban, M. B. Levy & E. E. Wilde) 603-606  
The evaluation of the bactericidal activity of ethylene glycol and some of its monoalkyl ethers against *Bacterium coli*. Part VII. (H. Berry & I. Michaels) 607-619

1 : October 1949

British Pharmaceutical Conference, Blackpool, 1949: Chairman's address: Pharmaceutical research. (N. Evers) 641-648  
The isolation and identification of beetle fragments from powdered vegetable drugs. (C. Melville) 649-660  
Indian henbane. Part I. (J. L. Forsdike & B. Johnson) 661-672  
The biological assay of vegetable purgatives. Part I. Senna leaf and their preparations. (T. C. Lou) 673-682  
The active constituents of the vegetable purgatives containing anthracene derivatives. Part I. Glycosides and aglycones. (J. W. Fairbairn) 683-694  
Notes on microbiological assays using *Lactobacillus lactis* Dornier. (G. E. Shaw) 695-700  
The growth activity for *Lactobacillus lactis* Dornier of commercial liver extracts. (G. E. Shaw) 701-704  
The vitamin B<sub>12</sub> concentration in liver extracts and a note on the relationship between clinical response and B<sub>12</sub> dosage. (W. F. J. Cuthbertson, J. F. Lloyd, W. B. Emery & K. A. Lees) 705-713  
The variations in colour of liquid extract of liquorice B.P. (J. H. Oakley & R. E. Stuckey) 714-720

1 : November 1949

The International Standard for vitamin D. (K. H. Coward) 737-746  
British Pharmaceutical Conference, Blackpool 1949.  
Penicillin formulation. (J. C. Floyd) 747-756  
The effect of the sulpha drugs on the growth of *Staphylococcus aureus*. (J. C. Floyd, J. Ghamrawi & F. Said) 757-761  
Wool alcohols, Part I. Observations on changes in physical and chemical properties in wool alcohols as a result of oxidation. (G. S. Muirhead, K. H. Oberweger, D. E. Seymour & D. Simmonite) 762-776  
The occurrence of methyl compounds in galenicals. (H. E. Brookes & H. K. Johnson) 777-783  
*Para*-aminosalicylic acid, Part III. Some further studies on the *in vitro* tuberculostatic behaviour of *para*-aminosalicylic acid and related compounds. (D. J. Drain, C. L. Goodacre & D. E. Seymour) 784-787  
*Para*-aminosalicylic acid, Part IV. Attempts to induce resistance to *para*-aminosalicylic acid in strains of *Mycobacterium tuberculosis*. (C. L. Goodacre & D. E. Seymour) 788-789  
Some aspects of the pharmacology of *para*-aminosalicylic acid. (E. M. Davin) 790-801  
The separation and identification of ergot alkaloids by paper partition chromatography. (G. E. Foster, J. Macdonald & T. S. G. Jones) 802-812  
The determination of benzene hexachloride (hexachlorocyclohexane) in pharmaceutical preparations. (W. H. C. Shaw) 813-817  
An examination of pyrogen from various sources. (D. W. Wylie & J. P. Todd) 818-835

1 : December 1949

The cardioactive glycosides. (A. Stoll) 849-868  
British Pharmaceutical Conference, 1949:  
Sodium and calcium glycerophosphates. A survey. (J. S. Toal & J. I. Phillips) 869-877  
Bacterial survival in systems of low moisture content. Part I. Enumeration and distribution of organisms in spray-dried powders. (K. Bullock, W. G. Keepe & E. A. Rawlins) 878-902  
Protein in malted preparations. (F. Wokes & C. Klatzkin) 903-914  
Fluorimetric and microbiological assays of riboflavin in malted preparations. (C. Klatzkin, F. W. Norris & F. Wokes) 915-930  
Report of a symposium on the storage of drugs and medicines. 931-949  
The chemistry of anti-pernicious anaemia factors. Part II. The "ninhydrin-reacting" hydrolytic fragment of vitamin B<sub>12</sub>. (B. Ellis, V. Petrow & G. F. Snook) 950-956  
The chemistry of anti-pernicious anaemia factors. Part III. 5:6-Disubstituted benzimidazoles as products of acid hydrolysis of vitamin B<sub>12</sub>. (G. R. Beaven, E. R. Holiday, E. A. Johnson, B. Ellis, P. Mamalis, V. Petrow & B. Sturgeon) 957-970  
Synthesis of the benzene analogue of vitamin A. (W. H. Linnell & C. C. Shen) 971-986

2 : January 1950

Les anti-épileptiques. (R. Hazard & J. Cheymol) 1-9  
The identification of the synthetic stilbene oestrogens. (J. W. G. Smith & G. E. Turfitt) 10-12  
A note on Rupe's rearrangement. (W. H. Linnell & C. C. Shen) 13-16  
The colchicine content and toxicity of colchicum seeds and corns collected at different heights. (V. M. Venturi) 17-19  
Antibacterial colloidal electrolytes: the potentiation of the activities of mercuric, phenylmercuric- and silver ions by a colloidal sulphonic anion. (A. A. Goldberg, M. Shapiro & E. Wilder) 20-26

The evaluation of the bactericidal activity of ethylene glycol and some of its monoalkyl ethers against *Bacterium coli*. Part VIII. (H. Berry & I. Michaels) 27-33  
A volumetric determination of barbituric acid derivatives. (E. Pedley) 39-44

## Journal of Physiology

109 : September 1949

Pressor responses to electrical stimulation of the carotid sinus nerve in cats. (E. Neil, C. R. M. Redwood & A. Schweitzer) 259-271  
The role of carbon dioxide in oxygen poisoning. (H. J. Taylor) 272-280  
Blood-pressure responses to electrical stimulation of the carotid sinus nerve in dogs and rabbits. (E. Neil, C. R. M. Redwood & A. Schweitzer) 281-287  
The nature of the action of renin and hypertensin on renal function in the rabbit. (N. C. Hughes-Jones, G. W. Pickering, P. H. Sanderson, H. Scarborough & J. Vandenbrouke) 288-307  
Graded responses of the isolated ventricle of the toad following release of acetylcholine by direct stimulation of varying frequency. (I. Spadolini) 309-313  
The site of excitation in the nerve trunk of the frog. (W. A. H. Rushton) 314-326  
Space distribution of excitability in the frog's sciatic nerve stimulated by slot electrodes. (C. Rashbass & W. A. H. Rushton) 327-342  
Space distribution of excitability in the frog's sciatic nerve stimulated by polar electrodes. (C. Rashbass & W. A. H. Rushton) 343-353  
The relationship between the slot excitability and the excitability due to a single pole. (C. Rashbass) 354-357  
Instability of response to stimulation of the sensorimotor cortex of man. (W. Penfield & K. Welch) 358-365  
The effects of cooling and of various means of warming on the skin and body temperature of men. (E. M. Glaser) 366-379  
The mode of reaction of interstitial connective tissue with water. (T. D. Day) 380-391  
Effects of electrical stimulation of the aortic nerve on blood pressure and respiration in cats and rabbits under chloralose and nembutal anaesthesia. (E. Neil, C. R. M. Redwood & A. Schweitzer) 392-401  
The blood flow through the human calf during rhythmic exercise. (H. Barcroft & A. C. Dornhorst) 402-411  
The action of D-tubocurarine chloride on foetal neuromuscular transmission and the placental transfer of this drug in the rabbit. (A. J. Buller & I. M. Young) 412-420  
The effects of cooling and warming on the vital capacity, forearm and hand volume, and skin temperature of man. (E. M. Glaser) 421-429  
The influence of variations in the light history of the eye upon the course of its dark adaptation. (L. C. Thomson) 430-438  
Vascular reactions in the human intestine. (J. Grayson) 439-447  
The release of histamine by D-tubocurarine from the isolated diaphragm of the rat. (M. Rocha e Silva & H. O. Schild) 448-455  
The respiratory rate and ventilation in the newborn baby. (K. W. Cross) 459-474  
The effect of cocaine on the acetylcholine output of the intestinal wall. (W. Feldberg & R. C. Y. Lin) 475-487  
The rickets-producing and anti-calcifying action of phytate. (E. Mellanby) 488-533

110 : December 1949

The mechanics of the semicircular canal. (A. A. J. van Egmond, J. J. Groen & L. B. W. Jongkees) 1-17  
Effect of dosage on the rate of disappearance of ethanol from the blood of dogs. (W. Cutting, H. Newman & J. Yee) 18-25  
The mechanical activity of single motor units in reflex contractions of skeletal muscle. (G. Gordon & A. H. S. Holbourn) 26-35  
A preparation of surviving rat small intestine for the study of absorption. (R. B. Fisher & D. S. Parsons) 36-46  
Factors determining the time course of rigor mortis. (E. C. Bate-Smith & J. R. Bendall) 47-65  
The decrease in frequency of contraction of the jejunum after transplantation to the ileum. (D. M. Douglas) 66-75  
Variability of the vital capacity of the normal human subject. (J. N. Mills) 76-82  
The influence of abdominal distension upon the vital capacity. (J. N. Mills) 83-86  
Action of potassium ions on brain metabolism. (K. C. Dixon) 87-97  
Sodium thiosulphate excretion in the cat. (M. G. Eggleston & Y. A. Habib) 98-109  
The relation of structure to the spread of excitation in the frog's sciatic trunk. (C. Rashbass & W. A. H. Rushton) 110-135  
Surface-active substances and the liberation of enzymes from rabbit polymorphonuclear leucocytes. (R. J. Rossiter) 136-144  
The nicotinic action of substances supposed to be purely smooth-muscle stimulating. (A) Effects of  $\alpha$ - $\beta$ -ethyl- $\gamma$ -trimethylammonium-propanediol (2268 F) upon skeletal muscle and ganglion cells. (N. Ambache) 145-163  
The nicotinic action of substances supposed to be purely smooth-muscle stimulating. (B) Effect of BaCl<sub>2</sub> and pilocarpine on the superior cervical ganglion. (N. Ambache) 164-172  
The circulation time in the cat, studied by a conductivity method. (J. A. B. Gray & W. D. M. Paton) 173-193  
On the actions of noradrenaline, adrenaline and isopropyl noradrenaline on the arterial blood pressure, heart rate and muscle blood flow in man. (H. Barcroft & H. Konzett) 194-204  
Motion picture observations on osteoclasts *in vitro*. (N. M. Hancox) 205-206  
The influence upon the vital capacity procedures calculated to alter the volume of blood in the lungs. (J. N. Mills) 207-216  
The rate of discharge of the extraocular motoneurons. (G. Reid) 217-225  
A study of the vibrations of the tympanic membrane under direct vision, with a new explanation of their physical characteristics. (R. Gucke & J. A. Keen) 226-236  
A quantitative method for the study of the reactions of the isolated cat's iris. (J. P. Quilliam) 237-247

110 : December 1949

The relation between force and velocity in human muscle. (D. R. Wilkie) 249-280  
Glucose absorption from surviving rat small intestine. (R. B. Fisher & D. S. Parsons) 281-293

- The effect of some sympathomimetic amines on the ascorbic acid content of rats' adrenal glands. (P. A. Nasmith) 294-300  
 Cation control in human erythrocytes. (F. Flynn & M. Maizels) 301-318  
 The influence of calcium, potassium and magnesium ions in cerebrospinal fluid on vasomotor system. (I. Leusen) 319-329  
 Acclimatization to heat and cold. (E. M. Glaser) 330-337  
 The isolation of a haemolytic substance from animal tissues and its biological properties. (H. Laiser) 338-355  
 Basal metabolic rates and physical fitness scores of British and Indian males in the tropics. (A. F. Munro) 356-366  
 On the preparation of secretin and pancreozymin. (J. Crick, A. A. Harper & H. S. Raper) 367-376  
 The monochromatism of the central fovea in red-green-blind subjects. (E. N. Willmer) 377-385  
 Iron supplies in foetal and newborn rats. (A. St G. Huggett & W. F. Widdas) 386-391  
 The equilibrium function of the otolith organs of the thornback ray (*Raja clavata*). (O. Lowenstein & T. D. M. Roberts) 392-415  
 The penetration of some sulphonamides into the intraocular fluids of the cat and rabbit. (H. Davson, with the technical assistance of P. A. Matchett) 416-421  
 Further observations on the properties of the central fovea in colour-blind and normal subjects. (E. N. Willmer) 422-446  
 Positional nystagmus of peripheral origin. (L. B. W. Jongkees) 447-449  
 Bicarbonate ion and striated muscle. (R. Creech) 450-457  
 Excretion of para-aminohippurate by the kidney of the cat. (M. G. Eggleston & Y. A. Habib) 458-467  
 Water, chloride and potassium exchanges in isolated blood-perfused dog lungs. (C. O. Hebb & R. H. Nimmo-Smith) 468-481  
 Enzymic formation of ortho-tyramine (*o*-hydroxyphenylethylamine). (H. Blaschko & P. Holton) 482-487  
 The *in vivo* formation of citrate induced by fluoroacetate and its significance. (P. Buffa & R. A. Peters) 488-500

### Journal of the Royal Army Medical Corps

93 : July 1949

- Clinical manifestations of tick-borne relapsing fever with special reference to the disease in Cyprus. (N. F. Coghill) 2-33  
 Disorders of micturition in poliomyelitis. Some observations on pathology and treatment. (D. S. Short) 34-42  
 Oral manifestations of agranulocytosis. (E. D. Stanhope) 43-46

93 : August 1949

- Surgery in Far Eastern theatres of war. (J. Bruce) 57-67  
 Medicine in Far Eastern theatres of war. (H. L. Marriott) 68-74  
 Psychiatry in jungle warfare. (A. H. Williams) 75-79  
 Air evacuation (clinical aspects). (A. V. Owston) 80-84

93 : September 1949

- Principles of surgery in the field including transfusion. (D. Fettes) 107-113  
 Training for and hygiene in the jungle. (J. J. O'Dwyer) 114-123  
 The progress in public health in the United Kingdom as reflected in the quality of the recruit volunteering for service in the Army. A survey of 65 years: 1848-1913. (D. Lewis) 124-150

93 : October 1949

- The Webster operation for gynaecomastia. (P. Clarkson) 161-167  
 A concept of some of the principles involved in the tactical employment of forward medical units. (J. C. A. Dowse) 168-186  
 Purification of water on a small scale. (H. J. Anderson) 187-203  
 The incapacitated soldier in the sixteenth century. (D. Stewart) 204-211  
 Ophthalmic surgery in war. (G. C. Dansey-Browning) 212-216  
 Medical records in the Army. (W. E. Conway) 217  
 Clinical records in surgery. (H. Cairns) 218-222

93 : November 1949

- The training of field medical units. (F. M. Richardson) 223-251  
 The work-end habit. (T. W. Carrick) 252-255  
 Empyema of the gall-bladder due to *spirochaeta typhi*. (J. K. B. Waddington) 256-259

93 : December 1949

- Practical notes on scrub typhus in the field. (J. R. Audy) 273-288  
 The training of field medical units. (Continued) (F. M. Richardson) 289-297  
 The symptomless transient urinary carrier of enteric organisms among Egyptians. (H. C. M. Walton) 298-303  
 The dental service in South-East Asia. (D. V. Muir) 304-308  
 Medical records in the Army. (Continued) (W. E. Conway) 309-312

### Journal of the Royal Institute of Public Health and Hygiene

12 : September 1949

- The Presidential Address, 1949. "Tuberculosis—certain unexplained mortality figures." (W. Elliot) 287-293  
 Parental care and child health. (I. R. Robertson) 304-314

12 : October 1949

- Diseases of animals transmissible to man. (E. M. Robinson) 325-335

12 : November 1949

- The Bengué Memorial Award Lecture, 1949. "World trends in the teaching of social medicine and public health." (R. Sand) 359-367

12 : December 1949

- The present position of diphtheria immunization. (W. W. King-Brown) 392-395

13 : January 1950

- Some popular fallacies regarding human nutrition. (H. E. Magee) 11-16  
 Food utensil sanitation. (L. E. Thomas) 17-22

### Journal of the Royal Naval Medical Service

35 : October 1949

- Royal Naval Hospital, Malta. (O. D. Brownfield) 245-251  
 Benjamin Bynoe (1804-1865). Surgeon of H.M.S. *Beagle*. (J. J. Keevil) 251-268  
 Comparisons of the Naval, Military, R.A.F. and civil medical services with private practice. Part II. (R. C. Munday) 269-279  
 Report on the Central Syphilis Register, July 1949. (H. L. Belcher) 280-292

36 : January 1950

- Cum grano salis. (J. W. L. Crosfili) 1-5  
 BCG vaccination. (I. C. Macdonald) 12-16  
 Diseases of leading importance to the Navy. (R. L. Ware) 16-22  
 Comparisons of the Naval, Military, R.A.F. and civil medical services with private practice. III. (R. C. Munday) 22-26  
 Tomography. (D. R. F. Bertram) 26-33

### Journal of Tropical Medicine and Hygiene

52 : September 1949

- Histoplasmosis of Darling (reticulo-endothelial cytomyces). (D. B. Jelliffe) 177-182  
 Fuetazo dermatitis. (K. V. Earle) 183-187  
 An epidemic of malaria in the Kenya Highlands transmitted by *Anopheles fumesus*. (R. B. Heisch & J. O. Harper) 187-190

52 : October 1949

- Treatment of Chinese kala-azar with sodium antimony gluconate. (E. Tuckman) 199-204  
 A new haemorrhagic ulcerative disease and its aetiology. (A. Castellani) 204-210

52 : November 1949

- The susceptibility of *Phlebotomus* species to DDT. (R. Kirk & D. J. Lewis) 223-225  
 Biological studies on Kenya school children. (J. I. Roberts) 225-237

52 : December 1949

- Splenectomy in the treatment of kala-azar. (L. E. Napier) 243-248  
 Tropical phlebitis and its relation to myositis tropicalis. (M. Gelfand) 248-251  
 Tuberculous lymphadenitis in Nigerian children. (D. B. Jelliffe) 251-253

53 : January 1950

- South-West Pacific pulmonary disease. (B. Thompson) 1-5  
 Faecal agglutinins against intestinal pathogens. (M. A. Gohar, A. A. Eissa & S. Mortada) 6-9  
 The syndrome of Onyala. (D. B. Jelliffe) 9-11  
*Staphylococcus aureus* food poisoning: an account of an outbreak in Khartoum. (A. Drysdale) 12-14

### Lancet

2 : 3/9/49

- Insulin therapy: successes and problems. (R. D. Lawrence) 401-405  
 The Guillain-Barré syndrome or acute infective polyneuritis. (C. P. Petch) 405-408  
 Effect of pentamethonium iodide on the peripheral circulation. (P. Arnold, R. H. Goetz & M. L. Rosenheim) 408-410  
 Incidence of *Staph. aureus* in the anterior nares of healthy children. (A. C. Cunliffe) 411-414  
 Serum-enzyme changes in perforated peptic ulcer. (H. Wapshaw) 414-415  
 A method of central sterilisation of syringes in hospital. (J. Murray) 415-416  
 Ovarian pregnancy. (A. H. Barber) 416-417  
 Simple oesophageal cast. (J. M. Willcox) 417-418  
 Perforated jejunal diverticulitis. (G. E. Moloney & J. N. Ward-McQuaid) 418  
 Intravenous procaine for postoperative atelectasis. (A. H. M. Siddons & E. Landau) 419

2 : 10/9/49

- Dysmenorrhoea. (A. J. Wrigley) 447-451  
 Mercury poisoning from fingerprint photography: an occupational hazard of policemen. (J. N. Agate & M. Buckell) 451-454  
 Vitamin B<sub>12</sub> by mouth in pernicious and nutritional macrocytic anaemia and sprue. (T. D. Spies, R. E. Stone, G. G. Lopez, F. Milanes, R. L. Toca & T. Aramburu) 454-456  
 Urinary excretion of radioactive iodine as a diagnostic aid in thyroid disorders. (A. S. Mason & R. Oliver) 456-460  
 Urinary excretion of radioactive iodine as a diagnostic test in thyroid disease. (D. G. Arnott, E. W. Emery, R. Fraser & Q. J. G. Hobson) 460-465  
 Transorbital leucotomy: some results and observations. (J. Walsh) 465-466  
 Perforation of intestine by fish-bone. (E. H. Travers) 466  
 Whooping-cough prophylaxis: Medical Research Council statement. 476  
 "Purification" of vaccine lymph. (D. McClean) 476-477  
 A state practice in Swedish Lapland. (A. E. B. Harding) 477-478  
 Reorganisation of the health services in the British Zone of Germany. (W. G. Harding) 482-484

2 : 17/9/49

- On seeing the patient through: the failure of medical co-ordination. (J. M. Lipscomb) 495-497  
 Tensile strength of sutures. I. The B.P.C. method of test. (D. M. Douglas) 497-499  
 Tensile strength of sutures. II. Loss when implanted in living tissue. (D. M. Douglas) 499-501  
 Incidence of penicillin-resistant and streptomycin-resistant staphylococci in a hospital. (P. M. Rountree & E. F. Thomson) 501-504  
 Flaxedil as a curarising agent in anaesthesia. (H. B. Wilson & H. E. Gordon) 504-505  
 Hyaluronidase in paediatric therapy. (W. Gaisford & D. G. Evans) 505-507  
 Effect of caronamide on excretion of *p*-aminosalicylic acid. (N. W. Horne & W. M. Wilson) 507-508  
 Effect of noradrenaline on the human circulation. (H. J. C. Swan) 508-510  
 Facial palsy and poliomyelitis. (T. Stapleton) 510-511

Curare with general anaesthesia for forceps delivery. (J. D. Bourke) 511-512  
Strangulated mesenteric hernia of caecum. (J. F. H. Bulman) 512-513  
Senile haematocolpos. (N. Alders) 513-514  
Acute arterial spasm complicating accidental haemorrhage in late pregnancy. (J. J. Handler) 514-515

## 2 : 24/9/49

Clues to the aetiology of Graves' disease. (J. H. Means) 543-548  
Tuberculosis : the control of an infectious disease. (J. Francis) 549-553  
Sequelae of infective hepatitis in children. Review of twelve cases. (W. G. Wyllie & M. E. Edmunds) 553-555  
Di-isopropyl fluorophosphonate as an intestinal carminative. (G. C. Arnell & A. S. Douglas) 556  
Disseminated sclerosis, a follow-up of 91 cases. (J. H. D. Millar) 556-559  
Experimental typhoid infection treated with chloromycetin and sulphadiazine. (A. W. El Borolossy & G. A. H. Burtle) 559-560  
Perforated enteric ulcer successfully treated conservatively. (D. L. Stevenson & R. B. Welbourne) 560-561  
Action of soda lime on chloroform. (H. L. Bassett) 561  
Medical care today. Progress reports from home and abroad. (J. A. Charles) 571-573

## 2 : 1/10/49

Cancer of the lung : review of a thousand cases. (G. A. Mason) 587-591  
Treatment of status epilepticus. (C. W. M. Whitty & M. Taylor) 591-594  
Torsion and other affections of the appendices epiploicae. (C. Wakeley & P. Childs) 594-596  
Bacteraemia following dental extractions. (M. G. McEntegart & J. S. Porterfield) 596-598  
Relation of birth weight to physical development in children. (R. S. Illingworth, C. C. Harvey & S. Y. Gin) 598-603  
Radiotherapy of accessible malignant tumours by alternating chess-board method. (B. Jolles) 603-606  
Haemolytic activity of whale-liver extract. (J. Innes & H. N. Robson) 606-607  
The eosinophil leucocyte, eosinophilia, and allergy : a hypothesis. (D. J. Dalton) 607-609  
Congenital hydronephrosis and hydro-ureter with contralateral pain. (M. Hudson) 609  
Food and population. (Horder) 617-618  
Measles in London. (G. E. Breen & B. Benjamin) 620-625

## 2 : 8/10/49

Acute mastitis. (A. Walsh) 635-639  
Haemophilus influenzae meningitis treated with streptomycin. (C. Ounsted) 639-644  
Some problems of emergency gastrectomy for haematemesis. (L. A. Ives) 644-646  
Intravenous iron in hypochromic anaemia : associated with rheumatoid arthritis. (R. J. G. Sinclair & J. R. Duthie) 646-647  
Lead poisoning in an infant from lead nipple-shields : association with rickets. (J. Gordon & T. P. Whitehead) 647-650  
Lead poisoning by cutaneous absorption from lead dressings. (C. C. Kennedy & H. A. Lynas) 650-652  
Penicillin in the cerebrospinal fluid. (J. W. T. Redfern, A. Elithorn, K. Till & F. A. Ibbott) 652-657  
Perforated peptic ulcer after gastro-enterostomy. (G. G. Crowe) 657  
The student's objective. (H. Cairns) 665-666

## 2 : 15/10/49

Some interpersonal factors in illness. (F. R. C. Casson) 681-684  
Expectant treatment of benign prostatic enlargement. (T. L. Chapman) 684-688  
Pteroyl-polyglutamic acids in the treatment of pernicious anaemia. (J. F. Wilkinson & M. C. G. Israels) 689-691  
Menorrhagia of emotional origin. (J. B. Blaikley) 691-694  
Tests for streptomycin sensitivity of tubercle bacilli in Tween 80 albumin liquid medium. (D. A. Mitchison) 694-696  
Louping-ill meningo-encephalitis. A further case and a serological survey. (G. H. Lawson, W. G. Manderson & E. W. Hurst) 696-699  
Ventricular fibrillation recorded ten hours before death from myocardial infarction. (W. M. Priest) 699-700  
Pneumonia and empyema due to *Salmonella oranienburg*. (A. M. Cooke & A. R. H. Williamson) 700-701  
The long-stay patient. (S. J. Firth) 709-710

## 2 : 22/10/49

The cardiology of old age. (C. J. Gavey) 725-736  
Familial calcification of the petrosphenoidal ligament. (J. B. Stanton & M. Wilkinson) 736-737  
Triple heart rhythm as a sign of cardiac pain. (W. Evans) 737-739  
Subacute myeloclerosis : report of three cases. (E. E. Wood & C. T. Andrews) 739-743  
Streptomycin in Friedländer pneumonia. (F. D. Rosenthal) 743-744  
Histamine metabolism in pregnancy. (R. Kapeller-Adler) 745-747  
Withdrawal symptoms in cannabis-indica addicts. (J. D. Fraser) 747-748  
Acute laryngotracheobronchitis : treated with chloromycetin. (A. Moncrieff & S. D. V. Weller) 748  
The difficulties of public health, past, present and future. (C. F. Brockington) 759-763

## 2 : 29/10/49

The doctor's creed : an address to medical students. (G. Fisher) 775-776  
Topectomy : the treatment of mental illness by frontal gyrectomy or bilateral subtotal ablation of frontal cortex. (J. L. Pool) 776-781  
Self-administered analgesia in labour, with special reference to trichlorethylene. (E. H. Seward) 781-783  
Synthetic oestrogens in mammary cancer. (A. L. Walpole & E. Paterson) 783-786  
Peripheral skin temperature in normal pregnancy. (C. C. Burt) 787-790  
Serum acid phosphatase in the diagnosis of carcinoma of the prostate. (C. T. A. Burgess & R. W. Evans) 790-792  
Acute polyarthritis nodosa in childhood. (A. W. Taylor & N. M. Jacoby) 792-794

Choice of a test meal. (J. N. Hunt) 794-795  
A polythene substitute for the upper two-thirds of the shaft of the femur. (H. J. Seddon & J. T. Scales) 795-796  
Pharmaceutical benefits in Australia : Act declared invalid. 806-807  
Experience with B. C. G. vaccination of student nurses. (F. H. Stevenson) 807-808

## 2 : 5/11/49

The significance of functional differentiation in mammary tumours. (B. D. Pullinger) 823-828  
The treatment of brain abscess with special reference to a conservative method. (L. C. Oliver & W. L. B. Leese) 828-831  
Continuous spinal block in puerperal hypertensive encephalopathy with anuria. (R. Bryce-Smith, E. H. Seward, E. A. Williams, E. O. Williams & R. A. Sladden) 831-835  
Haemolytic anaemia associated with Hodgkin's disease. (R. J. K. Brown & M. J. Meynell) 835-836  
Heat cramps. (W. S. S. Ladell) 836-839  
Asphyxia and shock in the newborn. (A. D. T. Govan) 839-842  
Fatal asphyxia from intratracheal rupture of a tuberculous mediastinal lymph-gland. (H. Angelman & W. M. L. Turner) 842-843  
International tensions : a challenge to the sciences of man. (O. Klineberg) 851-854

## 2 : 12/11/49

Maternal obesity. (J. H. Sheldon) 869-873  
The health of nurses in hospital. (D. Court) 874-882  
Neurological effects of oxygen in chronic cor pulmonale. (C. E. Davies & J. Mackinnon) 883-885  
Streptomycin in human tuberculosis. Study of 47 cases. (P. V. Karamchandani, R. Ramachandran, N. P. Devadas, S. R. Kidiyoor & P. Sanjeevarao) 886-890  
A screening test of chemical compounds for pituitary adrenocorticotrophic hormone activity. (T. D. Spies & R. E. Stone) 890-891  
Partial resection of autonomic function after paravertebral sympathectomy. (Intermediate lumbar sympathetic ganglia as the probable explanation.) (J. D. Boyd & P. A. G. Monro) 892-895  
A small outbreak of paratyphoid fever. (E. D. Irvine & T. G. Galvin) 904-906

## 2 : 19/11/49

Pathogenesis of atherosclerosis. (J. B. Duguid) 925-927  
The anterior tibial syndrome. (A. B. Carter, R. L. Richards & R. B. Zachary) 928-934  
Thromboangiitis obliterans treated by hypoglycaemia. (H. Mazanek) 935-937  
Departure of substances from the spinal theca. (F. Howarth & E. R. A. Cooper) 937-940  
Infant salmonella carriers. (I. M. Mackerras & V. M. Pask) 940-941  
Effect of the head-down position on the circulation in hypotensive states. (A. J. P. Graham & D. M. Douglas) 941-944  
Treatment of a lung abscess by inhalation of micropulverised penicillin. (D. T. O'Driscoll) 945-946  
The tuberculosis situation : waiting-lists and domiciliary treatment. (H. J. Trenchard) 956-957  
The home treatment of pulmonary tuberculosis. (W. H. Tattersall) 957-958

## 2 : 26/11/49

The diagnosis of bone tumours. (J. F. Brailsford) 973-975  
Chloromycetin in the treatment of typhoid fever : fourteen cases treated in the Middle East. (A. T. Cook & D. E. Marmion) 975-979  
Malignant disease of the thyroid gland. (K. M. Branson & W. Houston) 979-982  
Streptomycin in the treatment of tuberculous sinuses : review of 11 cases. (R. H. Davis) 982-984  
Gastric secretion and subsequent dyspepsia : a follow-up study. (R. Doll, F. A. Jones & N. F. MacLagan) 984-985  
Acute disseminated encephalomyelitis following herpes zoster, vaccination, and immunisation. (L. Wolman) 985-987  
Haemolytic effects of myxasins. (D. R. T. Clendon & J. B. Penfold) 987-989  
Hypersplenism with arthritis : report of a case. (W. R. Gauld) 989-991  
Hydrocolpos. (N. C. Sen) 991-993  
Effect of combined injections of deoxycortone acetate and ascorbic acid on rheumatoid arthritis. (E. Lewin & E. Wassen) 993  
The Royal Faculty of Physicians and Surgeons of Glasgow, 1599-1949. (A. K. Bowman) 1002-1004  
Poliomyelitis, 1949 : preliminary observations. (W. P. D. Logan) 1006-1010

## 2 : 3/12/49

"Pleural shock." (A. Morland) 1021-1023  
Caesarean section in infected cases. (F. Stabler) 1023-1026  
Q fever in Great Britain : isolation of *Rickettsia burneti* from an indigenous case. (F. O. MacCallum, B. P. Marmion & M. G. P. Stoker) 1026-1027  
Q fever in Great Britain : clinical account of eight cases. (J. B. Harman) 1028-1030  
Early diagnosis of cerebral palsy. (C. D. S. Agassiz, M. B. O'Donnell & E. Collis) 1030-1033  
A suggested method for the titration of certain antibiotics. (F. C. O. Valentine & R. G. S. Johns) 1033-1034  
Reticulocyte response to liver therapy in pernicious anaemia. (J. Kohárik-Kuchárik) 1034-1035  
Erythema multiforme exudativum (the Stevens-Johnson syndrome). (E. Dresner) 1036-1038  
Taste sensitivity to phenylthiourea in goitre and diabetes. (H. Harris, H. Kalamus & W. R. Trotter) 1038-1039  
The aged sick : review of 399 patients in chronic wards. (J. M. Greenwood) 1047-1048

## 2 : 10/12/49

Survey of physical fitness in Ceylon. (H. Cullumbine) 1067-1071  
Influence of heart-rate on cardiac output : studies with digoxin and atropine. (H. G. Kelly & R. I. S. Bayliss) 1071-1075  
Source of two hospital-infected cases of tetanus. (S. Sevvit) 1075-1078  
Non-traumatic thrombosis of the carotid artery. (N. O. Ameli & D. W. Ashby) 1078-1082  
Seasonal variations in thyrotoxicosis. (M. E. Morgans & W. R. Trotter) 1083-1084

Electric-blanket treatment of rheumatoid arthritis. (E. Frankel) 1084-1085  
 Q fever: report of a case. (W. G. Manderson) 1085-1086  
 Geriatrics in Northern Ireland. (G. F. Adams) 1095-1097  
 Chronic sick and elderly in hospital: conclusions from a Bradford survey. (P. McEwan & S. G. Lavery) 1098-1099

## 2 : 17/12/49

Peptic ulcer cases reviewed after ten years. Effect of medical treatment and indications for gastrectomy. (L. Martin & N. Lewis) 1115-1120  
 Penicillin-resistant staphylococcal infection in a maternity hospital. (M. Barber, F. G. J. Hayhoe & J. E. M. Whitehead) 1120-1125  
 Antipyretic action of cryogenine. (G. Bourne) 1126-1128  
 Vitamin E in intermittent claudication. (A. H. Ratcliffe) 1128-1130  
 Inhibition by methionine of the toxicity of crystals from agnised zinc. Observations on *Leuconostoc mesenteroides*. (J. G. Heathcote) 1130-1131  
 Eosinophilic leukaemia and familial eosinophilia: two illustrated cases. (J. D. Gray & S. Shaw) 1131-1134  
 Deoxycortone acetate and ascorbic acid in the treatment of rheumatoid arthritis. (D. Le Vay & G. E. Loxton) 1134-1135  
 Army medicine in the late war. Some mistakes of policy? (J. W. Todd) 1143-1148

## 2 : 24/12/49

Family doctor. The impact of modern therapeutic ideas on general practice. (R. J. Perring) 1163-1167  
 The insulin test for vagal section. (B. N. Brooke) 1167-1170  
 Sulphathione in pulmonary tuberculosis. (H. V. Morlock & R. Livingstone) 1170  
 Allergic specificity of pollens. (E. Budd & J. Freeman) 1171-1172  
 Aspirin in the treatment of vascular diseases. (P. C. Gibson) 1172-1174  
 Cervicodorsal osteomyelitis with extradural abscess. (D. B. Allbrook) 1174-1175  
 Spondylitis ankylopoietica with severe anaemia presenting as acute abdominal disease. (E. de C. Falle & M. Bennett) 1175-1176  
 Infantile cortical hyperostoses. (M. MacGregor & R. Davies) 1176-1178  
 D.D.T. poisoning in man: a suspected case. (A. M. G. Campbell) 1178  
 Sterilisation of polythene tubing for anaesthetic purposes. (R. Bryce-Smith) 1179  
 Army medicine in the late war. Some mistakes of policy? (Continued.) (J. W. Todd) 1195-1198

## 2 : 31/12/49

Temporomandibular arthrosis. (J. Foged) 1209-1211  
 A comparison of the anti-thyroid activity of para-aminobenzoic acid and thiouracil compounds. (J. F. Goodwin, H. Miller & E. J. Wayne) 1211-1213  
 Pneumoconiosis after exposure to sulphur dioxide fumes and dust from coke fires. (L. Dunner, R. Hardy & D. J. T. Bagnall) 1214-1216  
 Mechanism of cutaneous reactions to insulin. (R. G. Paley) 1216-1218  
 Protracted nervous complications of typhoid fever. (G. H. Jennings) 1218-1219  
 Deoxycortone with ascorbic acid versus adrenocorticotrophic hormone in rheumatoid arthritis. (T. D. Spies, R. E. Stone, E. de Maeyer & W. Niedermeier) 1219-1221  
 Syphilitic bursitis, with report of a case. (E. W. P. Thomas & A. J. Rook) 1221-1222  
 Army medicine in the late war. Some mistakes of policy? (Concluded.) (J. W. Todd) 1229-1235

## 1 : 7/1/50

Results of surgery. (C. Wakeley) 1-3  
 The adult: report of seven cases. (G. W. V. Greig)  
 Diphtheria immunisation in young babies: a study of some factors involved. (M. Barr, A. T. Glenny & K. J. Randall) 6-10  
 Pituitary adrenocorticotrophic hormone (A.C.T.H.) as a tool of clinical and laboratory research. (T. D. Spies & R. E. Stone) 11-14  
 Comparative serum testing with cardiolipin and standard Wassermann antigens: review of 5124 tests. (I. N. O. Price & A. E. Wilkinson) 14-16  
 Chloromycetin in scrub-typhus. (H. M. Giles & T. Symington) 16-19  
 Hirschsprung's disease. (M. Bodian, F. D. Stephens & B. C. H. Ward) 19-22  
 Passage of an intestinal tube per anum. (G. Frank) 22  
 A swallowed bougie. (J. A. Ross) 22-23  
 Direct medullary arterioles and arteriovenous anastomoses in the arcuate sponges of the kidney. (H. J. Barrie, S. J. Klebanoff & G. W. Cates) 23  
 Control of infection with the bovine tubercle bacillus. (J. Francis) 34-39

## 1 : 14/1/50

The early yield of human milk, and its relation to the security of lactation. (H. Waller) 53-56  
 Penicillin in tissue exudates after injection. (J. Ungar) 56-59  
 Treatment of tuberculous meningitis with streptomycin. (S. J. M. Russell & P. MacArthur) 59-63  
 Influenza in an isolated community. An epidemic on Ocean Island. (A. Isaacs, M. Edney, M. Donnelly & M. W. Ingram) 64-66  
 Pemphigus vulgaris treated with aureomycin. (F. R. Bettley) 66  
 Carbon tetrachloride poisoning. (R. W. E. Watts) 66-67  
 A fixed skin eruption due to phenytoin sodium. (R. D. Sweet) 68  
 Reduction of supracondylar fractures of the humerus, with backward displacement. (J. J. Shipman) 68-69  
 Fatal chronic tracheobronchitis due to *Pseudomonas pyocyanea* in two siblings. (J. R. O'Brien) 69-70  
 Urinary excretion of phenobarbitone after a large single dose. (A. Thompson) 70-71  
 Urinary incontinence cured by operation: an uncommon case. (M. Kenny) 71  
 Volvulus of the small intestine: the position of relief. (R. E. B. Tagart) 71-73  
 The National Collection of Type Cultures. (S. T. Cowan) 82-83

## 1 : 21/1/50

Postoperative paralysis in the upper extremity: report of five cases. (M. R. Ewing) 99-103  
 Brachial plexus lesions after cholecystectomy. (L. G. Kiloh) 103-105  
 Aetiology and treatment of auricular flutter. (D. H. Makinson & G. Wade) 105-108  
 Arsenic poisoning in industry. Report of a case. (M. Steele & D. V. G. Feltham) 108-110

Severe urticaria complicating streptomycin therapy. (D. C. Lindars) 110-112  
 Exfoliative dermatitis complicating streptomycin therapy. (W. C. Harris & R. V. Walley) 112-114  
 Acute diverticulitis of the caecum and ascending colon. (R. E. Shaw & J. Siegler) 114-115  
 Relapse in typhoid fever after treatment with chloramphenicol. (J. N. Briggs) 115-116  
 Abnormality on steroid metabolism associated with rheumatoid arthritis. (I. F. Sommerville, G. F. Marrian, J. J. R. Duthie & R. J. G. Sinclair) 116-117  
 Isolation of a polypeptide with high adrenocorticotrophic activity. (P. Morris & C. J. O. R. Morris) 117-118  
 Bacterial contamination of air in underground trains. (R. E. O. Williams, A. Hirsch & O. M. Lidwell) 128-131

## 1 : 28/1/50

Treatment of leprosy with diamino-diphenyl sulphone by mouth. (J. Lowe) 145-150  
 Observations on chloramphenicol. (J. D. Gray) 150-156  
 Effect of deoxycortone and ascorbic acid on formaldehyde-induced arthritis in normal and adrenalectomised rats. (G. Brownlee) 157-159  
 Removal of forceps from the abdominal cavity. (F. T. Ranson & M. Blumenfeld) 159-160  
 X-ray cinematography in congenital heart-disease. (R. Janker) 160-161  
*Haemophilus influenzae* meningitis: a possible ecological factor. (C. Ounsted) 161-162  
 Arteriovenous anastomoses in the stomach wall. (D. N. Walder) 162  
 The social adaptation of institution children. (F. Bodman, M. MacKinlay & K. Sykes) 173-176

## Medical Officer

## 82 : 3/9/49

The training of home helps. (R. Chadwick & H. L. Latham) 103-104  
 The hygiene of catering establishments. (C. F. White) 105  
 Ministry of Health return of infectious diseases. 108

## 82 : 10/9/49

The effect of recent social legislation on the welfare of women and children. (M. Baird) 113-114  
 Ministry of Health return of infectious diseases. 118

## 82 : 17/9/49

Zones of responsibility for socio-medical services. (F. Brockington) 123-124  
 Ministry of Health return of infectious diseases. 126

## 82 : 24/9/49

Edward Jenner and his work. (H. A. Ginn) 131-135  
 Ministry of Health return of infectious diseases. 138

## 82 : 1/10/49

The Public Health Service as a career. (H. C. M. Williams) 143  
 Ministry of Health return of infectious diseases. 147

## 82 : 8/10/49

Changing concepts in public health. (T. Ferguson) 153-155  
 A survey of domestic smoke abatement. (Simon of Wythenshawe) 156-158  
 Ministry of Health return of infectious diseases. 161

## 82 : 15/10/49

Persons in need of care and attention. (G. H. Hogben) 167-169  
 An outbreak of food poisoning. (R. S. Davidson) 169  
 Ministry of Health return of infectious diseases. 171

## 82 : 22/10/49

Co-ordination of tuberculosis schemes. (A. Davidson) 177-180  
 Ministry of Health return of infectious diseases. 182

## 82 : 29/10/49

The protean problems of typhoid fever. (M. T. I. Jones) 187-188  
 Sources of error in geriatric diagnoses. (F. D. Zeman) 188-189  
 Ministry of Health return of infectious diseases. 193

## 82 : 5/11/49

Persons in need of care and attention. (S. Leff) 199-200  
 The mystical age of seven years. (K. McAlpine) 200-201  
 Ministry of Health return of infectious diseases. 204

## 82 : 12/11/49

The foot of civilised man. (W. G. Booth) 209-210  
 Ministry of Health return of infectious diseases. 212

## 82 : 19/11/49

A paediatric clinic in the school health service. (E. Hinden) 217-218  
 Why has our tuberculosis service failed to cure the disease or prevent it? (S. G. Tippet) 218-219  
 Ministry of Health return of infectious diseases. 221

## 82 : 26/11/49

The scope of executive social medicine. (C. F. Brockington) 227-230  
 Ministry of Health return of infectious diseases. 232

## 82 : 3/12/49

The scope of executive social medicine. (Concluded.) (C. F. Brockington) 237-239  
 Ministry of Health return of infectious diseases. 241

## 82 : 10/12/49

A catering survey. (E. C. Downer) 247-249  
 Ministry of Health return of infectious diseases. 252

82 : 17/12/49

Now wash your hands ! (G. Bousfield) 257-258  
 Female genital infection and the lavatory seat. (W. M. H. McCullagh) 258  
 Ministry of Health return of infectious diseases. 262

82 : 24/12/49

An outbreak of food poisoning due to *Salmonella dublin*. (E. E. Cromb & C. R. Murdock) 267-268  
 Ministry of Health return of infectious diseases. 271

82 : 31/12/49

Schick test reactions in expectant mothers. (J. L. Bradley) 277-278  
 Ministry of Health return of infectious diseases. 284

83 : 7/1/50

The future of the child health services. (A. J. Dalzell-Ward) 5-9  
 Edward Jenner and his work : some observations on the article by Prof. Gins. (C. K. Millard) 9-10  
 Ministry of Health return of infectious diseases. 11.

83 : 14/1/50

Sir William Collins : surgeon and statesman. (A. S. MacNalty) 17-18  
 Administrative arrangements for vaccination and immunisation. (S. King) 18-19  
 A schizophrenic swan song. (R. P. Garrow) 20  
 Ministry of Health return of infectious diseases. 22

83 : 21/1/50

Anopheles eradication in Cyprus. (H. M. Shelley) 27-28  
 Ministry of Health return of infectious diseases. 30

83 : 28/1/50

Weight deficiencies of children attending a nutrition centre. (G. K. Lim)  
 With a statistical analysis. (B. Benjamin) 35-38  
 Ministry of Health return of infectious diseases. 40

## Medical Press

222 : 7/9/49

The Royal College of Physicians 110 years ago. (A. MacNalty) 204-210  
 The Royal College of Surgeons of England 110 years ago. (W. R. Le Fanu) 210-212  
 The Barbers' Company : some thoughts and reflections. (S. Walton) 212-214  
 The Society of Apothecaries. (D. C. L. Fitzwilliams) 215-220  
 The early history of the General Medical Council (1859-1886). (M. Heseltine) 220-235  
 Ophthalmology a hundred and ten years ago. (A. Sorsby) 235-237

222 : 14/9/49

The diagnosis and modern treatment of peritonitis in children. (J. R. Collins) 243-246  
 Treatment of the severed flexor tendon in the hand. (J. M. P. Clark) 246-250  
 The criteria of cure in pulmonary tuberculosis. (G. O. A. Briggs) 250-253  
 Osteoarthritis in general practice. (G. Armour) 253-258

222 : 21/9/49

Indications for gastrectomy. (D. Chamberlain) 265-268  
 A brief survey of immunisation and its results during the past ten years. (C. W. Anderson) 268-274  
 Anaesthesia in general practice. (F. K. Boston) 274-278  
 Paroxysmal haemoglobinuria with a report on three cases. (D. Shreehan) 278-280  
 The aetiology of mental deficiency. (N. H. M. Burke) 280-282

222 : 28/9/49

Modern and post-war trends in fracture surgery. (A. E. Burton) 291-294  
 Psychiatric approach to crime. (T. Christie) 294-296  
 Inguinal hernia : the problem of treatment. (J. A. Shepherd) 296-303  
 Miners' nystagmus. (D. Campbell) 303-306

222 : 5/10/49

Renal calculus. (H. P. Winsbury-White) 317-320  
 The differential diagnosis of nasal obstruction. (J. B. Cavenagh) 320-323  
 Sex education in schools. (D. W. Winnicott) 323-325  
 Avoidable transfusion mishaps. (R. Drummond) 325-331  
 The choice of anaesthetic in dental surgery. (O. P. Clark & S. B. Stoner) 331-334

222 : 12/10/49

Modern trends in treatment of anaemia. (H. T. Evans) 343-345  
 Industrial dermatitis. (J. H. T. Davies) 347-351  
 Notes on the heart, with special reference to intrathoracic tuberculosis. (G. B. Charnock) 351-356  
 Tumours of the orbit. (R. Parish) 356-357

222 : 19/10/49

The diagnosis and treatment of common complications during labour. (A. Concanon) 365-368  
 The practitioner and the national diet. (M. Cardwell) 369-373  
 Modern treatment in psychiatry. (L. C. F. Chevens) 373-377  
 Pulmonary tuberculosis in children. (F. C. S. Bradbury) 378-380

222 : 26/10/49

Causes and treatment of epiphora. (G. T. W. Cashell) 387-391  
 Recent progress in the treatment of rheumatic disorders. (G. Slot) 391-396  
 The radiological investigation of gall bladder disease. (C. K. Warrick) 397-400  
 "Shall we fast?" (J. Oldfield) 400-401

222 : 2/11/49

Modern trends in the treatment of menstrual disorders. (D. Daley) 409-413  
 Common fractures of the hand. (E. N. Callum) 413-418  
 The prognosis of heart disease in childhood. (J. W. Brown) 418-421  
 Personality factors in the mental disorders of old age. (J. W. Affleck) 422-424

222 : 9/11/49

Modern treatment of sinusitis associated with allergy. (E. C. Dunlop) 433-437  
 Supervision of the patient with an artificial pneumothorax. (H. T. Chatfield) 437-440  
 Pelvic endometriosis. (M. D. A. Evans) 440-443  
 Causation and treatment of loss of memory. (T. M. Davie) 443-445  
 Moniliasis. (E. C. B. Ibbotson) 446-448

222 : 16/11/49

The contribution of the Ministry of Labour and National Service to the rehabilitation and resettlement of disabled persons. (H. Wiles) 457-461  
 Rehabilitation in tuberculosis. (R. R. Trail) 462-465  
 Rehabilitation in infantile paralysis. (A. Rocyn-Jones) 465-469  
 Rehabilitation of the newly blind. (G. T. Allerton & T. S. Drake) 469-472  
 Rehabilitation of the deaf. (E. Whetnall) 472-476  
 The diagnosis and modern treatment of sciatica. (F. C. Durbin) 477-480

222 : 23/11/49

Significance of health administration. (H. S. Davies) 489-493  
 Traumatic condition affecting the fingers, hand and wrist. (W. E. Tucker) 494-496  
 The wearing of spectacles : facts and fallacies. (N. Cridland) 496-498  
 Tuberculous meningitis in general practice. (A. B. Christie) 499-502

222 : 30/11/49

Modern treatment (surgical) of peptic ulcer. (J. T. Chesterman) 511-514  
 Common diseases in school children. (H. L. Cronk) 515-518  
 Prevention and treatment of some anaesthetic complications. (H. M. Bird) 518-520  
 Cardiac allergy. (E. Lyon) 520-524

222 : 7/12/49

Modern trends in the treatment of dysmenorrhoea. (B. V. Dunn) 533-535  
 Pulmonary tuberculosis : some aspects of diagnosis and treatment. (R. C. Cohen) 535-540  
 Common affections of the eyes in general practice. (A. G. East) 541-544  
 Methods and applications of clinical psychology. (M. B. Brody & M. Williams) 545-547

222 : 14/12/49

Some observations on local authority health services in 1948. (I. G. Davies) 553-557  
 Obsessional neurosis. (E. Miller) 558-560  
 The treatment of subacute bacterial endocarditis. (H. Cookson) 560-563  
 The prevention of rickets. (B. Corner) 563-566  
 What has gone wrong with our tuberculosis service? (S. G. Tippet) 566-568

222 : 21/12/49

Modern treatment of chronic otitis media in adults. (T. M. Banham) 577-582  
 Modern treatment of bronchiectasis in children. (J. L. Collis) 582-584  
 Some modern advances in the treatment of early syphilis with antibiotics, with special reference to chloromycetin, aureomycin and the "one shot" treatment with penicillin. (R. R. Wilcox) 585-588  
 The role of sinusotomy and needle-puncture irrigation in the surgical treatment of frontal sinus infections. (W. H. B. Magauran) 589-591

222 : 28/12/49

The diagnosis and treatment of ruptures of the urethra in the male. (J. D. Ferguson) 599-602  
 Depression, normal and abnormal. (O. Fitz-Gerald) 602-604  
 Detachment of the retina. (C. D. Shapland) 605-614

223 : 4/1/50

The principles and practice of psychological therapy with children. (W. M. Burbury) 5-8  
 Early diagnosis of carcinoma of the breast. (G. Smith) 13-16  
 A brief survey of some recent advances in treatment of infectious diseases. (E. F. Dawson-Walker) 16-20

223 : 11/1/50

Diagnosis and treatment of some common disorders in infancy. (W. Gaisford) 27-32  
 The place of vagotomy in the surgical treatment of chronic peptic ulcer. (F. S. A. Doran) 36-39  
 Teaching and research in problems of old age. (T. H. Howell) 39-41

223 : 18/1/50

A survey of public health administration during the first year under the National Health Service Act. (C. G. Eastwood) 49-54  
 Herpes zoster ophthalmicus. (G. G. Penman) 54-56  
 Modern trends in plastic surgery. (J. N. Barmen) 56-58  
 Radiology of the heart. (R. I. Lewis) 58-62

223 : 25/1/50

The treatment of congenital heart disease. (J. Apley) 71-74  
 Drunkenness and the criminal law. (G. Forbes) 74-77  
 Some reflections on general medical practice in the past thirty-five years. (D. MacManus) 77-80  
 The choice of anaesthesia in ear, nose and throat operations. (J. H. T. Challis) 81-83

# Monthly Bulletin of the Ministry of Health and the Public Health Laboratory Service

8 : September 1949

- The disinsection of aircraft : recent progress of work in the United Kingdom and Colonies. (H. Whittingham & R. A. E. Galley) 186-187  
A suggested scheme for smallpox treatment. (D. F. Johnstone & J. L. Fluker) 188-189  
Notification of infectious disease in England and Wales, July, 1949. 189  
The treatment of experimental infection with *Brucella abortus* in guinea-pigs, including a trial of aureomycin. (J. C. Cruickshank) 190-202

8 : October 1949

- Infant vaccination under the National Health Service in England during 1948. (E. T. Conybeare) 204-208  
The age distribution of poliomyelitis in England and Wales. (B. Benjamin & A. H. Gale) 208-213  
Notification of infectious disease in England and Wales, August, 1949. 213  
Serological grouping of 2662 consecutive strains of  $\beta$ -haemolytic streptococci. (G. T. Cook, W. H. H. Jebb & R. Knox) 214-221  
The effect of summer temperatures on diphtheria prophylactics. (G. Bousfield) 222-225

8 : November 1949

- Mosquitoes in London. (P. G. Shute) 228-231  
Survey of sickness prevalence—March quarter, 1949. 232-238  
Notification of infectious diseases in England and Wales, September, 1949. 239  
A rapid screening test for use in the bacteriological examination of faeces. (H. W. Smith & S. P. W. Chave) 240-244  
A sterilizer for rubber bungs and instruments. (H. A. Tarr) 245-247

8 : December 1949

- Hygiene of trawlers. (J. D. Syme) 250-256  
Disinfection of ships after smallpox. (R. H. Barrett) 260-261  
Notification of infectious diseases in England and Wales, October, 1949. 262  
The influence of humidity on the survival of *Bacterium coli* on the skin. (A. M.-M. Payne) 263-271

9 : January 1950

- Mortality during the 1st world war and during and after the 2nd world war. (E. R. Bransby & D. V. Lindley) 2-11  
Survey of sickness prevalence—June quarter, 1949. 13-19  
Notification of infectious diseases in England and Wales, November, 1949. 20  
Canteen hygiene. Use of detergents and chemical sterilizing methods for washing up. (B. R. Frisby) 22-27  
Salmonella infection in a post-mortem room. (P. J. Wormald) 28-30

## Nutrition Abstracts and Reviews\*

19 : October 1949

- The mineral requirements and metabolism of poultry. Part III. Elements other than calcium and phosphorus. (C. Tyler) 263-274

## Overseas Post Graduate Medical Journal

4 : October 1949

- Obstetrics in the National Health Service. (W. Gilliat) 23-28  
Modern views on the management of placenta praevia. (C. H. G. Macafee) 29-33  
The modern practice of Caesarean section—some controversial views. (S. G. Clayton) 34-41  
Pelvimetry in obstetrics. (H. C. Bull) 42-50  
Analgesia and anaesthesia in modern obstetrics. (G. C. Steel) 51-56  
An evaluation of the various factors in infertility. (J. Stallworthy) 57-61  
The sympathetic nervous system in obstetric and gynaecological practice. (A. Davis) 62-68  
The present position of radiotherapy in the treatment of malignant disease of the pelvis. (M. Lederman) 69-74  
Flying Doctor Service of Australia. (L. C. Lum) 75-81  
Prostatic surgery. (T. J. D. Lane) 82-91  
The conservative treatment of hydronephrosis. (V. Dix) 91-98  
Ureteric transplantation in children. (D. S. Poole-Wilson) 99-103  
Hypospadias. (D. Browne) 103-108  
Crohn's disease. (T. L. Hardy) 109-113  
Crohn's disease : a review. (E. E. T. Taylor) 113-123  
Modern trends in the treatment of infections of the hand. (R. P. Jepson & H. Bolton) 125-132

4 : January 1950

- The trend of cardiology. (W. Evans) 171-172  
Cyanotic congenital heart disease. (J. W. Brown) 173-192  
The surgical treatment of congenital heart disease. (O. S. Tubbs) 193-198  
Advances in the treatment of heart disease. (G. W. Hayward) 199-204  
Radiology in cardiac disease. (G. Simon) 205-215  
Angiocardiography. (F. Gardner) 215-226  
The contribution of venous catheterization and other circulatory techniques to cardiology. (E. P. Sharpey-Schafer) 227-229  
Phonocardiography. (A. Leatham) 230-243  
The social welfare of cardiac patients. (D. M. Thornton) 245-248  
A survey of recent developments in blood transfusion. (R. Drummond) 249-261  
Tuberculous glands of the neck. (R. Reid) 263-268  
The broken nose. (J. Penn) 269-274  
The story of silk and silkworm gut. (A. M. C. Humphries) 275-280  
Hind-quarter amputation. (L. P. Le Quesne) 281-290

## Parasitology

40 : January 1950

- A method for studying the distribution and bionomics of trombiculid mites (Acarina: Trombiculidae). (B. M. Jones) 1-13  
The ecology of the sheep tick, *Ixodes ricinus* L. Microhabitat economy of the adult tick. (A. Milne) 14-34

- The ecology of the sheep tick, *Ixodes ricinus* L. Spatial distribution. (A. Milne) 35-45  
The occurrence and morphology of *Coenurus serialis* in rabbits. (A. G. Hamilton) 46-49  
The harvest mites ("Akidani") of Japan and the Far East and their relationship to the *Autumnalis* group of trombiculid mites. (C. B. Philip & H. S. Fuller) 50-57  
Experimental differentiation of *Leishmania*. (R. Kirk) 58-59  
A new species of parasitic mite, *Cnemidocoptes jamaicensis*, a causative agent of scaly leg in *Turdus aurantius*. (F. A. Turk) 60-62  
Studies of acari. VI. Parasitic mites from mammalian hosts obtained in Ceylon. (F. A. Turk) 63-76  
Parasitic copepods of fish from Ceylon. III. (P. Kirtisinghe) 77-86  
A method for estimating the toxic effect of contact insecticides on mosquitoes and house-flies. (G. G. Mer & S. Davidovici) 87-92  
On some abnormalities in *Hyalomma savignyi*. (B. Feldham-Muhsam) 93-95  
A review of the species of *Dinobothrium* (Cestoda), with a description of a new species. (H. A. Baylis) 96-104  
The variation of the British harvest mite (Trombiculidae, Acarina). (W. S. Richards) 105-117  
The distribution and biology of the harvest mite in Great Britain (Trombiculidae, Acarina). (W. S. Richards) 118-126  
Observations on the vertical migrations of the third-stage larva of *Haemonchus contortus* (Rud.) on experimental plots of *Lolium perenne* S24, in relation to meteorological and micrometeorological factors. (G. Rees) 127-143  
Anopheline larvae as intermediate hosts for larval trematodes. (T. W. T. Jones) 144-148  
Some observations upon prolonged treatment of *Plasmodium gallinaceum* infection in chicks with antimalarial drugs. (A. Bishop & B. Birkett) 149-158  
The stability of paludrine-resistance in *Plasmodium gallinaceum* in the absence of the drug. (A. Bishop & E. W. McConnachie) 159-162  
Sulphadiazine-resistance in *Plasmodium gallinaceum* and its relation to other antimalarial compounds. (A. Bishop & E. W. McConnachie) 163-174  
Cross-resistance between sulphanilamide and paludrine (proguanil) in a strain of *Plasmodium gallinaceum* resistant to sulphanilamide. (A. Bishop & E. W. McConnachie) 175-178  
The reactions of *Lucilia sericata* (Mg.) to various substances placed on sheep. (J. B. Cragg) 179-186  
The reactions of blowflies to organic sulphur compounds and other materials used in traps. (J. B. Cragg & B. A. Thurston) 187-194

## Practitioner

163 : September 1949

- The eye in general medicine. (A. J. Ballantyne) 173-181  
Colour blindness in the light of recent theories of colour vision. (H. Hartridge) 182-186  
The causation and treatment of detachment of the retina. (F. W. Law) 187-193  
Penicillin in ophthalmology. (A. Sorsby) 194-199  
The modern treatment of squint. (J. L. Wilkie) 200-206  
Ophthalmic emergencies. (J. W. T. Thomas) 207-212  
The care of the scalp and hair. (G. Hodgson) 213-220  
High heels and low heels. (N. C. Lake) 221-228  
Painful feet. (M. G. Good) 229-232  
The natural cure of an acute intussusception. An unusual case history. (J. H. Louw) 233-235  
Current therapeutics. XXI. Protein hydrolysates. (J. Beattie) 236-241  
Revision corner : Constipation in infancy and childhood. (B. Williamson) 242-244. The use and abuse of amphetamine. (L. Howells) 244-246. Cardiospasm. (R. G. Evans) 246-248

163 : October 1949

- Advances in medicine. (C. Wilson) 257-265  
Advances in surgery. (F. A. R. Stammers) 266-273  
Advances in midwifery. (W. C. W. Nixon) 274-281  
Advances in paediatrics. (W. Gaisford) 282-289  
Advances in the treatment of blood diseases. (L. Whitby) 290-297  
Advances in the treatment of skin diseases. (R. M. B. MacKenna) 298-304  
Advances in orthopaedics. (P. Wiles) 305-312  
Advances in urology. (M. F. Nicholls) 313-319  
Advances in anaesthesia. (R. Woolmer) 320-327  
Advances in the treatment of tuberculosis. (M. Daniels) 328-336  
Advances in the treatment of cancer. (S. Cade) 337-344  
Advances in the treatment of acute infectious diseases. (W. Gunn) 345-352  
Advances in nutrition. (A. P. Meiklejohn) 353-359  
Advances in industrial medicine. (A. J. Amor) 360-364  
Current therapeutics. XII. Pituitary adrenal function and rheumatic disease. (G. W. Thorn & T. B. Bayles) 365-380  
Revision corner : Flatulence and the use of carminatives. (G. D. Hadley) 381-383. Acute retention. (J. D. Fergusson) 383-385

163 : November 1949

- The general adaptation syndrome and the diseases of adaptation. (H. Selye) 393-405  
The problem of the etiology of thyrotoxicosis. (F. T. G. Prunty) 406-412  
The treatment of diabetes mellitus in infancy and childhood. (H. Whittaker) 413-418  
The problem of production of steroid hormones. (E. C. Dodds) 419-427  
The present clinical status of gonadotrophins. (G. I. M. Swyer) 428-436  
Hormone implantation therapy. (P. M. F. Bishop) 437-444  
Pain in peripheral vascular disease. (A. J. Slessor & J. Learmonth) 445-454  
Clinical influenza. (J. Hartsilver) 455-458  
Current therapeutics. XXIII. Para-aminosalicylic acid. (M. M. Nagley) 459-466  
Revision corner : Modern methods in the treatment of varicose ulcers. (I. MacKenzie) 467-469. The treatment of burns. (J. S. Tough) 469-471

163 : December 1949

- A modern viewpoint on influenza. (C. H. Stuart-Harris) 481-487  
The diagnosis and treatment of empyema. (M. Davidson) 488-495  
Primary atypical pneumonia. (C. A. Birch) 496-501  
Acute respiratory infections in infants. (R. E. Bonham-Carter) 502-509

- The use and abuse of penicillin in respiratory infections. (T. Anderson) 510-516  
 Oxygen therapy. (I. G. W. Hill) 517-522  
 Practical medical mycology: a discussion of simplified laboratory methods. (J. W. Wilson & O. A. Plunkett) 523-532  
 Psychiatric rehabilitation in hospital. (J. E. Nicole) 533-540  
 The present position of surgery in the treatment of Parkinsonism. (L. C. Oliver) 541-543  
 The British Pharmaceutical Codex, 1949. (W. A. R. Thomson) 544-547  
 Current therapeutics. XXIV. Haemostatics. (J. F. Wilkinson) 548-554  
 Early diagnosis of carcinoma of the uterus. 555-557  
 The treatment of threatened abortion. 557-559  
 Revision corner: Early diagnosis of carcinoma of the uterus. (G. H. Dodds) 555-557. The treatment of threatened abortion. (S. G. Clayton) 557-559

## 164 : January 1950

- The premature infant. (R. W. B. Ellis) 5-12  
 The general management of the newborn. (G. A. Neligan) 13-18  
 Jaundice and anaemia in the newborn. (D. MacCarthy) 19-27  
 Respiratory infections of the newborn. (H. E. Jones) 28-34  
 Gastro-enteritis in the first month of life. (G. Ormiston) 35-44  
 The care of the skin in the newborn. (R. T. Brain) 45-51  
 Injuries and malformations of the newborn. (G. Herzfeld & J. J. M. Brown) 52-60  
 Nursery hygiene during the first month of life. (F. C. Naish) 61-64  
 A psychiatrist looks at the newborn. (D. R. MacCallman) 65-71  
 The responsibility of modern medicine. (R. Platt) 72-76  
 Current therapeutics. XXV. Radioactive isotopes. (J. F. Loutit) 77-82  
 Revision corner: Gynaecomastia. (R. Asher) 83-86. Alopecia areata. (H. Gordon) 86-88

## Proceedings of the Royal Society, B

## 136 : October 1949

- The presentation of scientific information. (E. N. da C. Andrade) 317-333  
 The work of the National Institute for Medical Research. (C. Harington) 333-348  
 The Royal Greenwich Observatory. (H. S. Jones) 349-377  
 On chlorocruorin and haemoglobin. (H. M. Fox) 378-388  
 Fluctuations in the haemoglobin content of *Daphnia*. (H. M. Fox, S. M. Hardcastle & E. I. B. Dresel) 388-399  
 The abrupt transition from rest to activity in muscle. (A. V. Hill) 399-420  
 Is relaxation an active process? (A. V. Hill) 420-435  
 The formation of choleglobin and the role of catalase in the erythrocyte. (E. C. Foulkes & R. Lemberg) 435-448  
 The influence of nerve fibres on Schwann cell migration investigated in tissue culture. (M. Abercrombie, M. L. Johnson & G. A. Thomas) 449-460  
 Metabolic activity in tissue transplants. Hormone-induced formation of fructose and citric acid in transplants from accessory glands of reproduction. (C. Lutwak-Mann, T. Mann & D. Price) 461-471  
 The antitoxic relationship of some mammalian spermatozoa. (A. U. Smith) 472-479

## 136 : January 1950

- Bakerian Lecture. A region of biosynthesis. (H. Raistrick) 481-508  
 A class of enumerations of importance in genetics. (R. A. Fisher) 509-520  
 The utilization of carbon resources by *Bact. lactis aerogenes*. I. General survey. (A. C. Baskett & C. Hinshelwood) 520-535. II. The significance of the tri-carboxylic acid cycle. (A. C. Baskett & C. Hinshelwood) 536-543  
 The utilization of potassium by *Bact. lactis aerogenes*. (A. A. Eddy & C. Hinshelwood) 544-562  
 An investigation of the nature of certain adaptive changes in bacteria. (S. Jackson & C. Hinshelwood) 562-576  
 The effects of D-xyloketose and certain root exudates in extension growth. (R. Brown, E. Robinson & A. W. Johnson) 577-591  
 Crystalline anti-pernicious anaemia factor from liver. (K. H. Fantes, J. E. Page, L. F. J. Parker & E. L. Smith) 592-613  
 The annelid phosphagen: with a note on phosphagen in Echinodermata and Protochordata. (E. Baldwin & W. H. Yudin) 614-631  
 Respiration of harley plants. IV. Protein catabolism and the formation of amides in starving leaves. (E. W. Yemm) 632-649

## Proceedings of the Royal Society of Medicine

## 42 : August 1949

- Galen as a modern. (C. Singer) 563-570  
 Lupus vulgaris, resistant to calciferol. Treated with streptomycin and calciferol. (R. M. B. McKenna & B. Russell) 571-572  
 Werner's syndrome. (D. I. Williams) 572-573  
 Dermatoid herpesiformis with ocular manifestations. (P. J. Hare & W. N. Goldsmith) 573-574  
 Discussion on neurological aspects of rheumatic diseases. 575-581  
 Some aspects of electrodiagnosis and electrotherapy in the Royal Air Force. (E. F. Mason) 582-586  
 Clinical electromyography in the Royal Air Force. (A. T. Richardson) 587-592  
 Arthritis of wrist relieved by synovectomy. (M. C. Wilkinson) 593-594  
 Osteotomy of the spine in the treatment of severe dorsal kyphosis: four cases. (W. A. Law) 594-597  
 Comminuted fracture-dislocation of the shoulder: result seven years after excision of fragments and treatment on abduction splint. (L. S. Michaelis) 597-598  
 Traumatic genu recurvatum. (D. Trevor) 599  
 Congenital deformity of wrists. (R. C. F. Catterall) 600  
 Neuropathic joint showing a fracture of the lower end of the right femur and internal condyle of the right tibia both involving the knee-joint. (W. E. Tucker) 600-601  
 Spondylolisthesis with bilateral drop foot. (G. P. Arden) 601-602  
 Traumatic changes in the brain after spontaneous delivery at full term. (H. Brouwer) 603-608  
 Anterior retinal dialysis. (C. D. Shapland) 609-614  
 Discussion on antihistamine drugs. 615-629

- Recent advances in the study of venereal disease. [Abstract] (J. E. Moore) 629-630  
 Discussion on planning a paediatric unit in an undergraduate teaching hospital (with a training school for nurses). [Abridged] 631-635  
 A pattern of disease in infancy, based on 2,306 hospital admissions in the years 1946-48 inclusive. (J. M. Smellie) 636-642

## 42 : September 1949

- Treatment of undescended testicle. (D. Browne) 643-645  
 Fertility in operatively treated and untreated cryptorchidism. (T. S. Hansen) 645-651  
 Investigations on the endocrine function of the testicle in cryptorchidism. (H. Engherg) 652-658  
 Discussion on resectable carcinoma of the stomach. 659-672  
 Recent developments in auditory tests. (S. R. Silverman) 675-686  
 "I remember." President's address. (A. Daley) 687-696  
 Anaesthetic responsibility. 697-706  
 Discussion on leptospirosis. 707-720  
 The history of research upon the renal circulation. (K. J. Franklin) 721-730  
 Discussion on the significance of pathological tests in rheumatic disease. 731-744  
 Obstetric analgesia: a new machine for the self-administration of nitrous oxide-oxygen. (E. H. Seward) 745-746  
 Discussion on the treatment of carcinoma of the vulva. 747-754  
 Ocular defects in Still's disease. (H. E. Hobbs) 755-756  
 Multiple congenital anomalies of the eyes. (A. J. Ballantyne) 756-762

## 42 : October 1949

- Carcinoma of the lung. (J. S. Fulton) 775-782  
 The contributions of King's College, London, to the science of dentistry. (F. N. Doubleday) 783-790  
 The present position in the surgical treatment of carcinoma of the thoracic gullet. (C. P. Wilson) 797-800  
 Management of the patient with anuria. (A. Miller) 801-805  
 Observations of familial polycystic disease of the kidney. (J. D. Fergusson) 806-814  
 The sterilization of carious dentine. (J. L. Hardwicke) 815-829  
 Penicillin in the treatment of dead teeth. (W. G. Cross) 829-830  
 Symposium on reconstructive surgery of the paralysed upper limb. 831-844  
 Radon implantation for acromegaly and Cushing's syndrome. (D. W. C. Northfield) 845-853  
 Radiotherapy in the treatment of pituitary basophilism and eosinophilism. (F. Ellis) 853-860

## 42 : November 1949

- The destruction of John Hunter's papers. (D. C. L. Fitzwilliams) 871-876  
 Somatic movements of the prematurely born foetus—film demonstration. (I. Mackenzie) 877-879  
 A review of cerebral angiography. (J. W. D. Bull) 880-890  
 Clinical and electroencephalographic studies of temporal lobe function. (J. H. Rey, D. A. Pond & C. C. Evans) 891-904  
 Discussion: toilet training in early childhood. 905-909  
 Congenital anomalies of the aortic arch and its branches. (J. Apley) 918-922  
 Discussion on the physical, cytological and medical aspects of protection from ionizing radiations with special reference to the use of high voltage X-rays and radio-isotopes. 923-934  
 Discussion: post-graduate medical education in the Services. 935-944

## 42 : December 1949

- Autoradiographs with radio-active iodine. (I. Doniach & S. R. Pelc) 957-959  
 The thyroid clearance rate of plasma iodine as a measure of thyroid activity. (N. B. Myant & E. E. Pochin) 959-961  
 Urinary excretion of radio-active iodine as a measure of thyroid activity. (A. S. Mason) 961-962  
 Clinical use of radio-active iodine. (R. Fraser) 962-968  
 Discussion: the professional future of medical officers of the fighting forces. [Summary] 969-980  
 Stenosis of the larynx. (V. E. Negus) 981-986  
 Discussion on chronic retention of urine. 987-1004  
 Discussion on prolapse of the rectum. 1005-1016  
 Optic nerve compression and its differential diagnosis. (S. P. Meadows) 1017-1034  
 Discussion: specialization—its value and abuse. 1035-1039  
 Discussion on non-tuberculous conditions revealed by mass radiography. 1039-1044

## 43 : January 1950

- The recognition of subsidiary factors in the aetiology of infective diseases. (R. Lovell) 1-10  
 Corisone (compound E) and adrenocorticotrophic hormone in rheumatoid arthritis. (O. Savage) 11-20  
 Discussion: whether antenatal care? 21-28  
 Discussion: the integration of preventive health services. [Abridged] 29-34  
 The history of the discovery of Addison's disease. (P. M. F. Bishop) 35-42  
 Studies in chronic retention. (C. Wells) 43-52  
 Modern drugs in dental surgery. (W. J. Dilling) 53-60

## Public Health

## 62 : September 1949

- Pre-natal care in pregnancy complicated by general disease. (R. M. Cortet) 242-244  
 The meeting place of medicine and dentistry. (P. J. Stoy) 245-247

## 63 : October 1949

- Heart disease in children. (W. Evans) 3-4  
 Macte nova virtute. (A. Hutchison) 4-6

## 63 : November 1949

- Bridging the gap. (H. C. M. Williams) 21-24

## 63 : December 1949

- A health service for children. (H. M. M. Mackay) 37-40  
 The organisation of child health services from the point of view of a maternity and child welfare officer. (J. M. Mackintosh) 41-43  
 The organisation of a child health service. (F. Hall) 43-44

## 63 : January 1950

- Medical administration. (J. Yule) 55-58  
 Some aspects of integration of the health services. (G. H. Hogben) 58-59  
 A case of generalised vaccinia in an eczematous child simulating variola. (R. A. Good & I. M. McLachlan) 59-60  
 The organisation of the child health services. 60-63

## Quarterly Journal of Experimental Physiology

## 35 : 1949

- The determination of the renal clearance of diodone and the maximal tubular excretory capacity for diodone in man. (J. S. Robson, M. H. Ferguson, O. Olbrich & C. P. Stewart) 173-203  
 Some observations on the bronchoconstrictor effects of tubocurarine. (N. Mahfouz) 205-211  
 The effect of certain analgesic drugs on synaptic transmission as observed in the perfused superior cervical ganglion of the cat. (C. O. Hebb & H. Konzett) 213-217  
 An instrument for the study of vascular factors in the physiology and pathology of the human mammary gland. (V. R. Pickles) 219-231  
 Initial respiratory responses to the intratracheal inhalation of phosgene or ammonia. (J. Banister, G. Fegler & C. Hebb) 233-250

## Quarterly Journal of Medicine

## 18 : October 1949

- William Osler. (R. Hutchison) 275-277  
 Idiopathic thrombocytopenic purpura. (H. N. Robson) 279-297  
 Three cases of thrombocytopenic purpura occurring after rubella, with a review of purpura associated with infections. (J. F. Ackroyd) 299-318  
 The syndrome of hypopituitarism. (H. L. Sheehan & V. K. Summers) 319-378  
 Genetic and environmental factors in congenital heart disease. (M. Campbell) 379-391

## Thorax

## 4 : September 1949

- Non-specific suppurative pneumonia. (A. Logan & H. Nicholson) 125-133  
 Haemolytic anaemia complicating virus pneumonia. (E. Besterman & W. Brigden) 134-136  
 Cavernous pulmonary telangiectasis. (J. Hayward & L. Reid) 137-146  
 Spontaneous pneumothorax complicating artificial pneumoperitoneum. (E. G. S. Lumsden) 147-151  
 The radiology of primary atypical pneumonia. (P. W. Verco) 152-167  
 Pulmonary aspergillosis in coal workers. (A. G. Heppleston & S. R. Gloyne) 168-172

## 4 : December 1949

- Extrapleural pneumonectomy and pleurectomy in pulmonary tuberculosis. (I. A. Sarot) 173-223  
 Pneumonoplasty: periosteoplastic pneumonolysis. (F. R. Edwards) 224-233  
 The post-operative course of pneumonoplasty and its management. (J. H. Gifford) 233-236  
 Death from cerebral air embolism during thoracoscopy. (P. P. Philip) 237-242  
 Transpleural cardioplasty in achalasia: operation results and sequelae. (H. B. Wulff & A. Malm) 243-250

## Transactions of the Royal Society of Tropical Medicine and Hygiene

## 43 : September 1949

- The Chagas' disease of Uruguay. (R. V. Talice) 107-112  
 The nation-wide campaign against malaria in Venezuela. (A. Gabaldon) 113-164  
 Planning the control of sleeping sickness. (K. R. S. Morris) 165-198  
 Iron intake in North-West India. (H. Lehmann) 199-208  
 Stomach function in post-dysenteric debility. (H. Lehmann & F. P. Kayser) 209-214  
 Diphtheria in African natives in the Transkei, South Africa. (N. S. Turnbull) 215-224  
 Observations on the isolated gut of the mosquito. (H. A. Ragab) 225-230

## 43 : November 1949

- Presidential address. (H. E. Shortt) 239-255  
 Malaria among prisoners of war in Siam ("F" force). (T. Wilson & J. A. Reid) 257-272  
 Studies on protozoa. Part I. The metabolism of Leishman-Donovan bodies and flagellates of *Leishmania Donovanii*. (J. D. Fulton & L. P. Joyner) 273-286  
 A case of indigenous kala-azar in The Gambia. (J. H. Walters) 287-292  
 A scorbutic diet in a Nile Cataract community. (N. L. Corkhill) 293-302  
 The role of fat ingested in the diet in the incidence in spruce. (J. C. Gilroy) 303-310

- Gaps in the knowledge of yaws. (C. J. Hackett) 311-316  
 Observations on haemoglobin values in African children. (E. A. Beet) 317-328  
 Insulin-hypersensitivity in pellagrins and its significance. (F. Mainzer) 329-342  
 The cerebellar aspect of nutritional spinal ataxia. (T. J. Danaraj) 343-344

## 43 : January 1950

- Tropical phlebitis and other possibly related vascular disorders in tropical Africa. (M. Gelfand) 369-394  
 A tragedy: how Surgeon-Major N. C. Macnamara was deprived of priority in the discovery of the causative organism of cholera. (L. Rogers) 395-400  
 DDT and gammexane as residual insecticides against *Anopheles gambiae* in African houses. (R. C. Muirhead-Thomson) 401-412  
 An investigation of rheumatic fever in Fiji. (G. Barnes) 413-426  
 Tick-borne relapsing fever in Somaliland with special reference to the blood sedimentation rate. (A. D. Charters) 427-434  
 Paludrine treatment of experimental malaria infection: effective minimum doses. (M. Ciucu, L. Ballif & M. Chelarescu, with the co-operation of A. Timisescu, F. Vasiliu-Munteanu & M. V. Trofim) 435-438  
 Tropical myositis and idiopathic thrombophlebitis (tropical primary phlebitis). (M. Gelfand) 439-442  
*Capillaria hepatica* (Bancroft, 1893). A case report. (G. Engler & G. Sanchez) 443-444

## Tropical Diseases Bulletin\*

## 46 : August 1949

- Summary of recent abstracts. VII. Helminthiasis. (C. Wilcocks) 687-695

## 46 : September 1949

- Summary of recent abstracts. VII. Helminthiasis: nematodes. (Continued) (C. Wilcocks) 791-796

## 46 : October 1949

- Summary of recent abstracts. VIII. Typhus group of fevers. (C. Wilcock) 887-896

## 46 : November 1949

- Summary of recent abstracts. IX. Leprosy. (C. Wilcocks) 993-999

## Tubercle

## 30 : September 1949

- Childhood tuberculosis in Middlesbrough 1947 and 1948. (M. Walton) 195-201  
 Tuberculous households in Wales. (W. H. Tyder) 202-203  
 Domiciliary collapse treatment. (R. Heller) 204-209

## 30 : October 1949

- A survey of negatively reacting child contacts in relation to BCG vaccination. (J. B. Shaw & N. Wynn-Williams) 218-222  
 Para-amino-salicylic acid as an aerosol in the treatment of respiratory tuberculosis. (A. E. K. Salvi) 223-226  
 The host parasite relationship in tuberculous infection. (E. M. Brieger) 227-236

## 30 : November 1949

- The host parasite relationship in tuberculous infection. (E. M. Brieger) 242-253  
 A clinical survey of bronchiectasis. (B. Mann) 254-259  
 Pleurisy with effusion in early syphilis. (C. D. Calnan) 260-263

## 30 : December 1949

- What is atelectasis? (C. Khalabarder) 266-283  
 Tuberculosis morbidity—is there a common factor? (H. J. Robinson) 284-286  
 The control of tuberculosis in nurses. (J. M. Greenwood) 286-288

## 31 : January 1950

- PAS, in pulmonary tuberculosis. (G. Vallentin, E. Törnelli, A. Beskow, B. Cartensen, R. Thune, G. Helleberg & J. Lehmann) 2-10  
 Tuberculosis services of the future. (F. Heaf) 11-18

## Ulster Medical Journal

## 18 : November 1949

- A brief survey of early midwifery practice. (A. J. Dempsey) 109-115  
 Paragon. (J. H. Biggart) 116-128  
 The evolution of a social obstetric conscience. (C. H. G. Macafee) 129-142  
 The health centre and general practice. (F. Halliday) 143-152  
 Chronic appendicitis in children. (P. T. Crymble & I. Forsythe) 153-158  
 Hare lip and cleft palate. (G. D. F. McFadden) 159-170  
 Preventive medicine and the practice of obstetrics. (A. T. Elder) 171-191  
 A statistical review of the trend of infant mortality in Northern Ireland during the period 1922 to 1927. (E. A. Cheseman) 192-207  
 Two birthdays a hundred years ago. (W. W. D. Thomson) 208-211  
 Some aspects of eclampsia. (W. S. Campbell) 212-218  
 A fatal case of infectious mononucleosis with extensive zonal necrosis of the liver. (N. J. Ainley) 219-224

\* Journals marked with an asterisk in this Guide consist mainly of abstracts and are listed only when they include original articles.—Ed.
